[illegible]

Abstracts signed B C A. have been obtained by special cooperative arrangement with British Chemical Abstracts.

Entered as second-class matter at the Post-Office Station, Pa. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of November 3, 1912. Authorized July 13, 1928.

# CHEMICAL ABSTRACTS

Published by THE AMERICAN CHEMICAL SOCIETY at Easton, Pa.  
Secretary's Office: Mills Bldg., Washington, D. C.

Communications for the editor should be addressed to E. J. Cramo, Ohio State University, Columbus, Ohio.  
Remittances for subscriptions to this *Journal* (\$12.00 per year), changes of address, orders for subscriptions or back numbers, claims for missing numbers and all matters intended for the *Proceedings* should be sent to the Secretary, Charles L. Parsons, Mills Bldg., Washington, D. C. Foreign postage to Canada is \$0.70 extra. To other countries not within the Pan American Postal Union it is \$2.10 extra.

The Council has voted that no claims will be allowed for copies of journals lost in the mails unless such claims are received within sixty days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days advance notice is required.) "Missing from files" cannot be accepted as the reason for honoring a claim.—Charles L. Parsons, Secretary

The American Chemical Society also publishes *The Journal of the American Chemical Society* and *Industrial and Engineering Chemistry*

## CONTENTS

Patents	1	15 Soils, Fertilizers and Agricultural Poisons	201
Author Index	1	16 The Fermentation Industries	227
1 Apparatus, Plant Equipment and Unit Operations	1	17 Pharmaceuticals, Cosmetics and Perfumes	231
2 General and Physical Chemistry	1	18 Acids, Alkalies, Salts and Other Heavy Chemicals	249
3 Solvated Phenomena and Radiochemistry	15	19 Glass, Clay Products, Refractories and Enamelled Metals	255
4 Electrochemistry	27	20 Cement and Other Building Materials	261
5 Photography	33	21 Fuels, Gas, Tar and Coke	265
6 Inorganic Chemistry	37	22 Petroleum, Lubricants, Asphalt and Wood Products	273
7 Analytical Chemistry	41	23 Cellulose and Paper	281
8 Mineralogical and Geological Chemistry	57	24 Explosives and Explosions	287
9 Metallurgy and Metallography	59	25 Dyes and Textile Chemistry	299
10 Organic Chemistry	71	26 Paints, Varnishes and Natural Resins	305
11 Biological Chemistry	113	27 Fats, Fatty Oils, Waxes and Soaps	309
12 Foods	165	28 Sugar, Starch and Gums	317
13 Chemical Industry and Miscellaneous Industrial Products	185	29 Leather and Glue	319
14 Water, Sewage and Sanitation	195	30 Rubber and Allied Substances	323

## PERIODICALS

The official List of Periodicals Abstracted with key to library files and other information is to be found on pages 6019-6160 of Volume 25. Reprints of the List can be obtained from the editor. Price 50¢ each.

## PATENTS

Abstracts of patents are included in the appropriate sections of the *Journal* according to subjects. The countries whose patents are covered are:

Australia	Belgium
Austria	Canada
Danmark	Netherlands
France	Norway
Germany	Russia
Great Britain	Sweden
Hungary	Switzerland
Japan	United States

The dates which accompany abstracts of patents are those used by the U. S. Patent Office in citing the patents as references. These are:

Australia*	Accepted
Austria	Ausgegeben
Belgium*	Déposé
Canada*	Issue
Denmark	Bekendtgjort
France	Publié
Germany	Ausgegeben
Great Britain*	Complete specification accepted
Hungary	Megjelent
Japan	Granted
Netherlands	Vergeven
Norway	Offentliggjort
Russia	Vydannaya
Sweden	Offentliggjort
Switzerland	Veröffentlicht
United States	Issue

All British, French, German and United States patents of chemical interest are covered either by abstracts or by titles and references to previous abstracts (used when the subject has been previously patented in another country and an abstract published). For each of the other countries listed only those chemical patents are reported which have been issued to individuals or companies resident in that country or in a country not on the list and which have not been found to correspond to patents previously issued in any other country on the list. In addition to the name of the patentee it is the practice to give the avénue (in parentheses following the word "to"), if any. Or, if the inventor is not the patentee his name when available is given (in parentheses following the word "inventor(s)").

These are for the most part actual or approximate publication dates. For the countries marked with an asterisk, the publication date is not conveniently ascertainable (e. g., does not appear on the face of the patent); the date used,

# CHEMICAL ABSTRACTS

Published by THE AMERICAN CHEMICAL SOCIETY at Easton, Pa

Secretary's Office: Mills Bldg., Washington, D. C.

Communications for the editor should be addressed to E. J. Crane, Ohio State University, Columbus, Ohio

Remittances for subscriptions to this *Journal* (\$12.00 per year), changes of address, orders for subscriptions or back numbers, claims for missing numbers and all matters intended for the *Proceedings* should be sent to the Secretary, Charles L. Parsons, Mills Bldg., Washington, D. C. Foreign postage to Canada is \$0.70 extra. To other countries not within the Pan American Postal Union it is \$2.10 extra.

The Council has voted that no claims will be allowed for copies of journals lost in the mails unless such claims are received within sixty days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days advance notice is required.) "Missing from files" cannot be accepted as the reason for honoring a claim.—Charles L. Parsons, Secretary

The American Chemical Society also publishes *The Journal of the American Chemical Society and Industrial and Engineering Chemistry*

## CONTENTS

Patents	1	15 Soils, Fertilizers and Agricultural Poisons	1483
Author Index	1	16 The Fermentation Industries	1505
1 Apparatus, Plant Equipment and Unit Operations	1263	17 Pharmaceuticals, Cosmetics and Perfumes	1511
2 General and Physical Chemistry	1271	18 Acids, Alkalies, Salts and Other Heavy Chemicals	1523
3 Subatomic Phenomena and Radiochemistry	1291	19 Glass, Clay Products, Refractories and Named Metals	1529
4 Electrochemistry	1305	20 Cement and Other Building Materials	1535
5 Photography	1313	21 Fuels, Gas, Tar and Coke	1539
6 Inorganic Chemistry	1317	22 Petroleum, Lubricants Asphalt and Wood Products	1547
7 Analytical Chemistry	1321	23 Cellulose and Paper	1555
8 Mineralogical and Geological Chemistry	1329	24 Explosives and Explosions	1561
9 Metallurgy and Metallography	1337	25 Dyes and Textile Chemistry	1563

11 Biological Chemistry	1393	27 Fats, Fatty Oils, Waxes and Soaps	1595
12 Foods	1445	28 Sugar, Starch and Gums	1599
13 Chemical Industry and Miscellaneous Industrial Products	1457	29 Leather and Glue	1603
14 Water, Sewage and Sanitation	1473	30 Rubber and Allied Substances	1603

## PERIODICALS

The official List of Periodicals Abstracted with key to library files and other information is to be found on pages 6019-6100 of Volume 25. Reprints of the List can be obtained from the editor. Price 50¢ each.

## PATENTS

A statement giving information concerning patents and in particular as to how to obtain specifications and drawings, both United States and foreign, is to be found on page i of *Chemical Abstracts* 30, No. 1.

# CHEMICAL ABSTRACTS

Vol. 30

JANUARY 10, 1936

No. 1

## 1—APPARATUS, PLANT EQUIPMENT AND UNIT OPERATIONS

W. L. RUGER

Some early chemical balances. A. Rarich. *J. Soc. Chem. Ind.* 54, No. 42, 2-108 (1935). E. H.  
Some modern chemical balances. M. Dunbar. *J. Soc. Chem. Ind.* 54, No. 42, 10-158 (1935). E. H.  
A gas specific gravity balance. J. S. Hales and W. C. Moss. *J. Soc. Instrum. Engrs.* 12, 301-13 (1935).—The app. is based on counterbalancing with riders the upthrust on a glass ball when successively surrounded by air and the gas. It is portable, accurate to 1 or 2 in the 3rd place, requires a small quantity of gas, and a detm. can be made in 3-4 min. J. H. Moore

New apparatus for determining molecular weight by the campher method. Carl Twecke. *Mitteilungen* 15, 225-6 (1935).—In detg. mol. wts. by the method of Rast (C. A. 16, 2000), the substance is usually mixed with campher in a melting tube, heated in a bath of H<sub>2</sub>SO<sub>4</sub>, and the m. p. detd. with a thermometer graduated in fifths of a degree. The app. here described consists of a 250-cc. flask with ground-glass connection in the neck with a thermometer, as is usual with pycnometers. The flask is also provided with a stirrer and a Pt hook for holding the tube cong. the sample + campher. W. T. H.

The modern vacuum filter. Hans Paul. *Eng. Technics* 16, 250-2 (1935).—A discussion of the working principle, basic and special types, and fields of use of vacuum filters. E. H.

Micro filtration apparatus. Herman Yaroda. *Mitteilungen* 15, 204-202 (1935).—The app. described works on the same principle as the Bchner funnel. W. T. H.  
Recent accomplishments in the field of fractional ultrafiltration. Pierre Grabar. *Bull. soc. chim. Ind.* 17, 1245-1270 (1935); cf. C. A. 39, 6481P.—A review, with over 200 references. L. E. Gilson

Technic of ultrafiltration through Cellophane membranes. Lucien Brull. *Compt. rend. soc. chim.* 129, 98-9 (1935).—In the app. described ultrafiltration through ordinary sheet Cellophane under pressures of 30-40 atm. is possible. L. E. Gilson

A method for withdrawing single portions from continuous filtration and vacuum distillation. Walter Schmitt-Lange. *Arch. Hyg. Expt. Biol.* 114, 304-10 (1935). F. S.

A simple modification of the Cottrell apparatus for measuring elevations of boiling points. H. C. Palmer. *Soc. Sci. Res.* 17, 138 (1935). O. Remmich

A sound box for the electrically-driven laboratory centrifuges. N. Pollard. *Analyst* 60, 753-5 (1935).—To prevent the unpleasant noise of the centrifuge a box just large enough to hold the app. was made and lined with rubber sponge mats. The box is covered with wire. W. T. H.

Vacuum in laboratory and technology. H. Biermann. *Chem. Technik* 1935, 393-404.—The present status of vacuum technic is reviewed under the headings: vacuum production (types of pumps, production by absorption), vacuum-measuring instruments, sealing and connecting vacuum app., purifying and taking out vacuum app., some automatic devices to facilitate work with vacuum installations, application of vacuum in lab. and technology (distn., evapn., crystn., disinfection and sterilization, filtration). One hundred and forty-one references. J. H. Moore

A high-vacuum microdesiccator. Josef Unterwiesinger. *Mitteilungen* 15, 315-18 (1935).—The app. shown is of stout construction and permits the use of a high vacuum

and an elevated temp. for the drying. It is of the revolving type and is provided with a receptacle in which the capsule coning the substance is weighed before and after the drying. The app. is especially suited for work with substances which are hard to dry and are hygroscopic. W. T. H.

Modern drying machinery. T. J. Morgan. *Chemistry & Industry* 1935, 913-24. E. H.

How to use pilot plants in process development. F. C. Villard. *Chem. & Met. Eng.* 42, 534-5 (1935). E. H.

Fractional distillation of extremely small volumes of liquids. Anton A. Benedetti-Pichler and Julian R. Rachele. *Mitteilungen* 19, 1-5 (1935).—The distn. of a few cc. of liquid is best accomplished by heating below the b. p. in a closely covered space with an efficiently cooled condenser of small surface area in close proximity to the evap. liquid. The sum of the app. described, which is still in the exptl. stage, is to collect the distillate at a cold point in the space immediately above the evap. surface. A brass rack and piston device is provided for raising and lowering the condensing system. By means of a vacuum, ice-cold water is made to circulate in an outer tube but since the water rises but 1 ft., only the lower end of the condenser tube is cooled. An Al heating block is provided and a thermometer. W. T. H.

Continuous-action water still. Roberto F. Bonfi. *Industria Chim. Italiana* 6, 33-2 (1935).—A constant-level device, supplied with hot water from the condenser overflow, is attached to an inlet tube fused into the side of the glass distn. flask just below the middle. L. E. Gilson

Continuous production of distilled water free from carbon dioxide and ammonia. Frederick G. Straub. *Ind. Eng. Chem., Anal. Ed.* 7, 433-4 (1935).—Fifteen l. of condensed steam per hr. mixed with 30 cc. per min. of acid chlorate soln. cong. 9 cc. of concd. H<sub>2</sub>SO<sub>4</sub>, and 10 g. of Na<sub>2</sub>CrO<sub>4</sub> to 5 l. of water, was fed to a gas-fired Barnard still. Nine l. per hour of dist. water was generated which had a conductance of  $0.5 \times 10^{-4}$  and  $0.3 \times 10^{-4}$  mho with a p<sub>H</sub> value of 6.8. Sketch of equipment is shown. J. L. E.

A simple automatic cut-off for electric stills. M. R. Aravindarajah Rao and Basant Sanjiva Rao. *Ind. Eng. Chem., Anal. Ed.* 7, 577 (1935).—An app. for preventing the burning out of elec. heating units in water stills is described and a drawing is given. J. L. E.

Simple microburet without stopcock. Karl Schwarz. *Mitteilungen* 15, 304-11 (1935); cf. C. A. 37, 2047.—A no. of improvements have been made, particularly with respect to providing several jets. The use of the pipet, obtainable from Haack of Vienna, is explained. W. T. H.

Improved screw plunger for use with mercury piston microburets. S. J. Foley and E. A. Rowell. *Mitteilungen* 15, 303-4 (1935).—The advantage of the new design is that there is no opportunity for leakage of Hg along the thread of the screw. W. T. H.

A new absorption apparatus for the microchemical determination of carbon and hydrogen. A. Friedrich. *Mitteilungen* 19, 25-37 (1935).—The use of anhydrous and anoxic, which are more effective than CaCl<sub>2</sub> and soda lime, permits smaller and higher absorption tubes. Each tube consists of 2 parts; the inside part contains the absorber and the outside mantle is provided with an inner

and exit tubes for the gas. The 2 parts fit together and when properly placed the gas enters through an opening, passes down through the absorbent and back to a second opening in the stopper, where it passes out. W T H  
A home made Kipp apparatus J H H MacRae  
and T T Richards *School Sci Rev* 17, 137 (1935)

A self-starting flow regulating siphon G Monch  
*Z tech Physik* 16, 314 (1935) J B Austin  
Centralized measuring system for liquids in tanks  
W S Gilfoil *Chem & Met Eng* 42, 551 (1935)

An oil manometer G H Van Hengsfeld and J D Stark-  
weather *Mech Eng* 57, 633 5 (1935)—A new instru-  
ment is described in detail, with 1 cut, for measuring the  
abs. pressure in steam turbine condensers J H M  
Calculations for hydrogen-liquefaction apparatus with  
the help of s-T (heat content temperature) diagrams V.  
Ischer *Z ges Kalle Ind* 42, 174-8 (1935).

Burlap bags for bulk chemicals R W Lahey, *Chem  
& Met Eng* 42, 544-8 (1935)

Hydrogenation apparatus for small quantities of sub-  
stance J Erdos *Mikrochemie* 18, 393-8 (1935).—The  
app. described serves for the hydrogenation of a few cg.  
of substance and is designed so that it is easily possible to  
determine by measurement whether any H<sub>2</sub> has been absorbed by  
the sample and how much. The glass vessel in which the  
hydrogenation takes place is connected with a mech.  
shaker W T H

Water-cooled stone mill, its introduction and improve-  
ment James W Kent *Point, Oil & Chem Rev.* 97,  
no. 21, 20-7 (1935).

An all glass valve, John Willard *J. Am. Chem. Soc.*  
57, 2328-9 (1935)—An all-glass valve for use in systems  
where stopcocks are objectionable is described and illus-  
trated C. J West

Bin shapes and feeders Harlow F Harding *Ind  
Eng Chem* 27, 1338-41 (1935)—Bins of ordinary type,  
with truncated prism bottoms and single discharge open-  
ings, are subject to (a) segregation and (b) bridging of  
bin contents, causing variations of 20-30% in wt./cu. ft./  
hr. If 2 sides are vertical and others sloping, such trou-  
bles are lessened, if 4 sides are vertical and multiple dis-  
charge openings are used, difficulties are minimized.  
Bridging is prevented by striking the sides of the bin,  
using compressed air intermittently between double lin-  
ings of the bin, employing oscillators, scrapers, or belt  
conveyors within the bin. Six types of volumetric  
feeders are described and discussed, but better results  
are to be had from feeders giving const. wt./unit time.  
A counter-weighted hopper may load and then be dis-  
charged at const. time intervals or a traveling belt may  
act in a similar way—both essentially batch methods.  
An improved type uses a balanced belt and counterweight  
operating continually, oscillating about a pivot support,  
and by a linkage partly opening or closing a gate as needed.  
The actual weight of material delivered from the end of the  
belt remains the same per unit of time regardless of its wt./  
cu. ft., or whether it is coarse or fine. Grinders fed thus  
show increased capacity of 10% as compared with const.-  
vol. feed types, and reduced cost/ton and lessened wear on  
grinding parts W C Fbaugh

An improvement in the Sandera conductivity apparatus  
F Pridal *Lesty Cukrovár* 53, 490-2 (1935)—The S.  
cond. app. uses a high current intensity, heats the soln.,  
demands very quick readings and necessitates a dark  
room with special lighting. P. used a c, increased the  
resistances so that only 0.02 of the previous current passed  
through the soln., took readings with n. d.-c. milliamper-  
ammeter protected by a Se rectifying tube, and with a sep-  
arate made coarse adjustments quickly before taking the  
final readings leisurely under a small current intensity.  
With this arrangement P. detected the changes in cond.  
brought by a 0.5° change in the soln. temp. F M

A micro cell for the measurement of electrolytic conduc-  
tivities Alfred Fink and Philipp Gross *Mikrochemie*  
18, 169-74 (1935)—The cond. cell here described has a

capacity of 0.45-0.80 cc. and has been used for detg. the  
cond. of electrolytes dissolved in heavy water. The elec-  
trode of the measurement has been described previously,  
C. A. 28, 2246. The cell is essentially composed of a  
cylinder of 4 mm diam and 1.5 cm length. At both ends  
there are attached, at right angles, capillary tubes of 0.8  
mm which run upward parallel to the walls of the cell  
and, at the top, the tubes are bent into curves which are  
constructed at the open ends W T H

Auxiliary apparatus for luminescence analysis W.  
Kern *Appl. Phys.* 50, 1212-3 (1935)—An illustrated  
article W O E.

A mass spectrometer S H Bauer. *J. Phys. Chem.*  
39, 959-65 (1935)—It is proposed that a simple mass  
spectrometer can be constructed, based on a principle first  
discussed by Smythe (C. A. 21, 1057), and later used by  
him and Mattauch (C. A. 26, 4256) in the development of  
an efficient velocity filter for ions. The expl. arrange-  
ment suggested differs from these in that the oscillating  
field is directly made to be the mass analyzer, it being  
assumed that a condenser can be treated as ideal. This  
assumption is discussed and justified. The character-  
istics of such a mass spectrometer are discussed H. G.

A hydrogen discharge tube for absorption spectroscopy  
W. H. Watson and D. G. Hurst *Can. J. Research* 13,  
A, 19-21 (1935)—An inexpensive, easily assembled tube  
of rugged construction is described. All parts exposed  
to the discharge are water cooled. The capillary with  
its water-cooling sheath is the only glass part, is a self-  
contained unit and is easy to make. The tube has been  
operated without trouble at over 2 kw input at 1000 v.

Making light-pencils and furnaces with Nernst paste  
C. Tugwaldt, *Physik Z.* 36, 627-9 (1935).—Our  
methods of making pencils and tubes of various mixtures  
of ZrO<sub>2</sub>, Y<sub>2</sub>O<sub>3</sub>, CeO<sub>2</sub>, and ThO<sub>2</sub> are given. For electrodes,  
thin, interwoven wires of Pt or Pt-Rh were wound around  
the tube and cemented on with a paste of Zr nitrate.  
Bands were used for higher temps. The paste was ignited  
over a flame. The elec. resistances of tubes of the same  
size and shape, prep'd under the same conditions, but  
contg. resp. 2.7, 4.3 and 7.3% of Y<sub>2</sub>O<sub>3</sub>, were measured at  
1600° and 1750° and a min. was found at about 4.3%.  
The forming of tubes to make small furnaces is described.  
A tube 70 mm. long will heat up to 2000° on 220 v. in free  
air. The ends, to which the electrodes are attached,  
must be kept below the m. p. of Pt, but the tube can be  
heated to 2310° without forming large crystals on the  
surface, as with com. Nernst pencils. The first lighting  
requires a higher temp. than afterward, since the elec.  
resistance is reduced by the 1st heating L R Rushton

High temperature conveyors—a novel type for heating  
furnaces W. E. Rhythe *Iron Steel Engr.* 12, 16-22  
(Oct., 1935)—A high flexibility of design is described  
and illustrated W H Boynton

A homemade portable assay furnace James P. Sloss  
and Tidman M. Patten *Mining and Met.* 16, 451 2  
(1935)—By use of standard shapes of A. P. Green G-25  
bricks, fire-clay splits and a 6 X 8 muffle, an entirely  
satisfactory assay furnace costing \$9.50 was constructed.  
In heating, a torch is employed similar to those used to  
preheat large castings. Gasoline, kerosene or distillate  
under 20-30 lb. pressure (using a hand pump) is supplied.  
Consumption is 1/4 gal. per hr. Fusing and cupelling  
can be done simultaneously Alden H. Lmery

Minimizing hazards in operation of refrigerating sys-  
tems L S Morse *Ice and Refrigeration* 89, 187-4  
(1935)—Temp.-pressure relationships and refrigerants  
are discussed in relation to hazards in refrigerating sys-  
tems A H Johnson

New investigations in absorption refrigeration B H  
Jennings *Refrigerating Eng.* 30, 87-93 (1935)

Acid-stable lining instead of lead for receptacles  
Gregon'ev. *Zhurnal So No* 26094, Ser. 62, *Refraktarii  
Silikatnaya* No 1338 (1935)—Products coated with  
water glass and a siliceous material are resistant to acids  
in the presence of Na fluosilicate. They are attacked only

by HF and some higher fatty acids. Finely pulverized siliceous material is mixed with 4% Na silicate and liquid water glass (36° to 38°Bé.) and applied on metallic or wooden receptacles; 3 or 4 days are necessary for the coat to dry and harden. The coated ware may be treated with  $H_2SO_4$  to improve their resistance to fatty acids.

31. V. Kondoidy

Apparatus for distilling liquids. Edwin M. F. Guignard. Swiss 171,029, May 1, 1933 (Cl. 36a).

Apparatus for continuous distillation of liquids. Edwin M. F. Guignard. Fr. 784,520, July 22, 1935.

Continuous still, with preheating device. Barrag-Meguin A-G. Ger. 618,109, Sept. 2, 1935 (Cl. 12a. 5).

Crystallization. The Dorr Co., Inc. Brit. 431,812, July 16, 1935. Minor crystallizable constituents or impurities that show decreasing sol. with increasing concn. of the main soln. are removed by continuously concg the soln within the metastable range of said minor constituents so as not to permit spontaneous crystn. thereof and then mixing with fresh feed in such proportions that the mixt. is supersatd. to such a degree that the minor constituents are pptd. The process is applicable to the removal of fluosilicates from a soln. of  $H_3PO_4$ . App. is described.

Crystallizing manganese nitrate hydrate. Howard S. McQuaid (to Grasselli Chemical Co.) U. S. 2,017,960, Oct. 22. Crystals resembling light, dry snow are obtained by stirring a melt of Mn nitrate hydrate with solid  $CO_2$  in direct intimate contact.

Gas or liquid meters. Arne Zacharassen and Marius E. Petersen. Brit. 431,697, July 12, 1935. App. for measuring liquids or gases comprises 2 or more chambers for the fluid to be measured and a bellows or like extensible member in each chamber, the bellows being connected in pairs directly through conduits and filled with working liquid.

Thermohydrometer suitable for testing liquids such as "anti-freeze" solutions. Leo Edelmann (to E. Edelmann & Co.). U. S. 2,018,441, Oct. 22. Structural details.

Electronic temperature-indicating and control system suitable for use with laboratory ovens. Wm. S. Halstead. U. S. 2,017,839, Oct. 22. Various elec. and operative details.

Thermometer suitable for floating in water. Herbert Hastings. U. S. 2,019,221, Oct. 29. Structural details.

Rotary-drum filter. Harry W. Denhard (to Oliver United Filters Inc.). U. S. 2,018,598, Oct. 22. Structural details.

Filter for liquids. E. Häny & Co. Swiss 173,039, June 1, 1935 (Cl. 58J).

Air filter. Richard R. Halstead (to Halstead Corp.) U. S. reissue 19,732, Oct. 22. A reissue of original pat. No. 1,948,791 (C. A. 28, 2576).

Air filter. Harry S. Kaiser (to H. S. Kaiser Co.). U. S. 2,019,186, Oct. 29.

Air filter. Verner Dahlman (to Independent Air Filter Co.). U. S. 2,019,213, Oct. 29.

Multi-stage air filter. Herbert G. Kamrath (to General Motors Corp.). U. S. 2,019,131, Oct. 22. Structural details.

Filter for gases. Wilhelm Rehfus. Fr. 784,533, July 22, 1935. The filter is formed of bands twisted to spiral form and placed side by side to form a layer which is superimposed by another layer or layers.

Centrifugal separators. Gatehofnungshütte Oberhausen A.-G. Brit. 431,257, July 3, 1935. A centrifuge with nozzles or hollow outlet bodies leading to outlets in the wall of the drum has a distributing plate with guiding or distributing passages.

Magnetic separator. Karl Sittig. Ger. 618,156, Sept. 3, 1935 (Cl. 16. 4 01).

Pneumatic separators with spinner disks for spreading the material in a casing where it is subjected to a rising air-current. British "Rema" Manufacturing Co. Ltd. and Peter Howden. Brit. 431,147-S, July 2, 1935.

Baffle apparatus for separating dust from gases. Mas-

chinen- und Filterbau G. m. b. H. Ger. 618,493, Sept. 9, 1935 (Cl. 12a. 2 01).

Separating solid materials. Khas Prins. Brit. 431,801, July 16, 1935. In the sepn. of refuse from comparatively large-sized coal, a flowing stream of small coal is formed in a trough which has a series of baffles by which upward surges in the stream are produced, and the material to be sepd. is fed onto the top of the stream, the coal floating on the upper surface and being skimmed off at intervals while the refuse sinks and is carried away by the stream, from which it is ultimately screened. App. is described.

Apparatus for separating coarse and fine solids by the action of air currents. Charles E. Hermann. U. S. 2,018,669, Oct. 29. Structural details.

Apparatus (employing air currents) for separating heavy granular particles from comminuted diatomaceous earth. McKinley Stockton (to Diacrite Co.). U. S. 2,018,039, Oct. 22. Various structural and operative details.

Apparatus for separating materials of different specific gravities such as coal and refuse by agitation and use of a blast of air. Henry M. Chance. U. S. 2,018,010, Oct. 22. Structural, mech. and operative details.

Apparatus for separating liquids of different densities. Ruderich Seisenwerle. Ger. 618,020, Aug. 31, 1935 (Cl. 8a. 9 03).

Sifting-apparatus. Thomas Robinson and Son Ltd. Ida Robinson and Eric Nassau Molesworth (legal representatives of Wilfrid N. Robinson (deceased)). Brit. 432,060, July 19, 1935.

Sieves for grading, classifying, etc. Louis Herrmann. Brit. 431,841, July 16, 1935.

Devices for dispersing gases in liquids. The Distillers Co. Ltd. and James Lockey. Brit. 431,674, July 12, 1935. Addn. to 387,486 (C. A. 27, 4446) and 393,551 (C. A. 27, 5586).

Treating gases with liquids. Chemische Fabrik Carlthaus A.-G. Brit. 431,788, July 15, 1935. In a reaction tower, the filling consisting of elongated plate-shaped or hollow bodies is poured in from the walls so that the bodies arrange themselves, with respect to the incoming liquid, at an acute angle toward the axis of the tower, whereby the downflowing liquid is directed toward the center.

Gas washers. Wilhelm Francke. Brit. 431,309, July 4, 1935. Addn. to 393,117 (C. A. 27, 5385). Wet filters used for purifying gases as described in 393,117 are composed of layers of small hollow bodies located between sieves or netting, the thickness of a layer being, e. g., 20 mm.

Means for detecting impurities in gases. Bernhard Dräger. Brit. 431,804, July 16, 1935. An adsorbent, e. g., silica or alumina gel, impregnated with an indicator soln. is used.

Device for centrifuging liquids or suspensions in swinging holders. Ewald Collatz. U. S. 2,018,837, Oct. 29. Mech. details.

Apparatus for transferring liquefied gases from transporting containers. Wm. F. Mesinger (to Linde Air Products Co.). U. S. 2,018,144, Oct. 22. Various structural, mech. and operative details.

Dispensing measured quantities of liquefied gases such as liquefied ammonia from tank cars. Walter H. Knaus (to Atmospheric Nitrogen Corp.). U. S. 2,018,857, Oct. 29. App. and various operative details are described.

Dispensing measured quantities of liquefied ammonia or the like from tank cars, etc. Frank C. Clark (to Atmospheric Nitrogen Corp.). U. S. 2,018,833, Oct. 29. Various features of app. and operation are described.

Siphon for conducting liquids. Jose P. Anter. U. S. 2,018,110, Oct. 22. Various structural and operative details.

Sheet-metal containers for ether and other volatile substances. John Weaver Ltd., Howards & Sons Ltd., Arthur Swann and Frederick W. Williams. Brit. 430,776, June 25, 1935.

Tanks for storing volatile liquids in the open air. Askan Wilb Svendgaard. Brit. 431,001, June 28, 1935. Sech

tanks comprise a vessel having metal walls and having the top and sides covered with a layer of concrete or other material in direct contact therewith, said layer serving as a heat-insulator and as a reinforcement for the tank.

Apparatus for the recovery of solvent vapor from solutions employed in an installation for the making of films, foils, coated papers, etc. Gennady Frenkel. Brit. 432,176, July 22, 1935.

Apparatus for carbonating liquids in bottles. Geo. F. Sargent (to Sodax (1923) Ltd.). U. S. 2,018,424, Oct. 22. Various structural and operative details.

Emulsifying devices. Wm. M. Melmore and Alice L. Melmore. Brit. 431,978, July 18, 1935.

Recovering solids from solutions. Firma Rud. O. Meyer. Ger. 618,107, Sept. 2, 1935 (Cl. 12b). In processes in which solids are sprayed into a tower against a stream of hot gas, the dust carried away by the gas is sepd. and returned to the tower at a point where the temp. of the gas stream is sufficiently high to dry the dust. The process is particularly useful in recovering anhyd.  $MgSO_4$  or  $MgSO_4 \cdot H_2O$  from  $MgSO_4$  solns. App. is described.

Means for feeding air to drying towers. Willy Kuhles. Ger. 618,426, Sept. 13, 1935 (Cl. 12a 3).

Rotary-drum drying apparatus. Jørgen Brabæk. Ger. 618,160, Sept. 3, 1935 (Cl. 12a 2). See Brit. 326,829 (C. A. 24, 476).

Conveyor-band apparatus for drying ammonium sulfate. Elektra A.-G. für Elektrotechnik. Ger. 618,363, Sept. 6, 1935 (Cl. 12a 2).

Apparatus for concentrating a solution or suspension by spraying. Johan M. Visser. Brit. 431,756, July 15, 1935. The soln. is sprayed onto the bottom of an evacuated container, the bottom being already covered with a dry substance, scrapers being provided to agitate the dry material and a roller being provided to smooth down the dry substance after agitation.

Bulk evaporators. James Miller. Brit. 431,301, July 4, 1935.

Evaporating solutions or emulsions, particularly of materials sensitive to heat or oxygen. Johan Marie Visser. Ger. 618,105, Sept. 2, 1935 (Cl. 12a 2). See Fr. 746,203 (C. A. 27, 4321).

Apparatus for evaporating salt solutions. Escher Wyss Maschinenfabriken A.-G. Swiss 175,330, May 1, 1935 (Cl. 36f).

Evaporating device for humidifying air. Robert C. Yost and Cyril G. Schelly (to Yost-Schelly Patent Estate, Inc.). U. S. 2,018,990, Oct. 29. Structural and operative details.

Air-dehumidifying and -conditioning apparatus. Robert H. Polson (to Young Radiator Co.). U. S. 2,018,750, Oct. 29. Various structural and operative details.

Air-cooling and -dehumidifying apparatus. Jesse E. Rasmussen. U. S. 2,018,804, Oct. 29. Various structural and operative details.

Air-conditioning and -cooling system. Matthew M. Lawler (to Cooling and Air Conditioning Corp.). U. S. 2,018,453, Oct. 22. Various structural and operative features.

Air-conditioning system. Lawrence A. Philipp (to Kelvator Corp.). U. S. 2,019,091, Oct. 29. Various details of app. and operation.

Air-conditioning system. Kemper P. Brace and Norman L. Rowe, 3rd (to Air Conditioning Systems, Inc.). U. S. 2,019,291, Oct. 29. Various details of app. and operation.

Air-conditioning apparatus. Harold F. Lathrop (to General Elec. Co.). U. S. 2,019,351, Oct. 29. Structural details.

Apparatus for cleaning air. Ralph L. Layte (to Motor Improvements, Inc.). U. S. 2,018,074, Oct. 22. Structural details.

Mixing-apparatus. American Machine & Foundry Co. Brit. 431,946, July 16, 1935. A mixing blade or beater comprises a central shank and a heart-shaped head, the shank being disposed in the re-entrant angle.

Apparatus for mixing a liquid and a gas as in regenerat-

ing spent sodium plumbite solutions. Frederick W. Stone and James N. Garrison. U. S. 2,019,325, Oct. 29. Structural, mech. and operative details.

Apparatus (with a pump and injectors, etc.) suitable for mixing oil, water and air for combustion, etc. Merle E. Nanta. U. S. 2,017,867, Oct. 22. Structural and operative details.

Apparatus for mixing and blending dry batches of materials such as pigments, oxides, flour, cosmetics, etc. Frank J. Muench and John L. Muench (to General Machine Co.). U. S. 2,018,082, Oct. 22. Various structural, mech. and operative details.

Furnaces. Akt. Ges. Brown, Boveri & Cie. Brit. 430,870, June 26, 1935. In a furnace, more particularly a crematory furnace, in which difficultly combustible gases of combustion are burnt in secondary combustion channels and then pass through a recuperator, the channels are sep. from the recuperator and are arranged beneath an ash-collecting plate of the primary combustion chamber.

Furnaces. Victor Paschalis. Ger. 618,168, Sept. 3, 1935 (Cl. 18c. 11.f.0). Furnaces in which materials are heated by tracing gases are provided with exchangeable hollow fillers, the no., size and shape of which are varied in accordance with the gas velocity in such a manner as to obtain a max. heating effect. No sp. methods of procedure are indicated.

Muffle furnaces. Gibbons Brothers Ltd. and Wm. E. Gibbons. Brit. 431,871, July 17, 1935. In a furnace having side combustion chambers divided from the muffle by substantially vertical walls, the lower parts of the latter are formed of refractory material of greater heat cond. than that employed in the construction of the upper parts.

Rotary furnaces. Metallgesellschaft A.-G. Brit. 432,465, July 26, 1935. In a rotary furnace, particularly for chem. and metallurgical operations, e. g., the roasting of ores, a quantity of material equal to at least half the daily throughput is continuously maintained therein, preferably by employing haffle rings of suitable dimensions.

Rotary furnaces. Metallgesellschaft A.-G. Brit. 432,476, July 26, 1935. Divided on 432,465 (preceding abstr.). The gas outlet of a rotary furnace comprises a central valve-controlled passage, by which the gases issue directly from the end of the furnace, and an annular channel connected by piping with other offtakes along the length of the furnace and preferably situated in the 3rd 6th of the length starting from the upper end.

Furnace walls and linings. Sterling Metals Ltd. and Douglas J. Cascoigne. Brit. 432,512, July 29, 1935. The joints between the lining bricks and side walls of a high-temp. melting-furnace, e. g., a cupola, are protected from the corrosive action of the slag by using outwardly

bulging bricks.

Rotary-furnace linings. Wm. Scott. Brit. 432,213, July 23, 1935. A rotary melting furnace has an inner lining of refractory brick laid on rammed ganser which, for at least the main body portion of the furnace, is about half the thickness of the brick.

Heat exchanger (plate type). Treplin & Co. Nachf. Komm.-Ges. Ger. 618,450, Sept. 10, 1935 (Cl. 17f. 12.03).

Heat-exchange apparatus (with tubes and headers). Walter T. Wells (to Technicraft Engineering Corp.). U. S. 2,018,163, Oct. 22. Structural details.

Heat-exchange apparatus (of the shell and tube type) suitable for condensers, etc. Everett N. Sieder (to Foster Wheeler Corp.). U. S. 2,018,037, Oct. 22. Structural details.

Ball mills. Otto Liebeck. Brit. 430,471, June 19, 1935. A loose crushing element for a ball mill is of streamline or drop shape in order to prevent the formation of air eddies behind the falling element. Pins may be formed on the pointed end of the drop. An air current may be directed by nozzles in the direction of the falling bodies.

Ball mills for wet grinding. International Combustion Ltd. and James C. Farrant. Brit. 432,089, July 19, 1935. Preliminarily crushed material and  $H_2O$  are supplied to an auxiliary tank alongside the feed tank of the mill, the

auxiliary tank being provided with an overflow at the upper part and with an opening at the lower part through which H<sub>2</sub>O and material pass into the feed tank.

Fusion apparatus for making "chemical asbestos" from lime, alumina, magnesite and silica, etc. Charles C. Whittier. U. S. 2,018,478, Oct. 22. Various structural and operative details.

"Batchmeter" for timing operations such as those of concrete mixers. Rudolph I. Lindow (to Chain Belt Co.). U. S. 2,018,964, Oct. 29. Various structural, mech. and operative details.

Apparatus for filling tins containing tobacco, foods, etc., with inert gas heavier than air at atmospheric pressure. Carl Loehle. U. S. 2,019,422, Oct. 29. Structural and operative details.

Apparatus for irradiating liquids such as milk, etc. with ultraviolet rays. Henning A. Trebler and Carl J. Larsen (to Hanovia Chemical and Mfg. Co.). U. S. 2,018,332, Oct. 22. Various structural, mech. and operative details.

Apparatus for condensing milk, juices of fruits, vegetables or beef or for distilling liquors, oils, etc. Frederick J. Allen. U. S. 2,018,049, Oct. 22. Various structural and operative details.

Pressure-actuated flow meters. Electroflo Meters Co. Ltd. and Burton Duglison. Brit. 430,070, June 27, 1935. The construction in a flow meter is formed by a

tapering element arranged within the conduit and the element is formed with 1 or more float wells.

Machines for moistening pulverulent material, e. g., cement raw material with water or roasted zinc blende with sulfuric acid. Mikael Vogel-Jorgensen. Brit. 431,352, July 5, 1935.

Counter-balanced sheet-metal covers, applicable to the lips of metal-pouring ladles. Bulpitt & Sons Ltd. and Walter H. Bulpitt. Brit. 431,247, July 3, 1935.

Hydraulic presses for thin materials, such as for vulcanizing rubber floor coverings, etc. John Shaw and Sons (Salford) Ltd. and John Shaw. Brit. 430,999, June 28, 1935.

Measuring-valve stopper for bottles. Alfred Berendt. U. S. 2,017,839, Oct. 22. Structural and operative details.

Use of solid absorbents such as calcium chloride or lithium chloride in refrigerating apparatus. Wulff B. Normell. U. S. 2,019,346, Oct. 29. App. and various details of operation are described.

Air-cooled condenser suitable for refrigerating systems. Christian Steenstrup (to General Elec. Co.). U. S. 2,019,324, Oct. 29. Structural details.

Apparatus for producing acetylene under constant pressure. Albert Mortreux. Fr. 784,306, July 22, 1935.

Acetylene generator. Egon Mandl. Ger. 618,391, Sept. 9, 1935 (Cl. 206 47 03).

Determination of the parachor. E. J. Williams *School Sci. Rev* 17, 22-25(1935).—Elementary expt with sample data from students' notebooks. O. R.

The electric moments of some organic compounds. J. N. Pearce and Luther F. Berhenke. *J. Phys. Chem* 39, 1005-10(1935); cf. *C. A.* 29, 3504.—The dielectric constants and dielectric loss were measured at 25°. The total polarization and the dipole moments are calculated together with the special orientation of the group moments in the substituted benzaldehydes and in triethanolamine. The moments of diethanolamine and monoethanolamine are calculated from theoretical considerations agree well with the values determined experimentally. The molar polarization, molar refractivity and electric moment are:

Compd	P	M.R.	$\times 10^{18}$ e.s.u.
p-Bromobenzaldehyde	134.1	35.03	2.10
p-Hydroxybenzaldehyde	390.0	33.34	4.10
p-Methoxybenzaldehyde	345.0	37.95	3.85
p-Tolaldehyde	202.0	36.43	3.30
2-Ethylhexanol-1	103.6	40.45	1.74
$\alpha$ -Ethylcaproaldehyde	183.3	39.19	2.64
Triethanolamine	301.0	37.82	3.57
Diethanolamine	189.9	26.95	2.81
Monoethanolamine	122.0	16.22	2.27

F. L. Browne

The adsorption of light and heavy hydrogen in relation to the hydrogenation of ethylene. H. R. Klar *Z. physik. Chem.* A174, 1-14(1935), cf. *C. A.* 29, 1383.—The velocity was measured of the hydrogenation of ethylene with light and heavy H on an Fe catalyst between 0° and 175°. The velocity is lower with heavy H up to 100°; at higher temp (measurements up to 175°) it is higher with heavy H. The velocity shows a max at 125° with light H and at 150° with heavy H. By plotting the ratio of the velocities against the temp, a max is reached at 55°. To test this max more accurately measurements were made between 30° and 75° with a second catalyst (also Fe from oxalate). The max was found at 53°. The heat of activation of the hydrogenation with light H was calculated as 10.0 kcal and with heavy H it was 8.0 kcal at low temp and 12.5 kcal at high temp. A difference of 1800 cal in activation energy was found between 80° and 120° while on Ni between 0° and 30° it was 880 cal. The heat of activation of ethylene was calculated as 12.5 kcal. R. H. Baechler

Electrical streaming potential with turbulent flow. H. Reichardt *Z. physik. Chem.* A174, 15-21(1935).—From considerations of the boundary layer it follows that flow in the double layer remains a viscous flow during turbulence within a tube and that therefore the Helmholtz equation holds for streaming potential in turbulent flow. The ratio of streaming potential to difference in pressure is constant regardless of the form of the flow. R. H. Baechler

Methods of observing electrophoresis of dyes, bacteria, blood corpuscles, etc., with Cellophane as a semiconductor films. H. Waelisch *Kolloid-Z.* 73, 36-9(1935).—The

sign and relative magnitudes of electrophoresis can be determined microscopically at high magnifications by observation of a drop of soln. suspended from a Cellophane atrop. Elec. contact with the drop is made through the Cellophane which has been soaked in water to increase its cond. A modification is described for macroscopic demonstration of the electrophoresis of dyes. O. T. Q.

Viscosity and plasticity of disperse systems. VI. The effect of temperature and electrolytes on the plastic properties of kaolin. M. Volarovich and D. Tolstol. *Kolloid-Z.* 73, 92-6(1935); cf. *C. A.* 29, 7741.—In the temp. interval 10-57° the resistance to flow of the kaolin water mixt. (58.1% anhyd. Gluehowsky kaolin) is nearly independent of temp., while its Bingham viscosity  $\eta$  (reciprocal of Bingham's coeff. of mobility) decreases less rapidly than the viscosity of water. Small amts of NaOH (0.01-1.0% on basis of anhyd. kaolin) reduce both  $\eta$  and  $\eta'$  markedly. Larger amts of NaCl (1-7%) decrease  $\eta$ , but increase  $\eta'$ . However, with increasing concn. of both electrolytes, the plasticity (defined as  $\theta/\eta$ ) decreases. The reduction of  $\eta$  by NaOH is attributed to increased mobility of the clay particles as a result of peptization, that of  $\theta$  to the lubricating effect of the adsorption layer. The NaCl exerts both a coagulating and a dehydrating tendency, the former having the preponderating effect on  $\eta$ , which therefore increases, the dehydration causes  $\theta$  to decrease. VII. Plastic flow in an apparatus with cylinders capable of lengthwise displacement. D. Tolstol. *Ibid.* 96-101.—An improved form of Pochettino's coaxial-cylinder app. (*C. A.* 11, 2980) is described for use in detg. the plasticity of coned, flowing clay suspensions. It gave data for resistance to flow agreeing with those obtained in a rotating-cylinder app. Bingham's equation of plastic flow was tested at very low rates of flow (kaolin-glucose-glycerol mixts.); the calculated rates of flow were systematically higher than the exptl. Oscar T. Qumby

Viscosity of electrolytes in aqueous solutions and lyotropic numbers. J. H. C. Merckel *Kolloid-Z.* 73, 77-75(1935).—At concns. of 0.5 N or lower the viscosity of solns. of a series of salts of a certain cation (or anion) is a linear function of the lyotropic nos. (cf. Buehner, *C. A.* 29, 7156) of the anions (or cations). In a given series (e.g., the Na salts of univalent anions) one obtains a family of straight lines varying in slope with concn. but all intersecting at a relative viscosity of 1.000. An electrolyte at this point (e.g., KCl) gives aq. solns. with a relative viscosity of nearly 1.000 regardless of concn. unless the concn. exceeds 0.5 N. The slope at a given concn. is nearly independent of the alkali metal ion used with a series of univalent anions; this is not true for corresponding series of alk. earth salts. In either case a simple method of calcg. viscosities within 0.2% is available. The relative viscosities of 0.2 and 0.5 N solns. of the bromides and iodides of Mg, Ca, Sr and Ba were determined. Oscar T. Qumby

Dilute dispersion of light in white nonmetallizable sol. G. P. Luchinskii *Kolloid-Z.* 73, 30-42(1935); cf. *C. A.* 29, 2421.—Application of Lambert's law to the light transmitted by colloidal solns. is complicated because of the change in light quality and the continuous variation of the absorption coeff. The scattered portion is decomposed, more or less sharply into a spectrum. The dispersion coeff. for AgCl (75 mg/l.) and roum (155 mg/l.) hydrosols is inversely proportional to  $\lambda^3$  ( $\lambda$  = wave length). The true absorption coeff. is a more complicated function of  $\lambda$ . Distribution curves are given for transmitted and scattered light vs.  $\lambda$ . O. T. Q.

Determination of the particle size of silicic acid in a silicic acid-glycerol sol. I. Erbe *Kolloid-Z.* 73, 1-14(1935).—The sol investigated was a concn. product having the compn.  $\text{SiO}_2$  4.1,  $\text{H}_2\text{O}$  15.1 and glycerol 80.8%. Its  $\text{H}_2\text{O}$  content was varied by drying with  $\text{P}_2\text{O}_5$  or diln. with  $\text{H}_2\text{O}$ . Most of the particles had diams. between 40 and 50 m $\mu$ . Of the methods used to det. particle size (diffusion, centrifuging, ultrafiltration, ultramicroscopic) diffusion into agar gels gave the best results and showed the heterodispersity to be small. Diffusion through porous

glass plates gave less reliable results and so did all of the other methods. A modified King method (colorimetric) for det.  $\text{SiO}_2$  in quantities down to 0.006-0.01 mg. is described. A few d. and vacuo measurements are given.

**Production of mercury sols by reduction.** E. Sauer and Dora Steiner. *Kolloid-Z.* 73, 42-4 (1933).—Hg sols with negatively charged particles can be prep'd. by reduction of  $\text{HgCl}_2$  but not  $\text{Hg}(\text{NO}_3)_2$ ,  $\text{Hg}(\text{ClO}_4)_2$ , or  $\text{Hg}(\text{CN})_2$  with hydrazine in the presence of gum arabic and NaOH. Such sols can be obtained only when an intermediate, colloidal product of negative charge (e. g.,  $\text{Hg}_2\text{O}$ ) can be formed.  $\text{Hg}_2\text{NO}_3$  but not  $\text{Hg}_2\text{ClO}_4$ , as well as  $\text{Hg}_2\text{Cl}$ , can be used if the reduction is first carried out in HCl soln., where colloidal  $\text{Hg}_2\text{Cl}$  forms, and finally in NaOH soln., where the  $\text{Hg}_2\text{Cl}$  is converted to  $\text{Hg}_2\text{O}$  and then reduced to Hg.

**Chemical reactions between colloids.** H. Maruyama and Satoru E. Sauer and Dora Steiner. *Kolloid-Z.* 73, 45-7 (1933), of preceding abstr. and C. A. 29, 7697.—Mixing Hg sol with S sol produced a sol dark gray by reduced and reddish brown by transmitted light. The product showed less tendency to sediment than the reactants. Coagulation with electrolyte, extn. of excess S with  $\text{Na}_2\text{SO}_3$  soln. and analysis of the product demonstrated that  $\text{Hg}_2\text{S}$  had been formed. The reaction is less rapid than that between sols of Cu and S, requiring  $1/4$  to 1 hr. for substantial completion.

**Manganese ethoxide. Production and properties.** B. Kandelaki, I. Seta, and I. Tsvetkov. *Kolloid-Z.* 73, 47-9 (1933).—Prep'd. from  $\text{MnO}_2$  was prep'd. by the reaction of  $\text{MnCl}_2$  and NaOH in abs. EtOH at ordinary temp. The dark brown  $\text{Mn}(\text{OEt})_3$  soln. was poured off the insol. NaCl. After several days or weeks, violet crystals of  $\text{Mn}(\text{OEt})_3$  sep'd., which could be purified by reprecip. from abs. EtOH. The soln. of  $\text{Mn}(\text{OEt})_3$  in abs. EtOH is approx. 1% at room temp. Solns. of EtOH solns. of  $\text{Mn}(\text{OEt})_3$  decrease to red soln.  $\text{H}_2\text{O}$  gave reproducible brown hydroxide whose stability varied with concn.

**The effect of ultrasonic waves on the colloidal solubility of metal hydrides.** I. Naumov, S. A. and S. I. Watanabe. *Kolloid-Z.* 73, 50-51 (1933).— $\text{Fe}(\text{OEt})_3$  made from an. solns. of  $\text{FeCl}_3$  and  $\text{NH}_3$  and washed free of Cl and  $\text{NH}_3$  ions, can be dispersed permanently by ultrasonic waves (450,000 per sec.) without the addition of a peptizer unless too large an excess of  $\text{NH}_4\text{OH}$  (3-1) times the theoretical amt. was used in its prep'n. Ultrasonic waves greatly increase the peptization in the presence of small amts. of HCl (0.1-0.5 millimolar). Sols peptized by the ultrasonic method are much more readily coagulated than sols prep'd. by the usual methods.

**Influence of gases on silver sols.** T. Ivan Taylor and Wm. H. Core. *J. Phys. Chem.* 39, 975-100 (1935).—The effects of gases, O, N, H,  $\text{C}_2\text{H}_4$ ,  $\text{CH}_4$ , on Ag sols were det'd. by measuring pptn. values, cataphoretic velocities, conductivities and color changes. Gases have a stabilizing effect on sols that act on the border line of stability and apparently contain secondary particles. Agitation with gases produces a uniform distribution of stability ions giving an apparently homogeneous sol. When the secondary particles are broken up the adsorbed gas apparently prevents their re-formation. No increase in the av. charge of the particles was observed.

**The stability of silver iodide.** Yu. N. Gorkhovskii and I. R. Protas. *Z. phys. Chem.* A174, 122-34 (1935).—A study of the intensity of light scattered by AgI sols of a concn between  $5 \times 10^{-2}$  and  $5 \times 10^{-3} M$  led to conclusions concerning the stability of the disperse phase. The relation of stability to concn of the excess ion was studied. The critical nature of one of the ions was observed. The p-values of the isoelectric point was det'd. ( $5 \times 10^{-2}$  to  $5 \times 10^{-3} M$  excess AgI as well as the p-values of min. stability that appeared on each side of the isoelectric point ( $5 \times 10^{-2}$  to  $5 \times 10^{-3} M$  Ag<sup>+</sup> and  $2 \times 10^{-2}$  to  $10^{-2} M$  I<sup>-</sup>). The effect of elec-

trolytes with various anions of Ag or I ions was studied. The potentials were measured. The  $\text{Th}^{4+}$  ion can charge AgI positively. The data were explained from the standpoint of adsorption.

**Surface salting-out by electrolytes.** I. Surface salting-out and dielectric constant. V. K. Semchenko and E. A. Dymovskaya. *Kolloid-Z.* 73, 24-30 (1933).—See C. A. 29, 7667. II. The dependence of surface salting-out upon temperature. V. K. Semchenko and A. F. Gracheva. *Ibid.* 73, 31-3—See C. A. 29, 7723.

**The upper stability limit of (water) drops upon impact.** S. V. Gorbachev and V. M. Nefedova. *Kolloid-Z.* 73, 31-33 (1933).—When a moving water drop (1-1.5 mm. diam.) collides with another of the same size at rest, the 2 may coalesce or reveal with no apparent change, depending on 1. the angle  $\alpha$  between the line joining their centers at the instant of the impact and the direction of the moving drop and 2. the velocity of the moving drop. For a given  $\alpha$  and values of  $v$  in the range 0.1-1.9 m. per second, coalescence will occur until  $v$  exceeds a certain value.

**The lower stability limit of water drops upon impact.** S. V. Gorbachev and E. P. Mironov. *Kolloid-Z.* 73, 33-4 (1933).—Of preceding abstr.—A colloidal low relative velocity 2 colliding water drops will not coalesce, but the limiting value is not sharply defined. For drops of 1 mm. diam. at a relative velocity of 4 cm. per second half of the drops coalesce, averaged 0.5%. The coagulation of emulsions of microcolloids by electrolytes. I. Very Popkov. *Kolloid-Z.* 73, 33-4 (1933).—A 2% soln. of electrofibrinated microcolloid (11.5% N) in  $\text{MgCO}_3$  was treated with  $\text{FeCl}_3$  and  $\text{ZnCl}_2$ . With  $\text{FeCl}_3$  the soln. remained clear until a concn. of 50% was reached, where a slight turbidity was observed. Coagulation and slow sedimentation of the ppt. took place at a concn. of 91%  $\text{FeCl}_3$  (after 11 hr.). The ppt. had the appearance of a swollen gel, with no sediment in  $\text{MgCO}_3$  and had a N content of only 7.4%. The coagulation is attributed to action of the products of hydrolysis of the  $\text{FeCl}_3$ . With  $\text{ZnCl}_2$  a concn. of about 4% (5.5%) was required for coagulation, but the resulting ppt. could be reprecipitated by  $\text{MgCO}_3$ , indicating less destruction.

**The effect of water and alkali on the coagulation of egg white.** Joseph L. Donnelly. *Kolloid-Z.* 73, 35-36 (1933).—The effect of alkali (NaOH, KOH and  $\text{NH}_4\text{OH}$ ) and heat on the sol-gel transition of egg white was studied qualitatively by use of the white of fresh egg both cold and warmed with water. An increase in alkali concn. represents the hydrolysis of the protein and is accompanied by a ptn. of the alkali potassium. An increase in the hydrolysis and coagulation of the acid hydrolysis parallel a decrease in alkali concn. provided that the total amt. of water present is insufficient to dissolve the reaction product.

**Investigations of some properties of gold.** N. A. Yankin, D. N. Gorb. J. D. Venna and C. L. Pappas. *Kolloid-Z.* 73, 36-41 (1933).—A colloidal acetate gel in benzol sol. and the following hydrophils were studied: stannous phosphate, 75 per cent, manganese arsenate, silver and, zinc and gelatin. Various properties were measured and tabulated including gelatin time, sedimentation, viscosity, etc., velocity of sedimentation, osmotic, loss of liquid on heating and light absorption. Brief comments are given on each property.

**Amplification of an osmotic contraction to the Debye effect in the estimation of molecular weights of proteins by osmotic-pressure measurements.** David R. Briggs. *J. Phys. Chem.* 39, 985-97 (1935).—of C. A. 29, 4438.—The empirical relation,  $E_{90}[\eta] = \frac{1}{2} (P_0 - P_1 - P_2)$ , is a constant, holds for protein soln. Simultaneous of the osmotic pressure  $P_0$ , the osmotic pressure  $P_1$ , the osmotic pressure  $P_2$ , the critical osmotic pressure of protein of mol. wt.  $M$ ,  $E = \frac{1}{2} (P_0 - P_1 - P_2)$  the molar potential,  $\alpha$  of eqn. of diffusion is an derived from the

mass of the protein,  $[=]$ , concn. of all ions, bearing the same charge as the protein, in the colloid-conc. soln.,  $\pm c$ , concn. of foreign salt inside the membrane,  $\pm a$  concn. for a given colloid. This relation differs from the one previously found for gum arabic by the inclusion of  $F_2$ , which is negligible when the micelles are as large as those of gum arabic soln. By means of this relation the mol. wts. of proteins can be detd. in dil. solns. and in solns. in which the  $f_{\pm}$  is not that of the isoelec. point. Mol. wts. of 35,000, 60,000 and 91,000 ( $\approx$  about 15%) were found for crysd. egg albumin, uncrystd. serum albumin, and crysd. horse serum albumin, resp. F. L. B.

Remark on the work of E. Elsd and Th. Schatzkowsky concerning the effect of various metal compounds on gelatin. A. Kuntzel. *Kolloid-Z.* 73, 102-4 (1935) — E. and S. (C. A. 29, 3392) used a different definition of tanning than K. (C. A. 29, 3189). The two works agree essentially when this is taken into account.

Oscar T. Quamby

The solubilities of alkali chlorides and their mutual effect on their solubilities in liquid ammonia. G. Patschke and C. Tanne. *Z. physik. Chem.* A174, 135-55 (1935) — The system  $KCl-NH_3$  was studied in a temp. range of  $-80^\circ$  to  $+50^\circ$ . The solv. of  $KCl$  in liquid  $NH_3$  is small (max.  $\approx 0.252\%$  at  $-77.2^\circ$ ) and decreases with increasing temp. Crystalline compds. with  $NH_3$  do not form  $KCl$  crystallites in cubes which are largest when crysd. rapidly. The solv. of  $KCl$  in  $NH_3$  is almost doubled in the presence of  $NH_4Cl$  or  $NaCl$ . The system  $NaCl-NH_4Cl-NH_3$  was studied also. The solv. of  $NaCl$  is at first increased by the addn. of  $NH_4Cl$  but later depressed by large amts. of the latter. The solv. of  $NH_4Cl$  is slightly depressed by  $NaCl$ . These phenomena are explained on the basis of the electrostatic theory of Scherer (C. A. 25, 5821). The solv. curve for  $NH_4Cl$  by Kendall and Davison (C. A. 14, 2311) was confirmed.  $NaCl$  crystallizes in octahedra from  $NH_3$  which contains  $KCl$  or  $NH_4Cl$ . Practical applications of these findings are indicated. R. H. Baechler

The activity of the ions of hydrochloric acid. Zoltan Szabo. *Z. physik. Chem.* A174, 22-32 (1935) — The detn. of the ionic activities can be made with the aid of the  $e$  m f. of liquid chains with transport in cases in which the diffusion potential is known sufficiently accurately. The latter can be detd. as follows: let  $f_1$  and  $f_2$  represent ionic activity coeffs. at concns.  $m_1$  and  $m_2$ ,  $\bar{v}$  and  $\bar{u}$  the corresponding mean activity coeffs. and  $E$  the diffusion potential. The detd.  $e$  m f.  $E_d$  of the  $HCl$  concn. chain becomes  $(RT/F) \ln (f_1 m_1 / f_2 m_2) + e = E_d$ . A fictive  $e$  m f.  $E_f$  is detd. by the equation  $RT/F \ln m_1 / m_2 = E_f$ . The values  $E_f - E_d$  form a linear function of  $\log m$  up to a concn. of 0.2 M. The slope of  $E_f - E_d = F(\log m)$  is exactly that of  $E = (E_d + E_f)/2 = f(\log m)$  (where  $E_d$  is the  $e$  m f. of the cation chain and  $E_f$  the  $e$  m f. of the anion chain) an equation which must give the diffusion potential at least at great diln. Values

thus obtained for the diffusion potentials of the solns. of  $HCl$  of different concns. deviate about 3% from those calcd. by Henderson. The ionic activity coeffs. up to 0.2 M are equal to each other and to the mean activity coeffs. R. H. Baechler

Dependence of diffusion potential upon concentration. Zoltan Szabo. *Z. physik. Chem.* A174, 33-40 (1935) — The dependence upon concn. of various diffusion potentials was studied with the help of liquid chains with 2 identical electrodes, e.g.,  $Hg/HgCl$ , a mol.  $HCl$  x mol.  $HCl$  x mol.  $KCl$  a mol.  $HCl$ ,  $HgCl/Hg$ . Between solns. of different concns. of a single electrolyte the diffusion potential is independent of the structure of the transition layer, const. and reproducible. The principle of superposition holds. The transition layer must possess a cylindrical symmetry to make attainable const. and reproducible diffusion potentials between solns. of different electrolytes. The sum of the diffusion potentials in the above-named chain proved to be a linear function of the log of the  $HCl$  concn. up to 0.5 M. R. H. Baechler

The equilibrium ratio of solid liquid in three-component systems in which congruent-melting two-component compounds exist. II. Konstanty Iljynskowski and Maria Smyt. *Z. physik. Chem.* A174, 60-72 (1935); cf. C. A. 29, 5728' — The systems: 1 salicylic acid-urea-acetanilide and 2 urea- $\beta$ -naphthol-acetanilide were studied. The effect of the third component on the 2-component compd. was studied by the method of thermal analysis and with the following results: System I contains the congruent-melting additive compd., salicylic acid-urea and contains 2 eutectic points namely: (1) 54.0% acetanilide 15.75% urea, 30.25% salicylic acid, temp.  $78.5^\circ$ ; (2) 61.3% acetanilide, 3.0% urea, 35.7% salicylic acid, temp.  $73.5^\circ$ . System II contains 2 congruent-melting 2-component compds., urea- $\beta$ -naphthol and  $\beta$ -naphthol-acetanilide as well as 2 eutectic points and a peritectic point. (1) eutectic at  $75.3^\circ$ ,  $\beta$ -naphthol, 3.0% urea, 31.5% acetamide and temp.  $80.5^\circ$ ; (2) peritectic at  $36.5^\circ$ ,  $\beta$ -naphthol, 12.5% urea, 31.0% acetamide and temp.  $33.4^\circ$  and (3) eutectic at  $58.0^\circ$ ,  $\beta$ -naphthol, 14.0 urea, 48.0 acetamide and temp.  $43.5^\circ$ . The course of crys. in 3-component systems with peritectics is discussed with reference to phase diagrams. R. H. B.

The heat of dilution of nitric acid. G. Becker and W. A. Roth. *Z. physik. Chem.* A174, 104-14 (1935) — The heat of diln. of  $HNO_3$  + 5  $H_2O$  to  $HNO_3$  380  $H_2O$  at  $20^\circ$  was measured with 25 thermocouples. The heat of diln. plays practically no part; in bomb calorimetry one can use the const. value of 14.83 cal./millimol.  $HNO_3$ . The course of the heat of diln. is complicated and involves 3 distinct effects. R. H. Baechler

Handbook of Chemistry and Physics. 20th ed., edited by Chas. D. Hodgman. Cleveland: Chem. Rubber Pub. Co. 1931 pp. \$6, student ed. \$3.

W. ALBERT NOYES, JR.

Elements of the quantum theory. VI The hydrogen atom. Saul Dushman. *J. Chem. Education* 12, 520-39 (1935), cf. C. A. 29, 7171'.

Potential barrier. K. C. Kar. *Current Sci.* 4, 93-4 (1935) — A criticism of Gamow's use (cf. C. A. 25, 5835) of the uncertainty principle of Heisenberg in his development of the idea of a potential barrier in the nucleus. Helen S. Hepfield

Recent advances in science: astronomy. R. W. Wrigley. *Science Progress* 30, 278-82 (1935) — A review of recent work on the chem. compn. of the atoms of the planets. Joseph S. Hepburn

Quantum mechanics investigation of the cohesive forces of metallic copper. K. Fuchs. *Proc. Roy. Soc. (London)* A151, 555-602 (1935) — The energy of the 4s electrons in metallic Cu is calcd. by an extension of the

method of Wigner and Seitz (C. A. 29, 34'); the "exchange" energy between the 4s electrons and the closed shells is taken into account. The binding energy of the metal obtained was of the right order of magnitude, but, to calc. the correct compressibility, the interaction between the ions in the lattice, on account of the overlapping of the third shells with each other, must be considered. This is calcd. approx. by a statistical method. It is shown that for Cu the face-centered structure has a lower energy than the body-centered, but for Na the calcns. give almost equal energies for the 2 structures. E. R. Rushton

Determination of the effective temperature of some stars by the spectrophotometric method. M. Martin Lorton. *Astroph. Soc. Trans.* 33, 602-26 (1935) — The color-temps. of several stars were detd. by measuring photo-

metrically the relation between the energies  $W_2$  and  $W_1$ , which a star emits in 2 wave lengths,  $\lambda_2$  and  $\lambda_1$ . To eliminate different sensitivities of the plate to each wave length, on each plate there were photographed simultaneously the spectrum of the star and that of the pot. crater of a C arc, which gives a temp. of 3750°K. The influence of atm. absorption was detd. in each observation by photographing the star at 2 different zenithal distances.

I. M. Smythes

The standardization of photoelectric cells for measurement of visible light. 11. H. Poole and W. R. G. Atkins. *Trans. Roy. Soc. (London)* A235, 1-27 (1935).—Nineeen photoelec. cells, representative of the vacuum emission and rectifier types, have been standardized in light from the following sources: open solid-C arc, vacuum substandard filament lamp at 2360°K., artificial "mean noon sunlight" derived from the filament lamp by use of filters. The K and Na cells maintained const. sensitivity for more than 5 years and exhibit excellent proportionality between illumination and current up to full summer daylight. The Se and other rectifier cells exhibit a nonlinear illumination/current relationship. The perpendicular illumination to daylight required to give currents of 1 microamp were found to be 40,700 meter-candles (mc) for K, 2590 mc for K (thin film); 3710 mc for Na, 3700 mc for Cs (thin film), 16.4 mc for Se. The intrinsic sensitivities of the cell surfaces are, in microamps per lumen: 0.015 to 0.41 for Na, 0.21 for K, 1.78 for K (thin film); 3.81 for Cs, 121.2 for Se, 49.3 to 51.4 for Cu<sub>2</sub>O. C. C. Kietz

Shot effects of secondary electron currents. Lucy J. Hayner. *Physica* 6, 323-33 (1935).—The shot effects of secondary electron currents from plates of triode tubes were measured at 10<sup>3</sup> cycles. Calc. of electron charge from the shot effects agrees with Millikan's value within 1%. The av. no. of secondaries per primary electron,  $\bar{n}$ , ranges from 1 to 4.5. The variation of  $\bar{n}$  with energy of primaries agrees with the theory. The shot effects of both grid and plate currents were measured and Campbell's expressions applying to plate currents were extended to grid currents. From the difference in grid and plate effects it is concluded that secondary emission and primary impact are simultaneous within 10<sup>-11</sup> sec. C. E. P. J.

Photoelectric emission and the chemistry of surfaces. Cyrinus Ouellet. *Naturelisme canadien* 62, 271-81 (1935); cf. C. A. 28, 3651; 29, 2911.—An explanation of the fundamental principles of the subject with a somewhat more detailed description of some of the results obtained by O. in expts. carried out with a photoelec. meter.

A. Papineau-Couture

Electron diffraction and surface structure. G. I. Finch, A. G. Quarrell and H. Witman. *Trans. Faraday Soc.* 31, 1051-80 (1935); cf. C. A. 29, 2113.—Two types of cold-cathode equipment are described, one for high-precision work and one for less precise work involving detection of cryst. phases and similar studies. A feature of both of these cameras is a beam trap wherein mol. rays and electrons of low energy and light are caught. The monochromatic electron beam is focused magnetically. A large no. of methods of prep. specimens are detailed. These methods include: flashing, ion-thinning, cathodic sputtering, colloid pptn., chem. deposition, electrodeposition for transmission metallic samples, distn., vapor deposition, crystn. from solvents, casting, gas etching, slag-slagging and crystal cleavage for transmission metalloid and compd. specimens; and technic for reflection specimens. A section on the interpretation of electron-diffraction patterns is included. The appearance of extra or forbidden rings in diffraction patterns of metals is ascribed to the interstitial soln. of gases in the metal lattice. Some 80 diffraction patterns are reproduced and their interpretation is discussed. These patterns are made from Au foil, Al foil, Al<sub>2</sub>O<sub>3</sub>, Au, Pt and Cr electrodeposited films, colloidal Ag, Au and Pt, and flashed Zn deposits. It was found that Cr electrodeposited on Cu had a much smaller crystal size than that deposited on Ni, Fe, Sn or Bi. It has recently been found that a 30-sec. electrodeposition of Zn at 0.1 amp./sq. dm. sufficed to form a permanent cryst.

layer on cryst. Cu, but that a 3-minute deposition on polished Cu was necessary for the same effect.

H. A. Smith

A note on the reflection of cathode rays from a crystal surface. Shuzo Miyake. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 27, 286-91 (1935).—The position and breadth of the reflection spectrum were obtained from an exact soln. of the wave equation for electrons for a teeth-valley potential field. The validity of the simple kinematical theory (cf. Lashkarev, *Z. Physik* 86, 797 (1933), 89, 820 (1934)) was confirmed. The results agree closely with expt.

Victor Licks

Apparatus for electron diffraction at high voltages. G. P. Thomson. *Trans. Faraday Soc.* 31, 1049-51 (1935), cf. C. A. 29, 3593.—An adaptation of the Thomson-Pearser type of electron diffraction camera has been made where two-stage acceleration of electrons from a gaseous discharge is utilized. The advantages of this type of source for high-voltage electrons over a hot-cathode source are: (1) elimination of most of the high-voltage x-rays and (2) the production of monochromatic electrons without large auxiliary app. The equipment works well from 45 to 85 kv. Rectified high-voltage secondary current employing the Cockcroft doubling principle is used as the source of power. All structural and operational details are given.

H. A. Smith

Secondary effects of cosmic ultraradiation. H. Geiger. *Ergebnisse exakt Naturw.* 14, 42-78 (1935).—A review.

C. D. West

Artificial nuclear transformations. R. Fleischmann and W. Bothe. *Ergebnisse exakt Naturw.* 14, 1-41 (1935).—This review brings up to date the previous accounts of F. and B. (C. A. 29, 997) and of Kirchner (C. A. 29, 997).

C. D. West

The transformation of the elements through impacts with hydrogen nuclei. F. Kirchner. *Chem.-Ztg.* 59, 713-16 (1935).—A review.

S. Bradford Stone

Measurement of the ranges of the residues of some of the lighter elements from bombardment with high-velocity protons. Hugo Neuert. *Physik. Z.* 36, 629-42 (1935); cf. C. A. 29, 7178.—Protons with energies up to 200,000 v. were generated by Wien's acceleration method and the range and frequencies of the particles produced were studied by the cloud-chamber method of Kirchner (C. A. 28, 707). For B, a continuous distribution frequency, with a broad and strong max. at 22 mm. and a small and weak, but decidedly marked max. at 41 mm. was observed, in agreement with previous results (C. A. 29, 2140). For Be, a uniform range of 7.5 mm. was found for the residue particles. A new detn. of the range for Li in a chamber filled with H<sub>2</sub> showed that, instead of the range groups of 12, 9 and 7 mm. previously found, only 2 sharply defined ranges of 12 and 8.2 mm. are present. No nuclear residues for F were found at voltages up to 200,000.

E. R. Rushton

Detection of artificial radioactivity in a photographic emulsion. Tokio Takuchi and Takeshi Inai. *Proc. Phys.-Math. Soc. Japan* 17, 319-20 (1935).—Tracks due to  $\alpha$ - and induced radioactive particles formed by neutron bombardment are found in photographic emulsions.

F. O. Wieg

Investigations on neutrons. G. B. Monod-Huguen. *Ann. phys.* [11], 4, 137-201 (1935), cf. C. A. 29, 6198.—Cloud chamber studies were made of the trajectories in 11 produced by Po-Be neutrons. The neutron-proton collisions appear to be like those between elastic spheres. A statistical study of the trajectories, long and short, shows the neutron source to emit a group of slow neutrons of 0.125  $\times 10^6$  e. v. energy in addn. to the fast neutrons of 4.5 and 7.8  $\times 10^6$  e. v. The former suffer considerable diffusion when passing through matter, while the latter do not. The role played by the neutron in nuclear structures is discussed and a simple relation is found between the nuclear mass defect and the mass no.

Morris Muskat

Absence of appreciable  $\gamma$ -ray emission in collisions of rapid neutrons with protons. Thérèse Grivet-Meyer. *Compt. rend.* 201, 658-60 (1935).—With 2 Al Geiger-Müller counters arranged according to the Rossi method

in parallel and a Po + Be source (40 millicurie) between them at about 10 cm from each, the no. of coincidences with the source bore was 7.2/min., and the same when a screen of borax was interposed, but if the source was surrounded by paraffin, 11.1 and 6.2, resp. Conclusion: The increased no. of coincidences when the source was surrounded with paraffin (without the borax screen) is due to the enhanced action on the Al shells of the counters of the neutrons slowed down by the H of the paraffin (cf. Amaldi, *et al.*, *C. A.* 29, 4237). This may explain the observations of Lea (*C. A.* 28, 1921, 29, 6498). C. A. S.

Radioelements produced by neutrons. Pierre Preswerk and Hans v. Halban, *Fr. Compt rend* 201, 722-4 (1935).—When Tl is irradiated with Rn + Be (800 millicuries), in addition to the activity of 97 min (I) (cf. MacLennan, *et al.*, *C. A.* 29, 3594) one of  $t = 0.5$  min (II) was observed. This is shown chemically not to be an isotope of Au, Hg or Pb. The amt. of both I and II is increased if the neutrons are slowed down by paraffin. It is suggested that both are isotopes of Tl,  $^{204}\text{Tl}^{+1}$  and  $^{204}\text{Tl}^{+3}$  formed by capture of a neutron, and passing to  $^{204}\text{Pb}^{+2}$  and  $^{204}\text{Pb}^{+4}$  by emission of a  $\beta$ -ray. Sosnowski's results with Bi (*C. A.* 29, 3228) were not confirmed with 1200 millicuries of Rn + Be or 300 of Rn + B. When P was irradiated with slowed neutrons from Rn + Be in addition to activities of 3 and 145 min., one of  $t = 1.5$  days was observed, attributed to formation of  $^{31}\text{P}^{+2}$  by capture of a neutron. C. A. S.

Emission of fast particles. K. C. Kar, *Current Sci.* 4, 151-5 (1935).—The calcd. value for the radius of the core of a radioactive element is about  $10^{-11}$  wh. the energy of emitted  $\alpha$ -particles indicates that they become free at distances of  $10^{-11}$  to  $10^{-10}$  cm. K. suggests that the region between  $10^{-11}$  and  $10^{-10}$  cm., instead of being filled with electrically neutral particles, is really packed with large nos. of  $\alpha$ - and  $\beta$  particles, such that the net charge is zero. When an  $\alpha$  particle is emitted by the core, it penetrates this "neutral shell"—really a series of thin shells—and eventually ejects one of its  $\alpha$  particles. This makes the rate of disintegration in reality the rate at which particles are ejected from the thin shell. W. W. S.

Determination of the amount of radon in the water of Wen-Chuan Western Hills. Da-Tchang Tchong and Gung Tsong Yung, *Bull. Natl. Acad. Peiping*, 6, No. 2, 35-7 (1935).—The water of Wen-Chuan (bot. spring), Western Hills, near Peiping, contains only 0.5 to 1 cman ( $10^{-12}$  curie per l.) of radon. C. L. Tseng.

Indium isotopes and their nuclear spin. B. Venkatesachar and L. Sibaiya, *Proc. Indian Acad. Sci.* 24, 203-7, *Nature* 136, 437.—The hyperfine structure patterns of some of the significant  $\alpha$  lines of Ir have been photographed. A hollow-cathode tube described (*C. A.* 29, 7205) is used as a source. The results indicate that there are 2 isotopes with nuclear spins  $1/2$ ,  $h/2\pi$  and  $3/2$ ,  $h/2\pi$ . A consideration of the known facts regarding the occurrence of isotopes of different mass nos. in the various elements has led to the inference that the mass nos. of the 2 Ir isotopes are 191 and 193, with a relative abundance of nearly 1:2, the isotope with the higher mass no. having the higher nuclear spin. Harold Gershinowitz.

Sudden changes of energy experienced by electrons of great energy. Louis Leprince Ringuet, *Compt. rend.* 201, 712-14 (1935), cf. *C. A.* 29, 4258.—With the same arrangement, save that the radiation was filtered through 15 cm. Pb, trajectories of electrons totaling 75 m. were photographed. Of the tracks so examined 4 are considered to indicate production of pairs of electrons and 15 nuclear collisions. The energy losses indicate a no. of collisions about 10 times the theoretical. With a 15 cm. path, 0.1 mm. thick in the chamber (the length of the path through it is assumed to average double its thickness), exams of 60 tracks indicates losses of energy due to nuclear collisions  $\sim 10$  times more numerous than foreseen by theory. In both cases about  $1/10$ th of the electrons were pos., and the energies of these favor the hypothesis that they result from the formation of pairs of electrons by materialization of photons from Th C'. C. A. Silberrad.

Investigations on counting tubes with alkali cathodes. Walter Christoph, *Ann. Physik* 23, 747-60 (1935).—

The possibility of prep. Geiger-Müller counters for the visible spectrum was investigated. By making only a small part of the cylinder sensitive, counters were obtained which did not differ from the usual ones in the dark effect and in the counting range independent of voltage. It was not possible to stabilize their behavior. Whether an alkali-electrode photo-counter with a counting range independent of voltage is obtained or not appears to be independent of the construction. Victor Hicks.

The L emission spectrum of argon. M. Bačlovský and V. Dolejšek, *Nature* 136, 643 (1935).—By careful regulation of pressure in a special ionic tube and the spectrograph the L emission spectrum of Ar as well as lines of Ca, Na and Si are obtained. The following values are given:

	$\lambda$	$\lambda/R$	$\lambda/R$ calcd.
L	561	16.2	16.29
L	567	16.1	16.13

New measurements and observation of nondiagram  $L_{\alpha}$  lines of mercury, platinum and tungsten. Yvette Cauchois, *Compt. rend.* 201, 721-2 (1935), cf. *C. A.* 29, 3911<sup>14</sup> and following abstract.—Two Hg lines already measured (cf. *C. A.* 29, 3911<sup>14</sup>) are identified as satellite lines,  $L_{\alpha}^{\prime}$  and  $L_{\alpha}^{\prime\prime}$ , and 2 others of each of W and Pt, newly observed, as  $L_{\alpha}^{\prime}$  and  $L_{\alpha}^{\prime\prime}$  (cf. Richtmyer, *C. A.* 28, 707<sup>14</sup>). C. A. Silberrad.

Fine structure of the  $L_{III}$  absorption edge of rare earths. V. Dolejšek and M. Hylmar, *Compt. rend.* 201, 100-2 (1935).—The fine structures of the  $L_{III}$  absorption edges of Hf, Pr, Nd, Sm, Gd and Yb were detd. They are similar among themselves and show dependence both on the crystal and chem. properties and on the at. no. (cf. Kronig, *C. A.* 26, 4247). C. A. Silberrad.

New observations of L emission spectrum of platinum. Yvette Cauchois, *Compt. rend.* 201, 598-600 (1935), cf. *C. A.* 29, 3911<sup>14</sup>.—By a slightly modified method 32 lines in the L spectrum of Pt were measured and classified. Previous results are substantially confirmed, but 13 new lines (8 nondiagram and 4 forbidden) were discovered, and 3 (1 nondiagram) shown to be doublets. C. A. S.

X-ray interferences in a monocrystalline cathode. W. Kossel and H. Voges, *Ann. Physik* 23, 677-704 (1935), cf. *C. A.* 29, 4260<sup>14</sup>.—Interferences were obtained from x-rays excited by cathode rays striking the diffracting monocrystal. The positions of the interferences can be described as reflections of plane waves by lattice planes, all expected reflections occur. The relative positions of all the reflections are functions of the ratio of wave length to lattice constant, this ratio can be calcd. from measurements of the film only. The depth of the contributing reflection planes can be estd. from the penetration of the cathode rays into the lattice, the estd. penetration agrees with that calcd. from the  $\mu$  for x-rays. With Cu the resolu. closely approaches that for the ideal crystal. When the diffraction angle  $\leq 25^\circ$ , the lines are weaker than the background on one side, but stronger on the other, an elementary explanation is given in terms of the coherence of the reflected ray with a ray parallel thereto directly from the excited atom, a complete explanation in terms of the optical reciprocity of x-ray reflections is indicated. The fluorescent x-rays from monocrystals (with an appendix concerning electron diffraction) M. v. Laue, *Ibid.* 705-16.—The optical reciprocity law in combination with the dynamical theory of x-ray interference gives the explanation of the expt. on the preferred direction of emission in a monocrystal. The *Kirchhoff* lines are the analogy thereto for electron waves. Victor Hicks.

New focusing method in spectrography of x-rays. A. Kunzl, *Compt. rend.* 201, 656-8 (1935).—The method combines that of Hamos (*C. A.* 27, 5002) in which the reflecting surface of the curved crystal forms part of a cylindrical surface of which the axis passes through the source of x-rays, in place of that of Cauchois (*C. A.* 27, 464), with that of Bragg and de Broglie. By its means  $M_{II}$  and  $M_{IV}$  of Ta oxide were detd. as 6764 and 6901 X.U., resp., the differences between observed and calcd. values

of  $r/R$  thence deduced are similar to those observed by Siegbahn for W (C. A. 25, 4170). C. A. Silberrad

Paschen-Back effect. Pierre Jaquinot and Teal Belling. *Compt. rend.* 201, 778-9 (1935).—The Paschen-Back effect of lines 5780-90 and 5770 was measured by means of the Bellevue magnet with supplementary coils (cf. C. A. 23, 4230) with a field of 65,000 gauss (which gave a displacement of the central component of 5790 of 0.2 Å.). In both cases diamagnetism is shown and the results do not agree with values based on Houston's theory. C. A. Silberrad

Effect of electric field on absorption spectrum of sodium. Ny Tu-de and Weng Wen-Po. *Compt. rend.* 201, 710-14 (1935); cf. C. A. 29, 4347\*.—With the same arrangement the effect of fields up to 2800 v./cm. on Na vapor has been examined. The results confirm and extend those of Segré (C. A. 29, 2410), and closely resemble those already obtained for Rb and Cs, allowance being made for the change in the Rydberg constant. Absorption bands due to ions bound by van der Waal forces were observed (cf. Kuhn, C. A. 26, 830). C. A. Silberrad

Wave-length shifts of the spectral lines of tin due to the change of pressure. Toshiko Yuzo. *Science Repts Tokyo Bunriki Daigaku* 2, 207-77 (1935).—By use of an expit procedure similar to that (C. A. 29, 447) employed for Sb, observations have been made on the change in appearance and wave length of lines of Sn I, Sn II and Sn III effected by increasing pressure, up to a few cm. Hg, of the emitting vapor. The shifts noted for Sn II and Sn III lines are attributed to the Stark effect resulting from the electric field set up by the ionized atoms. These shifts when correlated with the term designations of the lines increased with increasing inner quantum number rather than with the total quantum number. Lines of Sn I were broadened with increasing pressure but not displaced because the field is either weak or absent owing to the paucity of ions. C. C. Kees

New terms in the spectrum of Fe II. J. C. Dolbe. *Proc. Roy. Soc. (London)* A131, 703-20 (1935).—Wave lengths of about 5000 lines of Fe II, observed as electrode lines in the spectrum of an Fe arc, have been measured on high-dispersion spectrograms. These, and other, data have served to extend the term analysis of Fe II by bringing into the list of known terms many new doublet, quartet and sextet terms. The new terms are those required by  $at$ , theory and account for more than 300 previously unclassified lines, making the total for which term combinations are now known about 1200. All the Fe II terms are presented in tables together with the electron configurations to which they belong. C. C. Kees

The intensities of the sodium lines in the sun's spectrum. G. Righini. *Z. Astrophys.* 10, 311-42 (1935).—The intensities of 22 Na I lines, appearing in the sun's spectrum, were measured by a method of photographic photometry. The observed equiv. breadths of the lines were found to follow the course given theoretically on the assumption that they are affected only by damping and Doppler effects, that the temp. is 5000°, and that a single coefficient of damping may be used for the various multiplets. C. C. Kees

Intensity measurements of the  $2P$ - $nD$  series of magnesium in the sun's spectrum. M. Minnaert and Jean Genaud. *Z. Astrophys.* 10, 377-84 (1935).—The equiv. breadths of the Mg I lines  $2P$ - $nD$  in the solar spectrum were measured and from these data their oscill. strength were derived. These were found to be nearly constant, or to increase with the series number,  $n$ . This improbable result cannot be accounted for by any of the causes known to affect the widths of lines. C. C. Kees

Analysis of the spectrum of trebly ionized zinc. Z. N. V. T. S. Subbaraya. *Proc. Indus. Acad. Sci.* 24, 115-18 (1935); cf. C. A. 29, 5741\*. Harold Gershunowitz

Effect of periodic variation in concentration of neutral atoms in an alternating current sodium-neon lamp. Willem Utechoeven and Cornelis Veldburg. *Compt. rend.* 201, 615-9 (1935); cf. C. A. 29, 2487\*.—Oscillograms of a Na-Ne lamp fed by a c. e. (50~) for current,  $I$ , p. d. of terminals,  $V$ , and intensity of yellow light,  $I$ , show the

curves for  $V$  and  $I$  to be much deformed, only that for  $I$  being approx. sinusoidal (cf. Pound, C. A. 28, 5347). The deformations are traced to variations of the concentration of Na atoms and ions in the mixed Ne and Na vapor. C. A. Silberrad

Variations in the spectrum of Nova Herculis 1934 from January 10, to March 12, 1935. H. Ohler. *Z. Astrophys.* 10, 327-38 (1935).—On Jan. 10, 1935, the emission lines of the 11 (Biller) series and the spark lines of some of the metals were the outstanding features of the spectrum of Nova Herculis. By Mar. 12, the bright bands of He I, C I, O I, O II and N II had become the conspicuous features of the spectrum. C. C. Kees

Possible variations of the profiles of the hydrogen lines in the sun's spectrum as dependent on the fluctuations in the sun's ultraviolet radiation. H. K. Kharadse. *Z. Astrophys.* 10, 439-43 (1935).—An indirect method for detecting variations in the ultraviolet solar radiation, which cannot be measured directly, would be to observe the variations in the widths of Fraunhofer lines at different phases of the sun's activity. Such observations, made for several lines in the solar spectrum, indicate that for the Balmer lines  $H\gamma$  and  $H\delta$  changes do occur in their profiles that coincide with the max. of solar activity. C. C. Kees

Oxygen in the sun's chromosphere. T. Boyds. *Nature* 136, 766-7 (1935).—Photographs show the infrared triplet of O at 7771, 7774 and 7775 as emission lines in the sun's chromosphere. Oxygen is thus a normal and probably abundant constituent of the chromosphere. H. O. Wieg

Heat of dissociation of the hydrogen molecule,  $H_2$ , determined from the rotational structure of the continuous absorption at the long wave-length limit of 830 Å. The absorption spectrum of hydrogen. I. H. Reuter. *Z. Physik* Chem. B29, 313-27 (1935); cf. C. A. 29, 1316\*.—Absorption spectra were obtained for para- $H_2$  and ordinary  $H_2$ , ortho- and  $1/2$  para- $H_2$  in a vacuum spectrograph with pressures up to 0.03 mm., and absorption paths up to 2 m. The results show that for the rotational levels,  $K' = 0, 1$  and 2, continuous absorption begins at sharply different wave lengths. This indicates that for higher rotational energies, a smaller quantity of energy is needed to dissociate the mol. into a normal and an excited H atom. The result obtained for the heat of dissociation of  $H_2$  mols. is  $102.72 \pm 0.02$  Kcal. This is compared with earlier results, both expit. and theoretical. G. M. Murphy

Ultraviolet absorption of oxygen. Levi Herman and Renée Herman. *Compt. rend.* 201, 174-16 (1935); cf. C. A. 23, 4980\*.—By the same arrangement the 2 systems of absorption bands of O between 2100 and 2800 Å., hitherto regarded as independent, have been observed simultaneously, the predominance of one or other depending solely on the pressure. It is suggested that the Herzberg band may be in reality 2 branches  $P$  and  $R$  the lines of which are superposed near the head. C. A. S.

New emission spectrum of sulfur in photographic infrared. Maurice Desautant and Jules Duchesne. *Compt. rend.* 201, 595-8 (1935).—The new system extends from  $\nu = 13.521$  to 14.148, and is given by  $\nu = 13.521 + 306\epsilon - 4\epsilon^2 + 2\epsilon^3 + 2\epsilon^4$ , with  $\epsilon' = 0.3$  and  $\epsilon'' = 0.4$ . It is attributed to  $S_2$ . C. A. Silberrad

The  $\lambda 4502$  band of NH. R. Winstanley Imit, R. W. N. Ivers and P. C. W. Smith. *Proc. Roy. Soc. (London)* A131, 602-9 (1935).—In the light from a hollow-cathode discharge in streaming  $NH_3$ , a new band of  $NH$ , predicted theoretically, was observed at  $\lambda 4502$  Å. This band, photographed with high dispersion, was found to consist of single  $P$ ,  $Q$  and  $R$  branches, of which the  $Q$  branch is the strongest. The analysis shows that it represents a  $3\Omega \rightarrow 3\Sigma$  transition, the new rotational term differences for the  $3\Omega$  state agreeing with those already known from the  $NH$  band at  $\lambda 2404$  Å. ( $3\Omega \rightarrow 1\Sigma$ ). The rotational constants, have been calculated, also for the new  $3\Sigma^+$  state the discovery of which completes the list of stable states of the  $NH$  mol., resulting from combination of the  $1S$ ,  $2P$  and  $3P$  states of the N atom with the normal state of the H atom. C. C. Kees

The continuous absorption spectrum of hydrogen bromide. C. F. Goodeve and A. W. C. Taylor. *Proc. Roy. Soc. (London)* A152, 221-30(1935).—With absorption cells ranging in length from 1 to 3355 cm. the intensity of the light transmitted by HBr gas at various pressures was measured in the spectral range from 2350 to 1800 Å. by a photographic process. From the observed extinction coeffs. and the known characteristic function of the ground state of the mol. on approx. course for the upper potential energy curve has been derived, which indicates that the mol. dissociates into 2 atoms each in its normal state.

C. C. Kiess

$\beta$  Bands of boron monoxide. A. Elliott. *Proc. Acad. Sci. Amsterdam* 38, 730-8(1935).—Measurements were made of the doublet septa of lines in the bands of BO. For  $K$  values below 53 the resoln. was too small to permit measurements. The observed septa in the  $\beta$ -bands are thought to be due to doubling of the  $\gamma$  level. If the doublet septa in this level is given by the expression:  $F_1(K + 1/2) - F_2(K - 1/2) = \gamma(K + 1/2)$ , then the value of  $\gamma$  calculated from the results is a little less than 0.02 cm.<sup>-1</sup>.

C. E. P. Jeffreys

Determination of atmospheric ozone. Comparison of spectrographic and chemical methods. Alexandre Dauvillier. *Compt. rend.* 201, 679-80(1935).—Numerous simultaneous detns. of atm. O<sub>3</sub> were made during the winter 1934-5 at Abisko (Sweden) by the spectrographic (cf. Chalange, et al., C. A. 28, 6633') (I), and chem. (cf. C. A. 29, 12') (II) methods. I gave on av. of 4.1 mg/100 cu m. with max. and min. 6.4 and 1.5, II an av. of 3.3 with max. and min. 0.6 and 0.0. C. A. Silberrad

Reduced thickness of atmospheric ozone in polar winter. Daniel Barbier, Daniel Chalange and Etienne Vassy. *Compt. rend.* 201, 787-9(1935), cf. C. A. 28, 4780'.—Measurements of the O<sub>3</sub> content of the atm. by the stellar spectrum method during the winter 1931-5 at Abisko (Sweden) showed reduced thicknesses of 1.55-3.45 mm, the amt. being low (under 2 mm.) when the origin of the air was in low latitudes, and high (often above 3 mm.) when of Arctic origin. C. A. Silberrad

Spectra of SeO and SeO<sub>2</sub>. R. K. Asundi, J. Jon Khan and R. Samuel. *Nature* 136, 612-3(1935).—The emission band of SeO consists of a lone  $\nu'$  =  $\nu$  progression expressed by  $\nu = 55,133 - (882\nu' - 6\nu'^2)$  with  $\nu' = 33,107$  cm.<sup>-1</sup> and  $\nu' = 0.10$  cm.<sup>-1</sup>, giving the energy of disson. as 4.17 v. for unexcited mols. The excited frequency  $\omega_1 = 513$  cm.<sup>-1</sup>. SeO<sub>2</sub> has 2 vibration modes,  $\omega_1 = 901$ ,  $\omega_2 = 663$ , and those of the antisymmetric valence vibration  $\omega_3 = 1189$  and  $\omega_4 = 790$  cm.<sup>-1</sup>. The origin of the system is at 32,500. The close energy correspondence indicates strong localization of the bonds. G. M. E.

Infrared absorption of hydrogen peroxide. Alfredo Maione. *Nuovo cimento* 12, 358-60(1935).—The spectrum of a soln. of 30% H<sub>2</sub>O<sub>2</sub> shows that the intensity of H<sub>2</sub>O bands at 1.5  $\mu$  and 2  $\mu$  is increased while their position remains unchanged. The bands at 3  $\mu$  and 4.6  $\mu$  are considerably shifted, the latter being replaced by a doublet with max. at 4.4  $\mu$  and 4.85  $\mu$ . J. B. Austin

Absorption spectra of the halides of some elements of the second group. CdCl<sub>2</sub>, CdBr<sub>2</sub>, CdI<sub>2</sub>, ZnCl<sub>2</sub>, ZnBr<sub>2</sub>, and SrCl<sub>2</sub>. C. M. Bhaskar Rao and M. Karim. *Current Sci.* 4, 97(1935).—The regions of absorption maxima of the spectra of the above salts were obtained by plotting the values of log  $K$  against wave length. Results are tabulated. Helen S. Hopfield

Absorption spectrum of selenium dioxide. Léon Bloch, Lucienne Bloch and Choong Shun-Piaw. *Compt. rend.* 201, 654-5(1935).—Absorption begins in the ultra-violet at 200 Å as a series of bands degraded toward the red (I), with max. near 2700 Å. and 200-300 Å. in width, as temp. rises absorption increases and at 250° is almost continuous from 2400 to 3200 Å. At 200° a second similar but more diffuse system (II) appears with center about 4000 Å., which increases with temp. in similar fashion until at 315° it extends from 3700 to 4300 Å., becoming almost continuous at 360°. At 430° the 2 systems unite. In I there are 2 periodicities, 250 and 650 cm.<sup>-1</sup>, in II

only one, 200 cm.<sup>-1</sup> (cf. Evens, C. A. 24, 3130.)

C. A. Silberrad

Absorption of light and double bonds. I. Problem and methods. Karl W. Hausser, Richard Kuhn, Alexander Smakula and Karl H. Kreuchen. *Z. physik. Chem.* B29, 363-70(1935).—Absorption measurements were made in a series of polyene dyes with photocell photometers, spectral photometers and with grating spectroscopes. The results of all 3 methods are in good agreement although the spectroscopic method shows the greatest deviations. The direction of the errors in this case depends on the position of neighboring bands and the magnitude of the errors is due to the width of the bands. II. Polyene aldehydes and polyene carboxylic acids. Karl W. Hausser, Richard Kuhn, Alexander Smakula and Max Hoffer. *Ibid.* 371-7.—Absorption was measured in hexane and abs. EtOH soln. for Me-(CH=CH)<sub>n</sub>-CHO with  $n = 1, 2, 3$  and Me-(CH=CH)<sub>n</sub>-COOH with  $n = 1, 2, 3, 4$ . The height of the absorption bands and the strength of absorption are linear functions of  $n$ . The displacement of the bands toward longer wave lengths was smaller with increasing  $n$ , as is found in other homologous series. III. Investigation in the furane series. Karl W. Hausser, Richard Kuhn, Alexander Smakula and Adam Deutsch. *Ibid.* 378-83.—Absorption measurements in alc. and hexane soln. were compared for aldehydes,

(CH=CH)<sub>n</sub>-CHO with  $n = 0, 1, 2, 3$  and for acids'

(CH=CH)<sub>n</sub>-CO<sub>2</sub>H with  $n = 0, 1, 2, 3$ . The place

of the long wave length absorption bands is very similar to that in aliphatic systems with 2 conjugated double bonds. This is also true for dicarboxylic acids as furan- $\alpha,\alpha'$ -dicarboxylic acid and muconic acid. The height of the bands is less than that of the corresponding aliphatic compds. The difference in the heights for the acids is approx. independent of  $n$ . IV. Diphenylpolyenes. Karl W. Hausser, Richard Kuhn and Alexander Smakula. *Ibid.* 384-9.—Absorption measurements were made in alc. and C<sub>6</sub>H<sub>6</sub> solns. of Ph-(CH=CH)<sub>n</sub>-Ph with  $n = 1, 2, 3, 4, 5, 6, 7$ . The height of the principal absorption band and the strength of the band are nearly linear functions of  $n$ . The position of the absorption max. changes also with increasing  $n$ , as in other series. The differences found in frequency between the alc. and C<sub>6</sub>H<sub>6</sub> soln. are independent of  $n$ . V. The absorption of compounds with conjugate double bonds of carbon at low temperature. Karl W. Hausser, Richard Kuhn and Georg Seitz. *Ibid.* 391-416.—Absorption spectra were obtained at -196° and between 3000 and 5000 Å. for (I) diphenylpolyenes, Ph-(CH=CH)<sub>n</sub>-Ph,  $n = 1, 2, 3, 4, 5, 6, 7$ , (II) polyene carboxylic acids, Me-(CH=CH)<sub>n</sub>-CO<sub>2</sub>H,  $n = 3, 4, 5$ , (III) lycopene, Me<sub>3</sub>-X<sub>2</sub>Y-X-Me<sub>3</sub>, where X = C=CH-CH<sub>2</sub>-CH<sub>2</sub>- and Y = (-MeC=CH-CH=CH-), (IV) diphenylacetylenes, Ph-C≡C-Ph and Ph-C≡C-C≡C-Ph and (V) mesoporphyrin. For I, II and III, the position of the absorption bands is given by  $\nu = (\nu_0 + 37.0 \cdot l + 47.1m) \times 10^4$  sec.<sup>-1</sup>,  $l, m = 0, 1, 2, \dots$ . For (I), there are other shorter wave-length bands that are similar to the biphenyl bands and of about the same intensity for all members of the series. They have been correlated with vibrations of the Ph groups in the mol. I or (IV), the observed bands agree with those of C<sub>6</sub>H<sub>6</sub> and are ascribed to the C triple bond. For (V) the strongest bands correspond with those of the double-bond C in aliphatic polyenes. VI. The fluorescence of diphenylpolyenes. Karl Wilhelm Hausser, Richard Kuhn and Ernst Kuhn. *Ibid.* 417-54.—The fluorescence bands of (I) are displaced with increasing  $n$  more than the corresponding absorption bands and the intensity becomes less. The dependence of the fluorescence on concn., solvent, temp. and state of

aggregation was investigated. The results are in agreement with the theory of quenched collisions, with collisions of the second kind more effective in the quenching than collisions with the solvent mol. At  $-196^\circ$ , the position of the bands is given by  $\nu = \nu_0 - 1580\sigma_1 - 1160\sigma_2$  cm $^{-1}$  where  $\nu_0$  is the position of the band of shortest wave length and  $\sigma_1, \sigma_2 = 0, 1, 2, \dots$ . The bands at 1550 and 1160 cm $^{-1}$  are also found in the Raman effect and correspond with C double-bond vibrations. The spectra are independent of the wave length of the exciting light and are a mirror image of the absorption spectra, the symmetry being very nearly the same with respect to position but differing in intensity. A few further compounds were investigated, (II) with  $n = 5$  and isomethylloxim, showing almost identical fluorescent spectra.

G. M. Murphy

Ultraviolet absorption spectra of  $\alpha$ -ethylenic nitriles. A. Castille and E. Ruppel. *Bull. soc. chim. Belg.* 44, 351-75 (1935).—Measurements have been made on hexane solns. of the cis and trans forms of nitriles of the crotonic series, RCH=CHCN. Values for  $\lambda$ ,  $1/\lambda$ ,  $\epsilon$ , and  $\log \epsilon$  are given for the following nitriles:  $\alpha$ -pentene,  $\alpha$ -hexene,  $\alpha$ -heptene,  $\alpha$ -octene,  $\alpha$ -nonene,  $\alpha$ -decene,  $\alpha$ -undecene, and  $\alpha$ -dodecene. Contrary to other homologous series containing only 1 functional group, in this series the absorption varies with the mol. wt. With the exception of  $\alpha$ -pentene nitrile the trans forms showed more pronounced bands than the cis variety.

W. J. Peterson

Absorption spectra of amines and amides in the near infrared, their use in determining amphoteric ions, influence of neighboring groups. Marie Freyran and Paul Rumpf. *Compt. rend.* 201, 606-84 (1935), cf. C. A. 29, 3235 $^{1/2}$ .—The band near 1.04  $\mu$  characteristic of tricoordinated N does not appear in (NH $_3$ ), 2HCl aq or NH $_3$  (OH) aq, but does so in (NH $_3$ ), HCl aq and NH $_3$  (OH) aq. Similarly it is absent in aq. solns. of glycocoll or taurine, but present in solns. of the Na and Li salts, resp., indicating that the neutral solns. contain the amphoteric ions  $^+NH_3CH_2CO_2^-$  and  $^+NH_3CH_2CH_2SO_3^-$ , but the salts the anions  $NH_2CH_2CO_2^-$  and  $NH_2CH_2CH_2SO_3^-$ . Similarly as regards  $p$ -toluenesulfonamide. Aq. soln. of urea shows a band at 1.0081  $\mu$ , but a concn. soln. of the nitrate shows none. Connections are traced between the exact position of the band and the nature of the adjoining portion of the mol.; thus  $\lambda$  is increased by proximity of (OH), reduced by that of CO.

C. A. Silberrad

Raman spectra of oleum. Jean Chédin. *Compt. rend.* 201, 724-6 (1935).—The Raman spectra of solns. of SO $_3$  in H $_2$ SO $_4$  contg. up to 70% SO $_3$  shows the H $_2$ SO $_4$  lines below and their absence above about 45% SO $_3$ , and with further increase in the percentage of SO $_3$  the gradual appearance of lines attributable thereto. Conclusion. On adding SO $_3$  to H $_2$ SO $_4$  it first forms H $_2$ SO $_4$  (45% SO $_3$ ) with a Raman spectrum contg. lines 300, 327, 450, 735, 960 and 1250 cm $^{-1}$ ; any excess SO $_3$  above 45% dissolves as such in H $_2$ SO $_4$ , giving rise to lines at 239, 535, 688 and 1075 of increasing distinctness as its amt. increases.

C. A. S.

Absorption spectra of colloidal metallic and organic solutions and absorption of metallic films. Adolfo T. Williams. *Compt. rend.* 201, 605-7 (1935); cf. C. A. 26, 5436; 27, 1274.—The absorption bands and coeffs. of absorption of each of variously prepd. colloidal solns. of Ag, Au and Pt have been detd. with results in general agreement with those previously obtained. The absorption spectra of true and colloidal solns. of gamboge are very similar, only the coeff. of absorption changing by reason of lateral diffusion in the colloidal soln.

C. A. Silberrad

Infrared absorption spectra of plant and animal tissue and of various other substances. R. Stair and W. W. Coblenz. *J. Research Natl. Bur. Standards* 15, 295-316 (1935) (Research Paper No. 830); cf. C. A. 28, 1929 $^{1/2}$ .—Infrared absorption spectra of 15  $\mu$  of rubber, styrene, indene, polystyrene, polyindene, Cellophane, onion skin, translucent membrane of pith pokeweed, the seed septum of moonwort, and the seed wing of the cotton tree, dried specimens of chitin (the outer integument of insects), pith of feathers, air bladder of fish, bat's wings, film of

dried egg albumin, com. gelatin, lining of egg shell, wing of a dragon fly, polyvinyl acetate and polyvinyl chloroacetate resins, Glyptal resin, shellac, paraffin oil, sperm oil, linseed oil, CCl $_4$ , CHCl $_3$ , PhEt, PhCl,  $\alpha$ -CHCl $_3$ , AcOEt, PrEt, BuEt and C $_6$ H $_5$ Cl, were obtained with a mirror spectrometer, vacuum thermopile, and galvanometer. Percentage transmission is plotted against wave length. Considered as a whole, the proteins examd. exhibit a characteristic spectrum (with individual differences) as previously observed in groups of chem. compds., such as the carbonates, alcs. and fatty acids. Gelatin shows characteristic absorption maxima at 3.0, 3.43, 4.2, 4.6, 5.9, 6.3, 6.8, 7.3, 8.1, 9.2, 11.0 and 12.2  $\mu$ . Some of these maxima have been identified with CH $_2$  and OH groups. Strong absorption at 6-8  $\mu$  is noted in hydrocarbons modified by NO $_2$  groups.

W. J. Peterson

The behavior of the infrared spectra of some aqueous salt solutions. Maria Battista. *Nuovo cimento* 12, 342-7 (1935).—The spectra of solns. of CuSO $_4$  (I), FeSO $_4$  (II) and MnSO $_4$  (III) have been detd. between 1  $\mu$  and 5.5  $\mu$ . The presence of I and II increases the intensity of all the H $_2$ O bands. The positions of the bands at 1.5  $\mu$  and 2  $\mu$  are not changed but the max. of the bands at 3  $\mu$  and 4.6  $\mu$  are shifted toward the red. III has a very complex effect, causing an increase in intensity for the band at 2  $\mu$  and a decrease for the bands at 3  $\mu$  and 4.6  $\mu$ .

A bibliography of the Raman effect. III. S. C. Sarkar and Dwijesh Chakravarty. *Indian J. Physics* 9, 553-622 (1935), cf. C. A. 27, 2381.

E. H.

Depolarization of the light scattered by heavy water. S. Bhagavanam. *Current Sci.* 4, 94 (1935).—Heavy water supplied as 99.5% pure was examd. with sunlight focused by a long focal length lens as incident radiation. The depolarization of the transversely scattered light was found to be 0.04, as compared with 0.00 for ordinary water. This shows that the heavy water mol., similar to the ordinary water mol., has only a feeble optical anisotropy.

Helen S. Hopfield

Raman spectrum of heavy water. Edmond Bauer and Michel Magat. *Compt. rend.* 201, 667-9 (1935); cf. C. A. 28, 6635 $^{1/2}$ .—Examd. with lig. 4358 the Raman spectrum of D $_2$ O contains lines at 170, 350,  $\sim$  500, 1207, 2389 and 2501 cm $^{-1}$ , corresponding with those of H $_2$ O at 170, 500, 700, 1659, 3221 and 3435, resp.; 2389-2501 is a doublet, not a triplet. 170 and 170 are vibration bands, 350-500 and 500-700 are attributed to libration of the mol. around 2 of their axes of inertia.

C. A. Silberrad

Raman spectra of iodic acid and the alkaline iodates as solids and solutions. C. S. Venkateswaran. *Proc. Indian Acad. Sci.* 2A, 119-22 (1935).—The Raman spectra of the iodic acid as a function of concn. and of the iodates of Li, Na and K in the state of the solid and solns. have been investigated. The crystal of iodic acid yields 5 intense lines and a no. of weak and sharp lines, which are replaced by intense and broad bands in soln. The spectra of the solns. for a very wide range of concns. varying from 18 N to 0.15 N show an anomalous behavior regarding intensity and frequency shifts. From a qual. study of the solid and solns., evidence has been obtained for the progressive disson. of the acid. The results show that the disson. is incomplete even at concns. of 0.5 N. Suggestions have also been put forward that the acid is polymerized in the solns. to an appreciable extent, the polymerization decreasing with diln. The spectra of the iodates give in general lines which have been identified with the oscillations of the pyramidal form of the mols. of the AX $_3$  type. K biiodate crystal has a spectrum somewhat similar to that of iodic acid. The presence of a new line in its spectrum indicates the existence of H $_2$ O $^{+}$  ions. The soln. of this salt behaves as if it were only a mixt. of H $_2$ O and KIO $_3$ .

Harold Gershinowitz

Raman spectra of isoprene, dipentene and ocimene. P. S. Srinivasan. *Proc. Indian Acad. Sci.* 2A, 105-12 (1935).—The Raman and the infrared spectra are compared and the results are interpreted in terms of the structures of the mols. The frequencies found for isoprene and ocimene lend support to the chem. structure assigned

to these compds. Although dipentene possesses a cyclic structure, it does not give the characteristic frequencies given by benzene or toluene. This is attributed to the presence of a puckered, rather than plane, ring.

Harold Gershnowitz

**Convergence error in depolarization measurements**  
R. Ananthakrishnan *Proc Indian Acad Sci A* 2A, 133-42 (1935).—The scattering of light in an interference field is discussed, and it is shown that for the simple case of 2 parallel plane-polarized intersecting beams, the depolarization at the interference maxima gives the correct value, while at the minima the depolarization ratio is reversed. The av. of the depolarization taken over the whole field is higher than the correct value. The treatment is extended to the cases in which a lens covered with a square aperture, and with a circular aperture, resp., is used to cone the light on the scattering medium. It is shown that the observed values of the depolarization would deviate from the genuine values by a correction factor which involves the square of the angle of convergence. It is pointed out that the same results follow by treating the incident beam as a bundle of incoherent rays. Some consequences of the theoretical results are discussed and the necessity for the perfection of the optical parts used in depolarization work is emphasized. Exptl results are given which illustrate the points discussed in the paper.

H. G.

**Redetermination of the depolarization of light scattering in gases and vapors**  
R. Ananthakrishnan *Proc Indian Acad Sci A* 2A, 153-60 (1935), cf. *C A* 28, 7033<sup>1</sup> and preceding abstr.—It is pointed out that the existing depolarization data of gases and vapors are gravely defective, and a redet. of the values has been made with improved exptl techniq. The results obtained are strikingly different from those of previous workers, and afford at the same time a natural explanation of many of the existing anomalies. The genuine depolarization of methane appears to be only of the order of 0.3%, which is in all probability to be attributed to the highly depolarized vibrational Raman lines. The depolarization shows a steady increase as one goes to the higher members of the homologous series, but the values in all cases are much smaller than they were hitherto assumed to be. Cyclopropane shows a very small depolarization in conformity with the known small depolarization of cyclohexane, while propylene shows a high value as would be expected from the presence of the double bond in it.  $\text{MeCl}$  is more anisotropic than  $\text{PtCl}_4$  and the depolarization factor of the former is much higher than that of  $\text{CH}_4$ .  $\text{CCl}_4$  shows an extremely small depolarization of 0.15%, which is discussed in detail. It is tentatively concluded that the depolarization of  $\text{A}$  is nil. The depolarization of  $\text{H}_2\text{S}$  is only 0.3%. An explanation is offered for the low depolarization of the hydride mols. in general.

H. G.

**Active nitrogen of long duration, law of decay and of increased brightness on compression**  
Lord Rayleigh *Proc Roy Soc (London)* A151, 567-81 (1935).—The catalytic activity of the walls was reduced to a min when they were wetted with  $\text{H}_2\text{SO}_4$  or  $\text{H}_3\text{PO}_4$ . With  $\text{H}_3\text{PO}_4$  in a large bulb, the glow remains visible for 6 hrs or more, and the reaction is probably of the sec order. When *Apezon* oil is used, the reaction is apparently of the first order. Photometric measurements of the luminosity made while the gas is being compressed show that the intrinsic brightness varies as the square of the concn of the active material. This indicates a bimol reaction, in which the excess of neutral  $\text{N}_2$  mols. takes no part, confirming the observation that the time of decay at const vol between 2 standard intensities is, at low pressures, almost independent of the pressure. At higher pressures, some secondary cause for the action of neutral gas, comparable to the

action of the walls, perhaps, must be sought.

E. R. Rushton

**Action of hydrogen bromide on the nitrogen afterglow**  
W. H. Rodebush and M. L. Spealman *J. Am. Chem. Soc.* 57, 1891-2 (1935).—The presence of  $\text{HBr}$  or  $\text{Br}$  intensifies certain bands in the N afterglow while certain other bands are weakened. It appears to be the Br atom rather than the  $\text{HBr}$  mol. which is responsible for the effects.

M. McMahon

**Influence of light on the stability of bleaching solutions.**  
J. P. A. Tuncer *Chem. Weekblad*, 32, 429-30 (1935).—The amt. of active  $\text{Cl}_2$  in bleaching solns. decreases after 70 days' exposure to daylight in filled white glass bottles 49-61%, in half-filled bottles 63-70% and in half-filled brown bottles 11-29%.

B. J. C. v. d. H.

**A photochemical reaction of chlorophyll**  
F. M. Baur *Helv. Chim. Acta* 18, 1187-90 (1935).—The following systems mixed with photographic collodion were exposed to sunlight: (1) chlorophyll,  $\text{CO}_2$  water, (2) chlorophyll, methylene blue, air-free,  $\text{CO}_2$  free water, and (3) chlorophyll, methylene blue,  $\text{CO}_2$  water. In (1) no  $\text{CH}_2\text{O}$  was found; in (2) and (3) 0.5 mg. was found. The results suggest that chlorophyll in the presence of oxidation-reduction systems such as methylene blue or ferric salts converts carbonic acid into  $\text{O}$  and carbohydrates. Since reaction occurs in  $\text{CO}_2$ -free water the  $\text{COOH}$  groups of chlorophyll itself must supply the  $\text{CO}_2$ . The exptl amt. of  $\text{HCHO}$  found is in agreement with this hypothesis.

E. O. W.

**Behavior of iodostarin in light**  
F. M. Baur, *Helv. Chim. Acta* 18, 1149-56 (1935).—A  $\text{CHCl}_3$  soln. of iodostarin (6,7-diiodo-6-octadecenoic acid) undergoes decomposition in light from the sun, a fig vapor lamp or an Osram lamp forming  $\text{I}_2$  and tartaric acid (6-octadecenoic acid). The reaction is reversible and has been measured from both sides, at room temp. the equl follows the mass-action law. Both the decompn. and formation of iodostarin are I-sensitized reactions, the rate in each case is proportional to the light intensity.

E. O. W.

**Further investigation of the decompn. of flavins by light**  
P. Karrer and Hans P. Meerwein *Helv. Chim. Acta* 18, 1126-30 (1935); cf. *C. A.* 29, 8605<sup>1</sup>, 4678<sup>1</sup>.—The decompn. by sunlight of a flavin contg. a tert. OII group, 9-(2'-hydroxy-2'-methyl-1'-propyl)isoxanthine (1), shows that it is not necessary that dehydrogenation occur at the 2'-position of the hydroxy side chain, as previously suggested. However, the rate of decompn. is much slower with 1 than with flavins contg. a primary or a secondary OII group. As with the other flavins photolysis proceeds more rapidly in aq. MeOH than in water.

E. O. W.

**Spectrum analysis**  
F. Twyman *Nature* 136, 609 (1935).—It is suggested that "spectrochem analysis" be used to denote the analysis of substances by their spectra, leaving "spectrum analysis" to indicate the analysis of the structure of a spectrum.

E. O. W.

**Variation of detonation spectra with nature of surrounding gas**  
(Michel Lévy, Mouraour) 24 Raman spectrum of the esters of some derivatives of  $\beta$  ketobutyric acid (*Mefone*) 10

**Light polarizers**  
Alvin M. Marks *Fr* 784,487, July 22, 1935. A transparent polarizer is made by suspending a transparent isotropic support in a soln. of an optically active substance and evap. the solvent so that a cryst. layer is formed on the support.

**Activating substances**  
Rafael Products Radium Berne soc anon *Swiss* 171,807, Apr. 16, 1935 (Cl. 116/). App. for submitting solid or liquid substances to the action of Ra is described.

#### 4-ELECTROCHEMISTRY

COLIN O. FINK

**Electrofiltration in electrolysis of gels**  
Jean Swynedauw *Compt. rend.* 201, 821-3 (1935); cf. *C A* 28,

5704<sup>1</sup>.—The phenomena of cathodic and anodic swelling previously described can be summarized in the statement

that in any region the direction of the gradient of ionic concn. and of electrofiltration are the same, swelling occurs, if opposite, depression. Isorlec. depression is also shown to be due to electrofiltration. C. A. Silberrad

Theory and practice of chromium plating. II. Mechanism of chromium deposition. N. D. Biryukov, S. Makareva and A. A. Timokhin. *Korrosion u Metall-schutz* 11, 193-201 (1935).—See C. A. 29, 1717

Leopold Pestel  
Throwing power of electrolytic baths. Albert Portevin and Michel Cymboliste. *Compt. rend.* 201, 819-21 (1935), cf. C. A. 29, 6510.—With the spiral arrangement previously described the throwing power (II) has been plotted against current density,  $D$  ( $= 0.5 A / sq. dm.$ ), for ordinary baths for Cd and Zn (cyanide),  $Sn (Na_2SnO_3)$ , Ni and Cu (sulfate), and Cr ( $CrO_3$ ) for varying temps. ( $T$ ), and concns. ( $c$ ). As  $D$  increases II diminishes except for Cd and Cr, such increase affects the yield of Cu and Ni but little, increases it for Cr and diminishes it for Cd, Zn and Sn, II decreases with rise in  $T$  for Cu, Cd and Zn, and Ni in a coned bath, but in general varies little for Cr; with increase in  $c$  it increases for Ni up to a limit, and changes little for Cu and Cr, increase in concn. of the bath may cause an increase or decrease in II. C. A. Silberrad

Electrometric control of displacement reactions. Suzanne Veil. *Compt. rend.* 201, 685-7 (1935), cf. C. A. 29, 5339.—Electrodes of Pt and Zn previously connected to an electrometer were inserted, the Pt was placed first in aq.  $CuSO_4$  ( $e.g., 0.2 N$ ) and the e. m. f. developed on inserting the Zn electrode plotted against time. The e. m. f. first measured ( $1.19 v$ ) decreases to a min. ( $0.93 v$ ) after about 0.5 hr., and then rises to about  $1.18 v$  after 2 hrs., remains approx. steady for 1 hr., and then becomes irregular. (Results vary with form of electrodes and concn. of bath.) It is considered that the phenomena point to the chemical being merely accessory to the Volta effect, and that the initial decrease in e. m. f. is a secondary Volta effect caused by replacement of the Zn surface of the cathode by a Cu one. C. A. Silberrad

The current flow between a small (point) glow cathode and a very large (infinite) anode in glow discharges with varying gases. F. Keller. *Z. Physik* 97, 8-33 (1935).—In the rare gases, diffusion streaming and gradient flow can be distinguished. The diffusion stream takes place when the electron density in front of the cathode is sufficient to make up for the fall in concn. This current streaming obeys the theoretical law. With too small an electron density, gradient current flow is observed. Measurements are made on  $N_2$ ,  $H_2O$ ,  $O_2$  and  $H_2$ . S. T.

Reactivity of carbonaceous materials in the electric arc. M. S. Maksimenko and Ya. M. Markovskii. *Metallurg* 10, No. 2, 31-7 (1935); cf. C. A. 29, 7183.—In an atm. of N the loss in wt. of the C electrodes is 4-5 times greater than in A because of the formation of  $CN_2$ ;  $C_2H_2$  is formed in a H atm. and CO in a  $CO_2$  atm. The quantity of these gases formed varies with the type of C electrode; those of petroleum coke are more reactive than graphite electrodes. H. W. Rathmann

Nitrogen in arc-furnace steel and deoxidation by carbide slag. Isao Hayashi. *Tetsu-to-Hagane* 21, 707-22 (1935).—The high N in elec. steel is due to  $CaCN_2$  produced in carbide slag by the reaction between  $CaC_2$  and N in the furnace. The reaction between  $CaCN_2$  in the slag and the metal bath is assumed to be  $CaCN_2 + 2(FeO, MnO) \rightarrow CaO + 2(Fe, Mn) + CO + N_2$ ;  $CaCN_2 + CO \rightarrow CaO + 2C + N_2$ . The  $N_2$  liberated goes into the bath. The greater the N content of the bath, the more nearly complete is deoxidation; and the lower the temp. of the bath, the more  $CaCN_2$  is produced in slag.

Tomo-o Sato  
The reaction mechanism at a graphite anode. V. Sihvonen. *Suomen Kemistilehti* 58, 35 (1935) (in German). E. E. Jukkola

Organic depolarizers. W. H. Hunter and L. F. Stone. *J. Phys. Chem.* 39, 1133-47 (1935).—The single potentials of quinone, ferro-ferri, m-nitroaniline, azobenzene-sulfonic acid,  $H^+$  and quinone-quinhydrone against cathodes of Pt, Au, Ag, Ni and Sn; 3,3'-diaminodiphenylbenzene and

1 quinhydrone against Pt; and  $Sn^{++}$  against Sn were measured in a special cell (diagram of app. given) while a const. current of 50 milliamperes was passed through. The magnitude of the increased positiveness obtained with any one depolarizer depends on the work function of the cathode, i. e., the work required to remove electrons, and on the "electron affinity" of the depolarizer, i. e., its ability to reduce the potential of the electrode to its normal potential against its own ions. With a given depolarizer the values of the single electrode potentials become more neg. and the work function increases in the order of metals given above. The first 5 depolarizers are arranged in the order of decreasing positiveness against Au and are practically the same for the other cathodes. The relative values of electron affinity must increase in the same order. On the assumption that all cations present in a soln. may be considered as depolarizers, "overvoltage" of any depolarizer as well as of  $H^+$  is considered the result of electron affinity and other effects such as adsorption of H into the metal and gas films. Janet E. Austin

Chemical detection of the use of azides in the preparation of electron tubes. H. Fritz. *Mikrochemie* 18, 162-8 (1935).—In a previous paper, C. A. 29, 5374, it was pointed out that the chem. examn. of the mirror deposits in electron tubes can give practical indications concerning the method used in making the tubes. In this paper it is shown that the detn. of the total N content of the mirror deposits gives pos. proof as to whether azides were used in the manuf. of the tubes. The tubes which have been made without the use of azides contain only about 1-2% of N per tube. When the N content of the mirror deposits is distinctly higher, it is certain that azides, usually  $BaN_3$ , have been used. The exact quantity cannot be detd. in this way but some idea as to whether little or much azide has been used can be shown. W. T. H.

Elec. furnace for heat-testing refractory products (Fr. pat. 784,105) 19. Elec. furnaces for melting glass (U. S. pat. 2,018,583-4) 19.

Electric batteries. La compagnie générale de piler Wonder. Fr. 784,113, July 22, 1935. Anodes for batteries of the Zn- $NH_4Cl$  type are composed of pure electrolytic Zn alloyed with Pb which is preferably 0.75-0.9% of the wt. of Zn.

Galvanic battery. Henry W. Brownson and Richard Chadwick (to Imperial Chemical Industries Ltd.). U. S. 2,018,942, Oct. 29. A homogeneous, malleable alloy of Zn with less than 0.6% of Hg is used for the manuf. of pressed cup-shaped battery containers.

Galvanic battery. "Petrus" Chemische Fabrik A.-G. Fr. 784,181, July 22, 1935. In a battery depolarized by air the liquid electrolyte contains a substance capable of swelling, e. g., starch products, in amt. such that the liquid is not sufficient to cause complete swelling. The pos. electrode is surrounded by an impregnated paper which is so slowly permeable to liquid that during the swelling operation no liquid reaches the electrode.

Storage batteries. Albert Strasser and Walter Germann. Swiss 175,782, July 1, 1935 (Cl. 109). To the active mass for Pb accumulators is added c. p. metallic Si, preferably in the colloidal form.

Electric cell of the Lalande type. Martin L. Martus and Edmund H. Becker. U. S. 2,018,563, Oct. 22. A battery with a Zn anode is used with a caustic alkali electrolyte soln. contg. about 1% of an added Mg salt such as  $MgCl_2$ ,  $MgCO_3$ , or Mg phosphate, and about 2% of an added reducing agent such as Na formate and hydroquinone.

Electrolytic condenser. Samuel I. Cole (to Aerovox Corp.). U. S. 2,018,488, Oct. 22. Structural features. Electrolytic condenser. Werner Herrmann and Erich Evers (to Siemens & Halske, A.-G.). U. S. 2,018,522, Oct. 22. In producing an electrolytic condenser, a spacing strip of fibrous material such as paper or cloth is spirally wound on at least one thin metallic ribbon so as completely to enclose the ribbon, and the wound ribbon is

moved through an electrolyte and afterward is wound on a core

Electrical conductor Henri Buefuit and Willem L. C. van Zwet (to Radio Corp. of America). U. S. 2,018,343, Oct. 22. A solid nonconducting core or core formed of material not freed from oxides or other metal compounds provided with a coating comprising finely divided particles of metal such as Zn coated with Ag and mixed with an organic binding agent.

Electrical resistances Steatit-Magnesia A.-G. Fr. 784,325, July 22, 1935. Conductive materials, such as charcoal, graphite, metal powder or metal oxides, in a fine state of division, are suspended in etherified compounds of cellulose to which softening agents, resins, waxes or filling materials may be added.

Electrolytic deposition of metals Bauindustrie A.-G. (Baug). Fr. 784,574, July 22, 1935

Electroplated master phonograph records. Alexander G. Russell (to Bell Telephone Laboratories, Inc.). U. S. 2,018,471, Oct. 22. Various structural and mfg. details.

Electrolysis Peintal soc. anon. Swiss 176,639, July 1, 1935 (Cl. 44a). A bath for the electrolytic production of an oxide layer on Al or Al alloys contains a sulfonic acid of an aromatic hydrocarbon such as benzenesulfonic, naphthalenesulfonic, or anthracenesulfonic acid, or a mixt. of these. Examples are given.

Electrolytic apparatus "Elin" A.-G. für elektrische Industrie. Ger. 618,062, Sept. 2, 1935 (Cl. 48a 14). See Austrian 140,522 (C. A. 29,3611\*)

Electrolytic apparatus for making thin sheet metal, Anaconda Copper Mining Co. Ger. 618,213, Sept. 4, 1935 (Cl. 48a 9). See Brit. 419,764 (C. A. 29,2863\*)

Electrolytic cell suitable for producing oxygen and hydrogen. Andrew C. Brown (to Compressed Industrial Gases, Inc.). U. S. 2,018,703, Oct. 29. Structural details.

Anodic oxidation of aluminum and its alloys. Aluminum Colors, Inc. Ger. 618,195, Sept. 3, 1935 (Cl. 48a 16). See Fr. 758,545 (C. A. 28,3007\*)

Silicon carbide Henry P. Kuehner (to Carborundum Co.). U. S. 2,018,193, Oct. 22. A small proportion of buckwheat hulls or the like is added to a charge of sand, C and salt for producing SiC in an elec. furnace.

Protecting metals against corrosion Société d'exploitation des câbles électriques, système Berthoud, Borel et Cie., and James Borel Swiss 175,038, Apr. 16, 1935 (Cl. 44d). Metals are protected against electrolytic corrosion by covering them with a noncorrosive coating in direct elec. contact with the metal and capable of conveying electricity from the metal by a flow of electrons. In the example the metal is coated with bitumen or fiber contg. free particles of C.

Mixture for liberating alkali metal. Percy L. Spencer (to Raytheon Mfg. Co.). U. S. 2,018,815, Oct. 29. A mixt. suitable for supplying alkali metal in elec. discharge devices comprises a stable alkali metal compound, such as CsCl together with Cd.

Induction furnaces. Ivar Rennerfelt, Brit. 432,712, July 29, 1935. A furnace with an open magnetic core having pole pieces adjacent to the hearth is provided with 1 or more arcing electrodes arranged in the upper part of the furnace. Cooling tubes for the core are provided.

Coreless induction furnace operated with three phase current Heraeus Vacuumschmelze A.-G. and Wilhelm Rohm. Ger. 610,906, Aug. 7, 1935 (Cl. 21a, 18 03). Addn. to 672,445 (C. A. 27,2883).

Electric combustion furnace for organic chemical analysis Rudolf Engeland. Ger. 618,466, Sept. 19, 1935 (Cl. 421 3 02)

Electrically heated salt bath furnace Siemens-Schuckertwerke A.-G. (Johann Schnepf, inventor). Ger. 618,262, Sept. 4, 1935 (Cl. 21a, 15 01). Preliminary fusion of the salt is effected by a heating element resembling an elec. immersion heater, which is embedded in the salt.

Apparatus for ionizing air or other gases Rudolf Auerbach (to General Elec. Co.). U. S. 2,019,333, Oct. 29. Structural and operative details.

Apparatus for generating negative ions Earle W.

Ballentine (to Solar Industries, Inc.). U. S. 2,018,434, Oct. 22. An app. for generating neg. ions substantially free from pos. ions in air at atm. pressure and suitable for treating air of houses comprises a metal anode which may be formed of sheet metal, a resistance wire of Ni-Cr alloy adapted to serve as a hot cathode, and a source of a.c. by which the wire is energized and the anode given a potential difference. Structural details are described.

Obtaining coherent masses from powdered materials The British Thomson-Houston Co. Ltd. Brit. 431,509, July 9, 1935. A mold for mfg. cemented carbides by the application of heat and pressure comprises a relatively heavy W or Mn tube supporting, by a shoulder, a hollow C tube within which the charge is compressed by plungers. The assembled mold is placed between C blocks and clamped between H<sub>2</sub>O-cooled electrodes, the current between which heats the metal tube, which acts as a heat reservoir and reinforcing member for the C tube.

Apparatus for decomposing or vaporizing liquids by means of a submerged electric arc. Kurt Wappler. Ger. 618,161, Sept. 3, 1935 (Cl. 12k, 4).

Noncontact making relays. Erich Hahann, Brit. 431,861, July 10, 1935. In app. for generating or amplifying elec. oscillations with the aid of finely divided materials, e.g., oxides, having a neg. resistance characteristic, the oxide, etc., is present as a coating on cores that are good conductors of heat and electricity.

Thus, Pt pellets of about 0.1 mm diam and coated with V<sub>2</sub>O<sub>5</sub> are mixed with similar pellets coated with Mn<sub>2</sub>O<sub>3</sub> in the proportions already known for mixts. of the powd. oxides. The metal of the oxide may be used as core and, in case a mixed oxide coating is desired, e.g., ZnO and CuO, the core may be a suitable alloy, e.g., of Zn and Cu. In an alternative arrangement, Pt wires are coated with the desired oxide, e.g., by spraying, drawing through the molten oxide, electrolysis, e.g., of vanadates or zincates, or, in the case of ZnO, by sublimation or by coating the wire electrolytically with the appropriate metal and then oxidizing.

Electrodes for rectifiers Harold B. Conant. U. S. 2,017,842, Oct. 22. A Cu plate is heated in a furnace having a temp. of 1000° until a coating of an O compound is formed on it, then cooled to about 600°, quenched in a bath of heavy mineral oil having a temp. of at least 70°, and then cooled to room temp. in a bath of relatively light mineral oil.

Electric fuse. Vernon Iloffe. U. S. 2,018,556, Oct. 22. A fusible element comprises a metal of low m.p. embedded in an arc-quenching powder such as marble dust and boric acid is held in contact with the surface of the metal to cause the metal to run when it is melted by an overload current.

Discharge apparatus N. V. Philips' Gloeilampenfabriek. Brit. 431,923, July 17, 1935. An artificially cooled Hg-vapor discharge tube having a gas-filling has an internal diam. of less than 3.5 mm. and the Hg-vapor pressure is so high that the potential drop in the discharge path exceeds 150 v per sq cm. Cd or Zn may be added to the Hg in the form of amalgams. In 1 form, the lamp is constituted by a cylinder of quartz of internal diam. 2 mm. and wall thickness 2 mm., the W leads being surrounded by insulating material and sealed into the lamp through intermediate glass members composed of SiO<sub>2</sub>, 83.3, B<sub>2</sub>O<sub>3</sub> 8.4, Al<sub>2</sub>O<sub>3</sub> 2.4 and CaO 0.4% sealed to the quartz.

Electron discharge tube containing a gas such as neon, argon or helium Charles J. Kaylo (to Sparks-Withington Co.). U. S. 2,018,174, Oct. 22. Various structural details.

Electron emission elements Chester H. Braselton (to Sirian Lamp Co.). U. S. 2,018,903, Oct. 29. A pasty mixt. is formed contg. BaCO<sub>3</sub>, SrCO<sub>3</sub>, BaCl<sub>2</sub> and dist. water, the paste is spread upon a supporting member such as a wire and the assembly is heated in the presence of O to convert the BaCl<sub>2</sub> to BaO and then at a higher temp. to convert the BaCO<sub>3</sub> to BaO.

Light-sensitive cells N. V. Philips' Gloeilampenfabriek. Brit. 431,746, July 15, 1935. A photoelec. device comprises a base plate of metal, e.g., brass, or of C,

which carries a photoelec. semiconductive layer of Se, Cu iodide, Cu<sub>2</sub>O or Mo sulfide which is sep'd. by a thin barrier layer of artificial resin from a metallic conductive electrode, e. g., a translucent Au film, the boundary between the Se and barrier layers being within reach of the light rays. The resin may be applied to the Se layer as a soln. of a PhOII- or ercol-CH<sub>2</sub>O resin in alc. and, after the evapn. of the solvent, the resin is further hardened by heating to about 200°. Alternatively, if the barrier layer is made of polystyrene, which is sol in CCl<sub>4</sub>, no subsequent heating after evapn. of the solvent is necessary.

**Suppression layer cathodes for photoecells.** Franz Rother. U. S. 2,019,093, Oct. 29. In producing suppression layer cathodes with a Cu base and an oxide coating, the base is coated with a thin layer of another metal such as Au which is not of the alkali group and then heated to cause the Cu to diffuse into and form an alloy with the other metal and to effect oxidation of at least part of the Cu so diffused to form an oxide coating over the alloy. Cl. C. A. 29, 2332.

**"Clean-up" material suitable for use in thermionic valves.** John D. McQuade (to Kemet Laboratories Co.). U. S. 2,018,965, Oct. 29. A mixt. of comminuted Cu about 25-50% is used with comminuted silver-colored active "clean-up" material such as a Ba-Sr-Mg alloy and serves to render the material more readily seen, by giving color contrast.

**Thermionic cathode.** Siemens Electric Lamps & Supplies Ltd., Percy D. Oakley and John N. Aldington. Brit. 431,810, July 10, 1935. In a high-pressure, metal-vapor discharge lamp, the emissive electrode consists of a core of emissive material surrounded by a helix of Ta.

**Glowing cathode.** Akt.-Ges. Brown, Boveri & Cie. Swiss 174,419, Apr. 1, 1935 (Cl. 112). A discharge tube cathode made of graphite coated with a metal of m. p. about 2000°, e. g., Mo or W, is described.

**Cold cathode electric discharge lamp containing gas such as neon and argon.** Franz Kother (to Rodalite Co.). U. S. 2,018,974, Oct. 29. At least 2 gas components such as Ne and Ar are used for producing described color effects. Cl. C. A. 29, 413.

**Discharge lamps.** The General Electric Co. Ltd., Victor J. Francis and John W. Ryde. Brit. 431,651, July 12, 1935. In a high-pressure metal-vapor lamp having a double-walled envelope, blackening of the walls of the inner discharge tube is prevented by providing a gaseous or vapor filling in the space between the walls; the filling may be O, H, air, H<sub>2</sub>O vapor, S vapor, CO<sub>2</sub> or N<sub>2</sub> in specified amts. The glass that may be used for the tube has the compn., SiO<sub>2</sub> 64, CaO 16, B<sub>2</sub>O<sub>3</sub> 8, Al<sub>2</sub>O<sub>3</sub> 21, Na<sub>2</sub>O 1 and BaO 0.5 parts.

**Positive column gaseous discharge lamp containing neon.** Leo L. Beck (to Claude Neon Lights, Inc.). U. S. 2,018,620, Oct. 22. Various details are described of a lamp contg. Ne together with 0.07-1.25% of A, Kr or Xe.

**Electric illuminating lamp for operation on alternating current and containing a rare gas such as neon and mercury.** Jean M. E. de Beaufort and Anton Lederer (in part to Ernest A. Lederer). U. S. 2,018,347, Oct. 22. Various details.

**Electric incandescent lamp.** Mary R. Andrews (to General Elec. Co.). U. S. 2,019,331, Oct. 29. A sep. heated body of carbon is placed adjacent to but out of direct contact with a lighting body contg. carbide of Ta, Hf, Zr or Cl.

**Electric incandescent lamp filaments.** Samuel Ruben (to Sirian Lamp Co.). U. S. 2,018,470, Oct. 22. Metal wire filaments such as those of W or Mo are coated with a mixt. formed from a compn. of Th oxide about 10% and Ce oxide about 1 part through which about 25% of B oxide is distributed. Cl. C. A. 29, 414.

## 5—PHOTOGRAPHY

P. R. BULLOCK

**Recent developments in color photography.** Gustav Grote. *Phot. Korr.* 70, 149-64 (1934), cl. C. A. 28, 7173. —A summary.

**The flash exposure.** W. B. Hislop. *Process Engineer's Monthly* 42, 265-6 (1935). —The flash exposure in half-tone screen work, besides overcoming the inertia of the emulsion in the shadows, improves the gradation of the reproduction and the printing of the shadow dots.

**A photographic development effect.** P. Odilo Hofmann. *Physik. Z.* 36, 650 (1935). —It is shown that 2 images made at different light intensity levels, but which ultimately will be of equal d., develop at unequal rates in the initial stages of development. The image made at the lower intensity level appears first. J. H. Webb.

**Acceleration of development by thiocarbamides.** Lippman-Cramer. *Phot. Korr.* 70, 145-8 (1934). —When almost unexposed (such as lantern) plates are bathed for 1.5 min. in a 0.001% soln. of thioamine or thiocarbamide before being developed in hydroquinone, a remarkable acceleration, without any production of fog, is seen in the early stages of development. High-speed plates show, however, considerable fog. In addition, to a similar acceleration of development. Acceleration can also be seen, prior to the well-known appearance of "pseudosolarization," on high-speed plates when thioamine or thiocarbamide in comparatively large amt. (e. g., 0.025%) is merely added to the developer. This pseudosolarization has not been found, with any one of 7 brands of plates tested, to give a min. il. as low as would be required for a practically useful reversal process.

**Research on fine-grain development.** Georg Schwarz. *Kino-technik* 16, 73-8 (1935). —A study of the properties of a no. of different developers leads to the conclusion that very little difference exists for equal d. and  $\gamma$ . Prog.

ress in reducing graininess depends largely on the photographic material. O. E. Miller.

**Fine-grain developers.** Lippman-Cramer. *Phot. Korr.* 71, 40-50 (1935). —Many recent investigations have verified L.-C.'s contention that, at equal values of  $\gamma$ , the so-called fine-grain developers show no advantage over normal developers. In a recent paper comparing certain fine-grain developers with dild. M.-Q. developers, Schwarz (preceding abstr.) found that the only difference was a longer exhaustion life for the fine-grain developers. L.-C. points out that this is to be expected because of the much higher concn. of developing agents. H. Parker.

**Do emulsion and developer alone determine fineness of grain?** Ph. Strauss. *Phot. Ind.* 33, 721-3 (1935). —Much stress is laid on the developer in published articles on the subject. S. points out that factors such as the time of development, time of exposure, quality of the exposing light, etc., should not be overlooked. In making enlargements, the optics of the projection machine, and the contrast and surface of the paper used, are important in detg. the graininess in the print. C. E. M.

**Different factors determining the behavior of a photographic developer.** M. C. F. Beukers. *Chem. Weekblad* 32, 328-9 (1935). —A short review of recent work on the influence of different factors, especially pn, on the behavior of developers (C. A. 27, 5260; Reinders, C. A. 28, 6377). Conclusions: Hydroquinone is 6 times more sensitive to pn changes than metol. Hydroquinone develops from pn 0.5 on, metol from pn = 7 on. At pn 10.5 to 11 both substances give equal ds. At lower pn both increase the induction period, metol less than hydroquinone. If errors due to pn as well as to the induction period are eliminated the blackening d. is a linear function of developer concn. The influence of KBr is considerably more at slightly lower pn; it causes increased induction time for hydroquinone. In metol-hydroquinone mixts.

at  $pH = 9$  practically all action during short developing periods is due to metal, at  $pH 8.8$  the hydroquinone can as well be omitted. The most effective mixt. is 1 part metal to 3-5 parts hydroquinone. B. J. C. van der H.

Sensitizing photogravure tissue. Alois Heigl and Karl Stötzer. *Reproduktion* 6, 159-61(1935).—Various  $pH$  control sets are discussed in connection with the  $K_2Cr_2O_7$  bath. While for C transparencies sensitized tissue may be kept under refrigeration for months, this is not considered applicable to photogravure. A C transfer may show only slight evidence of scum on glass or celluloid, and still form a heavy scum on Cu. A. M.

Influence of water on the sensitivity of photographic emulsions. André Charrion and Suzanne Valette. *Bull. soc. franç. phot.* 22, 156-8(1935).—See C. A. 29, 4276.

Desensitizing properties of iron nitrosulfide. Jacques Duclaux. *Science ind. phot.* 6, 321-2(1935).— $NaFe(NO)_2$  (prepn given) is a sol black compd possessing marked desensitizing properties. Details are given, the best results being attained by long immersion in a soln of the compd. A tendency to stain is diminished by adding alc. to the bath. Unlike some dye desensitizers, the compd shows no sign of sensitizing action at high diln. Fogged plates may be cleared by treatment with the compd followed by exposure to infrared radiation.

L. G. S. Brooker.  
Characteristic surface for the Villard effect. III. Hans Arens. *Z. wiss. Phot.* 34, 125-35(1935); cf. C. A. 26, 3740, 28, 7182.—In continuation of the previous expts with a low-speed, non-color-sensitized film emulsion, 2 other emulsions, 1 of which is of large grain, have now been used and A's earlier results have been qualitatively confirmed. It is considered that the results are in agreement also with those of Wood, Schaum, Volmer and Langerbanns, although the present investigation is more extensive, since it includes the independent variation in intensity and time of the white-light exposure.

E. R. Bullock.  
The concept of inert gelatin. A Steigmann. *Phot. Ind.* 33, 299-9(1935).—S defines inert gelatin as a gelatin which is almost entirely free from sensitizing substances. He considers that ripening sensitizers would be better termed ripening accelerators, since when added to a restrained gelatin they exert a desensitizing action on continued ripening.

E. R. Bullock.  
Restraining substances in gelatin, and the age of the animal. A Steigmann. *Phot. Ind.* 33, 276(1935).—Calf gelatin is richer in restraining substances than is the corresponding gelatin from cattle. Putrefaction in the lyming operation is also of influence, this renders the restraining substances more readily removable.

E. R. Bullock.  
Structure of negative layers. P. Wiegler. *Schweiz. Phot.-Ztg.* 37, 93-5(1935).—The graininess of a negative depends not only on the structure of the original emulsion but also on the developer and the degree of development. For fine grain development, W. suggests the following: metal (elcon) 16 g.,  $Na_2SO_4$  75-100 g.,  $H_2O$  1 l., this soln to be dild. for use with an equal vol. of either  $H_2O$  or 1% borax soln.

E. R. Bullock.  
The Agfa step color chart. Martin Biltz. *Phot. Ind.* 33, 746-52(1935).—This chart, introduced in 1931, has been used in numerous expert investigations of emulsion coatings and light filters. A description is given of its optical characteristics, including hue, reflection, brightness, etc.; the precision of measurements afforded by the table, and the evaluation of artificial light exposures.

C. E. McLendrye.  
Recent processes for the reproduction of multicolor subtractive pictures (Gasparcolor process). Bela Gáspár. *Z. wiss. Phot.* 34, 119-24(1935).—A discussion of the relative merits of additive and subtractive processes is followed by a review of previously proposed theoretical multilayer films, in which 3 emulsion layers, each carrying a dye or dye-forming substance, are coated in superposition. Each layer is sensitized to light of a color complementary to the final color of the layer. Their imperfections are discussed. The dye-forming sub-

stances, i. e., certain esters of vat-dye leuco bases, while satisfactory, are difficult to control in processing. Incorporating actual dyes in the emulsion layer offers the advantage of advance detn. of both shade and content of the dye. Here certain polyazo dyes are used. Sensitization of the new material is not complementary, but displaced toward the long-wave end of the spectrum, i. e., the yellow layer is green-sensitive, the magenta layer, red-sensitive, and the blue-green layer, sensitive to infrared to take advantage of the addnl. transmission of the dyes in this region. The entire production and processing of the Gasparcolor material now in use are described.

H. A. Kurtzner

Detection of artificial radioactivity in a photographic emulsion (Takéuchi, Inai) 3

Photographic developer. Charles W. Bennett (to Photo-Cast, Inc.). U. S. 2,018,657, Oct. 29. Borax and acetone are used in developers such as those contg. pyrocatechol, etc. They stabilize the developer against atm. oxidation although it is operative at temps. as low as 0°.

Photographic development baths. I. G. Farbermnd. A.-G. Ger. 616,890, Aug. 7, 1935 (Cl. 57b 13 01). Addn. to 612,492 (C. A. 29, 4686). The chlorobenzotriazole used according to Ger. 612,492 is replaced by a deriv. thereof, e. g., a methylchlorobenzotriazole. Cf. C. A. 29, 4685.

Photographic emulsions. B. Kankelwitz. Ger. 618,354, Sept. 6, 1935 (Cl. 57b 8 01). Mixts. of Hg salts and Au salts are added to photographic emulsions, to eliminate gray and yellow fog.

Tanned images. Kalle & Co. A.-G. Fr. 784,190, July 22, 1935. Collod films sensitized by aromatic nitro derivs. which acquire tanning properties under the action of light (Mg 1-nitronaphthalene-8-sulfonate, o-nitrobenzyl alc., Na 4-nitronaphthalene-1,8-dicarboxylate, and Na 1-nitro-8-methyl-naphthalene-4-sulfonate) are exposed to light under a negative and then treated in known manner to obtain tanned images. Cf. C. A. 29, 7842.

Combined sound record and colored picture films. Béla Gáspár. Brit. 432,464, July 28, 1935. The metal deposit images (both sound record and pictures) are produced in 1 or more layers of a single or multi-layer photographic material that has color-forming substances incorporated in the said layer or layers, either prior to or subsequent to the formation of the metallic images, the layer(s) being afterward so treated as to produce a colored sound record and colored pictures at the metal image or nonimage points. The color-forming substances comprise any substance which, when incorporated in the photographic layer, can be converted by oxidation, reduction, diazotization, etc., into a dye or pigment and which permits of selective destruction of the color in the required manner, they may include a substance which is itself colored but which is convertible into a dye of a different color to form the finished sound image. Various methods for carrying out the invention are described.

Thus, the dye-forming substance may be converted by a developer into a dye, at the points of the developed Ag, as described in Brit. 2562/1913 (C. A. 8, 2657); by this method a blue image may be produced in a layer contg.  $\alpha$ -naphthol by using a developer contg. diethyl-p-phenylenediamine hydrochloride, followed by the use of Farmer's reducer to remove the Ag. Or the oxidation method described in Brit. 379,679 (C. A. 27, 2892) may be used. Preferably, however, a method is used in which the formation of the dye is independent of the Ag image, the latter

being effective only for the selective destruction of the dye or dye-forming substance, among several examples, Zn ferriacrylate, diffusely incorporated in a photographic layer, preferably before the formation of the metallic sound and picture images, is developed by ferrous oxalate, a Prussian blue color being formed which is subsequently converted into reversed sound and picture images by a bath contg. thiocarbamide and HCl. Ni dimethylglyoxime or  $ZnCrO_4$  may alternatively be used for producing

red and yellow images, resp. A few base, which is subsequently oxidized to form the dye, may be incorporated in the layer as a finely divided deposit, e. g., a salt of phosphotungstic, molybdic or tartaric acid. The diffusely formed dye is then destroyed at the image or nonimage portions, e. g., as described in Brit. 291,718 (C. A. 28, 519), 297,170 (C. A. 28, 3014), 397,183 (C. A. 28, 3015) and 517,192 (C. A. 28, 3015); or the dye-forming substance may be first destroyed locally and the remainder then converted into the dye by further treatment. Cf. C. A. 29, 117.

Carrier for the recording of sound oscillations or picture impulses. Cornelis J. Dippel (to N. V. Philips' Gloeilampenfabrieken) U. S. 2,019,215, Oct. 29. A curing layer contains gelatin and a sulfonated ester oil.

Photographic papers. Paul Dau. Ger. 618,353, Sept. 6, 1935 (Cl. 57b. 2 02). In the making of highly lustrous photographic papers with the aid of aq. emulsions of wax, paraffin wax, shellac or like materials, more stable products are obtained by using emulsions which have been prepd. by mech. disintegration without the addition of chem. emulsifying agents.

Multi-color positive photographs or cinematographic pictures. John E. Thornton U. S. 2,018,104, Oct. 22. Numerous operative details are described.

Printing colored pictures. Anton Jasmitz. Ger. 616,542, Aug. 6, 1935 (Cl. 57d. 9). Addn. to 585,262 (C. A. 28, 1292). Details are given of a modified process of the kind described in Ger. 585,262 in which dyes not containing salts are used. Cf. C. A. 29, 4291.

## 6—INORGANIC CHEMISTRY

A. R. MCGLETON

Bromine oxide,  $\text{Br}_2\text{O}$ . W. Brenschede and H. J. Schumacher. Z. phys. Chem. B29, 356-8 (1935).—The reaction between  $\text{H}_2\text{O}$  and  $\text{Br}_2$  in  $\text{CCl}_4$  soln. results in a product containing more than 40%  $\text{Br}_2\text{O}$ . Methods of prep. and analysis are given. It decomposes in light according to the reaction:  $\text{Br}_2\text{O} \rightarrow \text{Br}_2 + \frac{1}{2}\text{O}_2$ .  $\text{Br}_2\text{O} + \text{CCl}_4 \rightarrow \text{CCl}_2 + \text{Br}_2 + \text{Cl}_2$  and at room temp. in the dark in a few days according to the same reaction. G. M. M.

Lower oxides and sulfates of iodine. Rama K. Bahl and James R. Partington. J. Chem. Soc. 1935, 1258-63.— $\text{I}_2$  in  $\text{HNO}_3$  (d. 1.4) does not give  $\text{I}_2\text{O}_5$ . Action of  $\text{HNO}_3$  (d. 1.5) on  $\text{I}_2$  gives hygroscopic yellow  $\text{I}_2\text{O}_5$ . Hot concd.  $\text{H}_2\text{SO}_4$  reacts with  $\text{HNO}_3$  to give yellow, granular, nonhygroscopic  $\text{I}_2\text{O}_5$  which heated above  $85^\circ$  forms  $\text{I}_2\text{O}_5$  (cf. Mun. C. A. 3, 1849). An intermediate product is an equimol. mixt. of  $\text{I}_2\text{O}_5$ ,  $\text{H}_2\text{SO}_4$  and  $\text{I}_2\text{O}_5$ ,  $\text{H}_2\text{SO}_4$  (cf. Millon, Ann. chim. phys. 12, 330, 345, 353 (1844); J. prakt. Chem. 34, 321 (1845)). Adding  $\text{I}_2$  to  $\text{HNO}_3$  in hot concd.  $\text{H}_2\text{SO}_4$  or heating  $\text{HNO}_3$  and  $\text{H}_2\text{SO}_4$  until  $\text{I}_2$  is evolved gives  $\text{I}_2\text{O}_5$ ,  $\text{H}_2\text{SO}_4$  with a small amt. of  $\text{I}_2\text{O}_5$ ,  $\text{H}_2\text{SO}_4$ .  $\text{I}_2\text{O}_5$ ,  $\text{H}_2\text{SO}_4$  (Christen, Compt. rend. 123, 814 (1906)) could not be produced. Ozonized  $\text{O}_2$  contg. 8-10%  $\text{O}_3$  gives yellow, granular, hygroscopic  $\text{I}_2\text{O}_5$  from  $\text{I}_2$  vapors. On heating above  $85^\circ$   $\text{I}_2\text{O}_5$  is formed. Foster Dee Saell.

Amorphous and crystallized oxide hydrates and oxides. The formation of orone by the oxidation of ferric hydroxides and ferric oxides. The existence of iron peroxide compounds. Alfons Krause, E. Kemnitz, F. Wyzniski and J. Sawicki. Ber. 68B, 1734-45 (1935); cf. C. A. 29, 7753.—The dependence of  $\text{O}_2$  evolution on concn. of the reactants in the system  $\text{K}_2\text{S}_2\text{O}_8$ - $\text{H}_2\text{SO}_4$  was studied. Under conditions where no  $\text{O}_2$  was evolved, addn. of ferric hydroxides or sulfate caused  $\text{O}_2$  evolution. Orthoferric hydroxide,  $\gamma\text{-FeO}(\text{OH})$ , and  $\alpha\text{-Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$  showed individual effects, depending on the strength of acid and their resp. rates of soln. Too slow soln. lowered rate of the  $\text{O}_2$  formation; too rapid soln. (high concn. in the soln.) caused decompn. of the  $\text{O}_2$ .  $\text{O}_2$  formation through a peroxide of the type,  $\text{Fe-O-O-SO}_3\text{H}$ , is suggested. L. E. Steiner.

Combinations of basic oxides and metalloids. M. Lemarchand and D. Samier. Bull. soc. chim. [5], 2, 1709-16 (1935).—See C. A. 29, 3249.

Bromine salts of trivalent bismuth. Madeleine Delapine-Tard. Ann. chim. [11], 4, 282-91 (1935).— $\text{Ir}(\text{OH})_3$  and  $\text{BiBr}_3$  when heated on a water bath yield  $\text{Ir}^{++}$  and  $\text{Br}_2$ . Upon evapn. a black mass results. Dissolve, filter and evap. again when the black or brownish bromide seps. easily. To  $\text{Ir}(\text{OH})_3$  add on excess of  $\text{HBr}$ , evap. and a black amorphous mass contg.  $\text{Ir}$  34.85 and  $\text{Br}$  57.0% results, which corresponds approx. to  $\text{IrBr}_3 \cdot \text{HBr} \cdot 2\text{H}_2\text{O}$ . This compd. was used in prep.  $\text{K}_3(\text{IrBr}_6) \cdot 4\text{H}_2\text{O}$ .  $\text{Ir}(\text{H}_2\text{O})_6\text{Br}_3 \cdot \text{H}_2\text{O}$  was prepd. by dissolving  $\text{IrBr}_3$  and  $2\text{KBr}$  in  $\text{H}_2\text{O}$ . Upon evapn.  $\text{HBr}$  is expelled and the salt is taken up with  $\text{H}_2\text{O}$ , filtered and when evapd. octahedral crystals are deposited. When pptd. by alc. needles are formed of compn.  $\text{H}_2\text{O}$  4.65%,  $\text{Ir}$  27.4,  $\text{KBr}$  33.6 and volatile  $\text{Br}$

33.5. To prep.  $\text{RbIrBr}_6 \cdot \text{H}_2\text{O}$  use a large excess of  $\text{RbBr}$ . 1 or  $\text{Ir}(\text{H}_2\text{O})_6\text{Br}_3$  pour a soln. of 5 g.  $\text{Na}_2(\text{IrBr}_6) \cdot 4\text{H}_2\text{O}$  into a soln. of 5 g.  $\text{RbBr}$  in 20 g.  $\text{H}_2\text{O}$  with const. stirring. A granular ppt. results after filtering and drying in the air, found  $\text{Ir}$  24.6%,  $\text{RbBr}$  21.8, volatile  $\text{Br}$  39.4.  $\text{Cs}_3(\text{IrBr}_6) \cdot \text{H}_2\text{O}$ ,  $\text{Cs}_2(\text{IrBr}_6) \cdot 2\text{H}_2\text{O}$ ,  $\text{Ag}_3(\text{IrBr}_6)$  and  $\text{Ag}_2(\text{IrBr}_6)$  were prepd. H. E. Messmore.

Preparation of cuprous chloride. Charles B. Dewitt. Chemist Analyst 24, No. 4, 15 (1935).—Mix 80 g. of powd.  $\text{CuO}$  and 64 g. of powd.  $\text{Cu}$  in a dry flask, add 200 cc. of concd.  $\text{HCl}$  while shaking constantly. If the solid salt is desired, use a slight excess of  $\text{CuO}$  and from this soln. ppt. the solid by adding 500 cc. of water. Allow to settle, decant off the mother liquor and wash the ppt. with glacial  $\text{AcOH}$  until free from  $\text{Cu}^{++}$  and then with alc. and finally ether. W. T. H.

Hydrates of monocalcium silicate. Jacques Lefol. Compt. rend. 201, 669-72 (1935).—Application to the ppt. formed by  $\text{CaCl}_2$  and  $\text{Na}_2$  silicate dried over  $\text{CaCl}_2$  (cf. compn. 1.2  $\text{CaO} \cdot \text{SiO}_2 \cdot 2\text{H}_2\text{O}$ , the 0.2 excess  $\text{CaO}$  being adsorbed) of the static method and that of dehydration at increasing temp. (cf. C. A. 28, 7229; 29, 10253) indicates the existence in addn. to that with 2.5  $\text{H}_2\text{O}$  of hydrates contg. 1 and 2  $\text{H}_2\text{O}$ . C. A. Silberrad.

The reaction between potassium permanganate and oxalic acid. O. M. Lidwell and R. P. Bell. J. Chem. Soc. 1935, 1503-5.—Contrary to Launer (C. A. 26, 452) the reaction rate at const.  $\text{pH}$  is essentially independent of the  $\text{Ca}^{++}$  concn. The presence of the complex  $(\text{Mn}(\text{C}_2\text{O}_4)_2)^{2-}$  is confirmed by the decompn. of  $\text{K}_2\text{Mn}(\text{C}_2\text{O}_4)_2 \cdot 2\text{H}_2\text{O}$  in acid solns. at a rate corresponding to the reaction of  $\text{KMnO}_4$  and  $\text{H}_2\text{C}_2\text{O}_4$  over ranges where reaction is slow. A neutral soln. of the salt is more stable than the  $\text{KMnO}_4 \cdot \text{H}_2\text{C}_2\text{O}_4$  mixt. and suggests that  $\text{H}^+$  is involved in the reaction which det. the rate of oxidation. F. D. S.

Electrometric and analytical evidence for the composition of precipitated basic copper perchlorate. Ralph A. Beebe and Seymour Goldwasser. J. Phys. Chem. 39, 1075-8 (1935); cf. C. A. 24, 3190; 26, 667.— $\text{Cu}(\text{ClO}_4)_2$  solms. were prepd. (A) from a soln. of  $\text{CuCl}_2$  by adding a slight excess of  $\text{BaCl}_2$ , centrifuging and adding a small weighed excess of  $\text{HClO}_4$  to prevent hydrolysis and (B) from  $\text{HClO}_4$  in excess with basic  $\text{CuCO}_3$ . When solns. 0.1 N or above were titrated electrometrically with a quinhydrone electrode, 1.74 mols. of carbonate-free  $\text{NaOH}$  was required for both direct and delayed titrations indicating the formation of a 1.6 basic salt,  $\text{Cu}(\text{ClO}_4)_2 \cdot 6\text{CuO} \cdot \text{H}_2\text{O}$ . This was confirmed by the analysis of the ppt. which showed a ratio of mols. of  $\text{Cu}$  to  $\text{ClO}_4^-$  to be 6.91. 2. No satisfactory theory for the structure of this salt has yet been advanced. Janet E. Austin.

Data on the system  $\text{BeSO}_4 \cdot \text{H}_2\text{O}$  and  $\text{ZnO} \cdot \text{H}_2\text{SO}_4$ . H. O. L. Schreiner and A. Sieverts. Z. anorg. allgem. Chem. 224, 167-72 (1935).—The binary system  $\text{BeSO}_4 \cdot \text{H}_2\text{O}$  and the ternary system  $\text{BeSO}_4 \cdot \text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$  were studied from  $-1^\circ$  to  $110^\circ$ . Methods of prep. and testing are given. The eutectic for  $\text{BeSO}_4 \cdot \text{H}_2\text{O}$  is at  $-18^\circ$  and

the solid phase is found as ice and the tetrahydrate. Isohexahydrate was observed under any conditions. Isotherms of the ternary system were made for 0°, 25°, 50° and 75° where up to 65%  $\text{H}_2\text{SO}_4$  the solid phase is the tetrahydrate while above 65% it is thought anhydrous  $\text{BeSO}_4$  exists.

Raymond H. Lambert

Formation of mix-crystals with tin monoxide. Erich Havel. *Monatsh.* 66, 197-200 (1935); cf. *C. A.* 27, 1838. — Mix-crystals of  $\text{SnO}$  with oxides of Pb, Mn, Fe, Zn and Ca were prepd by pptn from soln. The oxides of Co, Ni, Mg, Sr and Ba are not taken up by the  $\text{SnO}$  lattice. The colors produced by the mix-crystals are described. Those contg Cd, Fe and Mn were found to give x-ray powder-diagrams almost identical with those for pure  $\text{SnO}$ , whereas those contg Pb give a somewhat altered diagram, depending on the quantity of Pb. E. R. R.

Some substances analogous to graphite. IV. Riccardo Cusa and Francesco Bellino. *Gazz. chim. ital.* 65, 461-4 (1935), cf. *B. C. A.* 27, 241. — A better yield of tetraodofuran (I) than that by the method of prep. already described (*C. A.* 21, 2686) can be had by nitrating at 50-60° a mixt of aq pyromucic acid and  $\text{Hg}(\text{OAc})_2$  (4 mols) (acidified with  $\text{AcOH}$ ) until pptn is complete, treating the tetramercurofuran tetraacetate with  $\text{I}$  in aq KI, and purification of the pptn with  $\text{Me}_2\text{CO}$ . In 1 expt., the product crystd from  $\text{C}_6\text{H}_6$  gave a compd  $\text{C}_{10}\text{H}_8$ , i. e., the analysis of a tetraodofuran, which m 253°, and which on recrystn from  $\text{Me}_2\text{CO}$  was transformed into I. The decompn of I to a graphite was carried out by the method used in earlier expts. The product obtained at 300° was heated in N at higher temps. The following data give the temp., the percentages of C, of I, of ash and of O of the 6 products: 300°, 32.62, 56.60, 0.355, 10.37; 400°, 63.61, 7.88, 0.55, 28.06; 500°, 78.25, 0, 1.46, 20.39; 600°, 87.35, 0, 0.50, 12.15; 700°, 91.90, 0, 0.50, 7.54; 910°, 96.83, 0, 0.55, 2.60. The compn of the particular graphite (II) from heating at 500° approaches  $(\text{C}_6\text{O})_n$ . The O in the 910° product is probably still present in the bridge form. All the products have high adsorptive powers, e. g., whereas the adsorptive power of luran graphite (prepd at 500°) for  $\text{H}_2\text{Cl}_2$  is 11.5%, that of II is 283.62%.

C. C. Davis

The salts of  $\text{HSbF}_6$ . Willy Lange and Konstantin Ashtapoulos. *Z. anorg. allgem. Chem.* 223, 369-81 (1935). — Soln of  $\text{NaSbF}_6$  in  $\text{H}_2\text{O}$  at 20° is 128 g per l,  $d_4^{20} = 3.379$ ; easily sol in  $\text{CH}_3\text{OH}$ ,  $\text{C}_2\text{H}_5\text{OH}$ ,  $(\text{CH}_3)_2\text{CO}$ . It decomposes without melting. Soln of  $\text{KSbF}_6$  in  $\text{H}_2\text{O}$  at 20° is 1022 g per l,  $d_4^{20} = 3.34$ . It begins to sinter at 285° and decompose. Soln. of  $\text{NH}_4\text{SbF}_6$  in  $\text{H}_2\text{O}$  at 0° is 1187 g per l,  $d_4^{20} = 3.205$ . It sinters at 315° with decompn. Soln of  $\text{RbSbF}_6$  in  $\text{H}_2\text{O}$  at 18° is 502.5 g per l;  $d_4^{20} = 3.455$ . It sinters at 280° and m 340° without much decompn. Soln of  $(\text{CH}_3)_4\text{NSbF}_6$  in  $\text{H}_2\text{O}$  at 0° is 117.05 g per l,  $d_4^{20} = 2.078$ . It decomposes at about 356°. Solubilities in  $\text{H}_2\text{O}$ : diphenyl-4,4'-bis-diazonium-antimony hexafluoride,  $\text{C}_6\text{H}_5\text{N}_2\text{O}_2\text{SbF}_6$ , at 0° = 106.5 g/l; styrylbenzyl antimony hexafluoride,  $\text{C}_6\text{H}_5\text{N}_2\text{O}_2\text{SbF}_6$ ,  $\frac{1}{2}$   $\text{H}_2\text{O}$  at 28° = 5.125 g/l; bromantimony hexafluoride,  $\text{C}_6\text{H}_5\text{N}_2\text{O}_2\text{SbF}_6$ ,  $\frac{1}{2}$   $\text{H}_2\text{O}$  at 28° = 2.545 g/l; cocaine antimony hexafluoride,  $\text{C}_6\text{H}_5\text{N}_2\text{O}_2\text{SbF}_6$ , at 27° = 12.120 g per l,  $\text{C}_6\text{H}_5\text{N}_2\text{O}_2\text{SbF}_6$ ,  $\frac{1}{2}$   $\text{H}_2\text{O}$  decomposes at 256°.  $\text{C}_6\text{H}_5\text{N}_2\text{O}_2\text{SbF}_6$ ,  $\frac{1}{2}$   $\text{H}_2\text{O}$  at 253°:  $\text{C}_6\text{H}_5\text{N}_2\text{O}_2\text{SbF}_6$ , m 178.6° without decompn. Soln of  $\text{NaPF}_6$ ,  $\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$  at 0° is 1032 g per l of anhyd. salt;  $d_4^{20} = 2.269$ . The alkali salts in water produce an acid soln. due to hydrolysis while the P compds are stable. Equil-

The differences in properties of P hexafluorides and Sb hexafluorides due to difference in ion sizes are discussed.

Arthur A. Vernon

Magnetochemistry. II. Complex platinum compounds. J. A. Christiansen and R. W. Asmussen. *Kgl. Danske Vidensk. Selskab Math.-fys. Medd.* 13, No. 11, 16 pp (1935); cf. *C. A.* 28, 4950. — The Geopay app., previously used for the study of complex Rh compounds (cf

*C. A.* 28, 4950), was used to measure the susceptibilities of 23 complex org. Pt compds. contg. bivalent Pt as a central ion and 4 or 6 coordinated groups. The measurements indicate that, without exception, all of these compds. are diamagnetic, contrary to the predictions of Rose's rule. The implications of this in connection with Pauling's theory are discussed. The values for  $\chi$  lie in the range  $-0.472$  to  $-0.292 \times 10^{-6}$ . W. W. Stiller

The trichlorides of iridium. III. Agno dipyrindines. Marcel Delphine. *Ann. chim. [11]*, 4, 271-81 (1935). — See *C. A.* 29, 3033.

Bromodipyrindine derivatives of iridium. Madeleine Delphine-Jard. *Ann. chim. [11]*, 4, 292-300 (1935). — See *C. A.* 29, 3034.

The constitution, optical activity and photochemical behavior of platinum complexes. I. L. Lifschitz and W. Froentz. *Z. anorg. allgem. Chem.* 224, 173-93 (1935). —  $\beta$ -Dichlorobis(MeEt sulfide)Pt[(MeEtS)<sub>2</sub>](PtCl<sub>2</sub>), m. 127° (cf. *C. A.* 24, 5658). The  $\alpha$ -isomer is prepd. by heating the  $\beta$ -compd. to 130° for 30 min. and crystallizing from petr., either in the absence of light, pale orange needles, m. 63°.  $\alpha$ - and  $\beta$ -Dichlorobis-di-Et sulfide Pt, ClPt(EtS)<sub>2</sub>, also were prepd. (cf. *C. A.* 24, 2900).  $\alpha$ -S-Ethyl- $\alpha$ -thiolactic acid platinum, Pt(CH<sub>3</sub>CHSCOO)<sub>2</sub>, (I) is prepd. from MeCH(SiEt)<sub>2</sub>CO<sub>2</sub>H and K<sub>2</sub>PtCl<sub>6</sub> in a KOH soln. The greenish white compd., recrystd. from 1 alc-benzene soln., m. 208-9° (decompn). The  $\beta$ -form (II) is prepd. from the  $\alpha$ - on exposure to the quartz Hg lamp or better to direct sunlight in aq soln. The crystals are yellowish green, m. 184-9°.  $\alpha$ -Dichlorobis-S-ethyl- $\alpha$ -thiolactic acid platinum (III), m. 149-50°, crystallizes from a soln of I in cold 10-12 N HCl. The  $\beta$ -isomer (IV), m. 163-4°, is formed by heating I in 5 N HCl. The optically active isomers of I and II are prepd. in the same manner as the inactive salts, with care to avoid racemization. The active  $\alpha$ -compd., m. 205-6°. The  $\beta$ , obtained from the  $\alpha$ - by exposure to the quartz Hg arc, m. 180-2°. The optically active form of III m. 140-2°, that of IV m. 110-1°. The active forms readily undergo racemization and mutarotation. There probably occurs a hydration to [(H<sub>2</sub>O)Pt d-(ethylthiolactic acid)]<sub>2</sub> after splitting of the spiran type complex. The polarimetric behavior of  $\alpha$ - and  $\beta$ -forms is that of the Werner-Ramborg formula necessary for cis-trans compd. formation without the spiran structure. The results add weight to the validity of the Wardlaw hypothesis. R. H. L.

Complex compounds of cobalt, nickel and copper with amides and imides. Magneto-chemical studies. L. Cambi and Tremolada. *Gazz. chim. ital.* 65, 322-38 (1935). — The paper contains the exptl. part of a discussion of the magnetic behavior and constitution of complexes by C. (cf. *C. A.* 29, 6888), and deals with the various classes of Cu, Ni and Co complexes derived from amides and imides which give the buret reaction. The following data give the magnetic susceptibilities (at 294°) (abs.) in Weiss magnetons: Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 6H<sub>2</sub>O (I), 16.50; the compd. Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 2H<sub>2</sub>O (II), by dehydration of I at 105°, 15.45; the compd. Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 2C<sub>6</sub>H<sub>5</sub>N 2H<sub>2</sub>O (III), prepd. by letting II stand in C<sub>6</sub>H<sub>5</sub>N, 10.70; Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 3(H<sub>2</sub>NCH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub>) 2H<sub>2</sub>O (IV), 15.75; the compd. Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 3F<sub>2</sub>OH (V), from evapn *in vacuo* of aq-alc K pbthalimide and Ni(OAc)<sub>2</sub>, 16.60; the compd. Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 3(H<sub>2</sub>NCH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub>) 2H<sub>2</sub>O (VI), from V and  $\text{H}_2\text{NCH}_2\text{CH}_2\text{NH}_2$  in EtOH, violet, 18.20; [Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub>Cl<sub>2</sub> 2H<sub>2</sub>O (VII), 14.95; Ni acetoacetate, Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> (VIII), 17.1; Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 2MeNH<sub>2</sub> (IX), 2.40; Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 2FNH<sub>2</sub> 2H<sub>2</sub>O (X), 2.40; Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 2C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> (XI), 4.70; the compd. Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> C<sub>6</sub>H<sub>5</sub>N 4H<sub>2</sub>O (XII), from succinimide (XIII) and piperazine, 3.40; the compd. Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> C<sub>6</sub>H<sub>5</sub>N 2H<sub>2</sub>O (XIV), from XIII and putrescine, 3.70; the compd. Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> C<sub>6</sub>H<sub>5</sub>N 2H<sub>2</sub>O (XV), from XIII and cadaverine, 4.80; the compd. Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 2C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> 2H<sub>2</sub>O (XVI), from hydantoin, Ni(OAc)<sub>2</sub> and  $\text{iso C}_2\text{H}_5\text{NH}_2$ , yellow, 3.20; the compd. Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub> 2H<sub>2</sub>O (XVII), from decyandiamide (XVIII), 3.20; the compd. [Ni(C<sub>6</sub>H<sub>5</sub>O<sub>2</sub>N)<sub>2</sub>]K 4H<sub>2</sub>O (XIX), from alc. XIII, Ni(OAc)<sub>2</sub> and KOF<sub>5</sub>, yellow, hydrolyzes in water to I, 1.40; the

compd.  $[\text{Ni}(\text{C}_4\text{H}_7\text{O}_2\text{N})_2]_2\text{K}_212\text{H}_2\text{O}$  (XX), prepd. from 1 violet, D.R.; the compd.  $[\text{Cu}(\text{C}_4\text{H}_7\text{O}_2\text{N})_2]_2\text{K}_26\text{H}_2\text{O}$  (XXXIV), from oxamide,  $\text{CuCl}_2$  and  $\text{KOH}$ , rose-violet, 8.89; the compd.  $[\text{Cu}(\text{C}_4\text{H}_7\text{O}_2\text{N})_2]_2\text{K}_2$  (XXXV), from malonamide,  $\text{CuCl}_2$  and  $\text{KOH}$ , rose-violet, 10.00; the compd.  $[\text{Cu}(\text{C}_4\text{H}_7\text{O}_2\text{N})_2]_2\text{K}_21\text{H}_2\text{O}$  (XXXVI), from biuret,  $\text{CuCl}_2$  and  $\text{KOH}$ , 8.89; the compd.  $[\text{Cu}(\text{C}_4\text{H}_7\text{O}_2\text{N})_2]_212\text{H}_2\text{O}$  (XXXVII), from XVII, 8.90; the compd.  $[\text{Co}(\text{C}_4\text{H}_7\text{O}_2\text{N})_2]_2\text{K}_2$  (XXXVIII), from alc. barbitol,  $\text{Co}(\text{OAc})_2$  and  $\text{KOH}$ , violet, 23.00; the compd.  $[\text{Co}(\text{C}_4\text{H}_7\text{O}_2\text{N})_2]_2\text{K}_2$  (XXXIX), from phenobarbital,  $\text{Co}(\text{OAc})_2$  and  $\text{KOH}$ , violet-red, 22.40; the compd.  $[\text{Co}(\text{C}_4\text{H}_7\text{O}_2\text{N})_2]_2\text{K}_2$  (XL), from oxamide,  $\text{Co}(\text{OAc})_2$  and excess of  $\text{KOH}$  at high concn., bright red, 14.40 XXXVIII, XXXIX and XL are unstable, absorb moisture and decompose by oxidation. I, IV, VII, IX, X, XI and XIV were prepd. by Tschugacki (Ber. 39, 3181(1906)). Compds. similar to XIV and XV, but of indefinite compn. because of polymerization, were also prepd. by T. I to VIII and XXIX to XXXVII are paramagnetic, whereas IX to XII, XIV to XVII and XIX to XXVIII are diamagnetic. Based on the magnetic susceptibilities, the constitutions of the various complex compds., and the corresponding structures of the amides and imides from which they are formed, are discussed. C. C. D.

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

Polarographic methods in analytical chemistry. I Theoretical introduction. H. J. Antweiler. *Z. anal. Chem.* 102, 385-403(1955). cf. Heyrovsky, C. A. 19, 2797, 26, 3444; Kemula, C. A. 26, 9, Majer, C. A. 27, 2902.

W. T. II

The sulfur content of illuminating gas as a source of error in analytical work. A. Levin. *Z. anal. Chem.* 102, 412-18(1955).—Analytical data are given which show that ppts. of  $\text{CaO}$ ,  $\text{MgO}$ ,  $\text{Mg}_2\text{O}_3$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{NiO}$ ,  $\text{CuO}$ ,  $\text{ZnO}$  and  $\text{KCl}$  often weigh too much after ignition because of the S present in the gas used for heating.

W. T. II

Little-known qualitative inorganic reactions. Lucjan Szanajder. *Przemysł Chem.* 19, 13-18(1955).—Unfamiliar qual. reactions are given for Ag, Pb, Bi, Cu, As, Sb, Sn, Zn, Mn, Cr,  $\text{I}^{++}$ ,  $\text{Ni}^{++}$ ,  $\text{Co}^{++}$ , Al, Ca, Mg, Na,  $\text{SO}_4^{--}$ ,  $\text{SO}_3^{--}$ ,  $\text{BO}_3^{--}$ ,  $\text{I}^-$ ,  $\text{CN}^-$ ,  $\text{CNS}^-$ . References are given to original articles in the literature. A. C. Zachlin.

Chemical analysis by hydrogenation. II ter Meulen. *Bull. soc. chim.* [5], 2, 1692-4(1955).—Gauthier (C. A. 29, 3627) has studied some of the methods of ter Meulen (C. A. 25, 5875; 28, 2619) who now makes crit. comments on the work.

W. T. II

Quantitative analysis of solutions by spectrographic means. O. S. Dufendach, I. H. Wiley and J. S. Owens. *Anal. Eng. Chem., Anal. Ed.* 7, 410-13(1955).—An uncondensed spark is passed between a suitably chosen solid electrode and the soln. to be analyzed. The resulting spectrum is photographed and from measurements of the relative intensities of certain spectral lines, the analysis is made. Na, K, Mg and Ca have been detd. in this way in concns. corresponding to their occurrence in human urine. The results are within about 2% of the truth.

W. T. II

Improvements in methods of dealing with small quantities of liquids and precipitates. Beverly L. Clarke and H. W. Hermance. *Mikrochimie* 18, 289-93(1955).—Convenient capillary siphon pipets, a steam-jacketed capsule for evapn., the use of closed tubes for pptn. with  $\text{H}_2\text{S}$ , use of  $\text{AcSH}$  in place of  $\text{H}_2\text{S}$ , and a micro-dig. app., are described and illustrated. These improvements result from work in the Bell Telephone Labs. in N. Y.

W. T. II

Notes on the Pregl method of microanalysis. Josef Unteraucher. *Mikrochimie* 18, 312-15(1955).—The manipulation before every analysis of a hydrocarbon is amplified by introducing a glass stopcock in the tubing that leads to the Mariotte bottle. After releasing the pressure from Canus tubes in the usual way, all danger of contam-

nating the contents with glass splinters is avoided by sealing the tubes again and then heating with a 2-3 cm. long blast flame in such a way that the tube can be bent back and opened just below the constricted part. W. T. II.

Microchemical notes. XII. I. Rosenthaler. *Mikrochimie* 19, 17-22(1955). cf. C. A. 28, 6345.—Under the microscope the more rapid reaction of red  $\text{HgO}$  as compared with yellow  $\text{HgO}$  can be shown with  $\text{NH}_3$ ,  $\text{NaHSO}_4$  or  $\text{KH}_2\text{SO}_4$ . Typical crystals of vanillin compds. can be obtained with  $\text{Na}(\text{OH})$ ,  $\text{Ca}(\text{OH})_2$ ,  $\text{Ib}(\text{OAc})_2$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{NaOH}$ ,  $\text{NaOH}$  in  $\text{MeOH}$ , Zwickler's pyridine-Cu reagent, acid added to the alk. soln., and  $\text{Hr} + \text{HBr}$ . Many phenols, such as phenol itself, *o*-cresol, *m*-cresol, *p*-cresol, vanillin, thymol, guaiacol, *o*-naphthol, *p*-naphthol, pyrocatechol, resorcinol, hydroquinone, orcinol, phloroglucinol and pyrogallol, as well as apomorphine and acetoacetic ester, give characteristic ppts. with *p*-diazotraniline. Phloroglucinol and pyrocatechol, in addn. to those mentioned in a previous paper, also give cryst. ppts. with Zwickler's Cu-pyridine reagent. Protosulfon, the trivial name for 2',4'-diamino-4-azobenzene-sulfonamide, gives characteristic crystals with the K salt of tetranitro-diamino-Co, *o*-anthraquinonesulfonic acid,  $\text{AgNO}_3$ ,  $\text{Hg}(\text{NO}_3)_2$  and  $\text{Cu}(\text{OAc})_2$ .

W. T. II

New procedures for carrying out electrolytic spot tests. H. Fritz. *Mikrochimie* 19, 6-10(1955). cf. C. A. 24, 310.—A theoretical discussion of some possibilities with or without an outside source of elec. current, and with stationary or rotating electrodes.

W. T. II

Notes on the J. Lawrence Smith fusion. Mark O. Lamar, Wallace Al. Jazez and Wm. J. O'Leary. *Anal. Eng. Chem., Anal. Ed.* 7, 429-31(1955).—Difficulties in getting accurate results in the detn. of Na and K are likely to result from insufficient grinding of the sample, incomplete mixing with the  $\text{CaCO}_3$  used, use of too low an ignition temp. and failure to correct for the small Mg content of the  $\text{NaCl} + \text{KCl}$  obtained.

W. T. II

Use of cupferron in spectral analysis. Oskar Baudisch. *Archiv. Chem. Mineral. Geol.* 12B, No. 8, 6 pp.(1955).—In spectral analysis it is often desirable to obtain spectra free from the Fe lines. To remove Fe from samples such as, e. g., a mineral water, it is advantageous to add  $\text{HCl}$  and cupferron reagent. Cu is removed at the same time.

W. T. II

pn indicators. Chrs. I. Mullin. *Textile Colorist* 57, 518-20, 589-92, 604-70(1955).—A rather complete alphabetical compilation, with cross indexing of dyestuffs used in colorimetric pn detns., with Colour Index and Schultze nos., common and chem. names, formula, color and form,

$pH$  range, color changes, soly., prepn. of indicator solns., concn. generally recommended in  $pH$  detns. and titrations, comments, recommendations and suggestions, and references, where possible. It is of interest to dyers as indicating the  $pH$  of possible color change of dyed goods.

Chas. L. Mullin

Theory of neutralization indicators. Maria Mercedes Rodriguez Rego. *Anales asoc. quim. form. Uruguay* 38, 3-36(1935).—A general review. C. E. P. Jeffreys.

The use of styryl dyestuffs in qualitative microanalysis. P. Krumholz and E. Krumholz. *Mikrochemie* 19, 47-54(1935).—Heterocyclic bases which contain a  $CH_2$  group in the  $\alpha$ -position to the trivalent N atom can condense with aromatic aldehydes to form styryl derivatives. The condensation products thus formed are yellow but yield red or violet salts as a result of tautomerism. If such a styryl dyestuff forms a difficultly sol. double salt with a heavy metal halide, the dyestuff will behave as a univalent base and yield red salts even when formed in a yellow soln. In this way very sensitive tests can be made for Ag, Au, Pd, Pt, Cu, Hg, Sn, Cd, Co, Fe, Bi and Mn.

W. T. H.

Dipicrylamine as a micro-reagent for potassium, rubidium and cesium. C. J. van Nieuwenburg and T. van der Hoeft. *Mikrochemie* 18, 175-8(1935).—Poluektov, C. A. 28, 2642<sup>1</sup>, has advocated the use of dipicrylamine in  $Na_2CO_3$  soln. as a spot test for K. The reagent is equally useful for the identification of K, Rb and Cs under the microscope, as the crystals produced by the reagent are characteristic.

W. T. H.

New macro- and micro gravimetric method for determining copper. G. Spacu and C. G. Macrovici. *Z. anal. Chem.* 102, 350-2(1935).—In previous papers (C. A. 17, 1772, 18, 2300, 19, 3444) it has been shown that sensitive tests for Cu<sup>++</sup> can be made by forming deep blue, flocculent ppt. such as  $[CuZd(SCN)_3]$ ,  $[CuBzId]$  and  $[CuTid(SCN)_3]$ , which are complex compounds similar to the ammoniates and in these formulas Bzd and Tid represent ppt. benzidine and toldine. Since the pptn. is quant the ppt. can be filtered off, ignited to  $CuO$  and weighed. To the aq. soln. of Cu salt contg. not more than 10 mg. of Cu in 50-75 cc. of water, add 40-50 cc. of 1%  $NH_4CNS$  soln. and follow this with 10-20 cc. of a 2% soln. of either benzidine or toldine in alc. The thiocyanate should correspond to 4-5 times the theoretical value but the benzidine should be used in only slight excess. Filter off the blue ppt., wash thoroughly with water, dry, ignite and weigh the residual  $CuO$ . The results are excellent. For the micro-dtn. of approx. 5 mg. of Cu, add 20-25 cc. of the thiocyanate to 20-25 cc. of soln. and use only 4-6 cc. of the benzidine soln. After filtering, the color of the filtrate will darken as a result of oxidation, but this does no harm.

W. T. H.

Application of controlled potential to microchemical electrolytic analysis. A. J. Lindsey and H. J. S. Sand. *Analyst* 60, 739-44(1935).—The micromethod described in this paper is not only suitable for detg. Ca, Ag, Cd, Hg, Pb, Ni and Co but also for sepr. Bi from Pb and Cu from Sn and other metals, thus cannot be accomplished with the electrodes recommended by Pregl and without control of the cathode potential. Suitable app. is shown in a series of 5 drawings and the method of working is described. The inner, or working, electrode is the ordinary Pregl cathode with the beads removed. Instead of a central wire anode, as recommended by P., the anode is the outside electrode and is made of thin gauze. By using this large electrode, it is possible to keep the  $p.d.$  due to ohmic resistance in the electrolyte small and if suitable depolarizers are used it is possible to maintain the variation of anode potential within narrow limits.

W. T. H.

The micro-electrolytic determination of bismuth and lead and their separation by graded potential. A. J. Lindsey. *Analyst* 60, 744-6(1935).—*Detn. of Bi*.—To the soln. contg. not more than 6 mg. of Bi, add 1 ml. of concd.  $HNO_3$ , 2 drops of 50% hydrazine hydrate soln. and sufficient water to make 12 ml. Heat to 60-70° and electrolyze in the app. described in the preceding abstr. with

a  $p.d.$  between the electrodes of 0.8 v. while stirring with  $N_2$ . The current falls during the electrolysis from 80 to about 10 milliamperes. After 10 min. wash down the tube with a fine jet of water and increase the  $p.d.$  to 0.9 v. After 3 more min., cool, rapidly replace the electrolysis tube with a shorter tube contg. water, dip the electrodes in alc. and finally in ether, and dry 1 min. *To det. Pb*.—Add, to the soln. contg. not over 6 mg. of Pb, 2 ml. of concd.  $HNO_3$  and dil. to 12 ml. Heat nearly to boiling with a microburner and maintain this temp. during the entire electrolysis while stirring with  $N_2$ . Use a  $p.d.$  between the electrodes of 1.0 v. but this is not crit. and higher potentials can be used. After 7 min. wash down the sides of the vessel and in another 3 min. terminate the electrolysis as described above, the results are about 0.02 mg. high with 4 mg. of Pb. *To sep. Pb and Bi*.—Add to the soln. contg. not more than 6 mg. of either metal, 1 ml. of concd.  $HNO_3$ , 2 drops of 50% hydrazine hydrate soln. and water to make about 12 ml. Electrolyze at 60-70°, with  $N_2$  stirring and an anode-cathode potential of 0.8 v. After 10 min., when the current will have fallen from 70 to 10 milliamperes, wash down the sides of the tube and electrolyze another 2 min. with a  $p.d.$  of 0.9 v. Remove and weigh each electrode as described above.

W. T. H.

Determination of aluminum in nickel-chromium and nickel chromium-iron alloys. A survey of available methods. Fred P. Peters. *Chemist Analyst* 24, No. 4, 4-10(1935).—The removal of Fe, Ni, Co, Cr, Cu, etc., by electrolysis with a cathode of Hg is recommended. When this is not convenient, the use of cupferron is recommended to ppt. Fe and heating with  $HClO_4$  in oxidize  $Cr^{+++}$ .

W. T. H.

Determination of small quantities of antimony in zinc alloys. Frank W. Scott. *Chemist Analyst* 24, No. 4, 16-17(1935).—To 5 g. of spelter add 50 ml. of  $Br_2$  water and, very slowly, 10 ml. of concd.  $HNO_3$ . Next add 50 ml. of concd.  $HCl$  and boil the resulting soln. until it becomes sirupy. Neutralize with concd.  $KOH$  until  $Zn(OH)_2$  ppt. Add 20 ml. of concd.  $HCl$  and sat. with  $H_2S$ . Wash the ppt. formed with 1.2 N  $HCl$  which is satd. with  $H_2S$ . Dissolve the ppt. in 50 cc. of concd.  $HCl$  + a little  $KClO_4$ . Evap. to 10 ml. after filtering. Add 50 ml. of 10% tartaric acid soln. and add the mixt. slowly to 150 ml. of a soln. contg. 60 g.  $Na_2S$  and 40 g.  $NaOH$  per l. Filter and wash with very dil.  $Na_2S$  soln. Make the filtrate slightly acid with  $HCl$  and again sat. with  $H_2S$ . Filter off the sulfides of As, Sb and Sn and wash with 1.2 N  $HCl$  which is satd. with  $H_2S$ . Treat the filter and ppt. with concd.  $HCl$  and  $KClO_4$ , dil. to 100 ml. and filter, wash the residue well. Evap. to 50 cc. add 2 g.  $K_2F$  and evap. to 25 ml. to volatilize  $AsCl_3$ . Neutralize with  $KOH$ , add 1 g. of tartaric acid (at least 20 times the wt. of Sb present) and oxidize with  $H_2O_2$  (10 ml. of 3% soln. is usually sufficient). Boil to decompose or expel the greater part of the excess peroxide, cool slightly and add 2.5 g. of oxalic acid crystals. Boil 10 min. to remove  $CO_2$ , dil. to 100 ml. and sat. with  $H_2S$ . After 15 min. dil. to 250 ml. with boiling hot water and introduce  $H_2S$  for another 15 min. Filter through a filtering crucible, wash with 1.2 N water, alc.,  $CS_2$  and alc., dry at 105° and weigh as  $Sb_2S_3$  (cf. F. W. Clarke, *Chem. News* 21, 124, 1. Henz, *Z. anorg. Chem.* 37, 18).

W. T. H.

Direct titration of barium salts with potassium chromate in the presence of rosolic acid as indicator. Application of the method to the analysis of sulfates and in particular to the determination of sulfur in pyrite and in alga. A. V. Vinogradov. *Ann. chim. anal. chim. appl.* 17, 285-88(1935); cf. C. A. 28, 4333<sup>1</sup>, 4334<sup>1</sup>.

W. T. H.

Microdetermination of bismuth as bismuthyl iodide. Friedrich Hecht and Richard Reinher. *Z. anal. Chem.* 103, 253 8(1935).—Sirehinger and Zins, C. A. 22, 12<sup>19</sup>, 1926, described a micro-method for detg. Bi as  $BiOI$ . The method has been studied anew and some slight modifications were suggested. To the  $H_2(NO_3)_2$  soln. contg. not more than 0.01 g. of  $HNO_3$  add 0.1 N  $K_2I$  soln. dropwise until the soln. above the black  $BiI_3$  shows a yellowish tint. Dil. with water to 8 cc. and heat for a few min. on

the boiling water bath to about 70°. The ppt. will change to light red, lustrous BiOI. Add 0.25 cc. more of the KI soln. for each 0.5 mg. of Bi present and a drop of methyl red indicator soln. Add 1% NH<sub>4</sub> soln. until the indicator begins to change from red to yellow. Heat 1–2 min on the gently boiling water bath, allow the ppt to settle, filter through sintered glass, wash 3 times with hot water, dry at 105° and weigh. The results are not very accurate.

#### W. T. H.

**Determination of small amounts of boron by means of quinalizarin.** G. Stanley Smith. *Analyst* 60, 735–39 (1935).—Feigl and Krumholz (C. A. 24, 2400) made use of the fact that quinalizarin, as well as other hydroxyanthraquinones, yields highly colored solns in concd. H<sub>2</sub>SO<sub>4</sub> and on the addn of H<sub>2</sub>BO<sub>3</sub> a marked change in color takes place which can be used for identification purposes. About 0.002% of B can be detected by means of a soln. of quinalizarin in 93% H<sub>2</sub>SO<sub>4</sub>. Suitable concns of H<sub>2</sub>SO<sub>4</sub> for the colorimetric detn. are obtained by dilg 9 vols and 4 vols, resp., of concd. H<sub>2</sub>SO<sub>4</sub> with 1 vol of water. The latter soln. is much less sensitive but is better for detg. larger quantities of B. The reagent is prepd. by dissolving 10 mg. of quinalizarin in 100 ml of H<sub>2</sub>SO<sub>4</sub> (9.1). Suitable standards are obtained from a soln. obtained by dissolving 5 mg. of H<sub>2</sub>BO<sub>3</sub> per l. of H<sub>2</sub>SO<sub>4</sub> of the above concn. The method can be used for detg. 0.005 to 0.25 mg. of H<sub>2</sub>BO<sub>3</sub>. To det. B in Al-Si alloys, treat 0.5 g. of sample with 20 ml. of 10% NaOH in a large N. crucible. After the initial attack subsides, evaporate nearly to dryness, add 20 ml. of water, boil and pour the resulting soln. into 30 ml. of 60% H<sub>2</sub>SO<sub>4</sub>. Make up to exactly 100 ml. Place 1 ml. of this soln. and of the standard in sep. small comparison tubes, add 8 ml. of concd. H<sub>2</sub>SO<sub>4</sub>, mix, cool and add 0.5 ml. of 0.01% alizarin soln. Compare the colors.

#### W. T. H.

**The oxalates of calcium, strontium and magnesium.** J. Haslam. *Analyst* 60, 668–72 (1935).—Goy (C. A. 8, 478) showed that CaC<sub>2</sub>O<sub>4</sub>·H<sub>2</sub>O is formed from boiling solns and can be dried at 100–105°. Dick (C. A. 23, 4634) recommended drying by washing the ppt. with a.c. and ether but Moser and von Zombrö (C. A. 24, 4725) obtained results 1.6–3% too high by D's method. The expts. here described show that there is a slight pos. error but only in the neighborhood of 1 part in 1000. They recommend, however, titrating the ppt. with KMnO<sub>4</sub>. Expts. with oxalates of Sr, Ba and Mg show that they are not well suited for the accurate detn. of Sr, Ba or Mg but when these ions are present, they are likely to cause error in the Ca detn.

#### W. T. H.

**Microdetermination of cadmium with 8-hydroxyquinoline.** F. Wenger, Ch. Cimerman and M. Wyszewianska. *Mikrochemie* 16, 182–4 (1935).—To 2 cc. of neutral or faintly acidic soln. contg. 1–3 mg. of Cd in a micro beaker, add 1 drop of Merck's universal indicator, 1 drop of 3% Na<sub>2</sub>CO<sub>3</sub> soln. and 2–3 drops of 3% AcOH to dissolve any ppt. produced by the soda. Add 6–10 drops of 40% NaOAc soln. to make the indicator show pH = 6–7. Heat the buffered soln. to about 90° and introduce dropwise 3 times the theoretical quantity of 2% oxine soln., in a.c. Stir, heat to boiling and allow the ppt. to settle during 15 min. Filter, wash with hot water and with two 1-cc. portions of cold water. Dry at 120–130° and weigh. Of the 6 analyses reported the greatest error was 0.007 mg. Cd with a sample contg. 1.5 mg.

#### W. T. H.

**Application of the spectrograph to the determination of carbon in steel.** F. H. Emery and Harold S. Booth. *Ind. Eng. Chem., Anal. Ed.* 7, 419–21 (1935).—The aperiodic spark does not have sufficient potential to show small or large variations in the C content of steel. The nonmetallic constituents can be detd. spectrographically by the exploded wire, the vacuum spark or by the elec. furnace arc method.

#### W. T. H.

**Direct, simultaneous microdetermination of carbon, hydrogen and oxygen.** II. Analysis of pure compounds containing carbon, hydrogen, oxygen and sulfur. W. R. Kurner. *Ind. Eng. Chem., Anal. Ed.* 7, 363 (1935); cf. C. A. 28, 6394<sup>1</sup>.—The purpose of this investigation was to extend the procedure for the simultaneous detn. of C,

H and O to compds. which also contain S, to det. the ultimate fate of S present in different kinds of compds., and to study the mechanism of the reaction between oxides of S and the various absorbents which are present in the combustion tube filling. It was found that SO<sub>2</sub> or SO<sub>3</sub> is the primary product of the combustion and it is almost entirely the latter that is present in the final combustion product. The SO<sub>3</sub> is absorbed by the metallic Ag placed in the tube and retained as Ag<sub>2</sub>SO<sub>4</sub>. III. Analysis of pure compounds containing carbon, hydrogen, oxygen and nitrogen. *Ibid.* 366–8.—As a result of numerous expts. the hypothesis is advanced that in the thermal decomposition of substances contg. N, simple products are first formed which are eventually converted into only N<sub>2</sub> and NO<sub>2</sub>. The ratio formed appears to be a function of the manner in which the N is linked in the original org. compd. For amines and amides the ratio of N<sub>2</sub>:NO<sub>2</sub> = 74:26, for nitriles, nitro and heterocyclic N compds. the ratio is 41:59. The O values obtained by the method described are within 0.3% of the truth and the errors are largely a result of errors in the detn. of H and C.

#### W. T. H.

**Modified method for the determination of cobalt by the use of α-nitroso-β-naphthol.** Archibald Craig and Louis Cudroff. *Chemist Analyst* 24, No. 4, 10–14 (1935).—Evaporate the combined filtrates from 2 basic acetate pptns. of Fe<sup>+++</sup> to 200 cc., add 5 cc. of concd. HCl and 50 cc. of glacial AcOH. Heat nearly to boiling and add gradually 300 cc. of hot reagent (75 cc. of 50% AcOH for each g. of solid reagent) for not over 0.1 g. of Co. Keep hot for 2 hrs., filter, wash 10 times with 12% HCl and 10 times with hot water, dry and ignite to Co<sub>2</sub>O<sub>3</sub>, the results are satisfactory.

#### W. T. H.

**Spectrophotometric determination of copper in ores and mattes.** J. P. Mehlis. *Ind. Eng. Chem., Anal. Ed.* 7, 387–9 (1935).—The spectrophotometric method for detg. Cu which depends upon the measurement by a spectrophotometer of the transmittancy of light of a given wavelength through an ammoniacal soln. of Cu does not require a series of color standards, eliminates the matching of color shades by the eye and gives results which are more dependable than those obtained by the conventional colorimetric procedure. The use of a light filter or color screen is not necessary. It is claimed that the results obtained are just as good as those obtained by the iodide method and the procedure is quicker and easier.

#### W. T. H.

**Determination of gold with the aid of carbon monoxide.** Rodica N. Costeanu. *Z. anal. Chem.* 102, 336–8 (1935).—By the action of concd. H<sub>2</sub>SO<sub>4</sub> on HCO<sub>2</sub>H, CO is produced. The gas is passed through a tube contg. glass beads covered with P<sub>2</sub>O<sub>5</sub> and then comes in contact with 4 strips of filter paper which have been moistened with H<sub>2</sub>AuCl<sub>4</sub> solns. of known Au content and with 4 other strips of filter paper which have been moistened with a soln. prepd. by dissolving the sample in aqua regia. The excess CO as it leaves the app. is absorbed in ammoniacal CuCl<sub>2</sub> soln. By comparison of the color of the deposited Au with that of the standards, the colorimetric estn. is made.

#### W. T. H.

**Volumetric method for the estimation of lead.** Sachindra Nath Roy. *J. Indian Chem. Soc.* 12, 584–5 (1935).—Nearly neutral solns. contg. 0.2–2.0 g. of dissolved Pb can be detd. with an accuracy of about 0.5% by titrating with standard K<sub>2</sub>SO<sub>4</sub> with fluorescein as an external indicator.

#### W. T. H.

**Rapid electrometric method for determining manganese in tungsten steel.** N. Ya. Khlopov. *Z. anal. Chem.* 102, 263–70 (1935); cf. C. A. 29, 2473<sup>1</sup>.—To 0.2 g. of steel in a 400-cc. beaker add 3 cc. of water, and 25 cc. of 9 N H<sub>2</sub>SO<sub>4</sub>. Heat to start the chem. reaction. After the first, stormy evolution of gas has ceased, add 5–7 drops of 6 N HNO<sub>3</sub> and later, when the steel has all dissolved, add more HNO<sub>3</sub> and heat until the dark brown color of the soln. becomes yellowish. Boil to expel nitrous fumes, add 40 cc. of hot water and 10 cc. of 1.7% AgNO<sub>3</sub>. Pay no attention to a turbidity of WO<sub>3</sub>. Now add 3 cc. of 33% (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> soln. and allow to stand in a warm place (not over 60°) until the color of the soln. shows that some MnO<sub>2</sub> has been formed (about 5 min.). Cool to room temp., wash down the sides of the beaker and dil. to 200

cc. Add 3 cc. of 5% NaCl soln. to reduce  $MnO_4^-$  and at once proceed to the electrometric titration with arsenite soln. As electrodes Pt/W or Pt/Carborundum (graphite) proved satisfactory. With a little experience the end point is easy to find and the method is said to be more rapid than any electrometric method for detg Mn hitherto proposed. Data are given to show that the accuracy is satisfactory.

W. T. II  
Bismuthate method for manganese. II. Bartholow Park Ind Eng Chem, Anal Ed 7, 427 (1935); cf. C. A. 20, 2471 and Kolthoff, C. A. 29, 5770P.—If, after filtering off the excess  $NaBiO_3$ , a measured excess of Na arsenite soln. contg 3 drops of 0.01 M  $OsO_4$  is added, the  $MnO_4^-$  will be reduced quantitatively to  $Mn^{++}$  and in the titration with  $KMnO_4$  to an electrometric end point the same quant. reduction of the  $MnO_4^-$  takes place.

W. T. II  
Colorimetric determination of manganese in the presence of titanium. Geo J. Hough Ind Eng Chem, Anal Ed 7, 408-9 (1935).—When Mn is detd colorimetrically in soils or rocks the persulfate method is unsatisfactory. When 0.05% of Mn is present and 2-12% Ti, often no  $MnO_4^-$  color is obtained unless considerable persulfate and Ag soln. is present and even then the color develops slowly.  $KIO_4$  or  $NaBiO_3$  should be used as oxidizing agent. Attempts to remove Ti by evapn with  $HCl$  were futile.

W. T. II  
Colorimetric determination of molybdenum. Loren C. Hurd and Harry O. Allen Ind Eng Chem, Anal Ed 7, 396-8 (1935).—In the colorimetric detn of Mo, the  $HCl$  concn should be about 5.0%, the  $KCN$  about 0.6% and the  $NaCl$  above 0.1% by wt. Under some conditions  $H_2SO_4$  has an appreciable effect upon the color. The colored compd should be extd with ether 5 min after adding the reagents. Cyclohexanol can be used in place of ether but Bu acetate is not as suitable.

W. T. II  
Rapid determination of nickel and chromium in presence of manganese in ferrous alloys containing more than 1% carbon. Tadeusz Ciechocki Przemysl Chem 19, 1-2 (1935).—The sample is dissolved in  $HClO_4$  and the resulting  $Cr_2O_7^{--}$  titrated with a soln. of Mohr's salt with diphenylamine in concd  $H_2SO_4$  as indicator. Another sample is dissolved in the same way and the Ni detd. with dimethylglyoxime.

A. C. Zachin  
Microanalytical determination of certain metals of the platinum group in simple and complex salts. Julius Meyer and Karl Hoehne Mikrochemie 19, 64-71 (1935), cf. C. A. 29, 2471P. By igniting complex salts, such as phenylpyridine-hexachloroplatinate, in the Pregl microbalance the residual Pt weighed almost exactly the theoretical value, 17-30 mg. of complex salt and 4-8 mg. of Pt were obtained. Loss of Pt, as found by Pregl, only occurred when insufficient  $H_2$  to form  $HCl$  was present. Similar treatment of Rh compds. gave high results unless the final product was heated in  $H_2$ . Contrary to the experience of Palmer (Z anorg Chem 10, 321 (1895); 13, 211 (1897)) who worked with larger quantities of material, heating in  $H_2$  gave a metal which could be weighed in the air with satisfactory accuracy. With Ru it was found necessary to heat in  $H_2$  and cool in  $CO_2$  to get the proper wt. of pure metal. With Os compds. there was always some loss of Os by volatilization. Pd salts are decompd. and reduced by  $H_2$  even in the cold. By heating in  $H_2$  and cooling in  $CO_2$ , correct results can be obtained. With halides of Au there is always some loss by volatilization.

W. T. II  
Determination of small quantities of selenium in sulfur. Geo G. Marvin and Walter C. Schumb Ind Eng Chem, Anal Ed 7, 423-5 (1935).—From 10 to 20 g. of the sample is burned in a current of  $O_2$  and the Se removed from the products of combustion by a plug of asbestos in the front end of the combustion tube. The asbestos pad is treated with  $HNO_3$  to dissolve the Se and any Fe present is removed after pptn with  $NH_4OH$ . The filtrate is made acid with  $HNO_3$ , any  $HNO_3$  present removed by adding urea, the selenium acid is reduced with KI and the liberated  $I_2$  titrated with  $Na_2S_2O_4$ . As little as 0.001% of Se can be detd. by this method.

W. T. II  
Electrolytic determination of silver. A. Friedrich and

S. Rapoport. Mikrochemie 18, 227-34 (1935).—The electrolysis takes place in a total vol. of about 7 cc. to which a little concd.  $H_2SO_4$  and 1 cc. of 20% tartaric acid have been added. If an ag soln. is to be analyzed, the addn. of a few drops of the acid is sufficient but if a wet oxidation has been accomplished, the acid soln. should be reduced to less than 1 cc. At the start, the p.d. between the terminals is 1.3-1.4 v. but after 15 min. it is increased to 1.8 v. and kept so for half an hr. Before breaking the circuit, it is necessary to replace the electrolyte with water. In detg. up to 3.6 mg. of Ag the largest error was 0.003 mg.

W. T. II  
Electrometric determination of thallium. Winifred R. A. Hollens and James F. Spencer. Analyst 60, 672-6 (1935).—The method proposed consists in converting the  $Tl$  to the trivalent state, adding KI to the acid soln. and titrating the liberated  $I_2$  with either arsenite or thiosulfate soln. The end point can be detd. satisfactorily by means of the electrode system recommended by Pouik and Bawden (C. A. 20, 3144). Both reducing agents give reproducible end points down to 0.002 N solns. Presence of Zn and Fe does no harm but Cu behaves like  $Tl$ .

W. T. II  
Analysis of tin plate. Walmet and Mathieu Ann chim anal chim appl. 17, 280 (1935).—Instead of stripping off the plate, dissolving in acid and analyzing the resulting soln. for Sn and Pb it is recommended to take a piece of the metal as anode, suspend it in 12% NaOH soln. and electrolyze at 75° with a Cu wire as cathode. After the electrolysis, the cathode is dissolved in  $HNO_3$  and in a second electrolysis the Pb is deposited in the usual way upon a Pt anode as  $PbO_2$  and the electrolyte is filtered, leaving residual  $SnO_2$  which can be weighed.

W. T. II  
The use of induced precipitation for the detection of small quantities of titanium and zirconium. F. Fegi and E. Rajmann Mikrochemie 19, 60-63 (1935).—A very dil. Ti or Zr soln. (1:50,000) will give no ppt. with  $H_2AsO_4$  but if the other element is present pptn. occurs even in extreme dilns. such that other reagents fail to give the typical tests. Thus to test for Ti, take 10 cc. of the soln. which is about N in  $HCl$  and add a drop of 1% Zr soln. and 10 drops of 20%  $H_2AsO_4$  soln. Remove the ppt. with the aid of the centrifuge and wash until all colored ions are removed. Take a little of the ppt., add a drop of concd.  $H_2SO_4$  and dissolve by heating in a bath of boiling water. Cool and add a drop of  $H_2O_2$ ; a yellow color will be obtained if 1% of Ti is present. Similarly to test for Zr, take 10 cc. of the soln. which is about 2 N in  $HCl$ , add 12 drops of acid, 4% Ti soln. and 1 cc. of  $H_2AsO_4$  soln., boil 1-2 min., filter and wash with the aid of the centrifuge. Moisten the centrifuge with 1 drop of a mixt. of 10 parts concd.  $H_2SO_4$ , 1 part 30%  $H_2O_2$  and 10 parts water and dissolve by heating. Test the soln. for Zr with alkyl azoarsenic acid test paper. In this way 1.25-γ of Zr can be detected in 10 cc. of soln.; in other words the diln. is  $1.8 \times 10^4$ . With  $H_2AsO_4$ , Zr alone gives a barely visible ppt. at a diln. of  $1:10^4$ .

W. T. II  
Determination of vanadium in the field. V. A. Zilbermintz and K. P. Florenko Mikrochemie 18, 154-8 (1935).—Tananaev and Patschenko (C. A. 24, 567) showed that a most sensitive test for V consists in treating a soln. contg  $HVO_3$  with aniline +  $HCl$ , the V is reduced and a blue compd. is formed. The test can be utilized for a rapid colorimetric detn. of V which is sufficiently accurate for field tests.

W. T. II  
Spectrographic microdetermination of zinc. Preliminary note. Lewis H. Rogers Ind Eng Chem, Anal Ed 7, 421-2 (1935).—A spectrographic method for detg Zn in plant materials contg. 0.005-0.1% Zn is described. Fe is used as an internal standard. Fe when present in quantities exceeding 1% interferes.

W. T. II  
Determination of chlorine in organic compounds. I. A rapid lamp method. Wm. Marias Malisoff. Ind Eng. Chem., Anal. Ed. 7, 428 (1935).—Dissolve the org. compd. in a combustible solvent to make a soln. contg. about 0.2% Cl. Burn in the standard lamp and titrate the  $HCl$  formed.

W. T. II  
Simplified method of S. L. Penfield for the determina-

tion of fluorine in phosphorites and apatites. S. N. Rozanov. *Z. anal. Chem.* 102, 328-36 (1935).—See C. A. 29, 1032<sup>a</sup>.

Determination of oxygen and nitrogen in steel. Improvements in the vacuum-fusion method. John Chipman and M. G. Fontana. *Ind. Eng. Chem., Anal. Ed.* 7, 391-5 (1935).—Improvements in the technique and changes in the construction of the necessary apparatus have resulted in a vacuum-fusion apparatus that yields better results. The accuracy has been increased and the length of time required shortened. The  $O$  of  $Al_2O_3$  formed in the decarboxylation of molten steel by  $Al$  can be recovered within 1% of the truth. W. T. H.

Estimation of nitrogen by fumeless digestion. I. V. V. Narayana and V. Subrahmanyan. *Proc. Indian Acad. Sci.* 2B, 213-35 (1935).—See C. A. 29, 4504<sup>d</sup>. W. T. H.

Semi-micro-Kjeldahl determination of nitro and azo nitrogen. Robert A. Harst. *Ind. Eng. Chem., Anal. Ed.* 7, 432-3 (1935).—Take sufficient sample to yield 2-5 mg of  $N$  in a 100-cc., dry Kjeldahl flask containing 300 g. of pure dextrose, 1-1.5 g. of  $K_2SO_4$ , about 20 mg. of blue vitriol and a little well-washed aluminum (grain size 14). Add 4 ml. of concd.  $H_2SO_4$  and digest near the b. p. until the soln. is clear and then for an additional 15 min. To the cooled soln., add 35 ml. of water and 12 ml. of 50%  $NaOH$ . Distill as usual and receive the distillate in 25 ml. of 0.02  $N$   $HCl$ . Finally titrate the excess acid with 0.02  $N$   $NaOH$ , with a mixt. of methyl red and methylene blue as indicator. W. T. H.

Detection of small quantities of phosphorus and of phosphine. Ludwig Wolf, Werner Dusing and Andreas Martos. *Mikrochem. J.* 18, 185-92 (1935).—The method is based on the formation of black  $Ag_3P$  phosphate when the vapors of  $P$  or  $PH_3$  are passed into an ammoniacal  $AgNO_3$  soln. The vapors are passed in an intermittent current through a capillary tube which rests in a beaker containing the reagent. The deposit is thus formed in the capillary and from the amt. of deposit the quantity of  $P$  present can be estimated. W. T. H.

Benzidine acetate in the determination of bromides by silver. F. Burriel. *Anales soc. esp. fis. quim.* 33, 902-5 (1935). cf. C. A. 26, 420<sup>a</sup>.—The method of detg.  $Br^-$  by titration with  $AgNO_3$  with  $Cu(NO_3)_2$  + benzidine acetate as absorption indicator, is applicable to the detn. of  $Br^-$ . The method is accurate in 0.02  $N$  solns. of  $Br^-$  but it is not applicable to the detn. of  $Cl^-$ . E. M. Symmes.

Analytical determination of chlorides with adsorption indicators. F. H. C. Kelly. *Australian Chem. Inst. J.* & *Proc.* 2, 250-4 (1935).—Chiefly a review of previous work. W. T. H.

Titration of iodides in the presence or absence of chlorides and bromides with iodo-starch as indicator. Eugen Chirnogai. *Z. anal. Chem.* 102, 339-42 (1935).—Koltzoff (C. A. 11, 2868, 15, 3053) has shown how iodo-starch can be used as an indicator in the titration of  $I^-$  with  $Ag^+$ . However, added  $KIO_3$  or a little  $I_2$  to the soln. and the improvement in the procedure which is now suggested is to add a little  $F^{+++}$  to the soln. instead. For each 10 cc. of approx. 0.1  $N$  iodide add 1-2 drops of cold  $Fey(SO_4)_3$  soln., shake and add 2 cc. of 0.4% starch soln. Titrate with 0.1  $N$   $AgNO_3$  soln. until the blue iodo-starch changes to the characteristic yellow color of  $AgI$ . The iodo-starch turns first from blue to green, then to orange yellow and finally to the yellow end point. When  $Cl^-$  is present, the titration can take place in a soln. to which  $NaOAc$  has been added in place of  $(NH_4)_2CO_3$  as suggested by K. Then when the iodo-starch end point has been obtained, the  $AgI$  ppt. can be removed by filtration and  $Cl^-$  detd. by the Volhard method. The results thus obtained appear to be more accurate than those obtained by the procedure of K. W. T. H.

Volumetric determination of nitrites by means of ceric sulfate solution. H. Bennett and H. F. Hartwood. *Analyst* 60, 677-80 (1935).—Sol. nitrites can be titrated with  $Ce(SO_4)_3$  soln. with eriochrome as indicator. For detg. small amts. of  $K$  in soils the ppt. of  $K_2Co(NO_3)_6$  can

be dissolved and the nitrite titrated with  $Ce(SO_4)_3$  instead of  $KAlO_2$ , as is common practice. W. T. H.

Potentiometric determination of phosphate. I. A. Atanasiu and A. I. Velulescu. *Z. anal. Chem.* 102, 344-50 (1935).—The titrations described in this paper were carried out with  $Pt/Ni$ ,  $Pt/Camel$  and  $Pt/Hg$  electrodes but the best results were obtained with  $Pt/Ni$ . Irrespective of whether a monobasic, dibasic or tribasic alkali phosphate soln. is titrated with  $UO_2(OAc)_2$  soln., the ppt. is always  $HUO_2PO_4$ . The temp. of the soln. should be 60-70° and sufficient  $AcOH$  should be added to make  $pH = 5-5.6$ . The presence of 0.5-1.0% of hydroquinone is necessary. The titration must take place slowly. The presence of alkali or  $NH_4$  salts does not affect the end point. W. T. H.

Colorimetric determination of orthophosphate in the presence of metaphosphate and pyrophosphate. Kazimierz Boratynski. *Z. anal. Chem.* 102, 421-8 (1935).—The colorimetric method of Lohmann and Jendrasik (C. A. 21, 1206) which is modified is recommended. Instead of heating to 37°, it is recommended to heat 10 min. at 25° and allow to cool 5 min. As reagent for the reduction of the phosphomolybdic acid either 1,2,4-aminonaphtholsulfonic acid (eikonogen) or  $p$ -methylaminophenol sulfate (photo-red) can be used. The test is not given by metaphosphate or pyrophosphate but when much of the latter is present more molybdic acid is required. W. T. H.

Rapid gravimetric method for the analysis of selenates. Rafuca Ripan-Tilici. *Z. anal. Chem.* 102, 343-4 (1935). cf. C. A. 29, 7222<sup>a</sup>.—To det.  $Se$ , dil the soln. until it is approx. 0.01  $M$ , heat to boiling and introduce dropwise 0.5  $M$   $Pb(NO_3)_2$  soln. until about 0.1 cc. in excess is present. Boil 2 min. while stirring, stop heating, add sufficient  $PbO$  to make the soln. contain 30-35% alc. and allow to stand 4-5 hrs. with occasional stirring during the first hr. Filter, wash by decantation with 30% alc. and finally wash in the crucible with 3 cc. of concd. alc. and 1 cc. of ether. Allow to stand a few min. in a vacuum desiccator and weigh as  $PbSeO_4$ . If care is taken to avoid adding too much reagent, the results are excellent but the ppt. has a high degree of adsorptive power. W. T. H.

Analysis of small quantities of gas by means of the usual microanalytical apparatus. Wm. F. Bruce. *Mikrochem. J.* 18, 201-5 (1935).—In connection with work on the metabolism of bacteria, small quantities of gas were collected from culture media, the  $CO_2$  was detd. in the usual way and then the unabsorbed gas was heated with air and the resulting  $CO_2$  and  $H_2O$  were weighed. Slight changes in the Pregl combustion train were made. W. T. H.

Determination of carbon dioxide in gas mixtures by means of  $pH$  measurements. Yrjö Kauko and Julius Carlberg. *Z. anal. Chem.* 102, 393-407 (1935). cf. Kauko, C. A. 28, 3337<sup>a</sup>.—Further details concerning the method are given, particularly with respect to lab. practice. W. T. H.

The determination of carbon dioxide in air with a photo-colorimeter. Bytchina and Liska. *Chem. Listy* 29, 201-2 (1935).—A known vol. of air previously washed with water was passed through a reagent in a glass cell standing between the photocell of a Se cell colorimeter and a light source. The most satisfactory reagent was water containing  $1 \times 10^{-4}$  g. mol  $NaHCO_3$  and  $2 \times 10^{-4}$  g. mol dibromothymolsulfothalen per l. The equl. between the color  $t$  and the partial pressure of  $CO_2$  in atm. ( $P$ ) is given by the equation  $bP = 3.94 - 0.85 \log P$  (15°), where  $bP$  represents the  $pH$  detd. colorimetrically and not corrected for the electrolytic content of the soln. The const. 3.94 was detd. experimentally and is a function of the temp. and concn. of the substances in soln. The equation was correct for 0.03-0.30%  $CO_2$  in air by vol. The temp., pressure, water content, and vol. of the drawn air have no influence upon the results providing that a precision of not greater than 0.01  $pH$  is sought. Theoretically, the reagent ought to serve for an unlimited no. of detns.; actually, it must be changed in frequent intervals. Soot, tobacco smoke,  $SO_2$ ,  $H_2S$  and  $NH_3$  in the air are detri-

mental to the reagent, but all of these substances are removed by scrubbing with water. With a suitable app. the air can be analyzed for  $\text{CO}_2$  in 3 min with an accuracy of 2-3% based on the quantity of  $\text{CO}_2$  present. For temp other than  $18^\circ$  the vol. of  $\text{CO}_2$  has to be corrected by increasing the b.p.n 0.004 for every  $1^\circ$  rise in temp.

Frank Maresh

The determination of carbon dioxide in carbonates and in baking powders. I. Vojt *Chem. Listy* 29, 185-7 (1935), cf. C. A. 29, 5040<sup>1</sup>.—The use of  $\text{H}_3\text{PO}_4$  to liberate  $\text{CO}_2$  is advocated.

Frank Maresh

A test for hydrogen peroxide with diphenylcarbazide. L. N. Lapin *Z. anal. Chem.* 102, 418-20 (1935).—The test for  $\text{H}_2\text{O}_2$  which depends upon the formation of blue, ether-sol. perchromic acid can be made much more sensitive with the aid of diphenylcarbazide which reacts with the perchromic acid and as a result a reddish violet color is imparted to the ether in cases where the color of the blue perchromic acid is hardly visible. Make the soln to be tested acid with 2-3 drops of 20%  $\text{H}_2\text{SO}_4$  by vol., add 3-4 cc. of freshly prep'd abs. ether and a few drops of 0.01 N  $\text{K}_2\text{Cr}_2\text{O}_7$ . Shake and look for a blue color in the ether layer. Then add cautiously to the sep'd ether 2 drops of reagent prep'd. by heating a few crystals of diphenylcarbazide with 0.5 cc. of 96% alc. by vol. and adding, when cold, 5 cc. of abs. ether. As little as 5  $\gamma$  of  $\text{H}_2\text{O}_2$  in 5-10 cc. of liquid can be detected. W. T. H.

Color test for ammonia with hypobromite and thymol. P. Arne Hansen *Z. anal. Chem.* 102, 279 (1935).—The test recommended by Lapin and Heim (C. A. 29, 78<sup>1</sup>) is not new but was proposed by Hansen (C. A. 24, 3032) and has been used by others. W. T. H.

Some applications of thermomagnetic analysis in the study of oxides of iron. Georges Chaudron *Bull. soc. chim. Belg.* 44, 339-50 (1935).—Thermomagnetic analysis of any of the oxides of Fe is accomplished by tracing the curve of variation of magnetization as a function of temp. A new app. is described which permits heating of the sample in the open air. Curves are recorded, photographically. It is possible with the procedure described to detect the nature of the constituents of a mixt. of iron oxides. W. J. Peterson

Determination of potassium bitartrate in commercial calcium tartrate. L. Gadaud and J. Gadaud *Ann. chim. anal. chim. appl.* 17, 290 (1935).—The proposed method consists in boiling 10 g. of the sample with 150 cc. of water and 3 g. of  $\text{CaCO}_3$ . The soln. is made up to a definite vol. and from an aliquot part of the filtered soln.  $\text{KH}_2\text{C}_2\text{O}_4$  is obtained by evap. nearly to dryness, adding  $\text{AcOH}$ . The results obtained are low partly because some of the tartrate originally present as  $\text{KH}_2\text{C}_2\text{O}_4$  is converted to less sol.  $\text{CaC}_2\text{H}_4\text{O}_6$ . No analytical data are given. W. T. H.

Estimation of small quantities of magnesium sulfate. Max Moller and Gunver Schlegel *Mikrochemie* 18, 159-61 (1935).—Ernoch, C. A. 28, 65<sup>1</sup>, has shown how  $\text{MgSO}_4$  can be treated with  $\text{Ba(OH)}_2$  in excess, the washed ppt of  $\text{Mg(OH)}_2$  treated with  $\text{H}_2\text{SO}_4$  and then, after removing the excess acid, a new ppt of  $\text{Mg(OH)}_2$  and  $\text{BaSO}_4$  obtained as before and the process repeated until finally an easily weighable quantity is obtained. The suitable technique for converting 0.05 mg. of  $\text{MgSO}_4$  into a ppt of  $\text{BaSO}_4$  weighing over 1 mg. is explained. In the series of expts. described, the greatest error was less than 10% of the truth. W. T. H.

Quick method for silica. R. E. Stephenson *Chemist Analyst* 24, No. 4, 14-15 (1935).—Heating the dried sample with HF and  $\text{H}_2\text{SO}_4$  and degt. the  $\text{SiO}_2$  by loss in weight are again recommended. W. T. H.

Studies concerning the relation between sensitivity and molecular weight (weighting effect). P. Krumholz and H. Watzel *Mikrochemie* 19, 65-68 (1935).—The weighting effect in the salt formation of  $\text{HBI}$ , with heterocyclic bases was studied. Bi salts with iodide and org. bases in the presence of acid give difficultly sol. yellow ppts of the general formula  $\text{HBI}$ , base; such compds. can be used for the detection of Bi or for the detection of the base in question. Studies with quinoline and thiazole bases show that

the sensitivity of the test increases with the mol. wt. of the base. On the other hand, the decrease in the sol. product of the salts is out of all proportion to the increase in the mol. wt. of the salt formed. Thus the picoline salt has the mol. wt. = 684 and the quinaldine salt = 734 whereas the soly of the first salt is about 25 times as great as that of the second. The effect of making a quaternary compd. also increases the sensitivity but it seems highly improbable that here merely a weighting effect comes into play. W. T. H.

Rapid determination of moisture in small quantities of substance. J. Lrdos *Mikrochemie* 18, 250-60 (1935).—In tech. analysis, water is very commonly det'd. by adding to the weighed sample some org. liquid which does not mix with water and has a slightly higher b. p. The sample + liquid is then heated and the 2 immiscible liquids are collected which they distil off, the vol. of  $\text{H}_2\text{O}$  is then read (cf. Schlapfer, C. A. 8, 1056<sup>1</sup>). The same method is applicable to the study of medicinal and biol. substances. When proper corrections are made, the results are nearer the truth than is the case when  $\text{H}_2\text{O}$  is det'd. by loss in wt. A suitable app. is shown and the method of carrying out the analysis explained. W. T. H.

Volumetric determination of evaporation rates. L. A. Wellauer and J. B. Gregor *Ind. Eng. Chem., Anal. Ed.* 7, 299-3 (1935).—Rates of evapn. of org. solvents and thinners were det'd. by blowing dry air over the samples contained in standard graduated oil centrifuge tubes with tapered bottoms and held in a horizontal position. At definite time intervals the tubes were brought to the vertical position and after 1 min. the vol. was read. Duplication of results were secured to within  $\pm 3\%$ . A considerable saving in time and labor over gravimetric methods can be secured by the use of this evaporimeter. J. W. Shipley

The yellow color of hydrochloric acid containing selenium. II. The behavior of hydrochloric acid containing selenium in the cold and on dilution with water. Friedrich Ulrich and Hugo Dietz *Z. anorg. allgem. Chem.* 224, 213-24 (1935), cf. C. A. 29, 1361<sup>1</sup>.—The Se content of the yellow soln. was det'd. at decreasing temps. (lowest temp.  $-22.5^\circ$ ) and in various concns of HCl. The results indicate that the initial pptn. of elementary Se (Tyndall effect) depends upon both the temp. and the concn. of  $\text{SnCl}_2$ . The lower the temp. the less the amt. of  $\text{SnCl}_2$  necessary to cause the initial pptn. of elementary Se. L. W. Roth

Elimination of phosphoric acid in microchemical qualitative analysis. S. Gansburg and M. H. Pringheim *Bull. soc. chim. [5]*, 2, 1094-7 (1935).—To the hot  $\text{AcOH}$  soln. add some aged, colloidal Fe hydroxide and all the  $\text{H}_3\text{PO}_4$  will be ppt'd. W. T. H.

Notes on microsilicate analysis. I. Determination of silicic acid. Karl Schoklitsch *Mikrochemie* 18, 144-53 (1935).—The method of Galfayan and Tarayan (C. A. 28, 1392<sup>1</sup>) was applied to the detn. of  $\text{SiO}_2$  in basalt, granite, omphacite (pyroxene) and hornblende-feldspar; remarkably accurate results were obtained in the analysis of samples weighing 7-14 mg. The dried sample was heated with HF and  $\text{H}_2\text{SO}_4$  and then with  $\text{HNO}_3$  and  $\text{H}_2\text{SO}_4$ . The residue was heated for an hr. at about  $75^\circ$  with a weighed amt. of  $\text{NaPO}_3$  and from the final wt. the wt. of volatilized  $\text{SiO}_2$  obtained. It was necessary to correct for slight volatilization of the  $\text{NaPO}_3$ . W. T. H.

The determination of very small quantities of hydrocyanic acid. Applications in plant physiology and toxicology. M. T. François and N. Lafitte *Bull. soc. chim. biol.* 17, 1088-96 (1935).—One cc. of the slightly acidified soln. to be analyzed is placed in a test tube and the tube closed with a paraffined cork from which is suspended a dampened strip of Na picrate paper prep'd. according to the method of Guignard (C. A. 2, 865<sup>1</sup>). After standing 24 hrs. at room temp. the color of the paper is compared with that of control strips exposed in the same manner to solns. contg. known quantities of HCN. As little as 0.002 g. HCN per l. can be det'd. In the presence of starch or  $\text{NH}_3$  and its compds. the values obtained are a little too low. EtOH, castor oil and liver and thymus tissues do not interfere.

heart tissue fixes part of the HCN and causes considerable error.

L. E. Gilson

Determination of small quantities of mercury in leafy vegetables by means of diphenylthiocarbazon (dithizone) W. O. Winkler. *J. Assoc. Official Agr. Chem.* 18, 638-44 (1935).—The method described requires no elaborate app., is not time-consuming and yet gives consistently accurate results (to within 0.005 mg.) in detg. 0.005 to 0.02 mg. of Hg. It is based on the following principles: (1) When a dil. acid soln. contg. Hg and other metals is shaken with a  $\text{CCl}_4$  or  $\text{CHCl}_3$  soln. of dithizone, the normal green color of the dithizone soln. changes to a bright orange yellow because of formation of a sol. org. Hg complex (1 mg. Hg reacts with 2.6 mg. of dithizone). The yellow color persists as long as the Hg is in excess, when sufficient dithizone is added to react with all the Hg, any excess of reagent turns the soln. green or red or reddish violet, depending on whether traces of Cu are present in the mixt. (2) Cu in excessive concn. must be removed before the titration of the Hg, the retn. being accomplished by adding to the soln. some KI in presence of which the Cu may be extd. with dithizone, the Hg being left in soln. Pt metals are practically the only ones that interfere. (3) The Hg cannot be extd. or titrated with dithizone in acid soln. when iodides are present, but it can be extd. in ammoniacal soln.; it can be extd. from an acid soln. contg. iodides by the use of Na diethylthiocarbamate and  $\text{CHCl}_3$  as extractant. The method is essentially as follows: Destroy org. matter by gently refluxing a suitable sample (150-200 g. in the case of lettuce) with 50 cc.  $\text{HNO}_3$  and 300 cc.  $\text{H}_2\text{O}$  followed by oxidation with  $\text{KMnO}_4$  and addn. of  $\text{H}_2\text{O}_2$  to complete soln. of  $\text{MnO}_2$ , add 0.5 g. crystd.  $\text{NH}_4\text{OH}$  sulfate or chloride; if Sb is present add 15 cc. of 10% tartaric acid soln. previously extd. several times with dithizone soln. (0.05 mg. per cc. in  $\text{CCl}_4$  and  $\text{CHCl}_3$ ) to free it from Hg, to concn. the Hg ext. with successive portions of dithizone soln. till the ext. is green or reddish; if Cu is present in large quantities, shake the combined dithizone exts. with  $\text{H}_2\text{O}$  contg. a few drops of 1 + 1  $\text{H}_2\text{SO}_4$ , a few crystals of KI and a few drops of 5% Na arsenite soln. to prevent liberation of free I, the Cu remaining in the ext. and the Hg being transferred to the aq. phase; titrate by one of the following procedures: (1) make the soln. ammoniacal and titrate directly with dithizone (0.0125 mg. per cc. in  $\text{CCl}_4$ ) to a red end point (it is preferable first to make an approx. titration), liberate the Hg in an acid iodide soln. and repeat the titration accurately; (2) ext. the Hg from the acid soln. contg. iodides by adding 2 cc. of 1% Na diethylthiocarbamate soln. and using several 10-cc. portions of  $\text{CHCl}_3$ , then oxidize the exts. and titrate with dithizone. A. P. C.

Detection of organic compounds by means of spot tests X. F. Feigl and O. Freuden. *Mikrochemie* 18, 272-6 (1935); cf. C. A. 29, 6385<sup>1</sup>.—Place a fragment of the sample in a micro test tube and melt it together with a little diphenylamine over a free flame. Take up the melt in a drop of EtOH; if aniline blue is formed, it is proof that an oxalate was present. Carry out a blank test at the same time.

W. T. H.

Determination of selenium in organic matter. K. T. Williams and H. W. Lakin. *Ind. Eng. Chem., Anal. Ed.* 7, 409-10 (1935).—The method described by Robinson, Dudley, Williams and Byers (C. A. 28, 5363<sup>1</sup>) has given good results in several thousand detns. but is tedious and there is danger of losing some Se by spattering. To det. Se in vegetation, first grind the sample to pass through a 2-mm. sieve. Take 10 g. and digest with 50 cc. of concd  $\text{H}_2\text{SO}_4$  and 100 cc. of concd.  $\text{HNO}_3$  in a 600-cc. beaker. Stir with a thermometer and keep the temp. below 100° until frothing has ceased and then raise the temp. to 120°. Heat until there is no further evolution of  $\text{NO}_2$ . Cool, transfer to an all-glass distr. flask, add 100 cc. of  $\text{HBr}$  and 1 cc. of  $\text{Br}_2$  and collect 75 cc. of distillate. From this point continue as in the other procedure. W. T. H.

Volumetric modification of the Pregl halogen micro-combustion method for organic iodine. Paul L. Kirk and Kenneth Dod. *Mikrochemie* 18, 179-81 (1935).—The volumetric method of Kendall (C. A. 5, 3351; 6, 343;

1901; 8, 3665) can be used to advantage in connection with Pregl's halide combustion method. Excellent results were obtained with 3-10 mg. samples of 5 typical org. compds. contg. I. W. T. H.

Determination of protein nitrogen. Accelerating the Kjeldahl-Gunning digestion by addition of phosphates. H. W. Gerritz and J. L. St. John. *Ind. Eng. Chem., Anal. Ed.* 7, 380-3 (1935).—The substitution of 10 g. of anhyd  $\text{K}_2\text{HPO}_4$  or 12 g. of the trihydrate crystals for 10/16 of the  $\text{Na}_2\text{SO}_4$  or  $\text{K}_2\text{SO}_4$  used in the digestion of the samples shortened the required time to 25 min. or less. For the analysis of "mixed feeds" it is recommended to digest 25 min. or less over the Bunsen flame. When heated on a preheated 700-w. elec. plate, 9 min. proved sufficient. Samples of dried blood, fish meal, soybean meal and dried skim milk required less than 15 min. over grid burners. Low results were obtained when all the alkali sulfate was replaced by phosphate. The addn. of Fe to the catalysts and of  $\text{K}_2\text{SO}_4$  is unnecessary. W. T. H.

Titrimetric determination of organic substances by oxidation with chromic acid H. C. S. Svehlaga. *Z. anal. Chem.* 102, 321-8 (1935); cf. C. A. 29, 4683<sup>1</sup>, 6563<sup>1</sup>, von Feilenberg (C. A. 21, 3829) succeeded in detg. C in org. compds. by oxidizing them to  $\text{H}_2\text{O}$  and  $\text{CO}_2$  with  $\text{CrO}_3$ , but some of the results obtained varied about 10%. The expts. described in this paper were undertaken to det. whether the inaccurate results were due to faulty procedure and whether it were possible to modify the procedure so that a complete oxidation of the C will take place. As a result of expts. with benzoic acid, mannitol, sucrose, malonic acid, methanol, succinic acid, glutaric acid and adipic acid, the following procedure is recommended: Take of the org. substance an amt. equiv. to about 1 milli-equiv. of  $\text{K}_2\text{Cr}_2\text{O}_7$ . While cooling with ice, add slowly 2 cc. of ice-cold  $\text{H}_2\text{SO}_4$  and 10 cc. of 0.23 N  $\text{K}_2\text{Cr}_2\text{O}_7$  in 84%  $\text{H}_2\text{SO}_4$ . Heat 15 min., or longer if necessary, in boiling water. Cool, transfer to a 250-ml. flask contg. 40 cc. of water. To the mixt. add 20 cc. of 10 N KOH, dil. to about 150 cc. and cool to room temp. Then add 25 cc. of 0.4 N KI soln. from a buret, mix well, let stand 1 min., and titrate the liberated I with 0.1 N  $\text{Na}_2\text{S}_2\text{O}_3$ . In this way 5-10 mg. of substance can be detd. with an accuracy of 0.005 to 0.025 mg. W. T. H.

Color reactions of tartaric, citric and ascorbic acids. Otto Führl and Heinz Herrmann. *Biochem. Z.* 280, 449-57 (1935).—On warming with pyridine and  $\text{Ac}_2\text{O}$  tartaric acid gives an emerald green, citric acid a carmine red and ascorbic acid a violet-red color reaction, while other dicarboxylic acids give either a brown color or none at all. The pigments formed are high-mol. condensation products, sensitive to  $\text{O}_2$  and sol. in pyridine or acetone. Under the influence of the  $\text{Ac}_2\text{O}$  a chromogen is produced from the dicarboxylic acids, which is converted to the pigment by the pyridine. The pigments from citric and ascorbic acids were obtained in the form of beautiful rosette-shaped crystals which had the compn.  $\text{C}_8\text{H}_8\text{O}_{10}$  and  $\text{C}_8\text{H}_8\text{O}_{10}$ , i. e., of an acetylated dihydroxytartaric and ascorbic anhydride, resp. The color reaction is extremely sensitive and the presence of even 1  $\gamma$  of the dicarboxylic acid can be detected by its yellow fluorescence in the ultraviolet light of a Zeiss fluorescent lamp. S. Morpulis.

A semi-micro method for determining oxalic acid and calcium by the use of a permanganate titration and an indicator. Miloš Kminek. *Listy Cukrovar.* 53, 496-500 (1935).—From 1 to 40 mg. of oxalic acid was dissolved in hot water and pptd. as  $\text{CaC}_2\text{O}_4$  in a buffered  $\text{AcOH}$  soln. The ppt. was dissolved in 20%  $\text{HNO}_3$  contg. 1% of urea, treated with a few drops of  $\text{Na}_2\text{NO}_3$  soln. and slightly overtitrated with 0.005 N  $\text{KMnO}_4$ . The soln. was cooled and treated with 10 cc. of 0.0012 N  $\text{Fe}^{++}$  soln. and the excess of this reagent detd. by a second titration with  $\text{KMnO}_4$  to an end point with eriochrome. A similar procedure served for detg. Ca. The results were accurate to within about 1% of the truth. Frank Mareš.

Microscopy of the amino acids and their compounds I. Phosphotungstates and phosphomolybdates. Berlingame Bullock and Paul L. Kirk. *Mikrochemie* 18, 129-36 (1935).—Nearly all of the known amino acids were

studied and those ppts which could be obtained by treatment with phosphotungstic and phosphomolybdic acids were studied under the microscope and the results described with illustrations. II. Pterates and flavanates B. L. Crosby and P. L. Kirk. *Ibid* 137-43.—The wide use of picric and flavanic acids in the sepn. and isolation of the amino acids makes it desirable to know the microscopic appearance and properties of the resulting ppts. In this paper are reported the results of successful attempts to prep. cryst. compds. of nearly all the known amino acids with picric and flavonic acids. Photomicrographs are shown for representative compds. of each series.

W. T. II.

Microdetection of volatile amines, particularly monomethylamine, in the presence of ammonia. A. v. Waeck and H. Löffler. *Mikrochemie* 18, 277-82 (1935).—The method of Klein and Steiner (C. A. 22, 4577) has been modified so that a direct sepn. from considerable  $\text{NH}_3$  can be accomplished in the micro oven and the detection of volatile amines accomplished in a single drop of the fluid. At the bottom of a gas micro-oven which is 10-15 mm high and of 15 mm. diam., place 0.03-0.06 cc. of the neutral or faintly acidic soln. and add sufficient yellow  $\text{HgO}$  to make the surface of the liquid appear dry. Then add a few drops of 5.5% soda and of a 5%  $\text{NaCl}$  soln. Cover the heating chamber with a watch glass which carries on its bottom surface a drop of water to which has been added a few crystals of a nitronaphthol (usually 2,4-dinitro-1-naphthol). After 8-12 hrs the drop with the reagent will be dry. Now exam. the product on the cover glass under the polarizing microscope. In this first fraction will be found, first of all, the trimethylamine nitronaphtholate together with excess reagent. After the identification of the trimethylamine, if it is present, add a few drops of 2%  $\text{NaOH}$  to the sample and proceed as before with a new cover glass and reagent. Sometimes it is well to add 8%  $\text{NaOH}$  and carry out the expt. a 3rd time. The isomeric test is considerably more sensitive than that described above, as it permits the detection of 0.5  $\mu\text{g}$  in 1 cc, whereas the above test may not indicate less than 10  $\mu\text{g}$  in the most unfavorable cases. It should be used in doubtful cases.

W. T. II.

Tests on the von Fellenberg method of determining sugar by titration. Th. v. Fellenberg and Paul Dement. *Mitt. Lebensm. Hyg.* 26, 168-82 (1935).—The method (C. A. 14, 3618) is reviewed in the light of recent experiences and a new table is given showing the values of 0.5-30.0 cc. in 0.1 cc. increments of 0.1  $N$   $\text{I}$  soln. in terms of glucose, invert sugar, sucrose, lactose hydrate and maltose hydrate.

W. T. II.

Determination of glucose in the presence of disaccharides with Barfoed's reagent. Th. v. Fellenberg. *Mitt. Lebensm. Hyg.* 26, 182-92 (1935).—The effects of variations in the concn. of the  $\text{Cu}$  soln. and the manner and length of boiling are shown and a table is given for the glucose values of 1 soln. obtained by the following method of analysis. Reagents: (1) Dissolve 25 g. of pure  $\text{Cu}$  (OAc) in hot water contg. 3 cc. of glacial  $\text{AcOH}$  and dil. to 1 l. after filtering if necessary. (2) Dissolve 30 g. of Rochelle salt in water and dil. to 100 cc.; the soln. should be prepd. frequently as mold develops rapidly. Use the acid  $\text{NaCl}$ ,  $\text{I}_2$  and  $\text{Na}_2\text{S}_2\text{O}_3$  solns. as in the method of v. Fellenberg. Place 60 cc. of the above  $\text{Cu}$  soln. in a 200-cc. Erlenmeyer flask contg. some boiling stones. Add 20 cc. of the sugar soln., heat to boiling and keep at this temp. for 5 min., without violent boiling which will cause the loss of too much  $\text{AcOH}$ . Cool, add 100 cc. of the acid  $\text{NaCl}$  soln. to dissolve the pptd.  $\text{Cu}_2\text{O}$ , add 5 cc. of tartrate soln. and introduce  $\text{NaHCO}_3$  in small portions until a residue remains undissolved. Titrate with  $\text{I}_2$  soln. The application of the method to the analysis of ext. of malt is described.

W. T. II.

Tests on the gravimetric determination of maltose by the method of Wein. C. Zach. *Mitt. Lebensm. Hyg.* 26, 192-5 (1935).—Krause has studied the volumetric detn. of maltose on the same sample as that used by Z. The procedure of Wein (Z. anal. Chem. 26, 255 (1887)) was changed slightly as follows: 25 cc. of the maltose soln.

was added to 50 cc. of Fehling soln. and 25 cc. of water. After heating to boiling again, the boiling was continued 4 min. As a result of numerous analyses a table is given showing the maltose hydrate content corresponding to wts of  $\text{Cu}_2\text{O}$  ranging from 10 to 350 mg. for increments of 0.1 mg.

W. T. II.

Determination of hexamethylenetetramine. E. Schulek and Wilhelmine Gervay. *Z. anal. Chem.* 102, 271-4 (1935).—Schulte (C. A. 29, 3739) had some difficulty in carrying out the simple procedure recommended by Schulek and Gervay (C. A. 27, 1984). In the light of this criticism further expts. were made and results obtained showing that good results are obtained if certain simple precautions are taken. The hydrolysis must take place at  $100^\circ$  and if a strongly boiling water bath is not available a free flame should be used. A glass-stoppered Erlenmeyer flask should be used with a thin-walled, broad bottom.

W. T. II.

Determination of urethan also in the presence of aminopyrine, theobromine, caffeine and derivatives of carbamide. E. Schulek and Wilhelmine Gervay. *Z. anal. Chem.* 102, 275-9 (1935).—The app. used is the same as that recommended by Schulek and Vastagh (C. A. 25, 3932) and by Schulek and Kerényi (C. A. 26, 4270, 4412). Dil. the medicinal prep. to make it contain about 10 mg. ethylurethan in 5 cc. To this quantity of soln. in the 100-cc. Kjeldahl flask add 2 cc. of concd.  $\text{H}_2\text{SO}_4$  and boil vigorously under reflux condensation for 1 hr. Remove the condenser, add 2 drops of methyl red indicator soln., some rough pumice powder and 30-40 cc. of water. Rinse out the condenser and dry the ground glass connection. Distill into a 100-cc. Erlenmeyer flask contg. 10 cc. of 0.02  $N$   $\text{H}_2\text{SO}_4$ . While boiling the soln. in the flask, slowly add "boiled out" 10%  $\text{NaOH}$  until the methyl red changes to yellow and the soln. contains 2-3 drops of  $\text{NaOH}$  in excess. After distg. off 30-35 cc. of liquid, remove the receiver, boil off  $\text{CO}_2$  and titrate the excess  $\text{H}_2\text{SO}_4$  with 0.02  $N$   $\text{NaOH}$ . Numerous results show that the method is good.

W. T. II.

Curves for use in the colorimetric estimation of carotene. W. S. Ferguson. *Analyst* 60, 680-3 (1935).—The colorimetric detn. of carotene is usually based on a comparison with the color of  $\text{K}_2\text{Cr}_2\text{O}_7$  soln. In this paper, a curve is given showing the mg. of carotene corresponding to yellow units observed in a Lovibond tintometer and another curve showing the carotene values corresponding in readings obtained with a Klett colorimeter and dichromate solns. Very pure carotene was used in prep. these curves and the analytical data are given so that chemists can construct their own curves.

W. T. II.

Method for the analysis of technical  $\alpha$ -nitronaphthalene. B. P. Fedorov and A. A. Spruskov. *Z. anal. Chem.* 103, 28-38 (1935).—See C. A. 29, 2180.

W. T. II.

Volumetric determination of camphor by the hydroxylamine method. Robert Vandoni and Gerard Desseigne. *Bull. soc. chim.* [5], 2, 1685-91 (1935).—In previous methods, the ketone has been allowed to react in an alk. soln. with an excess of  $\text{NH}_2\text{OH} \cdot \text{HCl}$  and the excess was detd. by a double titration. In the method here proposed, a direct titration is made of the  $\text{HCl}$  liberated as a result of the formation of the oxime, bromophenol blue is used as the indicator. For the neutralization at the start of the analysis  $\text{Na}_2\text{CO}_3$ ,  $\text{CaCO}_3$  or  $\text{NaOH}$  in alc. can be used. Thus with  $\text{CaCO}_3$  the procedure is as follows: Into a 100-cc. flask introduce 50 cc. of 2  $N$   $\text{NH}_2\text{OH} \cdot \text{HCl}$ , 0.2 cc. of the indicator soln. and bring to the neutral tint. Add exactly 1 g. of pure  $\text{CaCO}_3$  and 1-2 g. of the substance. Boil on the water bath with reflux condensation and finally cool to  $30^\circ$ . The soln. should remain alk. to the indicator. Add a measured vol. of  $\text{HCl}$  until all the  $\text{CaCO}_3$  is dissolved and finally titrate with  $N$   $\text{NaOH}$  soln. The results are accurate to within about 1% of the truth. The procedure is applicable to the analysis of other ketones such as camphor and menthone.

W. T. II.

A comparative color test for coumarin and melibiose acid in *Melilotus* species. J. S. Clayton and R. K. Larmour. *Can. J. Research* 13, C, 89-100 (1935).—The coupling reaction between phenolic bodies and diazotized *p*-nitroaniline

in alk. soln. is shown to be of value in the detection and estn. of the coumarin and melilotic acid content of small quantities of sweet clover. The intensity of crimson color developed on treatment of pure coumarin solns. is shown to be proportional to the concn. of coumarin and to be adaptable to colorimetric measurements. For practical purposes it is shown that this reaction can be used for estn. of coumarin and melilotic acid together. It is

possible to obtain the crimson color directly with plant exts. contg. coumarin or melilotic acid, and a tentative method enabling comparisons to be made among small amts. of plant material is outlined. A comparison between results obtained by the colorimetric method outlined and by that of Obermayer shows that the latter method is open to several serious errors in the estn. of coumarin.

J. W. Shipley

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIKKE

Pyrophyllite in San Diego County, California. L. M. Richard. *Bull. Am. Ceram. Soc.* 14, 353 (1935).—There is a very large deposit, probably suitable for refractories. A typical analysis is:  $\text{SiO}_2$  66.80,  $\text{Al}_2\text{O}_3$  28.20,  $\text{Fe}_2\text{O}_3$  0.10,  $\text{MgO}$  trace,  $\text{CaO}$  trace,  $\text{K}_2\text{O}$  trace,  $\text{TiO}_2$  0.02,  $\text{MnO}$  0.04,  $\text{S}$  0.06,  $\text{H}_2\text{O}$  5.00 and  $\text{Na}_2\text{O}$  0.03%.

Mapping Michigan for geologists. Talbert Abrams. *Eng. Mining J.* 136, 564-5 (1935).—Over 12,000 miles have been photographed from the air for the study of Au, Fe and nonmetallic mineral deposits. W. H. B.

The nickel-copper occurrence in the Bushveld Igneous complex west of the Pilansberg. C. M. Schwellnus. Union S. Africa, Dept. Mines, *Geol. Series Bull.* No. 3, 36 pp. (1935).—The source, grade, treatment and uses of these ores are discussed. Alden H. Emery

Some geological aspects of recent research on coal. H. C. A. Hickling. *Colliery Guardian* 151, 423-5, 471-2 (1935).—An address. G. G.

Geology of southern Saskatchewan. F. J. Fraser, F. H. McLearn, L. S. Russell, P. S. Warren and R. T. D. Wickenden. Can. Dept. Mines, *Geol. Survey Mem.* No. 176, 187 pp. (1935).—The occurrences of coal in southern Saskatchewan are described and 25 analyses given. The petrographic and mech. analyses of over 1000 samples of sediments are summarized; the heavy mineral assemblages of the various formations are described. The gray, feldspathic sands in the Eastend area probably represent the undecomposed sediments; the sandy clays are derived by prolonged weathering and leaching. A. H. E.

Scotland: The tertiary volcanic districts. J. E. Healy. *Geol. Survey of Brit.* 1935, 115 pp.—The complex mutual relations of the intrusive and extrusive volcanic and plutonic rocks are discussed. Barite is worked in Arran; small deposits of diatomite occur in Mull and northern Skye; oolitic limy ironstone, mainly chamosite, with some Fe oxides and siderite forms a bed, worked during the War, averaging 8 ft. thick in the Upper Lias of Raasay, and immediately above it some 8-10 ft. of shale yielding 12-12.8 gallons and 6.2-7.4 lb.  $(\text{NH}_4)_2\text{SO}_4$  per ton. A little coal occurs in Arran, and lignite in Skye and Mull. Sapphires, of no value as gems, are found in Mull and Ardsnamurchan. C. A. Silberrad

The South of Scotland [geology]. J. Pringle. *Geol. Survey of Brit.* 1935, 97 pp.—At Leadhills argenteiferous galena, hematite, chalcopyrite, antimony, pyrolusite, phalerite and alluvial Au have been found and some are still worked; at Wanlockhead galena, hematite and phalerite. Monazite and arsenical pyrite occur at Cairnmore of Fleet; barite at Auchencarr (Kirkcubrightshire); Cu carbonate in the Priestlaw granite, and coal is or was worked at Canonbie and Sanquhar. There are several S and chalybeate springs in the area. C. A. Silberrad

The Welsh Borderland [geology]. R. W. Pocock and F. H. Whitehead. *Geol. Survey of Brit.* 1935, 84 pp.—Barite occurs near Pontesbury (8 m. S. W. of Shrewsbury) in veins and bunches, usually iron-stained and of platy habit, often encrusted with bitumen and associated with small quantities of malachite, chalcocite, azurite and bornite. Galena and phalerite associated with barite, fluorite and pyrite are found near Shelve (5 m. further S. W.). Coal is still worked south and west of Shrewsbury, but at Pitchford (6 m. S. S. E. of Shrewsbury) a black bitumen occurs from which the medicinal prepn.

Bedton's British Oil, was formerly made. The only occurrence in England and Wales of monchiquite is at Golden Hill between Chepstow and Usk. C. A. S.

North Wales [geology]. Bernard Smith and T. Neville George. *Geol. Survey of Brit.* 1935, 92 pp.—The most important economic products at present are the slates of Penryn and the coal and breccia of Denbigh and Flint, but numerous metalliferous deposits are or have been worked. In the Cambrian area of Carnarvon and Merioneth oolitic and psilolite Fe (hematite, pyrite, etc.), and (elsewhere) ores of Cu, Fe, Zn, As, Sb, Pb as sulfides, and a little Au. Galena, sometimes argenteiferous, sphalerite and chalcopyrite, sometimes associated with barite and fluorite, occur in the Silurian and Carboniferous areas, especially at Parys and Halkyn Mountains. C. A. S.

Northern England [geology]. T. Eastwood. *Geol. Survey of Brit.* 1935, 70 pp.—Besides coal the economic products of this region are numerous. Hematite, especially in large masses resulting from metasomatic replacement of limestone; Cu ores, formerly worked near Keswick; argenteiferous galena associated with sphalerite, at many places, wolframite and scheelite in Cumberland, and, in amounts too small to be of commercial importance, ores of Co, Sb, Bi, Au, Mn and Mo. In all cases there are many different mineral species. Barite and witherite are associated with the galena, and in some cases are found in close juxtaposition with coal; the barite is often associated with fluorite. Gypsum occurs in the Vale of Eden, and anhydrite in massive form at Billingham; while salt is frequently associated with both. Diatomite is found near Kendal, and graphite was worked near Keswick. There are numerous examples of pneumatolytic and thermal action. C. A. Silberrad

The Grampian Highlands [geology]. H. H. Read. *Geol. Survey of Brit.* 1935, 81 pp.—In this area there are, or have been, worked: ores of Mn at Tamentoul, in Islay, and at Dalry (Kilroy); the last containing up to 60-70% MnO<sub>2</sub>; of Fe at Tamentoul, Dalry, Ardilly (Banff) and Stonehaven; of Pb and Zn (galena and sphalerite often carrying Ag and Au, and associated with pyrite and chalcopyrite) in Islay and Argyll, at Tyndrum (Perth), Aberdeen, Strathpey and Lossiemouth; of Cu (usually chalcopyrite) in Islay and around Loch Fyne, (Cu-Ni ore, and elsewhere in the neighborhood nickeliferous pyrrhotite) near Inverary, while chrysocolla and malachite occur elsewhere. Barite, graphite, diatomite, talc and asbestos are also found, and a feldspar containing 8.90% K<sub>2</sub>O and 2.45% Na<sub>2</sub>O. There is much metamorphism due to intrusive rocks. C. A. S.

The geology of Ceylon. J. S. Coates. *Ceylon J. Sci.* B19, 101-87 (1935).—The mineralogical constituents of Ceylon rocks are discussed and data are given on the occurrences of economic minerals such as graphite, precious stones, mica, thoranite, ilmenite, monazite and zircon sands. K. D. Jacob

The porosity of Ceylon rocks. J. S. Coates. *Ceylon J. Sci.* B19, 189-91 (1935).—The porosity was in the approximate order: garnetiferous khondalite, dolerite, charnockite, khondalite, biotite-gneiss, pink granitoid gneiss, leptynite and pink granulite. The values for nearly all samples of charnockite were within the range for Aberdeen granite and Stonehaven granite from Great Britain. With the exception of the leptynite and pink granulite, the rocks were, for all practical purposes,

- impervious to water A method for the determination of the porosity of rocks is outlined K. D. Jacob  
 Notes on analysis of igneous rocks *América Minera de Jesus Rev chim pura applicada* 7, 115-19 (1932) — de J considers several ways of saving time in rock analysis such as a single evapn. for  $\text{SiO}_2$ , and a shorter  $\text{K}_2\text{SO}_4$  fusion (2 hrs) in an open crucible for Al + Fe C. ## 9—METALLURGY AND METALLOGRAPHY

D. J. BFMOREST, OSCAR F. HARDER AND RICHARD RIMACHI

The nonferrous mining and metallurgical industry in Spain. E. Jimeno and I. R. Morral. *Metals & Alloys* 6, 371, 372 (1935) D. S.

The role of patents in modern metallurgy. A. W. Deller. *Metals & Alloys* 6, 303-6 (1935) D. S.

The physical chemistry of flotation. VI. The adsorption of amines by sulfide minerals. Pluse Evelyn Wark and Jan Wm Wark. *J. Phys. Chem.* 39, 1021-30 (1935), cf. C. A. 29, 6374. —The max contact angle at the line of triple contact, air-solid- $\text{H}_2\text{O}$  is independent of the particular amine chosen, being within a few degrees of  $60^\circ$  for all amines. The amine induces a more or less permanent effect on the mineral surface, probably because of adsorption. Of the minerals tested, the Cu minerals respond most readily and pyrite responds least readily to amines; activated sphalerite closely resembles chalcopyrite in its response. With hexylamine, sphalerite can be floated away from galena. Of the amines tested, the quaternary ammonium salts are most readily adsorbed. The higher the homolog, the lower the necessary concn, i. e., the ethylamines are more effective than the methylamines, the propylamines than the ethylamines, etc. The primary amines are the least active, the secondary amines are more active, and the tertiary amines are still more active. Three cyclic amines—amine,  $\alpha$ -naphthylamine and piperidine—are of about the same order of activity as isoamylamine, but tribenzylamine is much more active. Contact tests closely parallel actual flotation tests carried out in identical soils. In general, the amines are more readily adsorbed from acid than from alkali soils.

Further tests in flotation of free gold—effect of amyl xanthate and pulp pH on recovery is studied—acid wash to remove chemical films has beneficial result. Tests should be run with checks. John W. Johns. *Eng. Mining J.* 136, 498-9 (1935), cf. Lange, C. A. 29, 2481. —Results are shown of a series of flotation tests showing the effect of Am xanthate and the pH of the pulp on the recovery of placer Au. Very low Au recovery resulted when K Am xanthate and terpeneol were used alone, but marked improvement was evident when the pH was kept between 7.7 and 8.2 by addition of  $\text{H}_2\text{SO}_4$  or NaOH as required to keep between these limits. W. H. B.

Milling practice for small gold mines. C. S. Parsons. *Trans. Can. Inst. Mining Met.* 1935 (in *Can. Mining Met. Bull.* No. 282) 437-64. —There are 3 types of Au mills commonly used at small mines: (1) amalgamation and gravity concn, (2) amalgamation and flotation, and (3) cyanidation. Costs of a small mill will be \$6000-\$2000 per ton of ore treated per day. Operating costs (without taxes, depletion or depreciation) are \$7-\$12. The general design and layout of small mills are discussed in detail. The flow sheets of 8 small mills are given and discussed. Alden H. Emery

Manitoba's newest gold producer—a brief description of God's Lake Gold Mines, Ltd. J. P. de Wet. *Can. Mining J.* 56, 474-6 (1935) W. H. Boynton

Southern gold at Hog Mountain. N. O. Johnson. *Eng. Mining J.* 136, 503-10 (1935) —Progress in mining and milling with standard methods at the leading enterprise in the Appalachian Mountains is indicated. Recovery and increase in mill capacity are expected upon completion of the installation of finer crushing equipment, and the production of a low-grade primary concentrate (10:1 ratio of concn) which will be reground and re-floated in a sep ball mill and flotation circuit. A cyanide plant will be installed at a later date. W. H. B.

Cam and motor Gold Mine, Southern Rhodesia. Digby V. Burnett. *Mining Mag.* 53, 201-13 (1935), cf. *Ibid.* 34, 73 85 (1926). —At the surface the lodes appear as quartz veins, below the first level they assume the character of lode, comprising parallel quartz stringers with arsenopyrite and pyrite intimately mixed with a gang of quartz, Al and Ca silicates, and Mg carbonates. Wet crushing in Nissen stamps, concn and roasting constitute the present metallurgical practice. Originally, gravity concentrates and oil flotation concentrates were mixed together before roasting, but because of the finely divided nature and chem. compn of the latter a very poor extn was obtained with roasting and subsequent cyanidation. In consequence of this and the disappearance in depth of the Sb content of the ore, it was considered advisable to abandon flotation and resort to gravity concn, on sliming tables. The total tonnage of concentrates from all sources is 11% of the tonnage milled. After crushing and a rough mech. concn the ore is treated on special reconcng tables, the richest cut-off passes to an amalgamating barrel. Some 71% of the total output is recovered by amalgamation. The concentrates after roasting are water-washed and leached for 14 days with 0.15% KCN soln. The residues after roasting for 10 hrs at temps up to  $740^\circ$  are sent in a dump and weathered for 4 months, after which they are retreated by grinding and cyanidation. Tonnes and recoveries are tabulated. In 1935 an ore of value 35 81 s is treated with an extn. of 84% A. W. P.

Statistical microscopic study of ore and mill products from the Anyox plant of the Granby Consolidated Mining, Smelting & Power Co., Ltd., Anyox, British Columbia. R. F. Head, Arthur L. Crawford, F. R. Thackwell and A. Lee Christensen. *Bur. Mines, Rept. Investigations* No. 3290, 18 pp (1935). —Except for an insignificant amt. of covellite, the entire Cu content is present as chalcopyrite, the mill heads (classifier overflow) contain quartz 27.00, chlorite 12.50, phlogopite mica 5.00, feldspar (chiefly secondary albite) 3.00, calcite 3.00, bronzite, actinolite, tremolite, uranite, etc., 5.79, pyrite 18.37, pyrrhotite 17.88, magnetite, goethite, etc., 3.05, and chalcopyrite 3.41%. Avocon of the Cu and Fe minerals is very close. The ore is ground to liberate most of the Cu and to free the rest from gang and large particles of Fe sulfides capable of being floated in a low-grade concentrate that is reground and re-floated. An alk. of 0.11 lb CaO per ton of soln is maintained in the primary cells and 0.02 lb in the reagent. Reagent consumption is neutral cresote oil 0.10, K 1 (xanthate) 0.05, pine oil 0.06, hydrated lime 2.00, NaCN 0.023 lb per ton of ore. The flow sheet is given. The best concentrate is made at 150-mesh, in sizes smaller than 150 mesh free pyrite and pyrrhotite float in increasing quantities. Greater difficulty is experienced in rejecting pyrrhotite than pyrite. Magnetite rejection is fairly good and open to little improvement, since 50% is locked with chalcopyrite. Locked chalcopyrite is negligible at -400 mesh. In the tails 64.9% of the chalcopyrite is free. Data are given showing the amt. of pyrite, pyrrhotite, magnetite and chalcopyrite in each size of the classifier overflow, in the primary Sub-A concentrate, in the middling feed, in primary middling, in middling concentrate, in the scavenger concentrate, in primary Sub-A tails, in middling tails, and in general tails. Alden H. Emery

Stamp milling and amalgamation practice at Goldenville, N. S. L. H. Henderson. *Trans. Can. Inst.*

*Mining Met.* 1935 (in *Can. Mining Met. Bull.* No. 283), 473-4; cf. *C. A.* 29, 6183<sup>1</sup>.—Discussion. A. H. E.

Copper mining and smelting in Germany. O. Bertoya. *Metalurgia* 12, 165-8 (1935).—A description of the ore deposit, mining, smelting and refining at Mansfeld plant at Harz mountain. J. L. Gregg

Purification of gallium by fractional crystallization. James I. Hoffman and Bourdon F. Scribner. *J. Research Natl. Bur. Standards* 15, 203-9 (1935) (*Research Paper* No. 823); cf. *C. A.* 29, 699<sup>1</sup>.—When Ga contg. (as impurities) small amts of Sb, Bi, Cr, Co, Ch, Cu, Au, In, Fe, Pb, Mn, Hg, Mo, Ni, Os, Pd, Pt, Rh, Ru, Ag, Ti, Sn, V and Zn is subjected to fractional crystn of the metal, all the impurities named tend to conc in the cryst portion, with the following exceptions. Ag, Hg, In, Pb and Sn are concd in the molten residue. Cu and Ti remain about equally divided between crystals and residue. Zn is dissolved by the HCl under which the crystn takes place and is entirely eliminated. It is shown that the sepn from Fe or Pt in excess of 0.001% from In or Pb in excess of 0.01% or from Sn in excess of 0.02% by fractional crystn. of the metal is impractical. W. J. Peterson

Manganese vein on Gowland Mountain, Albert County, N. B. W. J. Wright. *Can. Mining Met. Bull.* No. 283, 575 (1935); cf. *C. A.* 29, 6183<sup>1</sup>.—Discussion. A. H. E.

Concentration of titaniferous ores at Taberg, Sweden, with and without heat treatment. Gust G. Bring and P. G. Kihlstedt. *Jernkonorets Ann.* 119, 303-42 (1935).—The ore consists of a magnetite network with interlamellar growths of ilmenite parallel to the octahedral surfaces. These lamellae have a thickness of 0.1-5  $\mu$ , so mech. sepn. is impossible. Moreover the gang (chiefly olivine) clings tenaciously to the ore by a run of tough hornblende. By heating to 1000° the hornblende becomes friable and crushing to free minerals is facilitated. The magnetite attached to the hornblende, however, makes the gang magnetic. By mixing with a little coal the magnetization can be slightly prevented. At 1150° the ore begins to give off gas, but at 1100° the ore begins to soften and is quite homogeneous. A high degree of concn. cannot be attained. H. C. Duus

Recovering zinc and vanadium at the Rhodessa Broken Hill plant. T. R. Pickard. *Eng. Mining J.* 136, 459-60 (1935).—Concn., acid leaching and electrolysis are employed at this plant. Flowsheets are given for gravimetric concn. of V ore, for leaching of V concentrates, for Cu and P, for removal of Cu and P, and for Zn-ore leaching. Al cathodes are employed; the Zn is stripped by native laborers, piled on cars and taken to the furnace room. W. H. Boynton

Direct determination of concentration of zinc vapor in thermal reduction of zinc oxide. Octave Dore-Henault and Claude Decroly. *Compt. rend.* 201, 726-8 (1935).—A preliminary note describing an arrangement for detg. the concn. of Zn vapor (a) immediately above the crucible and (b) in the condenser, and giving as examples of the results obtainable for (a) 19.4-19.8% and for (b) 3.4-3.8%, the temp. of the charge varying from 920° to 1075° and of the furnace from 988° to 1125° (cf. Maier, *C. A.* 24, 5644).

The uses and occurrences of chrome. Gordon H. Chambers. *S. African Mining Eng. J.* 46, Pt. I, 708-9 (1935).—General. Alden H. Emery

Blast-furnace slag. A valuable by-product. James Watson. *Iron & Steel Ind.* 8, 457-61; 9, 12-13 (1935). (E. H.)

A study of blast-furnace slag. L. Rodriguez Pire and J. Garrido. *Anales soc. espan. fis. quim.* 33, 703-12 (1935).—A crystal from blast-furnace slag was examd. optically and by x-rays, showing  $m(110)p(001)$ , period  $7.8 \times 10^{-8}$  for a prism edge. Chem. analysis gave  $SiO_2:CaMgO:Al_2O_3 = 6:10:1$ . E. M. Symmes

Design and construction of hot blast stores. Albert Mohr, Jr., and Fred Wille. *Blast Furnace Steel Plant* 23, 689-94, 702 (1935).—See *C. A.* 29, 5701<sup>1</sup>. E. H.

Melting nonferrous alloys in a copola-type furnace. W. C. Alvin. *Trans. Am. Foundrymen's Assoc.* 6,

737-44 (1935).—The necessary changes are described for adapting an ordinary Fe-melting cupola to one for melting nonferrous alloys. Metal-fuel ratios, losses, the advantages and disadvantages are detailed for this type of melting. Downs Schaal

Continuous pouring of Ford cylinder blocks. E. F. Cone. *Metals & Alloys* 6, 299-303 (1935).—From 6000 to 6500 Ford cylinder blocks as well as some 1300 tons of other castings are poured daily by taking metal from a blast furnace (producing standard foundry Fe) and placing it in a 400-ton mixer with a definite quantity (about 60%) of cast Fe from a battery of cupolas (cupola charge contains 15% steel scrap), after mixing the metal is transferred to 20-ton elec. furnaces for 20-30 min. where it is superheated to 1445° and from which the metal flows at intervals into a specially designed air furnace fired with pulverized coal which acts as a heating reservoir for the pouring operations. The metal from the air furnace flows into a movable pouring truck or ladle so synchronized in its longitudinal and rotating motions that it receives metal continuously and discharges it intermittently to the molds as they travel on the mold conveyor reel. D. S.

Castings by pressure. P. Roux. *Metall. Ind.* 131-4 (1935).—General principles and methods of casting by pressure are discussed. G. T. Motok

Finishing zinc and aluminum die-castings. Herbert Chase. *Machinery* 42, 120-2, 181-4 (1935), cf. *C. I.* 29, 4316<sup>1</sup>.—The relative merits of different methods designed to finish Zn and Al die-castings for pleasing appearance and resistance to corrosion are discussed. Low-cost procedures for cleaning, buffing, plating and polishing are described. Plating-bath compns. for nickel plating zinc and aluminum die-castings are given together with a recommended procedure for etching prior to plating. Methods of applying enamel, lacquer and varnish coatings are discussed. A. L. Kave

Recrystallization and grain growth in cold-worked polycrystalline metals. L. W. Eastwood, Arthur E. Bousa and C. T. Eddy. *Am. Inst. Mining Met. Engrs., Inst. Metals Div., Tech. Pub.* No. 644, 19 pp. (1935).—Complete quant. data are presented on the grain sizes of cold-drawn and cold rolled  $\alpha$ -brass just after the complete recrystn and after the coalescence produced by annealing. Several new principles are deduced, which may disprove many current misconceptions. The most important of these principles are: (1) The grain size just after complete recrystn. of  $\alpha$  brass is dependent only upon the compn. and history of the material prior to deformation and upon the degree of deformation. (2) All grain growth obeys the same laws, germination as such being generally nonexistent since there is no discontinuity in the size of new grains produced. (3) Abnormality of grain growth in  $\alpha$ -brass is not produced by temp. gradients. (4) The large grains produced by annealing metals contg. low degrees of strain are due to the large grains formed upon recrystn. rather than to the absorption of grains by "germinant grains" produced by a "critically strained" metal at the "germinant temp." (5) Annealed cold-worked metals that do not undergo an allotrope transformation have coarser grains with higher annealing temp. since rapid heating through the so-called "germinant temp." to a higher temp produces a coarser grain rather than a finer one. C. L. Mantell

Structure of polished metal surfaces. C. S. Lees. *Trans. Faraday Soc.* 31, 1102-6 (1935).—Specimens of Cu and Au were polished in 3 ways: (1) by hand on a pitch lap with water and rouge, (2) under different loads on wet rouged flannel on a rotating disk, and (3) on flannel and a com. liquid polish. Electron-diffraction photographs were made of these surfaces alternately with electrolytic etching. The Cu was etched with a soln of 4 g. of  $Na_2SO_4$  per l. The Au was etched with 5% KCN soln. In each of these metals there is an amorphous layer on the surface which is sepd. from the underlying undisturbed metal by a layer of fine crystals oriented so that the (110) planes are approx. parallel to the surface. It is suggested that this preferred orientation is due to deformation caused by pressure normal to the surface.

The thicknesses of these 2 layers are influenced by time of polishing, pressure used and polishing agent employed. On Cu the 2 layers together are 200-1000 Å deep. The amorphous layer is 2-40 Å deep and the oriented layer 150-500 Å deep when method (1) or (2), resp., is employed for polishing. Au has a much thicker oriented layer, 10,000 Å or over. It is suggested that Cu is polished mainly by abrasive action of the rouge while Au is polished largely by the pressure applied to the sample. H. A. S.

**Metallic cementation VI. Cementation by means of silicon powder.** Tsutomu Kase, *Kinzoku-no-Kenkyu*, 12, 397-410 (1935), cf. C. A. 29, 790<sup>1</sup>.—By means of com. Si powder the cementation of Si into Fe, Ni and Cu at various temps. between 500° and 1200° was investigated. For the surface layer of the cemented specimens, the depth of penetration was measured, microscopic examn and chem. analysis were carried out, and the oxidation at high temp and corrosion by H<sub>2</sub>SO<sub>4</sub>, HNO<sub>3</sub> and HCl were studied. Si diffuses into the metals above noted at a temp. over 500°, and the rate of diffusion increases as the temp. rises. The rate of diffusion of Si into Fe increases abruptly at the A<sub>1</sub> point of Fe. The relation between the increase of wt. of the specimen (ΔW) or the depth of penetration (P), and the abs. temp. of the cementation (T) is given by an exponential function  $\Delta W$  (or P) =  $ae^{-b/T}$ . The relation between the ΔW or P and the length of time for cementation (t) is given by the similar function  $\Delta W$  (or P) =  $ade^{bt}$ , where a and b are different constants in each case. Though the cemented surfaces of Fe and Ni are brittle, they resist atm. oxidation at high temp. and they are not easily attacked by dil. H<sub>2</sub>SO<sub>4</sub>. The surface of Cu cemented by Si tends to become porous and decrease the wt. of the specimens. Tomoo-o Sato.

**Surface hardening for bearing purposes.** Christopher H. Bierbaum, *Machinery* 42, 204-6 (1935).—Pairs of bearing surfaces with desirable properties are made by mating a case-hardened steel surface with one of hard or chilled bronze. Best results are obtained when hardness of case gradually blends into that of softer core. Sudden transitions in hardness giving bearing surfaces susceptible to cracking or checking should be avoided. Optimum conditions are given for the use of chromium plate and nitrided hard cases as bearing surfaces.

**Heat treatment by forced convection.** W. A. Darrah, *Metal Progress* 28, No. 5, 85-90 (1935).—Hot gases from oil or gas combustion are forced around work in the furnace. Greater uniformity and economy in heat treatment are claimed. Good results are obtained up to 1500-1600° F.

**Certainty of results as the basis for the manufacture of high test gray iron.** E. Piwowarsky, *Trans. Am. Foundrymen's Assoc.* 6, 707-9 (1935).—Tensile, transverse and shear strength, hardness and carbide content were detd. on cast Fe test pieces cut from hollow box-shaped castings poured from melts containing various amts. of Si, P, Ni, Cr, Mo, W and Cu. D. S.

**Scaling of iron and other metals.** Kurt Fischbeck and Franz Salzer, *Metallwirtschaft* 14, 733-9, 753-8 (1935).—The work of other authors on the scaling and oxidation of Fe, given in 42 references, is reviewed at some length. Scale formed above 570° on Fe consists of several layers. Next to the Fe is "oxide-rich," which is Fe with O in solid soln, then follow FeO, Fe<sub>2</sub>O<sub>3</sub>, and Fe<sub>3</sub>O<sub>4</sub>. At lower temps. FeO breaks up into oxiferite and Fe<sub>2</sub>O<sub>3</sub>. The compn. and thickness of the different layers and the speed with which they form depend on the compn. of the gas in contact with the metal, its pressure and velocity, and on the temp. and the resistance to reaction and diffusion. Equations giving the relation of these factors under various conditions are developed. The rate of scaling of Fe increases until the A<sub>1</sub> transformation point is reached, where a sudden drop occurs, after which the rate increases again. Scaling of Fe can be reduced by the addn. of 10% Al, 15% Cr or Al and Cr. The authors themselves investigated the oxidation of pure Fe wire in CO<sub>2</sub>, H<sub>2</sub>O, NO, SO<sub>2</sub>, and O<sub>2</sub> and of Mn in lump form in

O<sub>2</sub> at various temps. The increase in weight is plotted against time and the initial reaction velocity against temp. The latter curves for Fe have a sharp break at the A<sub>1</sub> point in the case of each gas except SO<sub>2</sub>. The oxidation in SO<sub>2</sub> was so rapid that it was not carried above 850°. The curve for Mn has a much smaller break at the transformation point than the Fe curves. The scale from a heavily oxidized Fe wire was removed by filing off thin layers, and each layer was analyzed for Fe content and some were examd by x-rays. About 95% of the scale consisted of FeO, the balance of the higher oxides.

C. E. Macfarlane.  
**Effect of high temperatures on the strength of soft and medium carbon steels under static and dynamic stressing.** K. Uhlemann, *Metallwirtschaft* 14, 773-8, 795-8 (1935).—Static tensile, impact and endurance tests with smooth and notched test bars, were made at 20°, 200°, 300°, 400° and 500° on 5 steels. A was a 0.12 C steel, B 0.50 C normalized, C 0.50 C heat treated, D 0.60 C quenched and drawn, E 0.70 C, 0.27 Ni, 0.06 Cr, 0.12 W heat-treated. All the steels showed the characteristic blue brittleness at 200-300°, as evidenced by increased tensile strength and lowered elongation and reduction in area. The yield point did not increase in this range. The endurance limit increased similarly, but reached its max. at higher temps. For steel B the max. was between 400° and 500°, for the others between 300° and 400°. At 500° the endurance limit was lower than at 20°, with the exception of steel B. For steels A to D the increase in tensile strength was up to 25%, the increase in endurance limit slightly higher, from 18 to 27%. With steel E the increase in tensile strength above room temp. was slight, the endurance limit dropped 7% and then rose slightly but did not regain its 20° value. The impact strength dropped at 400° to 500°. No relation was found between impact and endurance properties. The surface oxidation which occurred at 400° and 500° did not lower the endurance limit in the same manner as salt-water corrosion. The notched bars for endurance tests had a 45° notch, 3.5 mm deep. The ratio of notched to smooth endurance limit at 20° was close to 0.5 and did not change much at elevated temps. It was slightly higher for steel A than the others, and for steel C dropped to 0.34 at 500°. Some tests were also made with a 0.25-mm deep notch. The ratio was higher and varied more with C content, 0.8 for A, 0.66 for B, 0.62 for D, and 0.56 for E. Complete data are given in tabulations and in graphs. Thirteen references. C. E. Macfarlane.

**Shafts of 1040 steel hardened from controlled atmosphere.** S. K. Oberer, *Metal Progress* 28, No. 4, 4-10 (1935), cf. C. A. 29, 725<sup>2</sup>.—Air-natural gas mixts. are introduced with the work into a horizontal continuous furnace and heated to 1550° F. The work progresses against rising temp. Arrangements are made for vertical quenching. Hardness may be controlled to 58-60 Rockwell C. W. A. Mudge.

**Case hardening and case hardening steels.** Thomas W. Hardy, *Iron & Steel Can* 18, 51-3, 70-4 (1935).—A review. E. H.

**Case-hardening nickel-chromium steel ingots.** Sayo Nishigaki, *Tetsu-to-Hagane* 12, 723-6 (1935).—Non-metallic inclusions in steel ingots contg. C 0.13-0.18, Ni 3.30-4.18 and Cr 0.80-1.15% were nearly spherical and 0.12-0.25 mm in diam. The no. of inclusions was max. at the center of the ingot and min. at the "transcrystallization zone," of which the thickness was about 40 mm. The inclusions were shown microscopically to be iron oxide, not silicate nor sulfide. Tomoo-o Sato.

**High manganese steel.** L. Sanderson, *Metallurgia*

12, 171-2, 176(1935).—Properties and uses of Hadfield steel are discussed. J. L. Gregg

Transformation points of nickel steels. Marius Sauvageot and Edmond Rousseau *Compt. rend.* 201, 611-13 (1935).—Dilatometric curves for a steel (Ni 6, C 0.62, Cr 0.5, Mo 0.42) heated for 1 hr. at 650-775° and slowly (3 hrs.) cooled show that the transformation point observed by Andrew and Dickie (cf. C. A. 21, 3336) occurs below 0° when heating is to about 650°, but not at a higher temp. (but becoming less marked) as the max temp. is higher. It gradually disappears as Ar' and Ar'' appear. That the phenomenon is essentially due to Ni is confirmed by similar curves being obtained for steels contg. 11 and 20% Ni (C 0.10-0.15%). It is due to segregation of the Ni, possibly as FeNi (31.15% Ni). Mn appears to behave similarly. C. A. Silberrad

Comparison of nickel and nickel-chromium steels with ordinary carbon steels. A. Leblanc *Métallurg.* 10, 131-4(1935).—A general comparison of physical properties of steels based on mech. tests. G. T. Motol

Aluminum additions in modern commercial steels. H. W. McQuaid *Metal Progress* 28, No. 6, 33-7(1935)

Phosphorus as an alloying element in steel. H. W. Gillett *Metals & Alloys* 6, 280-3, 307-10(1935)

Aluminum and its alloys—with special reference to transportation. W. Warren Waterhouse *J. Inst. Engrs Australia* 7, 295-301(1935).—Methods for the production of Al and its alloys are outlined and their value is indicated. Applications in aircraft, pleasure craft and railway and highway transportation are pointed out. W. H. H.

The abnormal phenomenon of cast copper-rich copper-silicon alloys during heating. Takumi Taketani and Saburo Katori *J. Chem. Soc. Japan* 56, 1058-64 (1935).—The abnormal thermal expansion which takes place in heating the cast Cu-Si alloy contg. 3.0-7.5% Si at 200-800° has been studied. The phenomenon is attributed to the homogenization of the  $\alpha$ -phase, and the soln. of the  $\beta$ -phase into the  $\alpha$ -phase as solid soln. T. Katsuragi

The homogenization of cast structures in copper-rich copper-silicon alloys. Takumi Taketani. *J. Chem. Soc. Japan* 56, 1064-71(1935); cf. preceding abstr. With the increase of Si content the temp. needed to cause homogenization of the  $\alpha$ -phase becomes lower and the tendency of the  $\beta$ -phase to remain undissolved by heating predominates. T. Katsuragi

The constitution of alloys of copper, aluminum and silicon. I. The equilibrium diagrams of three binary systems. Chiyojo Hisatsune. *Tetsu-to-Hagane* 21, 720-12(1935).—By means of a differential method of thermal analysis, elec. resistance method and microscopic examn., the equil. diagram of the binary alloy of the Cu-Al system was investigated, and a new diagram was proposed. The hcpus of this system consists of 8 branches corresponding to the crystn. of  $\alpha$ ,  $\beta$ ,  $\gamma$ ,  $\delta$ ,  $\epsilon$ ,  $\eta$ ,  $\theta$  and  $\kappa$ . All  $\delta$  and  $\eta$  phases form solid solns. in some range of compn.  $\epsilon$  and  $\gamma$  phases show the polymorphic transformations, that is,  $\epsilon_1 \rightleftharpoons \epsilon_2$  and  $\gamma_1 \rightleftharpoons \gamma_2$ , resp. The  $\theta$  phase crystallizes directly from the melts and forms solid soln. in a narrow range. Tomo-o Sato

Magnetic hard iron-nickel-copper alloys. Preliminary report. H. Neumann. *Metallwirtschaft* 14, 778-9 (1935).—The existence of Fe-Ni-Cu alloys with high magnetic and low mech. hardness, which was recently reported by Dhal, Pfaffenberger and Schwartz (C. A. 29, 7257) is confirmed. Higher values for coercive force, for a slightly different compn., than the max. reported by the other authors were found, also a different effect of heat treatment. C. E. Macfarlane

A new bearing metal—a lead-base alloy. C. H. Hacking. *Metal Progress* 28, No. 5, 61-4(1935).—A Pb bearing alloy contg. 2.5% Ca, Sn and other hardening elements has high strength at temps. near melting and is used for high-speed gas engines. W. A. Mudge

Alloys of lithium with mercury and (with) indium.

G. Grube and W. Wolf. *Z. Elektrochem.* 41, 675-81 (1935).—Heating and cooling curves have been made of 67 alloys of Li with Hg. The Li-Hg system as constructed from these data is (the compn. of the alloy is stated in weight% Li) 0-0.6 pure Hg, 0.6-18.0 LiHg, 18.0-29.0 LiHg, 29.0-70.0 solid solns. of LiHg, 70.0-72.0 LiHg, 72.0-91.0 LiHg, 91.0-92.0 LiHg, 92.0-100.0 solid solns. of Li. One eutectic point lies at 0.6% Li and -42° and another at 92% Li and 160°. LiHg and LiHg in 375° and 690°, resp., are fusible without decompn. The upper existence limit of the other compds. are for LiHg, 161°, LiHg, 375°, LiHg, 340° and LiHg, 235°. All compds. except LiHg are formed perfectly. In the Li in system only 1 compd., LiHg, is formed which melts without decompn. at 625°. LiHg forms with Li a continuous series of solid solns. while with In it forms only a limited solid soln. The system between 0 and 10% Li requires more work for clarification. The compds. of these systems fit into the generalization regarding alkali metal compds. of Biltz and Zintl and their co-workers. H. A. Smith

The equilibrium diagram of the silver-rich silver-aluminum alloys, with a note on the nature of the transformations. Ichijū Obinata and Masami Hagiya. *Kinzoku no Kenkyū*, 12, 410-29(1935).—The equil. diagram of the Ag-Al system in the range 0-11% Al has been revised from the results of x-ray analysis at ordinary and high temps., elec. resistance methods and microscopic study. In the alloys contg. 5.6 to 8.2% Al an eutectoid and a metatectoid-reaction take place, the temps. of which are 615° and 420°, resp. The metatectoid reaction,  $\alpha + \gamma \rightleftharpoons \alpha_2\text{Al}$ , can easily be suppressed by water-quenching of the alloy. The eutectoid reaction,  $\beta \rightleftharpoons \alpha + \gamma$ , is but little suppressed by the same treatment. The alloys quenched from the  $\beta$ -field consist of the  $\gamma$ -phase, super-satd with Ag, showing idiomorphically the diffraction lines belonging to the hexagonal close-packed lattice. In the quenched hypoeutectoid alloys an anomalous increase of elec. resistance was observed at about 200° in heating. This was attributed to the formation of a compd. Ag<sub>2</sub>Al. The crystal structure of the  $\beta$ -phase has been detd. by means of x-ray analysis at high temp. This phase was of a body-centered cubic lattice, the parameter of which was found to be 3.295 Å at 700° (Al = 7.99%). Tomo-o Sato

Preparation and physical properties of amalgams of silver, tin and zinc. Kazumieri Duzcko. *Przemysł Chem.* 19, 10-13(1935); cf. C. A. 29, 2859.—The 2 amalgams with highest Ag content were prepd. by mixing Hg with electrolytic Ag. All others were prepd. by the electrolytic method—depositing each metal from its anode through a soln. of its salt and to the Hg cathode. Single potentials

Metal	in anal. gram	%	Prinell hardness	Density	Resistivity Ohm cm 30°	$F_{25}$ 18°	$F_{25}$ 23°
Ag	47	62	103.00	11.09	0.042 $\times 10^{-4}$	0.4381	0.8200
Ag	48	87	112.00	14.25	0.045 $\times 10^{-4}$	0.3433	0.8336
Ag	51	32	18.50	12.34	0.145 $\times 10^{-4}$	0.7083	0.8326
Ag	27	47	10.00	11.20	0.093 $\times 10^{-4}$	0.6512	0.8410
Ag	21	25	8.7	13.40	0.103 $\times 10^{-4}$	0.6374	0.8357
Ag	19	69	8.60	7.95	0.048 $\times 10^{-4}$	0.2350	0.2119
Sn	70	43	7.40	8.04	0.081 $\times 10^{-4}$	0.2325	0.2119
Sn	72	69	6.42	8.76	0.078 $\times 10^{-4}$	0.2250	0.2119
Ag	42	55	15.20	10.54	0.069 $\times 10^{-4}$	0.7538	0.7155
Zn	31	23	13.40	11.34	0.124 $\times 10^{-4}$	0.7698	0.7205
Zn	31	83	13.30	11.43	0.119 $\times 10^{-4}$	0.7519	0.7332

were measured against a Hg electrode. After prepn. the amalgams were pressed under a pressure of 2500 kg. Amalgams of Ag and Sn form chem. compds., while those of Zn form only an ordinary mixt. This is in agreement with results of Preston (C. A. 26, 411) and Stenbeek (C. A. 27, 6233). A. C. Zaichin

An investigation of the zinc-rich portion of the system iron-zinc. E. C. Truesdale, R. L. Wilcox and J. L. Rodda. *Am. Inst. Mining Met. Engrs., Inst. Metals Div., Tech. Pub. No. 651*, 37 pp.(1935).—New values for the soly. of Arceio iron in high-purity Zn were obtained by 3 direct sampling methods at temps. between 425° and 875°. These data are lower than all previously published

values, obtained from primary cooling-curve arrests. The solid soly of Fe in Zn was investigated by microscopical, elec-cond, x-ray and magnetic-susceptibility methods, but only the microscope gave useful results. The eutectic temp was detd from differential cooling-curve arrests. The 2 peritectic temps were relocated at new high values by cooling curves, but especially by heating curves, which were more accurate. The Zn-rich portion of the system has thus been fixed as follows. Solid soly of Fe in Zn, between 0.0009 and 0.0023%, m p of Zn 419.45°, eutectic temp not less than 419.40 ± 0.05°; lower peritectic 672 ± 1°, upper peritectic 782 ± 1°, soly of Fe in molten Zn 0.018% at 419.4° (the eutectic), 3.0% at 672°, 7.4% at 782°, 9.2% at 875°. All previous data bearing on the Fe-Zn system are critically reviewed, and the equil. diagram is brought up to date.

C. L. Mantell

Isomorphism of the ternary compounds  $Mg_2Zn_3Al_4$  and  $Mg_2CuAl_4$ . F. Laves, K. Lohberg and H. Witte. *Metallwirtschaft* 14, 793-4 (1935).— $Mg_2Zn_3Al_4$  was prepd. by melting the 3 metals together in the theoretical proportions, and a homogeneous melt was obtained.  $Mg_2CuAl_4$  could not be made by melting.  $CuAl_3$  and  $Mg$  in powder form were pressed under 20,000 atm. and heated 60 hrs at 500° to alloy them. Twelve alloys of various compns. were made and examd microscopically and by x-rays. Only the alloy corresponding to the formula  $Mg_2Zn_3Al_4$  showed lines corresponding to a cubic lattice.  $Mg_2Zn_3Al_4$  is also cubic. Both compds contain approx. the same at % of Mg, 37, and correspond to the formula  $Mg_2X_3Al_4$ , where X may be Cu, Zn or Al. The av radius of the X atom in both compds is about the same, 1.39 Å. and 1.41 Å. The lattice const.,  $a$ , for  $Mg_2Zn_3Al_4$  is 14.16 Å. and for  $Mg_2CuAl_4$  14.25 Å.

C. E. Macfarlane

Electrical conductivity of rust. Gunther Cohn. *Z. Elektrochem.* 41, 660-4 (1935).—For the local-element theory of corrosion the cond of rust must be appreciable and such detns are thus valuable. The conds of rusts (1) formed at 50° for 21 years on the inside of a cast iron condenser tube, (2) formed for many years on a garden bench near the sea coast, (3) formed for 206 years on a cast iron common submerged in sea water and (4) formed on an old Viking wrought iron sword in a dry place for 1000 years were detd. The compns of the rusts in percentage of  $Fe_2O_3$ , FeO,  $H_2O$ , total C and free C were, resp., for (1) 20.6, 41.4, 10.6, 7.9, 6.8, for (2) 50.3, 37.1, 9.2, 2.9, 1.5, for (3) 41.3, 23.1, 13.4, 8.8, 6.1; and for (4) 77.1, 7.2, 12.8, 1.2, 0.0. The total C and free C in the original iron in percentage were, resp., for (1) 3.0, 2.3, for (2) 2.9, 1.5, for (3) 7, and for (4) 0.25, 0.0. The specific conductivities for these samples of rust were, 19.7, 0.3, 28.0 and 0.8 mho per cm. The rust consisted of mixts of a  $FeO(OH)$  and  $Fe_2O_3$  with graphite and carbidite except for (3) where the crystal size was so small that sep x-ray diffraction lines could not be distinguished, except for graphite. These cond values are high because of networks of graphite and carbidite in the rust. These highly conducting networks are responsible, through their cond., for the corrosion-accelerating power of rust. The depolarizing action is effective through this action of the graphite and carbidite. The action of the C in the rust is similar to the action of graphite originally mixed with the Ni oxide used in the alk. or Leclanche cell. The elec. conds of 2 types of Acheson graphite with 0.44 and 0.08% ash and porosities of 29.8 and 31.4%, resp., were detd at 20° as 960 and 1420 mhos per cm.

H. A. Smith

Corrosion resisting materials in chemical industry. Evert Norlin, et al. *Medd Sterges Ind* 18, 68-108 (1935).—An introductory address followed by discussions.

A. R. R.

Corrosion of metals and alloys in speiron oil. Genji Shinoda. *Proc. Phys. Math. Soc. Japan* 17, 267-8 (1935).—Low-C steel, Cu, Al, Sn, Pb, Duralumin, 12%-Sn bronze, 40%-Zn brass, Constantan, Ni and Sn-solder were exposed for 1 month to the oil at 170-5°, at a pressure of  $10^{-1}$ — $10^{-2}$  mm. Al was most satisfactory on account of the lack of effect on both metal and oil. Steel

is best for the outer case. Solder cannot be used near the heater.

Gregg M. Evans

The corrosion of magnesium alloys. IV. The corrosion of ternary alloys of magnesium. Susumu Morioka. *Kinsoku-no-Kenkyu* 12, 322-56 (1935), cf. C. A. 28, 5796a.—Ternary alloys of Mg contg. Bi and Ca or Sb, 14 series of ternary alloys of Mg contg. 1-8% of 2 of the alloying elements, Zn, Cd, Sn, Pb, Al and Sb, except for Sb (0.3-3.0%), and those contg. Si and Mn or Co were subjected to the corrosion tests for 0.1 N NaCl soln. The ternary alloys of the systems, Mg-Zn-Sn, Mg-Zn-Cd, Mg-Sn-Cd, Mg-Sn-Pb, Mg-Zn-Sb and Mg-Sn-Sb were very resistant to corrosion, especially in the range of

Zn	1-3%	Sn	2-8%
Zn	3-6%	Cd	1-6% (Zn + Cd less than 10%)
Sn	more than 3%	Cd	1-3%
Sn	more than 4%	Pb	1-6%
Zn	1-6%	Sb	0.3-0.6%
Sn	2-3%	Sb	less than 0.8%

Welding. E. Jimeno, A. Modolelli and F. R. Morral. *Anales soc. esp. fis. quim.* 33, 690-708 (1935).—A general survey of welding gives the outstanding phys and chem. problems, and a macro- and micrographic study of 3 samples of welds shows the structure and hardness in the various regions. X-ray photographs show the defects.

E. M. Symmes

The corrosive action on metals of solutions of ammonium nitrate in liquid ammonia. I. M. Libinson, I. I. Kukushkin and A. S. Morozova. *J. Chem. Ind. (Moscow)* 12, 590-7 (1935).—Al is not corroded by concd.  $NH_3$  solns of  $NH_4NO_3$ , Pb and Sn are slightly corroded, Fe is strongly corroded and Zn is completely dissolved. The presence of  $H_2O$  in the soln. increases the corrosion of Fe, but when  $H_2O$  is entirely removed, the vapor pressure of the  $NH_3$  becomes too high for practical use. The mechanism of the corrosion is discussed. Oxidation of Fe surfaces by such compds as  $K_2CrO_4$  or coating them with Bakelite lacquers protects the surface. Prevention of disson of the  $NH_4NO_3$  by addn of  $CaCl_2$  or better,  $NH_4CO_3NH_3$ , also prevents corrosion. The partial pressure of  $NH_3$  over solns contg. 70-80%  $NH_4NO_3$  at 20-6° and 739-47 mm. varies from 220 to 450 mm.

Concentration of ores by flotation. Royal S. Handy. U. S. 2,019,306, Oct. 29. In the treatment of a finely divided ore such as complex Pb-Zn ore, natural colloidal matter is substantially completely removed by adding a deflocculating agent such as Na silicate substantially completely to release the ore from any depressing action of such matter in the subsequent pulp, water is added to the residual cryst. matter to form a deflocculated pulp free from any depressant, and this pulp is agitated and there is added to it an artificial colloidal material such as cum. glue in such selective quantity as definitely to depress all the different kinds of ore particles contained in the pulp and to permit the depressed particles to be subsequently acted upon by respective conditioning agents for selective flotation.

Metal separation by selective chloridization. Jesse O. Betterton (to American Smelting and Refining Co.) U. S. 2,019,470, Oct. 29. In the sepn of metals, such as Pb and Zn or Bi, by selective chloridization, corrosion of the app. employed in introducing Cl into the molten

metal bath is decreased by maintaining the temp. of the app. below the surface of the molten bath at a lower temp. than the surrounding molten metal by circulating a cooling medium through the app. out of contact with the Cl and molten bath. App. is described.

Treatment of oxidized ores Meyer Mineral Separation Co. Ger. 618,402, Sept. 9, 1935 (Cl. 40a. 2.60). See U. S. 1,898,018 (C. A. 27, 2059).

Treatment of sulfide ores Carl Gutz Ger. 618,185, Sept. 3, 1935 (Cl. 40a 11.50) Commuted sulfide ores are heated gradually with a solid, liquid or gaseous hydrocarbon material to a temp. somewhat above 1000° but substantially below the normal reduction temp. of the sulfide, e. g., below 1400° when CuS ore is treated. The treatment is effected in the absence of air but in the presence or absence of steam. The gases evolved in the process are returned to the furnace, with or without combustion gases or water gas. The treatment liberates the metals from the sulfides Cl C A 29, 439<sup>3</sup>.

Treatment of sulfide ores containing iron Charles R. Kuzell Ger. 618,186, Sept. 3, 1935 (Cl. 40a 13.70) See Brit. 309,690 (C. A. 28, 4514).

Chlorination of sulfide ores Raymond F. Bacon Ger. 618,183, Sept. 6, 1935 (Cl. 40a 2.60) See Brit. 374,071 (C. A. 27, 4040).

Multiple-chamber plant for reducing ores, etc., with gases Alaria Grütter (nee Pfeiffer) Ger. 614,953, June 22, 1935 (Cl. 40a 11.50) Addn. to 602,278 (C. A. 29, 5799).

Concentrating gold Stanley Tucker and Minerals Separation Ltd. Brit. 472,046, July 19, 1935 Au is combed, by forming the ore in finely ground condition into a pulp with H<sub>2</sub>O in the presence of a mercurial reagent, e. g., Hg or a Hg salt, e. g., Hg(CN)<sub>2</sub>, and free alkali cyanide, such that the surfaces of the Au particles present are modified by the reagent and then seep the Au from the ore by film or froth flotation. Hg, if used, is not used in amt. sufficient to effect amalgamation. A sulfidizing agent, e. g., an alkali polysulfide, alkali sulfide or S or an org. S deriv. of H<sub>2</sub>CO<sub>3</sub>, e. g., an alkali xanthate, a fat acid, e. g., oleic acid, and (or) a Sn salt, e. g., SnCl<sub>4</sub>, may be used in conjunction with the mercurial reagent.

Amalgamator for working fine gold. Ulysses H. Nottingham. U. S. reissue 19,739, Oct. 22. A reissue of original pat. No. 1,961,428 (C. A. 28, 4692).

Deoxidizing and purifying copper. Société d'Electrochimie, d'Electrometallurgie et des acides electriques d'Urgine. Brit. 430,520, June 20, 1935, and 430,869, June 26, 1935, divided on 430,520. These correspond to Fr. 770,362 (C. A. 29, 4439), 430,526 being restricted to the addn. of metals and 430,869 to the addn. of metal-7 loids. Cl. C. A. 28, 5031<sup>4</sup>.

Refining copper. Norddeutsche Affinerie. Brit. 430,563, June 20, 1935. Cement Cu, in non-briquetted form, is melted down and refined in an internally heated rotary-drum furnace. The Cu is so charged as to be on the bottom and both side walls of the furnace and preferably contains 6-15% H<sub>2</sub>O as a result of drying and re moistening, or is preheated to between red heat and the m. p. in a drum or circular furnace provided with rabbling arms.

Condensing magnesium vapor. Frank R. Kemmer (to American Magnesium Metals Corp.). U. S. 2,018,203, Oct. 22. The vapor is caused to impinge against a cooled surface provided with a film of liquid inert to Mg, such as kerosene, to condense the Mg to a solid state, and the surface is continuously moved to present new cooled areas and fresh liquid film to the vapors and maintain continuous condensation, while excluding air. App. 9 is described, and U. S. 2,018,266 also relates to such app.

Condensing magnesium vapors. Oesterreichisch Amerikanische Magnesit A.-G. Brit. 431,537, July 10, 1935. In the condensation of Mg vapors from gases consisting of or contg. CO, the vapors are quickly cooled by direct contact with a liquid indifferent to Mg and which protects the Mg from chem. reaction down to a temp. at which a reaction between the Mg and CO no longer takes place,

e. g., room temp. Cooling liquids, e. g., hydrocarbon oils, that wet the Mg powder, are used. App. is described. Zinc. La Nouvelle Montagne Soc. anon. Ger. 618,463, Sept. 10, 1935 (Cl. 40a. 34.30). Compact Zn is recovered from powd. mixts. of Zn and ZnO by fusing the mixts. with NH<sub>4</sub>Cl in an amt. 1.5-2.5 times that required to convert the ZnO into ZnCl<sub>2</sub>. Layers of fused Zn and ZnCl<sub>2</sub> are obtained, and the excess of NH<sub>4</sub>Cl volatilizes. The treatment is particularly applicable to the powd. deposits which accumulate in the tubes of Zn distn. retorts.

Zinc. Octave Dony-Hénault. Fr. 784,407, July 22, 1935. The sepiu of liquid Zn in the distn. of this metal is made complete by interposing a diaphragm of artificial carbon, of fine and regular texture, capable of allowing gases to pass but retaining the heavier metal vapor.

Deoxidizing zinc Metamine G. m. b. H. Ger. 618,464, Sept. 9, 1935 (Cl. 40a 34.80) Fused com. Zn is agitated, at a temp. within its solidification range, with a metal which has a higher m. p. than Zn and a greater affinity for O, e. g., Cu, Al or Mg. A chloride, sulfide or like compd. of such a metal may also be used.

Compound metal articles I. G. Farbenind. A.-G. (Franz Dufschmid, inventor) Ger. 618,063, Sept. 2, 1935 (Cl. 43a 5) Layers of different metal powders, e. g., layers of powd. Fe and Ni or layers of powd. Fe-Ni mixts. of different compn., are superimposed and sintered together, and the product is subjected to mech. treatment, e. g., compression or rolling, in a reducing atm. Numerous details are given, and various modifications are indicated. Thus, a layer of a metal oxide may be included, or one or more of the layers may be sintered separately before the other layers are applied.

Furnace for reducing ores Akt.-Ges. Brown, Boveri & Cie. Ger. 618,184, Sept. 5, 1935 (Cl. 40a 11.50). Details are given of an internally heated furnace to which reducing gases are supplied and in which a no. of superimposed traveling bands support the ore.

Metallurgical furnaces. Maurice H. V. Delot and Roland A. Pigal. Brit. 432,497, July 29, 1935. A smelting furnace, preferably of the rotary type, is heated by a burner that produces an annular flame with an inert cone, the burner being so directed that the flame is flattened by contact with the bath of molten metal.

Metallurgical furnaces. Eduard Wecke Ger. 618,216, Sept. 4, 1935 (Cl. 18a. 11.01) Means is described for preventing the destruction of furnace arches and suspended roofs through thermal expansion.

Rotary-tube furnace suitable for roasting pyrites, etc. Carl P. Debusch (to American Lurgi Corp.). U. S. 2,019,397, Oct. 29. Structural, mech. and operative details.

Rotary hearth furnace for production of lead from sulfide ores. Felix Freiherr von Schluppenbach (to American Lurgi Corp.). U. S. 2,018,242, Oct. 22. Various structural, mech. and operative details.

Metal-heating furnaces. John Fallon. Brit. 430,833, June 26, 1935. In a continuous furnace for heating sheets or plates, having a roller-way conveyor comprising a series of rollers geared together for rotation at uniform speed, electrically operated means is provided for imparting, at intervals, a high-ejecting speed to a variable no. of rollers at the discharge end.

Heat-treating furnaces having roller-way conveyors comprising rollers carrying work-supporting disks. Driver-Harris Co. Brit. 431,450, July 8, 1935. Divided on 429,781 (C. A. 29, 7139<sup>9</sup>).

Fusion furnace for metals. Paul L. C. Blanchard, Maurice H. V. Delot and Roland A. Pigal. Fr. 784,660, July 22, 1935. The flame is annular and composed of a layer of carbon particles in combustion directed on to the metal.

Blast-furnace tuyères. Vereinigte Stahlwerke A.-G. (Theodor Richter and Karl Heilmann, inventors). Ger. 615,795, July 12, 1935 (Cl. 18a. 5). Addn. to 610,239 (C. A. 29, 3643<sup>9</sup>).

Means for securing metal bands to blast-furnace shafts

Demag A-G Ger 618,274, Sept. 4, 1935 (Cl. 18a 4.01)

Cupola furnace fired with gaseous, liquid or pulverulent fuel Peter Marx Ger. 611,120, Sept. 20, 1935 (Cl. 31a 1.10)

Discharge device for furnaces for annealing sheet metal. Benno Schilde Maschinenbau-A-G Ger. 618,452, Sept. 9, 1935 (Cl. 18c 9.50)

Apparatus for charging furnaces with materials such as sheet steel in annealing boxes. Clarence L. Taylor (to Aetna Standard Engineering Co.). U. S. 2,019,102, Oct. 29. Mech. features.

Furnace for coating wire with molten metal as in coating wire with spelter Wm E. Weaver (to General Elec. Co.). U. S. 2,019,283, Oct. 29. Various structural and operative details.

Thermal treatment of metals and alloys. Gesenkschmiede Handwerks m. b. H. Ger. 618,279, Sept. 6, 1935 (Cl. 18c 8.80). In treating metals or alloys in gas-fired or elec.-heated hearth furnaces having a heart of reducing material, scaling is prevented by repeatedly turning the metal or alloy so that the whole surface is brought into contact with the hearth.

Apparatus for bending and hardening leaf springs. Vulkanhammer - Maschinenfabrik Hans Gestmann. Ger. 618,434, Sept. 9, 1935 (Cl. 18c 2.21).

Hardening and quenching continuous treads of car wheels Alfred Walcker (to American Steel Foundries). U. S. 2,019,281, Oct. 29. A plurality of streams of quenching fluid are directed against the tread so that each of the streams is disposed at an acute angle to an axial plane through the tread at the point of impact of the stream.

Pickling metals Henkel & Cie G m b H. Fr. 784,182, July 22, 1935. Comps. which contain at least one thiosulfuric acid ester group in the mol are added to pickling baths to reduce corrosion. Such comps. include Na benzylthiosulfate,  $\text{OHC}_6\text{H}_4\text{CH}_2\text{SSO}_3\text{Na}$ ,  $\text{NaSO}_3\text{SCl}_2\text{COOR}$ ,  $\text{CH}_3\text{CH}(\text{SSO}_3\text{Na})\text{COOR}$  (where R is  $\text{C}_6\text{H}_5$ ,  $\text{C}_6\text{H}_4$ ,  $\text{C}_6\text{H}_3$ ,  $\text{C}_6\text{H}_2$ ,  $\text{C}_6\text{H}$ ,  $\text{Et}$ ,  $\text{SSO}_3\text{Na}$  and the Na salt of aryl and octyl-thiosulfuric acid ester).

Apparatus for pickling coiled strips of wire, etc. Stephen L. Williams (to Extended Metal Products Co.). U. S. 2,019,206, Oct. 29. Structural and mech. features.

Hot-plating containers such as milk cans with material such as molten tin Isaac J. B. Demers (to Superior Metal Products Co.). U. S. 2,018,951, Oct. 29. Various operative details are described.

Extensometer suitable for testing wire, sheet metal, etc. Constantine D. Timokitis (to Baldwin-Southwark Corp.). U. S. 2,017,876, Oct. 22. Various structural, mech. and operative details.

Apparatus for testing the tensile and compression strengths of materials such as metals Albert E. Arthus U. S. 2,018,773, Oct. 22. Structural, mech. and operative details.

Apparatus for degreasing wire with volatile solvents. Clarence F. Dazley (to James H. Bell). U. S. 2,018,648, Oct. 22. Various structural, mech. and operative details.

Magnets Siemens & Halske A-G Brit. 431,210, July 3, 1935. A permanent magnet carried on the end of a train to operate a relay over which the magnet travels is in the form of an ellipsoid of rotation and is made of a non-magnetic steel alloy having a coercive force of over 300 Oersted, e. g., an alloy contg. Al 2-25, Ni 6-30% and the remainder Fe with or without addns. of Co, Cr, W and (or) Mn. In an example, the alloy contains Al 10, Ni 20, Fe 70% and the remainder is Cr and Co.

"Industrial iron" production from iron sponge. Hermann Esser. U. S. 2,018,200, Oct. 22. Iron sponge contg. C and Fe or Fe in its original pulverulent form is pressed into a rough form, and the pressed material is further treated in an extrusion press which causes a considerable flow of the particles and friction between them which causes them to become further heated. The product may be formed into tubes or bars. App. is described.

Carbonizing iron and steel Ewald Harns. Ger

618,025, Aug. 30, 1935 (Cl. 18c, 3.15). The material is treated in known manner with a gaseous or vaporized carbonizing agent until the rate of carbonization begins to slacken. The supply of carbonizing agent is then cut off, and the material is kept at a temp. near the lower critical temp. in an inert atm. or in vacuo until a sufficient proportion of C has diffused inward from the surface of the material. The carbonizing treatment is then resumed.

Steel Abdul M. Malik and Sardar M. K. Alvi Brit. 431,260, July 1, 1935. Steel is manufd. from pig Fe contg. Si up to 1 and P of about 0.1-1.75% in basic converters without increasing the P content by using a preheated blast in the converter. If the Si content is higher than 1%, cold blast is used until the Si is reduced to 1% or less and then the preheated blast is used. The temp. of the blast varies from 200° to 900° according to the P and Si present. The tuyères are made of fireclay contg. 40%  $\text{Al}_2\text{O}_3$ .

Alloy-steel machine elements such as axles and toothed gears. Augustus B. Kinzel (to Electro Metallurgical Co.). U. S. 2,018,257, Oct. 22. Machine elements designed to withstand shock at temps. between about -20° and -80° and having at such temps. an Izod impact strength of at least 10 foot lbs. are formed of an alloy steel contg. Fe together with Cr 0.25-3.25, Cu 1.25-0.25 and C not over 0.5%.

Overhead electric-transmission line, Frank F. Fowle and Frederick M. Crapo (to Indiana Steel & Wire Co.). U. S. 2,019,447, Oct. 29. A steel conductor is used contg. at least 0.25% of C, not more than 0.3% Mn and not more than 0.15% Si.

Overhead electric-transmission line, Frederick M. Crapo (to Indiana Steel & Wire Co.). U. S. 2,019,445, Oct. 29. A conductor is formed of C steel which contains less than 0.5% C, less than 0.3% Mn when the C exceeds 0.25% and which has been quenched from above its  $A_1$  crit. temp. by a liquid medium which has a temp. below the m. p. of Fe.

Difficultly fusible alloy. Jean Mayor. Fr. 784,229, July 22, 1935. The constituents of the alloy, e. g., W carbide 85, Co 12 and Ni or Mo 3%, are heated in a closed mold under vacuum until the constituents are fused, whereby a pressure is exerted on the alloy until the moment of cooling. The constituents may be introduced in the form of powder or pieces.

Hard alloys Allgemeine Elektricitäts-Ges. Ger. 618,127, Sept. 2, 1935 (Cl. 49b 17). See Brit. 385,629 (C. A. 27, 2769).

Aluminum alloys Vereinigte Leichtmetall Werke G. m. b. H. Brit. 431,842, July 16, 1935. Age-hardenable Al alloys contain Cu 3-5, Mg 1.3-1.4, Si 0.4-0.7 and Mn 1.25-1.45%.

Alloys of barium with aluminum. John E. McCarty and Donald W. Randolph (to General Motors Corp.). U. S. 2,018,143, Oct. 22. Ba provided with an oxidation-preventing coating such as pyroxaline lacquer is immersed in molten Al maintained at a temp. of about 700-750°, resultant slag is removed, another portion of Ba is similarly added, slag is again removed, and these operations are continued until the desired proportion of Ba has been added, the melt being then held for a few min. to insure thorough alloying and then poured into a suitable mold.

Aluminum magnesium alloys. I. G. Farbenindustrie A-G Brit. 419,774, June 24, 1935. Cold-worked Al-Mg alloys that contain at least 3% Mg, are free from any intentional addn. of Si and may contain up to 1.5% of addl. elements, e. g., Mn, Zn, Ca, are improved by subsection to annealing under such conditions of temp. and duration as to preclude recrystallization. Cl. C. A. 28, 6957.

Separating the components of copper and silver alloys I. G. Farbenindustrie A-G Brit. 432,144, July 22, 1935. Alloys contg. 30-70% Cu with the remainder consisting substantially of Ag are treated with Cl<sub>2</sub> whereby, after the reaction has started, a fluid chloride melt is formed without further application of exothermic heat. The melt is poured into a solvent for  $\text{CuCl}_2$ ; when dil. HCl and (or) a NaCl soln. is used, AgCl is recovered as

such, but by using an excess of  $\text{NH}_4\text{OH}$ , the Ag is liberated as metal and  $\text{CuCl}_2$  is formed and retained in soln. To control the temp. of reaction, neutral salts, e. g.,  $\text{NaCl}$ ,  $\text{CaCl}_2$ , that increase the soly. of  $\text{CuCl}$  in the solvent used may be incorporated in the reaction mixt.

**Hardening copper-zinc alloys.** Imperial Chemical Industries Ltd. Ger. 618,465, Sept. 9, 1935 (Cl. 404,160). See Brit. 370,177 (C. A. 28, 1653).

**Iron alloys.** Fried. Krupp A.-G. Brit. 431,248, July 3, 1935. Addn. to 423,900 (C. A. 29, 6064). Fe alloys capable of pptn. hardening and suitable for cutting and hot-working tools contain W 10-35 and (or) Mo 2-12, Co 25-50, C 0.1-1, Cr 3-15 and V, Ti and (or) Ta up to 10%. If there is only 1 of the last 3 metals, there is at least 6 times as much V as C or at least 4 times as much Ti as C or at least 6.5 times as much Ta as C. If there is more than 1, there is a corresponding total amt. in relation to the C. The alloys are heat-treated by cooling quickly from about 1000° and then reheating Cl. C. A. 29, 6763.

**Iron alloys, deoxidizing steel.** Société d'électrochimie, d'électrometallurgie et des aciéries électriques d'Ugine. Brit. 431,329, June 27, 1935. Fe alloys are made by violently intermixing a molten fluid slag other than a deoxidizing slag that has been exhausted by a violent intermixing with oxidized steel, the slag contg. 1 or more oxide compds. of alloying substances, with a molten ferrous metallic bath that reduces the said oxide compds., the violence of the intermixing being such that the slag is finely divided and dispersed in the metal, the slag being sepd. from the molten alloy after the turbulence has subsided. For producing Fe-Ni, Fe-Mo and Fe-Cu alloys, the ferrous bath itself acts as the reducing agent, the slag contg., e. g., Ni silicate,  $\text{CaMoO}_4$  or  $\text{CuO}$ , resp. Reducing agents, e. g., C,  $\text{CaC}_2$ , Al, Si, Mn, Fe-Ti, Ca, Ti, Al silicide, Ca silicide, may be added to the bath, e. g., for the reduction of Cr ores contained in the slag. For the production of alloys contg. reducing agents, e. g., Si, Al, Mn or Ti, excess of such agent is added to the ferrous bath, the excess being ealed to correspond to the amt. of oxides to be reduced in the slag. The ferrous bath may be of deoxidized Fe, steel that has been deoxidized by violent intermixing with very fluid non-reducing slags capable of extg. the oxides dissolved therein, or Fe alloys, the alloying element or elements being that or those to be reduced from the slag or some other element or elements. Basic, neutral or acid slags may be used, e. g., slags contg.  $\text{SiO}_2$ ,  $\text{CaO}$ ,  $\text{Al}_2\text{O}_3$ , titanic acid,  $\text{MgO}$ , alkali, Fe oxide or Mn oxide. For example, a slag may contain  $\text{SiO}_2$ ,  $\text{CaO}$ ,  $\text{MgO}$  and  $\text{Al}_2\text{O}_3$ ; in this case, by the use of Si-Al and Si-Ca as reducing agents, it is sufficient to add  $\text{MgO}$  to the slag to compensate for losses due to manipulation.

**Iron alloy.** Alloy Research Corp. Fr. 784,293, July 22, 1935. Fe alloys of high heat resistance contain Ni, Cr, Mo and Cu. Mn, Si and Al may also be present. Examples are: (1) Cr 18, Ni 8, Mo 2.8, Cu 2.8, C 0.1%, (2) Cr 18, Ni 8, Mo 3, Cu 2.5, W 2.5, C 0.1%, (3) Cr 18, Ni 8, Mo 1.5, Cu 1.5, Mn 3, C 0.1%, the rest being Fe in each case.

**Rustless iron alloys.** Alloy Research Corp. Brit. 431,469, July 1, 1935. An alloy of inherently fine grain structure comprises Cr 10-50, C 0.00-0.09, N 0.00-0.2 and Ni, Mo, W, V and (or) Cu 0-3%, the remainder being substantially Fe. Small amts. of Mn and Si may be present. Cl. C. A. 28, 58024.

**Magnetic iron alloys.** Swift, Levick & Sons Ltd., Geo. D. L. Horsburgh and Frederick W. Tetley. Brit. 431,660, July 12, 1935. Permanent magnets are made from Fe alloys contg. Al, Ni, Cu and Co, with or without other elements, e. g., Cr, the casting being rapidly cooled from 850-1350° and thereafter hardened at 550-725°. The alloys may contain Al 5-20, Ni 10-25, Cu 1-15 and Co 1-20%. The casting may be subjected to the above heat treatment directly or may be cooled before being heated to 850-1350°.

**Magnetic iron alloys.** Heihachi Kamura. Brit. 431,675, July 18, 1935. Addn. to 420,543 (C. A. 29, 3293).

1 Modifications of the alloys of 420,543 contain also 0.01-2.5% Si, with or without up to 1% Ti.

**Magnetic nickel-iron alloys; annealing.** Telegraph Construction & Maintenance Co. Ltd., Walter F. Randall and Frank H. Smith. Brit. 430,987, June 21, 1935. In the manuf. of magnetic Ni-Fe alloys contg. 30-60% Ni to which has been added at least 1 element of low solid soly., e. g., Ag, Be, Sb, Mg, Ca, Cu, the alloys are annealed at 900° or over to form a homogeneous solid soln., cooled sufficiently rapidly to obtain a state of supersatn. of the added element or elements in solid soln., subjected to an amt. of cold working sufficient to reduce them to their final size, e. g., a reduction of thickness of 10-80%, and then soaked at over 250° but below 500° sufficiently long to produce a pptn. of some of the added element or elements. One or more freely sol. resistance elements, e. g., Cr, Mo, Mn, W, Al, Si, V, Co, may be added to the alloys. Cu may act as a pptg. element or as a freely sol. element especially when 1 of the other freely sol. elements is present. In an example, 28.5 parts of an alloy contg. Ni 40, Fe 60, Mn 0.5 and Cr 1.5 parts are melted with Ag 1.5 parts and the alloy cast, the casting is hot forged, annealed at 1100° for 30 min., cold rolled without intermediate annealings down to 0.01-in. strips and sheared; the cold-rolled strip is then soaked for 2 hrs. at 300°.

**Foils, wires, ribbons and tape of magnetic alloys.** Heraeus-Waackenschmelze A.-G. Brit. 427,205, Apr. 17, 1935. Magnetic alloys for use in elec. app. involving the use of small magnetic fields have an initial permeability of over 800 and are produced as tape, etc., by drawing or rolling to a thickness not exceeding 0.03 mm, the constancy of permeability under working conditions being thereby increased. The tape, etc., may be subjected to cold deformation after a preceding annealing. Alloys contg. Fe 50, 19, Ni 50, 76 and Cu 0.5 are mentioned. In 431,511, July 5, 1935, divided on 427,205, such wires, etc., are incompletely annealed after a preceding cold working to improve the constancy of permeability under working conditions. The annealing consists of a heat treatment at such temp. and for such time as will modify the magnetic properties appreciably but not to the extent obtained by heating above the crit. temp.

**Removing alloying metals from lead and its alloys.** National Lead Co. Brit. 431,353, July 5, 1935. See U. S. 1,976,333 (C. A. 28, 72419).

**High-strength nickel-cobalt-iron-titanium alloys.** Geo. P. Halliwell (to Westinghouse Elec. & Mfg. Co.). U. S. 2,018,520, Oct. 22. Alloys which are suitable for engine valves or valve seats are formed of Ni 20-70, Co 60-10, Fe 5-50 and Ti 0.5-10% and are quenched from a temp. of 900° or higher and aged at 500-800° for at least a half hr.

**Sintered alloys of tungsten carbide and carbonitride with metals such as tungsten and cobalt.** Richard R. Walter. U. S. 2,018,752, Oct. 29. Alloys suitable for machining tools, etc., are formed from W carbide or carbonitride 50-80 and a metal such as W and Co.

**Journal brass for rail-vehicle axles.** Walter Peyerlinghaus. U. S. 2,018,417, Oct. 22. An alloy is used formed from Mn 1.5-7.0% together with a lead-bronze contg. Cu and 10-30% Pb.

**Coated centrifugally cast metal pipe.** Frederick C. Langenberg and Horace S. Hunt (to U. S. Pipe and Foundry Co.). U. S. 2,018,025, Oct. 22. An externally coated centrifugal metallic pipe mold is coated with a finely divided dry coating material such as ferro-Si of which not more than 5% is retained on a 150-mesh screen and not less than 10% on a 200-mesh screen (various operative details being described).

**Coppering iron.** Ernst Stettler Sohn. Swiss 176,045, June 1, 1935 (Cl. 44b). The Fe surface is cleaned, polished and treated with a coppering soln. consisting of an aq. soln. of  $\text{CuSO}_4$  and  $\text{HCl}$ . The coppered surface is then washed with an alk. liquid.

**Aluminum bronze powder.** Dale M. Boothman (to Aluminum Co. of America). U. S. 2,017,850, Oct. 22. Thin flat Al such as foil or sheet material is coated with material such as tallow, lard, oil or stearic acid to prevent

welding of overlapping pieces under rolling pressure, then thinned by rolling to break up the metal and form flakes. U. S. 2,017,551 relates to rolling Al coated with lubricant to form flakes in the form of a cake which is then broken up. App is described.

Treating aluminum surfaces to coat them. Herbert B. Wertheber (10% to Bentoo H. Grant and 70% to Richard F. Grant) U. S. 2,018,694, Oct. 29. The surface is subjected to the action of an aq. alk. soln. of borax and boric acid (suitably at the h. p.).

Coating aluminum and its alloys. Peintal soc. anon. Swiss 175,365-7, May 10, 1935 (Cl. 444). Al and its alloys are given a firm corrosion-proof covering by first forming an oxide layer and then treating with a soln. of chlorinated rubber products (175,365). A corrosion-proof oxide coating is given to Al or its alloys by treatment with an aq. alk. bath at temps above 100° (175,366). Another method is to form an oxide coating on the Al or alloy and then apply a coating of aq. asphalt emulsion (175,367).

Coloring aluminum. Peintal soc. anon. Swiss 176-414, July 1, 1935 (Cl. 91). Colored patterns are formed on Al or Al-alloy surfaces by first producing an oxide layer on the surface, coloring this and then etching away this layer in the required pattern by an alk. reagent.

Coloring aluminum articles. James F. Leahy (to Atlas Tack Corp.). U. S. 2,019,229, Oct. 29. Articles such as buttons or eyelets are treated with a soln. of an oxidizing agent such as a hot dil. soln. of  $\text{Na}_2\text{Cr}_2\text{O}_7$  and  $\text{Na}_2\text{CO}_3$  to form an oxide coating and are then treated with an alk. soln. such as one of  $\text{Na}_2\text{CO}_3$  and having a pH of about 10-11, and are finally treated with a dye-forming dye to form an insol. color lake on the articles. Cl. C. A. 29, 43321.

Coloring aluminum objects. Peintal soc. anon. Swiss 176,415, July 1, 1935 (Cl. 91). Al objects are colored by oxidizing the surface, forming a pattern on this layer with a water repellent such as bees wax, and finally treating the surface with an aq. soln. of dye or coloring matter. The water repellent may be itself colored.

Coloring aluminum and its alloys. Siemens & Halske A-G (Alexander Jenny and Nikolai Budloff, inventors). Ger. 615,692, July 9, 1935 (Cl. 484 3). Addn. to 607,012 (C. A. 29, 17664). A light-sensitive coating, produced on superficially oxidized Al or Al alloy as described in Ger. 607,012, is uniformly exposed to light and then converted into a colored coating by any of the usual photographic developing, fixing and toning processes.

Coloring the surface of aluminum and its alloys. Martin Tosterud (to Aluminum Colors, Inc.). U. S. 2,018,398, Oct. 22. An adsorbent oxide coating is formed on the surface and in this coating there are adsorbed coloring substances such as various metal compounds.

Producing colored protective coatings on zinc. Heinz Diehauer. Ger. 615,665, July 9, 1935, 615,815, July 12, 1935 and 615,911, July 15, 1935 (Cl. 484 3). Addn. to 613,024 (C. A. 29, 54117). In the process of Ger. 613,024, (1) the baths used are improved by adding 1-2% of  $\text{NH}_4\text{Cl}$  (615,665), (2) the heavy metal sulfate is replaced by other salts of heavy metals, and the  $\text{NiSO}_4$  molybdate by other molybdates (615,815) and (3) the baths are regenerated after use by addn. of up to 3% of K bitartrate (615,911).

Rustproofing compositions. Eberhard Wurbs. Brit.

431,641, July 10, 1935. See Ger. 567,349 (C. A. 28, 64139).

Inhibiting the interior corrosion of sealed metallic containers such as cans containing foods. James E. McConkie (to American Can Co.). U. S. 2,018,682, Oct. 29. The inside of the container is provided with a coating such as a varnish or lacquer and which contains a Ca sulfite or  $\text{Na}_2\text{SO}_3$ .

Uniting corrosion-resisting plates or sheets such as those of stainless steel with an intervening plate or sheet of mild steel. Wallace C. Johnson and Alfred E. Maskrey (to Pyralone Corp.). U. S. 2,018,725, Oct. 29. Various operative details are described.

Electric welding apparatus. Conrad L. Neffler (to Western Elec. Co.). U. S. 2,018,379, Oct. 22. App. is described in which the force compressing together materials to be welded is gradually reduced to zero as their fusion together is effected. U. S. 2,018,380 relates to welding Al or Cu rods or the like under specified pressure and c-d. conditions, and describes app.

Apparatus for welding silicon-steel sheets for magnetic uses. Ralph E. Asbury (to American Rolling Mill Co.). U. S. 2,017,933, Oct. 22. Mech. features.

Welding or fusing bar or rod. Walter S. Bingham. U. S. 2,018,116, Oct. 22. A rod is formed of an alloy of Fe, conig, C, Mn, Si, P and S in such proportions that a weld deposit made with the rod on a larger mass of parent metal and air-cooled from the molten state has the cementite structure of hypoeutectic white cast iron and a brittleness less than that of such white cast iron.

Welding fluxes. The British Thomson-Houston Co. Ltd. Brit. 430,722, June 24, 1935. A flux for use in elec. arc welding and preferably used as a coating on an electrode comprises substantially equal parts of feldspar (I),  $\text{TiO}_2$  and liquid Na silicate. A preferred flux consists of 100,  $\text{TiO}_2$  100, low-C Fe-Mn 8, liquid Na silicate 100 and  $\text{H}_2\text{O}$  47 parts. A tape of cellulosic material, e. g., cotton, may be impregnated with the flux and folded longitudinally about an electrode core with its edges abutting 1 another and parallel to the axis of the core. A substantial layer of flux may be provided between the core and the impregnated tape.

Welding fluxes. The British Thomson-Houston Co. Ltd. Brit. 431,324, July 4, 1935. A flux for use in arc welding and preferably used as a coating on an electrode comprises approx. feldspar 1,  $\text{TiO}_2$  1, liquid Na silicate 2 parts and C equal to 0.5-2% of the total of the preceding ingredients. The preferred flux consists of feldspar 21.52,  $\text{TiO}_2$  22.52, liquid Na silicate 45.05, petroleum rock 0.9 and  $\text{H}_2\text{O}$  9.1 parts.

Solders; fluxes. Harold Turner and Johnson, Matthey and Co. Ltd. Brit. 431,584, July 11, 1935. A solder, particularly for use with rustless or stainless Fe or steel alloys consists of Ag 4-80, Mn 1-40 and Cu 10-70%. Up to about 1% of a deoxidizing agent, e. g., Al, Si, P, may be present. The solder may be used with a flux of a fluoride and  $\text{H}_3\text{BO}_3$  or a borate, e. g., powder borax glass 60 and KF 40%.

Soldering strip for securing joints of metal such as electrical splices. Harold W. Burk (50% each to Ralph M. Burk and Ufa E. Guthrie). U. S. 2,018,117, Oct. 22. A sheet of metal such as Al is provided on one side with a layer of soldering material and on the opposite side with a layer of readily inflammable material and is sufficiently pliable to be bent to conform to the joint to which it is to be applied.

## 10-ORGANIC CHEMISTRY

CHAS. A. RUTILLER AND CLARENCE J. WEST

Aurochromes and resonance. C. R. Burry. *J. Am. Chem. Soc.* 57, 2115-17 (1935).—A general discussion of the role of resonance in the color of dyes. C. J. W.

Reaction between sulfur dioxide and olefins. III. Higher olefins and some limitations of the reaction. L. Ryden and C. S. Marvel. *J. Am. Chem. Soc.* 57,

2311-14 (1935); cf. C. A. 29, 72761.—Ten vols. of liquid olefin and 10 vols. liquid  $\text{SO}_2$  with 1 vol. 3%  $\text{H}_2\text{O}_2$  and 1 vol.  $(\text{CH}_3\text{O})_2$ , allowed to stand about 12 hrs., gave the following polyulfones: methylpropene,  $(\text{C}_3\text{H}_5\text{SO}_2)_n$ , m. (Bloc Maquenne, decromin) 340°, 80% yield, 2-pentene, m. 290-300°, 75%; 1-pentene, m. 340°, 80-90%, 1-

of Klenk and Ditt. P. A. Levene and P. S. Yang. *Ind.* 751 — Polimeral A. P. Lothrop

Preparation of ethylenimine from ethanalamine Henry Wenker *J. Am. Chem. Soc.* 57, 2328 (1935) —  $\text{HOC}_2\text{H}_4\text{NH}_2$  (610 g) and 1020 g of 96%  $\text{H}_2\text{SO}_4$  heated rapidly over a free flame until charring begins at 250°, give 71%  $\text{CH}_2=\text{CH}_2$ ,  $\text{NH}_3$ ,  $\text{O}$ ,  $\text{SO}_2$ ,  $\text{O}$ , distn with 40%

NaOH gives 28.5% of  $\text{C}_2\text{H}_5\text{NH}_2$ , b. 55–65°. C. J. W.

Preparation and properties of acetyl-d- and acetyl-l-methylcholine chloride Randolph T. Major and Howard T. Bonnett. *J. Am. Chem. Soc.* 57, 2125–6 (1935) — d-Dimethylaminoisopropanol (I), b.m. 124–6°,  $[\alpha]_D^{25}$  –17.1°, is obtained by resolution of the dl-isomer with bromocamphorsulfonic acid in LiOAc; d-tartaric acid gives the l-isomer, b. 125°,  $[\alpha]_D^{25}$  –14.8°. I and MeI give d- $\beta$ -methylcholine iodide, m. 170–7°, a. 24.7°; the l-isomer, m. 176.5–7.5°,  $[\alpha]_D^{25}$  –24.7°, d- $\beta$ -methylcholine, m. 165–7°,  $[\alpha]_D^{25}$  38.8°, l-isomer, m. 165–7°,  $[\alpha]_D^{25}$  –38.2°, d-acetyl- $\beta$ -methylcholine chloride (II), m. 200–1°,  $[\alpha]_D^{25}$  41.9°, l-isomer (III), m. 201–2°,  $[\alpha]_D^{25}$  –41.3°. The muscarine-like action on the blood pressure of III is  $1/10$  that of the dl-isomer, that of II is somewhat greater than that of the dl-isomer. The action of III on the isolated intestine is considerably less and that of II is comparable to that of the dl form. C. J. West

The crystalline and gelatinous salts of phosphoglyceric acid C. Neuberg and W. Schuchardt. *Biochem. Z.* 280, 293–6 (1935), cf. C. A. 28, 7240° — Phosphoglyceric acid gives beautifully crystalline salts with Ba or Cd, but with Co, Zn, Mn, Fe<sup>++</sup> or UO<sub>2</sub> it yields glass-clear gelatinous compds. The present study deals with the salt formation of the synthetic racemic acids. The formation of these gelatinous compds is less marked with racemic 3-phosphoglyceric acid than with the optically active acid. With racemic 2-glyceric acid phosphoric acid this tendency is so slight that a gelatinous salt was prepd only with UO<sub>2</sub>, whereas with Cd an amorphous product was formed. The benzenoid salt is as beautifully crystalline as that with the isomeric 3-phosphoglyceric acid. S. Morgulis

Action of hydrogen peroxide upon simple carbon compounds III. Glycolic acid H. Shupley Fry and Kenneth L. Milstead. *J. Am. Chem. Soc.* 57, 2260–72 (1935), cf. C. A. 25, 2968° — Since the yields of  $\text{HCO}_2\text{H}$  to those of  $\text{H}_2$  were invariably greater than 2, which ratio, according to the equation  $2\text{HCO}_2\text{H} + \text{CO}_2 + 3\text{H}_2\text{O}_2 \rightarrow \text{H}_2 + 2\text{HCO}_2\text{H} + 2\text{CO}_2 + 4\text{H}_2\text{O}$  (I), is 2, 1, it follows that the reactions represented by this equation and  $\text{HOCH}_2\text{CO}_2\text{H} + 2\text{H}_2\text{O}_2 \rightarrow \text{HCO}_2\text{H} + \text{CO}_2 + 3\text{H}_2\text{O}$  (II) were concurrent. Secondary reactions are  $\text{HCO}_2\text{H} + \text{H}_2\text{O}_2 \rightarrow \text{CO}_2 + 2\text{H}_2\text{O}$  (III),  $2\text{H}_2\text{O}_2 \rightarrow 2\text{H}_2\text{O} + \text{O}_2$ . The extents of the occurrence of the reactions represented by I, II and III with increasing concn of  $\text{H}_2\text{O}_2$  are. II shows a tendency to decrease, I, small variations, and III a tendency to increase. The sums of the percentage quantities of the  $\text{H}_2\text{O}_2$  active in the several reactions (equations I, II and III) and the inactive or directly decomposed  $\text{H}_2\text{O}_2$  are, within the limits of exptl. error, practically 100% of the initial quantities of the  $\text{H}_2\text{O}_2$  employed in each exptl. run. The  $\text{HOCH}_2\text{CO}_2\text{H}$  can also be accounted for in practically 100%. The results serve to check quantitatively the accuracy not only of the exptl. method employed, but also of the equations derived for the 3 reactions assumed to occur and the extents of their occurrence, resp., when  $\text{H}_2\text{O}_2$  reacts with  $\text{HOCH}_2\text{CO}_2\text{H}$ . C. J. West

Configurational relationships of acids of the isopropyl and isobutyl series to those of the normal series — P. A. Levene and R. E. Marker. *J. Biol. Chem.* 111, 299–312 (1935) — Substances of the type  $\text{Me}(\text{CH}_2)_m\text{R}(\text{CH}_2)_n\text{CH}(\text{CH}_3)_x$ , where m was varied, holding n const., and vice versa, were studied to det. the effect on rotation of substitution of a normal radical by a branched chain. Substitution of an iso-Pr for a normal Pr group produces a significant effect on the rotation both with respect to sign and numerical value. As compared with members of the normal Bu series, those of the iso-Bu series show differences in the direction of rotation only in the case

of 2-isobutyl-1-bromopentane, the rotatory dispersion curves of which are being studied. The rotations of the members of the iso-Bu series compared with those of the iso-Pr series show similarity in the direction of rotation in 3 cases and it is suggested that a difference in the partial rotation of 1 of the 2 significant constituents may exist. Removal of the iso-Pr group by a  $\text{CH}_3$  from the asym. center brings about a difference in the effect of this group on the rotations similar to that observed with the hydrocarbons and secondary carbinols contg. this group. Removal of an iso-Pr group by 2  $\text{CH}_3$  groups from the asym. center causes little change in the rotations from those of the corresponding normal Pr substances. By methods previously described (C. A. 29, 5827°) the following were prepd.: l-MeCHCHMeCO<sub>2</sub>H (I), b. 90°,  $[\text{M}]_D^{25}$  –21.9°; d-MeCHCHMeCO<sub>2</sub>Et, b. 146°, d. 0.866,  $[\text{M}]_D^{25}$  38.5°; d-MeCHCHMeCH<sub>2</sub>OH, b. 142°, d. 0.823,  $[\text{M}]_D^{25}$  6.3° (Ac deriv., b. 147°,  $[\text{M}]_D^{25}$  3.8°); d-MeCHCHMeCH<sub>2</sub>Br, b. 140°, d. 1.190,  $[\text{M}]_D^{25}$  30.6°; d-MeCHCHMeCH<sub>2</sub>CO<sub>2</sub>H, b. 109°, d. 0.921,  $[\text{M}]_D^{25}$  16.6°; d-MeCHCHMeCH<sub>2</sub>CO<sub>2</sub>Et, b. 165°, d. 0.889,  $[\text{M}]_D^{25}$  20.5°; d-MeCHCHMeCH<sub>2</sub>CH<sub>2</sub>OH, b. 164°,  $[\text{M}]_D^{25}$  31.2°; d-MeCHCHMeCH<sub>2</sub>CH<sub>2</sub>Br, b. 162°, d. 1.109,  $[\text{M}]_D^{25}$  56.6°; MeCHCHMeCH<sub>2</sub>Br, b. 90°, d. 0.695,  $[\text{M}]_D^{25}$  28.3°; MeCHCHMeCH<sub>2</sub>CO<sub>2</sub>H, b. 92°, d. 0.912, n<sub>D</sub> 1.4278,  $[\text{M}]_D^{25}$  –13.7°; MeCHCHMeCH<sub>2</sub>CO<sub>2</sub>Et, b. 117°, d. 0.899,  $[\text{M}]_D^{25}$  –18.1°; MeCHCHMeCH<sub>2</sub>CO<sub>2</sub>Et, b. 164°, d. 0.855,  $[\text{M}]_D^{25}$  21.5°; MeCHCHMeCH<sub>2</sub>CH<sub>2</sub>OH, b. 157°, d. 0.816,  $[\text{M}]_D^{25}$  –10.8°; MeCHCHMeCH<sub>2</sub>CH<sub>2</sub>Br, b. 68°,  $[\text{M}]_D^{25}$  –7.5°; MeCHCHMeCH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>H (II), b. 91°, d. 0.9012,  $[\text{M}]_D^{25}$  –1.1°. All values for d are for d<sub>20</sub> unless otherwise stated; for  $[\text{M}]_D^{25}$  at 25° and are calc'd max. values, except those for I and II which are not max. R. C. Elderfield

Synthesis of homocysteine. Wilbur L. Patterson and Vincent du Vigneaud. *J. Biol. Chem.* 111, 393–8 (1935) — Na (23 g) was added to MeOH (150 cc) and followed by  $\text{PhCH}_2\text{SH}$  (124 g). When the Na was dissolved,  $\text{Cl}(\text{CH}_2)_4\text{Cl}$  (I) (380 cc) was added, the mixt. shaken and the violent reaction checked by cooling in ice. After pouring into  $\text{H}_2\text{O}$ , sepd. the product and removing I at 100 mm., distn gave 71% of benzyl  $\beta$ -chloroethyl sulfide (II), b. 114–16°. To Na (46 g) in abs EtOH (1 l) was added  $(\text{EtO})_2\text{C}_2\text{H}_5$  (480 g), followed by I (373 g). After refluxing 6 hrs., the mixt. was slowly added to KOH (560 g) in 2 l of 50% EtOH and boiled 1 hr. Removal of the alc. acidification with HCl, extrn. with Et<sub>2</sub>O, and crystn. from  $\text{C}_6\text{H}_6$  gave 75% of benzylthiothymalonic acid, m. 114–17°. To this (127 g) in Et<sub>2</sub>O (1 l), Br (28 g) was slowly added at 0° during 15 min. The mixt. was poured into concd.  $\text{NH}_4\text{OH}$  (1300 cc). After 48 hrs., when all was in soln., excess  $\text{NH}_3$  was removed in vacuo, concd. HCl (200 cc) was added and the soln. heated 1 hr. Neutralization to litmus with  $\text{NH}_4\text{OH}$  gave 3-benzylhomocysteine (III) (65 g). To III (40 g) in liq.  $\text{NH}_3$  (300 cc) was added, with stirring, Na in slight excess. After evapn. of the  $\text{NH}_3$ , the residue was treated with  $\text{H}_2\text{O}$ , and, after acidification to phenolphthalein with HCl, removal of unchanged III, aeration in the presence of  $\text{FeCl}_3$ , 75% of homocysteine (IV) was obtained. III with Na and BuOH gave 78% of IV. R. C. Elderfield

Synthesis of crystalline cystinylglycine and benzylcystinylglycine and their isolation from glutathione Hubert S. Lonnig and Vincent du Vigneaud. *J. Biol. Chem.* 111, 385–82 (1935) — Dicarboxycystinyl chloride coupled with glycine (3 mols) in N NaOH gave dicarboxycystinylglycine (I), m. 182–3° ( $\text{EtOAc}$ ),  $\text{Et ester}$ , m. 168°. To I (6.2 g) in liq.  $\text{NH}_3$  (II) (50 cc) was added Na (17 g). After appearance of the blue color, II was evapd.,  $\text{H}_2\text{O}$  added and the soln. neutralized with III and aerated. Acidification with HCl, concn. and addn. of EtOH pptd. cystinylglycine (III) (2.7 g), m. 210° (Dennis bpt.),  $[\alpha]_D^{25}$  –67.5° ( $\text{H}_2\text{O}$ ), –86.0° (N HCl). Amorphous cystinylglycine (IV) was obtained by pptn. of the residue from evapn. of II obtained above with  $\text{H}_2\text{SO}_4$ . To III (0.76 g) in II (15 cc) was added Na (0.3 g) followed by  $\text{PhCH}_2\text{Cl}$  (0.6 g). Evapn.

(1933), cf. *C. A.* 27, 2629) Likewise diphenimide (III) and II in Et<sub>2</sub>O on standing ppt. *N*-methylphenimide, m 108°, while the mother liquor yields very small quantities of an undensified compd., m. 183°, and an undensified compd., m. 150°. An undensified methylphenimide was obtained by Wagerhoff (*Ann.* 252, 22) from Na diphenimide and MeI. C. C. Davis

**Mechanism of oxidation processes.** XLII. The degradation of citric acid. Heinrich Wieland and Robert Sonderhoff. *Ann.* 520, 150-6 (1933); cf. *C. A.* 29, 4320<sup>7</sup>.—It has been shown previously (*C. A.* 27, 4872) that citric acid (I) is decomposed by yeast into 2 AcOH, HCO<sub>2</sub>H and CO<sub>2</sub>. Longer action of the yeast produces H<sub>2</sub>, which probably results from the decomposition of the HCO<sub>2</sub>H. It is probable that CO(CH<sub>2</sub>CO<sub>2</sub>H)<sub>2</sub> is an intermediate product in the decomposition of I, its reaction with yeast and that of CH<sub>2</sub>(CO<sub>2</sub>H)<sub>2</sub> are described. The aerobic dehydration of I is discussed. C. J. West

**Hydrogenation of carbon dioxide and a correction of the reported synthesis of urethane.** Mark W. Fawcett and Homer Adams. *J. Am. Chem. Soc.* 57, 2222-3 (1935), cf. *C. A.* 29, 723<sup>7</sup>.—In an attempt to prep. *N*-pentamethylenesulfolamide through the reaction of Me sulfolate and piperidine at 250° under H<sub>2</sub>, Wojcik and A. (*C. A.* 29, 723<sup>7</sup>) obtained a product which they reported as Ph *N*-pentamethylenesulfoethan; it is now shown that the product is a mixt. of PhOH and formylpiperidine. The hydrogenation of CO<sub>2</sub> to HCO<sub>2</sub>H in the presence of an amine takes place at 80° or less over Raney Ni. The rate and temp. necessary for hydrogenation apparently varies with the structure of the amine as well as with the catalyst. At 230° sheet brass is an active catalyst. If the hydrogenation is carried out much above 100° the formate is dehydrated, giving the amide (formylamine). 2,2,6,6-Tetramethyl-4-hydroxypiperidine in EtOH with Ni at 100° for 6 hrs. gives 67% of the formate of the amine (47% after 3 hrs.), piperidine at 150° gives in 9 hrs. 76% of *N*-formylpiperidine, AmNH<sub>2</sub> at 150° in 5 hrs. gives 45% *N*-formylamine, b<sub>p</sub> 124-5°. 1-Phenyl-2-aminopropanol at 80° in 1 hr. gives 53% of the formate of the amine. *O*-Aminopropiophenone at 80° in 1 hr. gives the formate of the amine (its purity did not justify calcn. of the yield), *N*-butyl-2-methylpiperidine at 100° in 6 hrs. gives the formate of the amine. Piperidine in PhOH at 250° in 5 hrs. with brass gives 50% of *N*-formylpiperidine. Ph(CH<sub>2</sub>)<sub>3</sub>NH<sub>2</sub> in PhOH at 250° in 4 hrs. with brass gives 23% *N*-formyl deriv. AmNH<sub>2</sub> in PhOH at 250° in 5 hrs. with brass gives 33% of the *N*-formyl deriv. *N*-Formyl-8-phenylethylamine, b<sub>p</sub> 180-1°. *N*-*N*-Dimethylurea, m. 88°. *β*-Phenylethylamine formate, m. 128-9° (decolor). 2,2,6,6-Tetramethyl-4-hydroxypiperidine formate, m. 207°. 1-Phenyl-2-aminopropanol formate, m. 169° (decolor). The possible mechanism of the reaction is discussed. C. J. West

**Separation of guanidine and methylguanidine by means of *β*-naphthalenesulfonyl chloride.** W. C. Hess and M. X. Sullivan. *J. Am. Chem. Soc.* 57, 2331-2 (1935).—Butyl-*β*-naphthalenesulfonylguanidine, m. 204-6°, results in 93% yield from 1.5 g. guanidine (I) carbonate and 1 cc. 5 N NaOH in 10 cc. H<sub>2</sub>O and 4.5 g. *C*-CuH<sub>3</sub>SO<sub>3</sub>Cl (II) in 10 cc. Et<sub>2</sub>O, it contains 2 mols. H<sub>2</sub>O, at 24° 109 cc. H<sub>2</sub>O dissolves 9 mg. Methylguanidine (III) does not react under these conditions, but with 110 cc. III in H<sub>2</sub>O and 220 g. II in Et<sub>2</sub>O with 2.5 cc. 5 N NaOH, *β*-naphthalenesulfonylmethylguanidine, m. 101-2°, seps in 65% yield. Creatine, creatinine, glycoamine and glycoxyamine do not react. From a mixt. of 50 mg. each of I and III, 90% of the I and 43% of III may be sepd. C. J. W.

**Rearrangement of allyl ethers in the purine series, with some remarks on the hydrogenation of allyl ethers.** Ernst Berkmann and Heuz Neumhold. *J. Chem. Soc.* 1935, 1263-7.—2,6-Dichloro-7-methylpurine (I) and CH<sub>3</sub>CHClCH<sub>2</sub>OH with Na, heated 3 hrs. at 100°, give 7,6-diallyl-7-methylpurine (II), m. 111-12°. Catalytic reduction of II gives heteroxanthine (III). Heating II at 170° for 2 hrs. gives 1,2-diallyl-7-methylxanthine, m. 227-8°, which does not give III on reduction. I and 2,4-hexanediol with Na, heated 4 hrs. at 165° with shaking,

give 1,2-bis(α-methyl-2,4-pentenyl)-7-methylxanthine, yellow, b<sub>p</sub> 216-22°, rearrangement occurring during distn. as racem; O<sub>2</sub> gives EtCHO and EtCO<sub>2</sub>H. Catalytic reduction of Ph allyl ether gives 75% PhOPr and 25% free PhOH. 2,6-Dipropoxy-7-methylpurine m. 92°; this is not changed on treatment with H<sub>2</sub> and Pd. C. J. West

**Constitution of the purine nucleosides.** III. Potentiometric determination of the dissociation constants of methylated xanthines. Alexander G. Ogston. *J. Chem. Soc.* 1935, 1376-9; cf. *C. A.* 29, 741<sup>7</sup>.—Values of p<sub>K</sub> are reported as follows, the 2 values being in H<sub>2</sub>O and 90% EtOH at 18°: xanthine 7.7, 9.3; 1-Me 7.7, 9.2; 3,7-di-Me 9.9, 11.3; 3-Me 8.5, 8.6; 1,3-di-Me 8.6, 8.7; 7-Me 8.5, 8.2; 1,7-di-Me 8.5, 8.7; 9-Me 6.3, 6.8; 1,9-di-Me 6.3, 6.6; xanthosine 6.0, 6.6. The basic functions in all cases are very weak; in terms of potential, the buffering produced was of the same order of magnitude as the reproducibility of the liquid junction potential, so no accurate estimate of their consts. could be made. The values show that substitution of the 1-position produces no change in the dissociation constants in most cases; it is probable that where the dissociation constants of different xanthines have the same values, the structures are similar, in those having "Zwitter" ion structures the distribution of the charge in the mol. will have the controlling effect of the dissociation constants, since this is largely detd. by the elec. work of removal of the proton and an identity of the values of the constants argues an identity of charge distribution. Xanthosine is probably substituted in the 9-position. Structures of several of the above compds. are discussed. C. J. West

**Chemistry of the tetrose sugars.** I. A crystalline triacetate of d-threose from the degradation of strontium xylonate with hydrogen peroxide. Nomenclature in the tetrose group. Robert C. Hockett. *J. Am. Chem. Soc.* 57, 2260-4 (1935).—Electrolytic reduction of xylone in NaBr-SrCO<sub>3</sub> soln. gives 95% of Sr d-xylonate, with 5 mols. H<sub>2</sub>O, [α]<sub>D</sub><sup>20</sup> 13.2° (0.4260 g. in 25 cc. H<sub>2</sub>O); oxidation with H<sub>2</sub>O<sub>2</sub> and acetylation gives 15% of d-threose triacetate, m. 117-18° (cor.), [α]<sub>D</sub><sup>20</sup> 35.65° (0.891 g. in 26.18 cc. CHCl<sub>3</sub>); the mol. wt. indicates that it is a monomer. MeONa in dry MeOH-CHCl<sub>3</sub> gives d-threose, with an equl. rotation of -12.3° (1.1288 g. in 50 cc. H<sub>2</sub>O); the sugar was characterized as d-threosamine, m. 164-5°, dibenzylidene-d-threitol, m. 218-22°, [α]<sub>D</sub><sup>20</sup> -78.2° (0.1800 g. in 25 cc. CHCl<sub>3</sub>), and bromine d-threosate, m. 197-8° (cor.), [α]<sub>D</sub><sup>20</sup> -36.8° (0.4420 g. in 25 cc. H<sub>2</sub>O). Oxidation gives d-tartaric acid. Certain errors in nomenclature in the tetrose group are corrected. II. The degradation of d-xylone by the method of Wohl.

The rotation of d-threose. Ibid. 2265-8.—Acetylation of the reaction product of d-xylone and NH<sub>4</sub>OH HCl with MeONa gives 48% of tetraacetyl-d-xylonic nitrile, m. 81-2° (m. ps cor.), [α]<sub>D</sub><sup>20</sup> 50.3° (0.7815 g. in 25 cc. CHCl<sub>3</sub>); concd. NH<sub>4</sub>OH gives 78% of d-threosidacetic acid, m. 165-7°, [α]<sub>D</sub><sup>20</sup> -10.85° (0.5970 g. in 25 cc. H<sub>2</sub>O); tri-Ac deriv., m. 179-80°, [α]<sub>D</sub><sup>20</sup> 74.2° (0.3434 g. in 25 cc. CHCl<sub>3</sub>). Quant. hydrolysis of I with 0.1 N H<sub>2</sub>SO<sub>4</sub> at 100° shows a rate corresponding to 4 (mins and decimal logs) = 0.0063 = 0.0013 and permits detn. of the equl. sp. rotation of d-threose in dil. acid as -12.5°, during hydrolysis the rotation is found to drift toward a small l-rotation. The formation of the tri-Ac deriv. indicates an aldehydo structure for I. The prepn. of d-erythrosamine and benzylidene-d-threitol from I hydrolyzates shows the identity of the sugar formed with that obtained by deacetylation of d-threose triacetate.

C. J. West  
d-Xylomethylolose and derivatives. P. A. Levene and Jack Compton. *J. Biol. Chem.* 111, 325-33 (1935); cf. *C. A.* 29, 2923<sup>7</sup>.—A general method for obtaining pentomethyloloses from pentoses, consisting in the catalytic reduction of the α-halogen aldose deriv. to the corresponding aldolmethylolose, is given. 5-Iodomonoacetone-d-xylolose (I) was prepd. by the method of Levene and Raymond from 5-tosylmonoacetone-d-xylolose I (20 g.) in abs. MeOH (150 cc.) was reduced with Raney's Ni catalyst (III) with addn. of 10% NaOH soln. (40 cc.). After 1 hr.

the filtrate from II was satd. with  $\text{CO}_2$ , concd. and the residue extrd. with  $\text{Et}_2\text{O}$ , giving a quant. yield of acetone-*d*-xylose (III), m. 69–70° (lit.  $\text{O}$ -petr. ether),  $b_p$  86–7°,  $[\alpha]_D^{20}$   $-21.0^\circ$  ( $\text{H}_2\text{O}$ ),  $-18.2^\circ$  ( $\text{CHCl}_3$ ). This with  $\text{Ac}_2\text{O}$  in  $\text{C}_6\text{H}_5\text{N}$  (IV) gave 3-acetylmannoacetone-*d*-xylose,  $b_p$  79–80°,  $[\alpha]_D^{20}$   $-1.4401$ ,  $[\alpha]_D^{25}$   $-2.55^\circ$  ( $\text{CHCl}_3$ ). III with  $p\text{-MeC}_6\text{H}_4\text{SO}_3\text{Cl}$  in IV gave the 3-oxyl deriv., m. 41–2° ( $\text{C}_6\text{H}_5\text{N}$ ),  $[\alpha]_D^{20}$   $-18.02^\circ$  ( $\text{CHCl}_3$ ), which on hydrolysis with alc. KOH gave III, thus showing that no apparent Walden inversion occurs during the hydrolysis III on hydrolysis with 1%  $\text{H}_2\text{SO}_4$  at 100° for 1 hr gave sirupy *d*-xylose (V),  $[\alpha]_D^{20}$   $-2.16^\circ$  (abs.  $\text{EtOH}$ ),  $[\alpha]_D^{25}$   $-13.26^\circ$  ( $\text{H}_2\text{O}$ ), *p*-bromophenylhydrazide, m. 69–70° (iso- $\text{PrOH}$ ),  $[\alpha]_D^{20}$   $-26.05^\circ$  (IV); *p*-bromophenylazone, m. 175–6°,  $[\alpha]_D^{20}$   $64.7^\circ$  (IV- $\text{EtOH}$ ), becoming const. after 18 hrs. at 20°. *p*-phenylazone, m. 179–80°,  $[\alpha]_D^{20}$   $66.6^\circ$  (IV- $\text{EtOH}$ ), becoming const. after 18 hrs. at 0°. V and  $\text{Ac}_2\text{O}$  in IV gave the tri-*Ac* deriv.,  $b_p$  105–6°,  $n_D^{20}$  1.4422,  $[\alpha]_D^{20}$   $60.87^\circ$  ( $\text{CHCl}_3$ ). R. C. Elderfield

Crystalline *d*-gulonemethose and derivatives. P. A. Levene and Jack Compton *J. Biol. Chem.* 111, 335–46 (1935).—By application of the Kiliani cyanohydrin reaction to pentomethyloses, hexomethyloses have been made available. To *d*-xylose (50 g.) in  $\text{H}_2\text{O}$  (110 cc.) was added 80%  $\text{HCN}$  (30 cc.) and  $\text{NH}_4\text{OH}$  (4 cc.). After standing 4 hrs. at 0° and 40 hrs. at room temp. the mixt. was poured into  $N$   $\text{Ba}(\text{OH})_2$  (1 l.) and boiled 2 days. Removal of  $\text{Ba}$  with  $\text{H}_2\text{SO}_4$ , concn. and crystn. from abs.  $\text{EtOH}$  gave *d*-gulonemethyloxalate (I) (22 g.), m. 150–1° ( $\text{AcOH}$ ),  $[\alpha]_D^{20}$   $-63.0^\circ$  ( $\text{H}_2\text{O}$ ), changing after 14 days to  $-63.8^\circ$ . From the mother liquor of I sirupy *d*-gulonemethyloxalate (25 g.) was obtained. That the new  $\alpha\text{-OH}$  group in I is to the right of the chain is shown by the rotations of Na *d*-gulonemethyloxalate,  $[\alpha]_D^{20}$   $-11.03^\circ$ , the free acid,  $[\alpha]_D^{20}$   $-5.0^\circ$  and the *p*-bromophenylhydrazide, m. 132–3°,  $[\alpha]_D^{20}$   $8.8^\circ$ . On methylation by Purdie's method gave a mixt. of material,  $b_p$  125–45°, chiefly trimethyl-*d*-gulonemethyloxalate (II), and open chain tetra-*Me* *d*-gulonemethyloxalate,  $b_p$  90°. II was oxidized with concd.  $\text{HNO}_3$  at 100° for 7 hrs. and after methylation of the product with 2%  $\text{HCl-MeOH}$  gave *d*-dimethyl dimethylsuccinate, m. 67–8°. To I (2 g.) in  $\text{H}_2\text{O}$  (15 cc.) and to Congo red at 0° was added 2%  $\text{Na-Hg}$  (63 g.) over 2 hrs. Neutralization to litmus, concn., pptn. of the  $\text{Na-SO}_3$  with abs.  $\text{EtOH}$ , and removal of impurities by pptn. with  $\text{Et}_2\text{O}$  gave the sirupy *d*-gulonemethyloside (III) (0.7 g.),  $[\alpha]_D^{20}$   $-35.7^\circ$  ( $\text{H}_2\text{O}$ ); *p*-bromophenylhydrazide (IV), m. 135–6° ( $\text{EtOH}$ ),  $[\alpha]_D^{20}$   $-16.10^\circ$  (abs.  $\text{EtOH}$ ), const. after 2 weeks at 9.8°,  $[\alpha]_D^{20}$   $-49.12^\circ$  ( $\text{C}_6\text{H}_5\text{N}$ ), const. after 2 weeks at 31.70°; *p*-bromophenylazone, m. 195–6°,  $[\alpha]_D^{20}$   $0^\circ$  ( $\text{C}_6\text{H}_5\text{N-EtOH}$ ), const. after 2 hrs. at 15.3°; phenylazone, m. 182–3°,  $[\alpha]_D^{20}$   $0^\circ$  ( $\text{C}_6\text{H}_5\text{N-EtOH}$ ), const. after 1 hr. at 17°. From IV by decompn. with  $\text{BaI}_2$ , III was obtained cryst., and in 130–1° ( $\text{AcOH}$ ),  $[\alpha]_D^{20}$   $-42.3^\circ$  ( $\text{H}_2\text{O}$ ), const. after 30 min. at  $-38.03^\circ$ . R. C. E.

Crystalline structure of the angars. II. Methylated sugars and the conformation of the pyranose ring. E. G. Cox, T. L. Goodwin, and A. I. Wagstaff. *J. Chem. Soc.* 1935, 1493–504; cf. *C. A.* 29, 5573.—From the study of the x-ray data recorded in conjunction with others previously published it is concluded that the C atoms in the  $\text{C}_6\text{O}$  ring of simple and methylated aldopyranoses are nearly coplanar, the O ring being displaced out of their planes. Reasons are adduced for supposing that the ring form is not appreciably different in soln. and the conformation deduced from the x-ray data is shown to account satisfactorily for the various chem. reactions (formation of  $\text{MeCO}$  compds.). The x-ray data confirm the configurations assigned to  $\alpha$ - and  $\beta$ -glucose. 2,3,4-Trimethyl- $\alpha$ -lyxose, orthorhombic needles, showing forms  $g\{011\}$ ,  $h\{100\}$  ( $g:h = 81^\circ$ ),  $a = 12.76$ ,  $b = 9.29$ ,  $c = 8.19$  Å,  $\alpha$  (no. of asym. mole in unit cell, 4, whence  $d$ , (calcd.)  $= 1.31$  g./cc. (obs. 1.26); the space group is  $P2_12_12_1$  ( $Q$ ); the min.  $n = 1.48$  and is perpendicular to the  $a$ -axis. 2,3,6-Trimethyl- $\alpha$ -glucose, acicular orthorhombic combinations of  $a\{100\}$  and  $h\{100\}$ , terminated by  $c\{001\}$ ;  $a = 20.45$ ,  $b = 11.00$ ,  $c = 4.79$  Å,

$n = 4$ ,  $d$ , (calcd.)  $= 1.28$  (obs. 1.26); space group  $P2_12_12_1$  ( $Q$ ),  $a = 1.435$  (parallel to  $c$ ),  $\gamma = 1.51$ . 2,3,4,6-Tetramethyl- $\alpha$ -glucose, elongated orthorhombic combinations of  $a\{100\}$  and  $h\{110\}$ , terminated by  $c\{001\}$  ( $a:m = 51^\circ$ ),  $a = 12.29$ ,  $b = 14.85$ ,  $c = 4.74$  Å,  $n = 4$ ,  $d$ , (calcd.)  $= 1.22$ , space group  $P2_12_12_1$ ;  $a$  (parallel to  $c$ )  $= 1.475$ ,  $\gamma$  (parallel to  $c$ )  $= 1.54$ . 2,3,4,6-Tetramethyl- $\alpha$ -galactose, orthorhombic,  $a = 25.20$ ,  $b = 10.07$ ,  $c = 4.79$  Å,  $n = 4$ ,  $d$ , (calcd.)  $= 1.28$  (obs. 1.24); space group  $P2_12_12_1$ . 2,3,4,6,7-Pentamethyl- $\beta$ - $\alpha$ -glucoheptose, monoclinic crystals with approx. hexagonal outline,  $a = 10.87$ ,  $b = 8.10$ ,  $c = 8.45$  Å,  $\beta = 92^\circ 10'$ ,  $n = 2$ ,  $d$ , (calcd.)  $= 1.25$  (obs. 1.23); space group  $P2_1$  ( $C_2$ ). 2,3,4-Trimethyl- $\beta$ -methylglucoside, orthorhombic needles,  $a = 17.54$ ,  $b = 16.08$ ,  $c = 4.45$  Å,  $n = 4$ ,  $d$ , (calcd.)  $= 1.25$  (obs. 1.23), space group  $P2_12_12_1$  ( $Q$ ),  $\alpha = 1.465$ ,  $\gamma > 1.525$ . 2,3,4,6-Tetramethyl- $\alpha$ -methylmannoside, monoclinic,  $a = 10.22$ ,  $b = 7.69$ ,  $c = 8.41$  Å,  $\beta = 97^\circ 14'$ ,  $n = 2$ ,  $d$ , (calcd.)  $= 1.235$ , space group  $P2_1$  ( $C_2$ ). 1,3,4-Trimethylfructose (observed in a simple micro-desiccator), orthorhombic prisms,  $a = 18.49$ ,  $b = 8.60$ ,  $c = 7.14$  Å,  $n = 4$ ,  $d$ , (calcd.)  $= 1.29$ , space group  $P2_12_12_1$ ,  $\alpha = 1.49$ ,  $\gamma = 1.525$ . 2,3,6-Trimethyl- $\beta$ -methylglucoside, fine needles,  $c = 4.41$  Å;  $\alpha = 1.47$ ,  $\gamma = 1.553$ . 2,4,6-Isomer, fine needles,  $c = 4.41$ ,  $\alpha = 1.465$ ,  $\gamma > 1.535$ . 2,3,4-Trimethyl- $\beta$ -methyl-*d*-arabinoside,  $c = 4.87$  Å. 2,3,4-Trimethyl- $\alpha$ -methyl-*n*-arabinoside,  $c = 4.85$  Å,  $\alpha = 1.475$ ,  $\gamma > 1.555$ . 2,3,4,6-Tetramethyl- $\beta$ -methylgalactoside, flattened needles,  $c = 4.74$  Å,  $\alpha = 1.47$ . 2,3,4-Trimethyl- $\beta$ -xyloolactone, flattened needles,  $c = 4.60$  Å,  $\alpha = 1.465$ .  $\alpha$ -Ethylglucuronoside, small needles,  $c = 5.60$  Å. 2,3,5-Trimethyl- $\gamma$ -lyxonolactone, monoclinic prisms,  $c = 4.42$  Å,  $\alpha < 1.47$ . 2,3,5-Trimethyl- $\gamma$ -arabinolactone, needles (probably orthorhombic),  $c = 4.60$  Å,  $2\theta = 80^\circ$  approx. Hexamethylxyluronoside-*d*-lyxonuronoside, fine needles with  $c = 4.20$  Å. 1,3,4,5-Tetramethyl- $\beta$ -fructose,  $\alpha = 1.51$ ,  $\gamma = 1.53$ . 2,3,4-Trimethyl- $\alpha$ -xylose,  $\alpha = 1.48$ ,  $\gamma = 1.555$ . The original should be consulted for the discussion.

C. J. West

Detosylation of 4- and 5-tosylacetone-*d*-methylramnosides. P. A. Levene and Jack Compton *J. Am. Chem. Soc.* 57, 2300–10 (1935).—The usual methods of prep. acetone-*d*-methylramnoside (I) are attended by the simultaneous formation of acetone-*d*-methylramnopyranoside (II), at times to the extent of 30–40%. The 5-tosyl deriv. (III) of I, m. 82–3°,  $[\alpha]_D^{20}$   $-13.6^\circ$  (MeOH,  $c$  3.168). II gives a 4-tosyl deriv. (IV), m. 61–2°,  $[\alpha]_D^{20}$   $21.94^\circ$  (MeOH,  $c$  3.030). Alk. hydrolysis of III leads to the production of an unsatd. compd. in 90–5% yield, together with I; the unsatd. compd.,  $\text{C}_{12}\text{H}_{18}\text{O}_6$ ,  $b_p$  56–60°,  $n_D^{20}$  1.4401; IV yields II quantitatively; these hydrolyses are accomplished without Walden inversion III with m. p. 80° is a mixt. contg. in addn. to pure III, a small proportion of the IV; alk. hydrolysis of this product leads to the formation of the unsatd. deriv. together with a small proportion of II. Reductive alk. hydrolysis of III gives I; IV gives II. The rates of hydrolysis of I and II are given as curves. C. J. West

Crystalline *d*- $\alpha$ -galactose and some of its derivatives. Raymond M. Hann, Alice T. Merrill and C. S. Hudson. *J. Am. Chem. Soc.* 57, 2100–3 (1935); cf. *C. A.* 28, 5046.—Details are given of the prep. from *d*-galactose of *d*- $\alpha$ -galactepionic amide, *d*- $\alpha$ -galactepionic acid (I) and its lactone. I (0.3431 g. in 25 cc.  $\text{H}_2\text{O}$  at 20°) shows a mutarotation from 2.5° to  $-23.3^\circ$  in 10 days. The lactone (45 g.) on reduction with Na- $\text{H}$  gives about 25 g. *d*- $\alpha$ -galactepine (II), crystg. as the monohydrate in 4 months, which shows  $[\alpha]_D^{20}$   $-22.5^\circ$  (1.1500 g. in 10 cc.  $\text{H}_2\text{O}$ ), changing to  $-14.1^\circ$  in 72 hrs. (for anhyd. sugar,  $-26^\circ$  and  $-15.3^\circ$ ). MeOH with 1.5%  $\text{HCl}$  gives 65% of  $\beta$ -*d*- $\alpha$ -galactepioside, m. 132° (m. ps. cor.),  $[\alpha]_D^{20}$   $-70.2^\circ$  (0.2708 g. in 10 cc.  $\text{H}_2\text{O}$ ); the rate of hydrolysis in 0.05  $N$   $\text{HCl}$  at 100° was 0.0004 (mins and decimal logarithms), its *pen*-*Ac* deriv., m. 108°,  $[\alpha]_D^{20}$   $-20.4^\circ$  (0.2354 g. in 10 cc.  $\text{CHCl}_3$ ).  $\beta$ -*Et* *d*- $\alpha$ -galactepioside, m. 135°,  $[\alpha]_D^{20}$   $-65.4^\circ$  (0.2310 g. in 10 cc.  $\text{H}_2\text{O}$ ); *pen*-*Ac* deriv., m. 92°,  $[\alpha]_D^{20}$   $-24.9^\circ$  (0.3570 g.

in 10 cc  $\text{CHCl}_3$ . The benzyl mercaptal of II, m.  $191^\circ$ ,  $[\alpha]_D^{25}$   $30.3^\circ$  (0.2212 g in 10 cc  $\text{CH}_2\text{N}_2$ ); its *aceto-*Ac deriv., m.  $120^\circ$ ,  $[\alpha]_D^{25}$   $-10.6^\circ$  (0.2633 g in 10 cc  $\text{CHCl}_3$ ); the *aceto-*Ac deriv., m.  $129^\circ$ ,  $[\alpha]_D^{25}$   $-48.1^\circ$  (0.2950 g in 10 cc  $\text{CHCl}_3$ ). Attention is called to the parallelism of phys. and chem. properties, as well as rotational behavior, of substances of configurationally related structures in the sugar group, as illustrated from substances of the mannose and  $\alpha$ -galactose series.

C. J. West.  
Methylation of glucose phenylsulfonate and its formulation as a derivative of fructopyranose. Elizabeth E. Percival and Edmund G. V. Percival, *J. Chem. Soc.* 1935, 1398-402.—Glucoseazone and  $\text{Me}_2\text{SO}$ , in  $30^\circ$   $\text{NaOH-Me}_2\text{CO-EtOH}$ , heated at  $70^\circ$  for 10 min., yields the 3-Me deriv. (I), plates, m.  $116-17^\circ$ ,  $[\alpha]_D^{25}$   $-44^\circ$  ( $\text{CHCl}_3$ ,  $c$  0.7),  $-49^\circ$  ( $\text{EtOH}$ ,  $c$  0.7), changing to  $-12^\circ$  in 36 hrs.; the equal mixt. forms fine needles. Treatment with  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CHO}$  yields an osone, from which I is regenerated in 5 min. at room temp. by  $\text{PhNH}_2\text{NH}_2$ ,  $\text{AcOH}$ . Reduction of the osone with Zn and  $\text{AcOH}$  gives 5-methylfructose (II), with  $[\alpha]_D^{25}$   $-50^\circ$ . In following the course of glycoside formation in the cold, it was found that, whereas fructose gives 100% furanose, II gives 62% of a pyranose in 24 hrs., while the quantity of furanose (14-15%) remains const. during this time. Heating II with 3%  $\text{MeOH-HCl}$  at  $75^\circ$  for 5 hrs. and methylation gives 1,3,4,5-tetramethylfructose (III) (after hydrolysis), Glucoseazone, treated 3 times with  $\text{Me}_2\text{SO}$ , gives a tri-Me deriv., as a red syrup; this yields a trimethylfructose by way of the osone;  $\text{MeOH-HCl}$  reacts slowly at room temp. to form almost exclusively a pyranose, indicating substitution in position 3 and a free HO group in position 6. Further methylation yields III, proving that the sugar was essentially 3,4,5-trimethylfructose. Position 6 in the glucoseazone is therefore either prevented from undergoing methylation by steric effects, which is improbable, or is concerned with ring formation and it is considered probable that the osone contains a pyranose ring and has the structure

C. J. West

Pseudogalactal, Hermann Lohaus and Otto Widmayer, *Ann.* 529, 301-4 (1935).—Triacetylalactal (29 g), boiled 20 min. with 20 parts of  $\text{H}_2\text{O}$ , gives 11 g diacetylalactal,  $\text{C}_8\text{H}_{12}\text{O}_6$  (I), b.p.  $163-5^\circ$ ,  $[\alpha]_D^{25}$   $-26.9^\circ$ ; *p*-nitrophenylhydrazide, m.  $178^\circ$ ; *Et* acetal,  $\text{C}_{12}\text{H}_{18}\text{O}_6$  (from  $\text{HCl}(\text{OEt})_2$ ), b.p.  $156-8^\circ$ ,  $[\alpha]_D^{25}$   $-39.70^\circ$ . I and Ba-(OH)<sub>2</sub> give isogalactal, whose *p*-nitrophenylhydrazide, m.  $187^\circ$ , repeated distn. gives protogalactal I with Pd and  $\text{H}_2$  gives dihydro- $\beta$ -galactal diacetate, b.p.  $148-53^\circ$ ,  $[\alpha]_D^{25}$   $41.2^\circ$  (*p*-nitrophenylhydrazide, m.  $145^\circ$ ; *Et* acetal, b.p.  $107-8^\circ$ ,  $[\alpha]_D^{25}$   $23.75^\circ$ ); dihydrogalactal, m.  $128^\circ$ ,  $[\alpha]_D^{25}$   $48.1^\circ$ .

Structure of sodium sulfonic acid ester of galactan from Indica laminarioides (Rhodophyceae). W. Z. Hassid, *J. Am. Chem. Soc.* 57, 2046-50 (1935); cf. C. A. 27, 5782.—The Na sulfonic acid ester of galactan,  $[(\text{C}_6\text{H}_7\text{O}_2\text{SO}_3\text{ONa})_n]$ , (I), from the red alga, *Indica laminarioides*, has a mol. wt. of 1560 and therefore  $n$  is 6, the titration curve and the sp. cond. indicate that I is a salt of a strong acid. By electrolysis, the Na was removed and the substance, initially neutral, became acid,  $p_n$  of about 3, this was not obtained pure, because all the Na could not be removed and also because part of the  $\text{SO}_3\text{H}$  group was removed. Acetylation gives a product with 2 Ac groups per 1 mol. galactose. Acid or alk. hydrolysis gives a galactan (II) with  $[\alpha]_D^{25}$   $82.2^\circ$  and  $78^\circ$  ( $\text{H}_2\text{O}$ ), resp. The

1 methylated product contains 21.23% MeO and has  $[\alpha]_D^{25}$   $17.2^\circ$  ( $\text{CHCl}_3$ ); hydrolysis gives a dimethylmethylgalactoside. II gives a trimethylgalactan with 44.5% MeO,  $[\alpha]_D^{25}$   $32.4^\circ$  ( $\text{H}_2\text{O}$ ,  $c$  0.8), which yields a trimethylgalactose on hydrolysis,  $[\alpha]_D^{25}$   $129^\circ$  ( $\text{H}_2\text{O}$ ,  $c$  0.8); oxidation with Br and then with  $\text{HNO}_3$  and subsequent esterification give a dimethylarabodimethoxyglutarate, hydrolyzed to dimethoxyhydroxyglutaric acid. A tentative structure of I is

This is, apparently, the 1st time that a homogeneous galactan, consisting entirely of galactose units, has been obtained from a plant.

C. J. West

The molecular constitution of benzene. G. B. Bannan, *Gazz. chim. ital.* 65, 371-423 (1935).—Following an extensive and crit. review of the present status of the problem of the constitution of aromatic nuclei, certain quantum concepts which have a bearing on this problem are discussed. The methods of Pauling (C. A. 27, 2870) and of Huckel (C. A. 26, 5826) for explaining the aromatic properties of  $\text{C}_6\text{H}_6$  are then discussed critically, in addition to which certain concepts already advanced by B. (cf. *9th Intern. Congress Pure Appl. Chem.*, Madrid, 1934; cf. C. A. 29, 7299) are reviewed. In this connection it is shown that, from the phys. point of view, the assumption of a ring structure for  $\text{C}_6\text{H}_6$ , thiophene, pyrrole and furan is plausible and satisfactory, since it explains the chem. behavior of these compounds and their derivatives. One hundred references.

C. C. Davis

Mechanism of polymerization reactions IV.  $\alpha$ -Phenylbutadiene. E. Bergmann, *J. Chem. Soc.* 1935, 1359-60; cf. C. A. 26, 2797.—The dimer of  $\text{PhCH}=\text{CHCH}=\text{CHCH}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{CH}_2$ , since oxidation gives

$\text{BrOH}$  and  $\text{HO}_2\text{CCH}(\text{CH}_3)\text{CO}_2\text{HCH}(\text{CH}_3)\text{CO}_2\text{H}$  (I). The mechanism of the dimerization is discussed. Since other possible formulas for the dimer are  $\text{PhCH}=\text{CHCH}=\text{CHCH}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{CH}_2$ , which should yield 1-

7 phenylbutane- $\alpha,\beta,\gamma$ -tricarboxylic acid (II) on oxidation and  $\text{PhCH}=\text{CHCH}=\text{CHCH}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{CH}_2$ , which should

yield the  $\alpha,\gamma,\delta$ -tricarboxylic acid (III), these acids were studied. III, m.  $163-5^\circ$  (decomps.), was prepd from  $\text{CH}_3(\text{CO}_2\text{Et})\text{CH}(\text{CH}_3)\text{CH}(\text{CO}_2\text{Et})$  and  $\text{PhCH}=\text{CHCH}=\text{CHCH}(\text{CH}_3)\text{CH}(\text{CH}_3)\text{CH}_2$  with  $\text{EtONa}$  (*Et* ester, b.p.  $230-40^\circ$ , m.  $42^\circ$ ), followed by hydrolysis and decarboxylation at  $130^\circ$ . II, m.  $168^\circ$  (Duff and Inghold, C. A. 23, 1949). Neither II nor III was identical with I. In the synthesis of II by the benzylation of the tetracarboxylic acid from  $\text{CHNa}(\text{CO}_2\text{Et})_2$  and *Et* fumarate, some I is formed.

C. J. West

Stability against interchange of the iodine atoms in diphenylphosphonium iodide. F. Jahnburger, B. Topley and J. Weiss, *J. Chem. Soc.* 1935, 1295-G.—By use of radioactive NaI prepd by neutron bombardment, the interchange of I with the 2 I atoms in diphenylphosphonium iodide (I) was studied. On crystals of I from  $\text{H}_2\text{O}$ -alc. contg. active NaI the resulting solid was strongly radioactive. Diphenylphosphonium hydride derived from it was converted to I with inactive NaI and was inactive. Therefore interchange occurs with the neg. I only. Boiling 20 min. in alc. and  $\text{H}_2\text{O}$ -alc. gave no interchange. I with active neg. I heated at  $103^\circ$  with  $\text{PhI}$  for 5 min. when pumped and the neg. I replaced with inactive I gave inactive I. A check portion not so treated was still active.

Foster Dee Snell

Decomposition of *p*-iodoaniline. F. B. Dains, R. G. Brewster and John A. Davis. *J. Am. Chem. Soc.* 57, 2326-7 (1935).—*p*-I-C<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> (400 g.), on standing 3 years in a glass-stoppered bottle, gave 95 g. 2,4-di-C<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> and about 190 g. unchanged *p*-I-C<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, with some 80 g. black insol. mass.

Molecular rearrangement of sulfenamides [sulfenamidates]. II. Maurice L. Moore and Treat B. Johnson. *J. Am. Chem. Soc.* 57, 2234-6 (1935); cf. C. A. 29, 7300<sup>7</sup>.—Certain sulfenamidates have been rearranged by digestion in EtOH-NaOH to give the corresponding *o*-mercaptodiphenylamines, whereas, upon heating alone, the same compd. gives *p*-amino sulfides. The free *o*-amino sulfides, so far as examd., do not suffer a rearrangement under the same conditions, hence the question arises, whether the sulfenamidates pass through the intermediate stage before forming the *o*-mercaptan deriv. As yet this point has not been clarified. 2-O<sub>2</sub>N-C<sub>6</sub>H<sub>4</sub>-SNHPh gives 87% of 2-O<sub>2</sub>N-C<sub>6</sub>H<sub>4</sub>-NH-C<sub>6</sub>H<sub>4</sub>-SNa-2; the *o*- and *p*-toluides give 80 and 90% of the corresponding derivs. These were characterized as the thiomethyl ethers, m. 67-8°, 94° and 84-8°, resp.

C. J. West  
Identification of carboxylic acids as carboxylates of benzylamine and *o*-phenylethylamine. C. A. Buehler, Louise Carson and Rachel Edds. *J. Am. Chem. Soc.* 57, 2181-2 (1935).—The following compds. of PhCH<sub>2</sub>NH<sub>2</sub> with acids are sufficiently stable to permit AcOEt or abs. EtOH to be used for purification. Benzylammonium carboxylates (acid given): HCO<sub>2</sub>H, m. 95-7° (all m. ps. cor.); AcOH, m. 90.3-7.1°; EtCO<sub>2</sub>H, m. 40.7-7.5°; PrCO<sub>2</sub>H, b<sub>p</sub> 109-10°; BuCO<sub>2</sub>H, m. 51.7-2.7°; ClCH<sub>2</sub>CO<sub>2</sub>H, m. 119.9-20.9°; Cl<sub>2</sub>CHCO<sub>2</sub>H, m. 120.3-1.3°; PhCH<sub>2</sub>CO<sub>2</sub>H, m. 122-2.6°; *o*-MeC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 145.4-6.4°; PhCH<sub>2</sub>CHCO<sub>2</sub>H, m. 135.9-6.3°; BrOH, m. 127.2-8.4°; *o*-H<sub>3</sub>NC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 112-13.2°; *m*-isomer, m. 134-4.6°; *p*-isomer, m. 197.6-8.6°; *m*-BrC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 160.6-1.2°; *o*-ClCH<sub>2</sub>CO<sub>2</sub>H, m. 130.5-1.5°; *p*-isomer, m. 149.2-0.8°; *p*-isomer, m. 160.3-1.3°; *o*-HOCH<sub>2</sub>CO<sub>2</sub>H, m. 94.3-5.5°; *m*-isomer, m. 183.2-9.6°; *p*-isomer, m. 216.6-17.2°; *o*-MeOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 121.5-2.3°; *m*-isomer, m. 113.1-14.1°; *p*-isomer, m. 144.8-5.0°; *o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 143.9-5.7°; *m*-isomer, m. 174.9-5.5°; *p*-isomer, m. 197.3-8.9°. *o*-Phenylethylammonium carboxylates: HCO<sub>2</sub>H, m. 97.8-3.8°; AcOH, m. 92.1-2.5°; EtCO<sub>2</sub>H, b<sub>p</sub> 120-1°; PrCO<sub>2</sub>H, b<sub>p</sub> 125°; ClCH<sub>2</sub>CO<sub>2</sub>H, m. 94.7-5.5°; PhCH<sub>2</sub>CO<sub>2</sub>H, m. 115.6-16.4°; *o*-MeC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 113.3-13.7°; PhCH<sub>2</sub>CHCO<sub>2</sub>H, m. 144.5-5.1°; BrOH, m. 140.6-1.2°; *o*-H<sub>3</sub>NC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 111-11.6°; *m*-isomer, m. 163.9-9.4°; *p*-isomer, m. 185.6-6.4°; *m*-BrC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 143.9-9.7°; *o*-ClCH<sub>2</sub>CO<sub>2</sub>H, m. 130.9-1.9°; *m*-isomer, m. 144.7-5.3°; *p*-isomer, m. 152.2-3.2°; *o*-HOCH<sub>2</sub>CO<sub>2</sub>H, m. 102.1-2.9°; *m*-isomer, m. 137.2-8.4°; *p*-isomer, m. 199.3-9.9°; *o*-MeOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 158.7-9.1°; *m*-isomer, m. 131.4-1.8°; *p*-isomer, m. 132.8-3.4°; *o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, m. 129.5-30.1°; *m*-isomer, m. 170.7-1.1°; *p*-isomer, m. 195.8-6.8°.

C. J. West  
Amides obtained from benzenesulfonic acid. L. Chas. Ralston and Stewart E. Hazlet. *J. Am. Chem. Soc.* 57, 2172-4 (1935).—The following amides were prepd. by treatment of 2 mol. proportions of the amine in 3 vols. dry EtO with 1.25 mols. of crude PhSOCl in 2 vols. EtO, with continuous agitation at 0° (the name of the starting amine is given): *o*-ClC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, m. 107-8°, 76% yield; *m*-isomer, tan, m. 100°, very poor yield; *p*-isomer, m. 155.5°, 78%; *o*-BrC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, lavender, m. 110-11°, 20%; *m*-isomer, pink, m. 112-14°, 19%; *p*-isomer, lavender, m. 150.5°, 47%; *o*-MeC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, pink, m. 124-5°, 44%; *m*-isomer, m. 102-3°, 44%; *p*-isomer, yellow, m. 100-1°, 56%; *o*-MeOC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, purple, m. 108-13°, very poor yield; *m*-isomer, m. 133-4°, poor yield; *p*-isomer, purple, m. 133-4°, 89%; *p*-H<sub>3</sub>NC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>Et, m. 114-15°, 29%; 2,5-Me<sub>2</sub>(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>, yellow, m. 133°, 26%; *o*-C<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, tan, m. 143-4°, very poor yield; PhCH<sub>2</sub>NH<sub>2</sub>, m. 100-4°, 26%; 4-H<sub>3</sub>NC<sub>6</sub>H<sub>4</sub>Ph, m. 165.5°, high yield; 2-H<sub>3</sub>NC<sub>6</sub>H<sub>4</sub>Cl, yellow, m. 206°, very poor yield; 4-H<sub>3</sub>NC<sub>6</sub>H<sub>4</sub>Cl, pink, m. 165-6°, very poor yield. Anilides of benzenesulfonic acid were

prepd. as follows: *o*-BrC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, m. 130-1°, 72%; *m*-isomer, m. 117.5-18.5°, 69%; *o*-MeC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, lavender, m. 122-3°, 97%; *m*-MeOC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, m. 82.5-3.5°, quant. yield; *p*-H<sub>3</sub>NC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>Et, m. 183.5-4°, quant. yield; 2,5-Me<sub>2</sub>(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>, m. 175-6°, 88%; 4-H<sub>3</sub>NC<sub>6</sub>H<sub>4</sub>Ph, m. 145-8°, 67%; 2-H<sub>3</sub>NC<sub>6</sub>H<sub>4</sub>Cl, m. 136-8°, 74%; 4-H<sub>3</sub>NC<sub>6</sub>H<sub>4</sub>Cl, m. 145-5.5°, quant. yield.

C. J. West  
Some derivatives of *p*-fluorobenzenesulfonic acid. Raymond M. Hann. *J. Am. Chem. Soc.* 57, 2167-8 (1935).—Dry HCl passed through AlCl<sub>3</sub> in a soln. of PhF in CS<sub>2</sub> upon stand., followed by SO<sub>2</sub> (3 hrs.), gives 75% of Na *p*-fluorobenzenesulfonate dihydrate (I), diamond crystals. I and benzyl *p*-thiourethane (II) in 0.25 N HCl give the II salt of *p*-fluorobenzenesulfonic acid, m. 161° (m. ps. cor.). Oxidation of I with H<sub>2</sub>O<sub>2</sub> and addn. of II give the II salt of *p*-fluorobenzenesulfonic acid, m. 166°. Refluxing I and PhCOCH<sub>2</sub>Br in 85% EtOH gives *p*-fluorophenyl phenacyl sulfone, m. 151°. With *p*-ONC<sub>6</sub>H<sub>4</sub>Cl<sub>2</sub> there results *p*-fluorophenyl *p*-nitrobenzyl sulfone, pale yellow, m. 185°. I and ClCH<sub>2</sub>CO<sub>2</sub>H give *p*-fluorobenzenesulfonylacetic acid, m. 110-11° (II salt, m. 144° (decompn.)); *p*-bromophenacyl ester, m. 126°. I and ClCH<sub>2</sub>Ac give a quant. yield of *p*-fluorophenylsulfonylacetone, m. 66°; CO(CH<sub>3</sub>)<sub>2</sub> and I give *α*,*γ*-di-*p*-fluorobenzenesulfonylacetone, m. 144°.

C. J. West  
Halogenation of phenolsulfonic acids in nitrobenzene. Ralph C. Iluston and Arthur H. Neely. *J. Am. Chem. Soc.* 57, 2176-8 (1935).—PhOH (31.3 g.) and 50 g. concd. H<sub>2</sub>SO<sub>4</sub>, heated 2 hrs. at 100-10°, addn. of 100 g. PhNO<sub>2</sub> and then 15 g. fuming H<sub>2</sub>SO<sub>4</sub> (temp. not above 10°), followed by 107 g. Br<sub>2</sub> and 50 g. PhNO<sub>2</sub> (dropwise during 2 hrs.), give 10.4% of 2-Br-C<sub>6</sub>H<sub>4</sub>OH and 72.7% of 2,6-Br<sub>2</sub>C<sub>6</sub>H<sub>3</sub>OH; using 95 g. H<sub>2</sub>SO<sub>4</sub> gives 9.5% 2,6-Br<sub>2</sub>C<sub>6</sub>H<sub>3</sub>OH and 45.5% of 2-Br-C<sub>6</sub>H<sub>4</sub>OH. With 68 g. H<sub>2</sub>SO<sub>4</sub>, Cl<sub>2</sub> gives 70.3% of 2,6-Cl<sub>2</sub>C<sub>6</sub>H<sub>3</sub>OH and 17% 2-Cl-C<sub>6</sub>H<sub>4</sub>OH; min. yields of 24% of 2,6-Cl<sub>2</sub>C<sub>6</sub>H<sub>3</sub>OH and 72% 2-Cl-C<sub>6</sub>H<sub>4</sub>OH were obtained with 100 g. H<sub>2</sub>SO<sub>4</sub>. *o*-MeC<sub>6</sub>H<sub>4</sub>OH (36 g.), 55 g. concd. H<sub>2</sub>SO<sub>4</sub>, 60 g. Br<sub>2</sub> and 50 g. PhNO<sub>2</sub> give 60% crude 6-Br deriv. and 13% 4,6-Br<sub>2</sub> deriv. Cl<sub>2</sub> gives 30% of the 6-Cl deriv. and 12% of the 4,6-Cl<sub>2</sub> deriv. Bromination or chlorination of the 4- and 6-sulfonic acids of *m*-MeC<sub>6</sub>H<sub>4</sub>OH in PhNO<sub>2</sub> gives the 2- and 4-Br and the 2,6-Br<sub>2</sub> derivs. and the 2-Cl, 2,4- and 2,6-Cl<sub>2</sub> derivs. Sulfonic acid groups on the C<sub>6</sub>H<sub>5</sub> ring of PhOH and derivs. are stable toward halogenation in the presence of acid if carried out in an inert anhyd. solvent.

C. J. West  
Pyrolysis of allyl-*p*-phenetidine. F. L. Carnahan. *J. Am. Chem. Soc.* 57, 2210-11 (1935).—The Na compd. of phenacetin and allyl bromide, followed by hydrolysis, yield 31% of allyl-*p*-phenetidine (I), b<sub>p</sub> 134.5°, b<sub>m</sub> 265° (decompn.), d<sub>4</sub><sup>20</sup> 1.0090, n<sub>D</sub><sup>20</sup> 1.5493; *p*-toluenesulfonfyl deriv., m. 81° (86% yield). Refluxing I at atm pressure gives 0.465 mol. *p*-EtOC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, 0.40 mol. C<sub>6</sub>H<sub>5</sub> and 0.447 mol. resinous material. The initial step appears to be a splitting into radicals at the C-N bond.

C. C. D.  
The condensation power of pyrocatechol derivatives. Paolo Dreyfuss. *Gazz. chim. ital.* 65, 498-501 (1935).—A review and discussion, based on the work of various investigators, and with special attention to the previous work by D. (Dist., Bonn 1933). The power of condensation of derivs. of *o*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub> at the 4- and 5-positions is evident from recent literature. This condensing power should be taken into account in all investigations of pyrocatechol derivs., for on the one hand this power opens new possibilities in syntheses, but on the other hand may give rise to undesired reactions.

C. C. D.  
Alkyl ethers of 2,2-bis(4-hydroxyphenyl)propane. I. Some dialkyl ethers. G. R. Yohe and J. F. Vitche. *J. Am. Chem. Soc.* 57, 2250-60 (1935).—The ethers of HO-C<sub>6</sub>H<sub>4</sub>(CH<sub>2</sub>)<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OH were prepd. with the dialkyl sulfates and alkali or (Am deriv.) from the alc. and SO<sub>2</sub>Cl<sub>2</sub>. Me ether, b<sub>p</sub> 190°, m. 69-61.5°, n<sub>D</sub><sup>20</sup> 1.5696; Et ether, m. 49-50°, n<sub>D</sub><sup>20</sup> 1.5556; Pr ether, b<sub>p</sub> 200-20°, n<sub>D</sub><sup>20</sup> 1.5443, d<sub>4</sub><sup>20</sup> 1.0159; Bu ether, b<sub>p</sub> 212-13°, m. 20°, n<sub>D</sub><sup>20</sup> 1.5368, d<sub>4</sub> 0.9961; Am ether, b<sub>p</sub> 225-30°, m. 34.5-5.5°, n<sub>D</sub><sup>20</sup> 1.5306.

The yield of the first 4 is about 50%, of the Am deriv. 1 28%.

Addition of chloroform and bromoform to  $\beta$ -chloroheptaldehyde. Joseph W. Howard. *J. Am. Chem. Soc.* 57, 2317-18 (1935); cf. C. A. 29, 1704<sup>1</sup>— $\beta$ -Cl- $\text{C}_6\text{H}_4\text{CHO}$  (46 g) and 80 g  $\text{CHCl}_3$  with 4 g KOH, on standing 3 hrs, give 20 g *trichloromethyl- $\beta$ -chlorophenylcarbinol*  $\text{bm}$  187-8°,  $d_{20}^{25}$  1.5233, acetate,  $m$  120-1°; propionate,  $m$  71-2°; benzoate,  $m$  125-6°; butyrate,  $\text{bp}$  172-3°,  $d_{20}^{25}$  1.331. The *tribromomethyl deriv.*  $\text{bp}$  198-200°,  $m$  90-1°.

Rearrangement of thiocyanates into isothiocyanates. Ernst Bergmann. *J. Chem. Soc.* 1935, 1361-2—Cinnamyl thiocyanate (I),  $m$  63°, results in 15% yield from 12 g KSCN and 20 g  $\text{PhCH}_2\text{CHCH}_2\text{Cl}$  in 75% EtOH; on refluxing for 1 hr, 1 yields cinnamyl isothiocyanate (II), yellow,  $\text{bp}$  182°; thus the classical scheme of rearrangement applies to this reaction. Catalytic reduction of I yields  $\gamma$ -phenylpropyl thiocyanate,  $\text{bp}$  80°, also prepd from  $\text{PhCH}_2\text{CH}_2\text{CH}_2\text{Br}$  (III) and  $\text{NH}_4\text{SCN}$ ; it has an intensely viscous effect. II and  $\text{PhNH}_2$  in  $\text{Et}_2\text{O}$ -EtOH give  $\text{PhCH}_2\text{CHCH}_2\text{NHCSNHPh}$  III and  $\text{K}$  phthalimide yield *phthaloyl- $\gamma$ -phenylpropylamide*,  $m$  61°, which also results from catalytic reduction of  $\text{PhCH}_2\text{CHCH}_2\text{N}(\text{CO})\text{C}_6\text{H}_5$  (Posner, *Ber.* 26, 1890 (1893)). This shows that cinnamylamine does not have the isomeric structure  $\text{PhCH}(\text{NH}_2)\text{CH}_2\text{CH}_3$ .

Emulsion XXII. Influence of substitution in the benzene nucleus on the fermentative splitting of phenol  $\beta$ -D-glucosides. H. Burkhardt Heffrich and C. Pauline Burt. *Ann.* 520, 150-63 (1933); cf. C. A. 29, 6017<sup>1</sup>— $\alpha$ -HOC<sub>6</sub>H<sub>4</sub>OMe (29 mols) and 1 mol acetobromoglucose with 1 mol NaOH in  $\text{Me}_2\text{CO}$ -H<sub>2</sub>O, after 4 hrs, at room temp, give 55% of the *tetra-Ac deriv.*,  $m$  155-7°,  $[\alpha]_D^{25}$  -30.2° ( $\text{CHCl}_3$ ), of *guaiacol- $\beta$ -D-glucoside*  $m$  155-7°,  $[\alpha]_D^{25}$  -30.2° with 1 mol H<sub>2</sub>O,  $[\alpha]_D^{25}$  -65.8° (H<sub>2</sub>O); it is very hygroscopic. Isoeugenol (III) gives *isoeugenol- $\beta$ -D-glucoside* (III),  $m$  137.5-9.5°,  $[\alpha]_D^{25}$  -60° (abs. EtOH); *tetra-Ac deriv.*,  $m$  149-3°,  $[\alpha]_D^{25}$  -24.8° ( $\text{CHCl}_3$ ) (9.2 g yield from 15 g II). The 3-benzyl ether (IV) of protocatechuic aldehyde 4- $\beta$ -D-glucoside, with 1 mol H<sub>2</sub>O,  $m$  165-8°,  $[\alpha]_D^{25}$  -65.2° (abs. EtOH); the compd is very hygroscopic. Tetraacetylprotocatechuic aldehyde 4- $\beta$ -D-glucoside (11.6 g) and acetobromoglucose with NaOH in  $\text{Me}_2\text{CO}$ -H<sub>2</sub>O at room temp, for 20 hrs give, after deacetylation, about 8.5 g *protocatechuic aldehyde 4- $\beta$ -D-glucoside-3- $\beta$ -D-glucoside* (V), with 1 mol H<sub>2</sub>O,  $[\alpha]_D^{25}$  -100.5°. With an emulsion with a  $\beta$ -glucosidase value of I 2, the following percentage was decomposed in the time given: I, 10 min 24.8%, III, 10 min, 19.5%, IV, 6 min, 16.3%; V, 33 min 41.2-61.2%; with an emulsion with  $\beta$ -glucosidase value of 5.5, V in 6 min is decomposed to the extent of 43.7-59%.

Condensations of benzoylformanilide with acetone, ethyl phenylacetate and diethyl malonate. John V. Scudi and H. G. Lindwall. *J. Am. Chem. Soc.* 57, 2302-3 (1935); cf. C. A. 29, 7307<sup>1</sup>— $\text{PhNHCOBz}$  and  $\text{Me}_2\text{CO}$  with a little Et<sub>3</sub>NH at room temp for 6 hrs, give 80% of 2-phenyl-2-hydroxy-4-pentanoneanilide,  $\text{PhC}(\text{OH})(\text{CONHPh})\text{CH}_2\text{Ac}$ ,  $m$  137-8°; phenylhydrazones,  $m$  174-5° (decompn); further action of  $\text{PhNHCOBz}$  (2 weeks) gives 25% of 2,6-dihydroxy-2,6-diphenyl-4-heptanone-1,7-dianilide,  $\text{CO}(\text{CH}_2\text{C}(\text{OH})(\text{CONHPh}))_2\text{Pb}$ ,  $m$  171-2°;  $\text{PhNHCOBz}$  and  $\text{PhCH}_2\text{CO}_2\text{Et}$  after 3 months at room temp give 90% of  $\alpha,\beta$ -diphenylmaleinanil, yellow,  $m$  178-9°, reduction gives 80% of  $\alpha,\beta$ -diphenylsuccinanil (I),  $m$  234-5°. With  $\text{CH}_3(\text{CO}_2\text{Et})_2$  there results 95% of 2-phenyl-2-formanilide-1,1,3,3-tetracarboxypropane,  $m$  107-8°; vacuum distn gives 75% of  $\alpha$ -carboxy- $\beta$ -phenylmaleinanil, yellow,  $m$  111°, reduced to the succinanil,  $m$  104-5°; hydrolysis gives I.

Resolution of *dl*-mandelic acid with (-)-ephedrine. Robert Rogers. *J. Chem. Soc.* 1935, 1544—Details are given of the resolution; 130 g *dl*-acid yield 45 g *l*- and 30 g *d*-acid; most of the ephedrine is recovered.

C. J. West

Lichen acids. VI. Constituents of *Ramalina scopulorum*. Francis H. Cud and Alexander Robertson. *J. Chem. Soc.* 1935, 1379-81; cf. C. A. 27, 3463—The lichen *Ramalina scopulorum* (1478 g), extd. with  $\text{Me}_2\text{CO}$  for 15 hrs, gives about 20 g stictic acid (I) (Zopf's scopulonic acid, C. A. 1, 1877), which seps. from 80%  $\text{Me}_2\text{CO}$  with 2 mols H<sub>2</sub>O; it is identical with the acid from *Lobaria pulmonaria* (Ashina, C. A. 29, 4227, 4787); the diacetate  $m$  235-6°, and the tetraacetate,  $m$  226-7°; the dianil,  $m$  234°. With 10% aq. KOH there results stictic acid, which is considered substantial evidence for the presence of a lactone ring in I with  $\text{MeI}$  and  $\text{Ag}_2\text{CO}_3$  give the compd.  $\text{C}_{12}\text{H}_{10}\text{O}_6(\text{OMe})_2$ ,  $m$  174°;  $\text{Ag}_2\text{O}$  gives an isomer,  $m$  242-3°. C. J. W.

Attempted preparation of vanilloylformic acid. W. E. Barch. *J. Am. Chem. Soc.* 57, 2330 (1935)—The prepn of vanilloylformic acid by Mottern's method (C. A. 29, 135<sup>1</sup>) could not be repeated; difficulty was also experienced in repeating his prepn of apocyanin. A. B. Lamb reports that 2 other investigators could not repeat the prepn.

Configuration of the  $\Delta^1$ -tetrahydro- and the hexahydroterephthalic acids. W. H. Mills and G. H. Keats. *J. Chem. Soc.* 1935, 1373-5—Slight modifications of Baeyer's method produced from 400 g. terephthalic acid 170 g. *trans- $\Delta^1$ -tetrahydro deriv.* (I) and 40 g. *cis*-(II)-isomer,  $m$  228° and 161°, resp. I was resolved with *hucine* in H<sub>2</sub>O; the pure *l* form has  $[\alpha]_D^{25}$  -279° and  $m$  222°; the other isomer could not be purified. Catalytic reduction of I and II gives the corresponding hexahydro acids,  $m$  309° and 167°, resp. In these cases the more sol. form has the *cis*-configuration. For II at 22°  $K_1 = 0.82 \times 10^{-4}$ ,  $K_2 = 0.81 \times 10^{-4}$ ,  $1, K_1 = 1.18 \times 10^{-4}$ ,  $K_2 = 1.19 \times 10^{-4}$ , while I is slightly stronger, the ratio  $K_1/K_2$  is nearly the same for both acids. From Ingold's formula this gives values of  $r$  for II and I of 8.14 and 8.25 A, resp.

Hydrophthalides VII. Sergio Berlingozzi and Vittoria Senatori. *Gazz. chim. ital.* 65, 424-40 (1935); cf. C. A. 26, 2728—In addn to the sapon of benzyldiene- $\Delta^1$ -tetrahydrophthalide (I) by aq. KOH to form *o*-phenylacetyl-tetrahydrobenzoic acid (II), already described (C. A. 26, 2728), expts show that sapon under different conditions leads to a different product. Ale. I (8.5 g. in 100 cc) and aq. KOH (5 g. in 25 cc.), reduced 5 min. and treated with H<sub>2</sub>SO<sub>4</sub> yield 6 g. of an isomer (III),  $\text{C}_{12}\text{H}_{10}\text{O}_4$ ,  $m$  115°, sol. in cold dil. Na<sub>2</sub>CO<sub>3</sub> (reprecipd. by mucic acids). *Ag sol.* With aq. NaOH and  $\text{NH}_4\text{OH}$  HCl, III forms the oxime,  $\text{C}_{12}\text{H}_{11}\text{O}_3\text{N}$ ,  $m$  82° (cf. 154-5° of the oxime of II). III in boiling aq. KOH, acidified with H<sub>2</sub>SO<sub>4</sub> and let stand, forms II, whereas II in boiling aq. alc. KOH on acidification yields unaltered II. This shows that II is the stable and III the unstable form. Evapn of the mother liquor from the crystn of III yields  $\beta$ -phenyl- $\alpha,\gamma$ -diketotetrahydroindene,

$\text{C}_8\text{H}_7\text{COCHPhCO}$  (IV), canary-yellow,  $m$  104°; its solns. in aq. alkalis are intense violet-blue, and IV is pptd. by acids; it also is formed by evapn of a soln. of I and NaOMe in MeOH or NaOEt in EtOH and treatment of the residue with dil H<sub>2</sub>SO<sub>4</sub>. The yield is higher with MeONa. The mother liquor in this case contains a trace of III, the proportion of which is larger from EtONa than from MeONa. Ice-cold II (4 g.) in 2% aq. KOH (100 cc) and aq. 2% K<sub>2</sub>CO<sub>3</sub> evolve Br<sub>2</sub> and yield, after steam-distn of the filtered liquid and acidification of the residue with H<sub>2</sub>SO<sub>4</sub>, 0.8 g. of Br<sub>2</sub>H, while the mother liquor extd with Et<sub>2</sub>O yields 0.5 g. of Br<sub>2</sub>H. The wash liquor from the Br<sub>2</sub>H made alk. with  $\text{NH}_4\text{OH}$  and treated with CaCl<sub>2</sub> and AcOH gives (CO<sub>2</sub>)<sub>2</sub>Ca, while the filtrate treated with H<sub>2</sub>SO<sub>4</sub> and extd with Et<sub>2</sub>O yields a compd (V),  $m$  50°, with a strong odor of  $\text{PhCH}_2\text{CO}_2\text{H}$ , and which is probably the latter. With KMnO<sub>4</sub> under the same conditions, III gives twice as high a yield of Br<sub>2</sub>H, a little (CO<sub>2</sub>)<sub>2</sub>Ca, Br<sub>2</sub>H and V. III (4 g.) in 5% aq. NaOH (80 cc.) and 5% Na-Hg (30 g.), let stand, and acidified with HCl, ppts 3.2 g. of *o*-phenylacetyl-hexahydrobenzoic acid (VI),  $m$  98°, stable on prolonged

heating at 100°; converted into an anhydride by concd.  $\text{H}_2\text{SO}_4$  at 100°, which excludes its being a  $\gamma$ -HO acid. It is also formed by refluxing either II or III in 10% aq. NaOH with powd. Zn, and acidifying with HCl. VI and PhHNH<sub>2</sub>, heated cautiously at 100°, and the product purified by soln. in aq.  $\text{Na}_2\text{CO}_3$  and reprecip. with HCl, yield the phenylhydrazide,  $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{N}_2\text{O}$ , m. 50° (decomp.). VI is oxidized by  $\text{KMnO}_4$ . Na-Hg has practically no action on II, III or VI (2 g. in 5% aq. NaOH (20 cc.) and 4% Na-Hg (100 g.), refluxed, neutralized with HCl, the filtered liquid acidified, the ppt. extr. with dil.  $\text{Na}_2\text{CO}_3$  and water, and purified with  $\text{Et}_2\text{O}$ , yields approx. 1.2 g. of benzylhexahydrophthalide, m. 79°, and approx. 0.5 g. of bis(benzylhexahydrophthalide)phthalone, m. 113°. Neither is sol. in cold dil.  $\text{Na}_2\text{CO}_3$ , while both are sol. in boiling aq. alk. hydroxides (reprecip. by acids), and these solns. are fairly resistant to  $\text{KMnO}_4$ . When I was first prepd. (loc. cit.), the position of the double bond was not established and therefore that in II was also uncertain. The prepn. and properties of II and III, particularly their behavior with  $\text{NH}_4\text{OH}$  and analogous cases in the literature which are discussed, indicate that they differ only in the position of the double bond. Their reactions with alk.  $\text{KMnO}_4$  lead to the conclusion that III has the

constitution  $\text{HO}_2\text{CCH}(\text{CH}_2)_3\text{CH}(\text{CH}_2)_3\text{COOCH}_2\text{Ph}$ ,

while that of II might be either  $\text{HO}_2\text{CCH}(\text{CH}_2)_3\text{CH}(\text{CH}_2)_3\text{CH}(\text{CH}_2)_3\text{COOCH}_2\text{Ph}$  (VII) or  $\text{HO}_2\text{CCH}(\text{CH}_2)_3\text{CH}(\text{CH}_2)_3\text{CH}(\text{CH}_2)_3\text{CH}(\text{CH}_2)_3\text{COOCH}_2\text{Ph}$ . Hydrogenation of II and III and analogous reactions cited from the literature lead in turn to the conclusion that II has the constitution VII. The condensation of  $\Delta^1$ -tetrahydrophthalic anhydride with  $\text{PhCH}_2\text{CO}_2\text{H}$ , described in earlier work, probably takes place according to the reaction:

→ I. This should be of utility in the synthesis of certain natural substances, e. g., sedononic acid, sedonolic acid and its internal anhydride. C. C. Davis

Migration of allyl groups in the ethyl acetate-acetic series. Ernst Bergmann and Herbert Corte. *J. Chem. Soc.* 1935, 1363-5.— $\text{PhCH}(\text{CH}_2)_3\text{CH}_2\text{Cl}$  (35 g.) and  $\text{AcCH}_2\text{NO}_2/\text{Et}$  in dry  $\text{C}_6\text{H}_6$ , boiled 48 hrs., give *Et*  $\beta$ -cinnamylacetate (I), b<sub>1</sub> 200°, and 2 g. of *Et*  $\beta$ -cinnamylacetate, b<sub>1</sub> 258°. Hydrolysis of I yields  $\gamma$ -benzylidenbutyric acid and  $\alpha$ -phenyl- $\beta$ -hexen-4-one.  $\text{PhCH}(\text{CH}_2)_3\text{CH}_2\text{OH}$ , *Et*  $\beta$ -ethoxycinnamate and  $\text{NH}_4\text{Cl}$ , heated 1 hr. at 150°, give *Et*  $\beta$ -cinnamylacetate (II), b<sub>1</sub> 162°, and *Et*  $\beta$ -cinnamylacetoxy- $\alpha$ -cinnamylcrotonate (III), b<sub>1</sub> 200-10°. This reaction is primarily an *O*-cinnamylation, thus affording support for Claisen's view that the 1st stage in the alkylation of *Et* methoxycrotonate involves the "enolic" *O*. Alk. hydrolysis of II yields cinnamyl isopropenyl ether, b<sub>1</sub> 120-2°, and  $\beta$ -phenyl- $\beta$ -vinylpropionic acid, b<sub>1</sub> 162°; the alkali treatment of II to some extent leads to a rearrangement which is accompanied by a "transposition" of the alkyl group. Heating II at 260° for 6 hrs. gives a small yield of I; this rearrangement is the reason for the formation of III in the above reaction; in the 1st stage is formed II, which is rearranged into I and the enolic form of the latter is again cinnamoylated on the HO group. C. J. West

Reversibility of the Friedel-Crafts condensation. Hydrogenation phenomena. L. L. Alexander, A. L. Jacoby and Reynold C. Fuson. *J. Am. Chem. Soc.* 57, 2203-9 (1935).— $\text{PhCH}_2\text{CH}_2\text{CH}_2\text{Br}$  is formed from  $\text{p-Cl-C}_6\text{H}_4\text{CH}_2\text{CH}_2\text{CH}_2\text{Br}$  or from  $\text{PhCH}_2\text{CH}_2\text{Br}$  with  $\text{AlCl}_3$  in  $\text{C}_6\text{H}_6$  satd. with HCl; likewise, 5 g.  $\text{PhCH}_2\text{CH}_2\text{CO}_2\text{Me}$  gives 3 g.  $\text{PhCH}_2\text{CH}_2\text{CO}_2\text{Me}$ .  $\text{p-Cl-C}_6\text{H}_4\text{CH}_2\text{CH}_2\text{CH}_2\text{Br}$  and  $\text{BrCH}_2\text{CH}_2\text{CO}_2\text{Et}$  with Zn in  $\text{CaH}_2$  give 79% of the *Et* ester, m. 79-80 5°, of  $\beta$ -phenyl- $\beta$ -(*p*-chlorophenyl)- $\beta$ -hydroxypropionic acid, light yellow, m. 188 5-6° (decomp.).  $\text{Ac}_2\text{O}$  and  $\text{AcONa}$  give  $\beta$ -(*p*-chlorophenyl)cinnamic acid, m. 168°, which with  $\text{AlCl}_3$ , HCl and  $\text{CaH}_2$  yields  $\text{PhCH}_2\text{CH}_2\text{CO}_2\text{H}$ . ( $\text{PhCH}_2\text{CH}_2\text{CH}_2\text{Br}$ ) results in 70% yield from  $\text{p-Cl-C}_6\text{H}_4\text{CH}_2\text{CH}_2\text{CH}_2\text{Br}$ .

in 20% yield from ( $\text{PhCHCl}_2$ ); and in about 50% yield from  $\text{p-Br-C}_6\text{H}_4\text{CH}_2\text{CH}_2\text{CH}_2\text{Br}$ . C. J. West

Asymmetric syntheses. IV. The action of optically active nitrates on 2-bromofluorene. J. T. Thurston and R. L. Shriner. *J. Am. Chem. Soc.* 57, 2163-6 (1935); cf. C. A. 28, 1451.—2-Bromofluorene (I) and *dl*-octyl nitrate (II) with  $\text{EtOK}$  in abs.  $\text{Et}_2\text{O}$  at 45° give 62.5% of 9-nitro-2-bromofluorene as the *K* salt, which gives a green color with  $\text{FeCl}_3$ . I and *dl*-II at 35° give a *K* salt with a 4.43°, *dl*-II gives a salt with  $-1.71^\circ$ . Acidification of the salts gives optically inactive *ac*-9-nitro-2-bromofluorene (III), yellow, m. 132°; *l*-FeCl<sub>3</sub> gives a green color; boiling with  $\text{EtOH}$  gives the normal *NO* compd. (IV), m. 139°. Br gives 2,9-dibromo-9-nitrofluorene, yellow, m. 139°. The Ag salt of IV and *MeI* gives an unstable nitronic acid, which readily decomposes into 2-bromofluorenone oxime (V) and  $\text{HCHO}$ . IV does not absorb Br, while III absorbs 50% of the theory, V absorbs 50 76% and the *dl*-K salt, 89.2-90.4%. C. J. West

Action of Grignard reagent on certain fuchones. Percy L. Julian and Wm. J. Gist. *J. Am. Chem. Soc.* 57, 2030-2 (1935).—Fuchone or *p*- $\text{MeOC}_6\text{H}_4\text{CPh}_2\text{Cl}$  with  $\text{MeMgI}$  gives *p*- $\text{MeOC}_6\text{H}_4\text{CPh}_2\text{Me}$ ; this is a case of 1,6-addn. and confirms the results of Bayer and Villiger (*Ber.* 36, 2793 (1903)). Diphenyl- $\alpha$ -methoxy-naphthyl-carbinol m. 162°; the chloride m. 151°, with  $\text{MeMgI}$  there results 1,4-diphenyl-1,4-methoxynaphthyl-ethane, b<sub>1</sub> 220-30°, m. 144°. Naphthofuchone gives the same product, thus indicating a 1,6-addn. None of the 1,6-addn. products could be isolated from the reaction of these fuchones with  $\text{PhMgBr}$ . Anthra-fuchone gives a 1,2-addn. product,  $\text{MeMgI}$  yielding 9-methyl-10-benzohydroxyidene-9,10-dihydroanthran-9-ol, m. 223°; oxidation gives  $\text{Ph}_2\text{CO}$  and anthraquinone. 9-Phenyl-10-benzohydroxyidene-9,10-dihydroanthran-9-ol (I) gives a chloride, m. 220° (decomp.); rool. Ag gives in  $\text{C}_6\text{H}_6$ , a deep reddish brown soln., almost completely decolorized by atm. O, the peroxide could not be crystd. The bromide m. 168°. I is stable and does not rearrange into its isomer with the anthracene structure; its halogen derivs. likewise have apparently the dihydroanthracene structure. C. J. W.

Reaction of Grignard reagents with some succinic anhydrides. Chaim Weizmann, Ottilie Blum-Bergmann and Felix Bergmann. *J. Chem. Soc.* 1935, 1370-1.— $\alpha$ - $\text{C}_6\text{H}_5\text{CH}_2\text{MgBr}$  and 10 g. succinic anhydride give 2.5 g. of  $\alpha$ - $\text{C}_6\text{H}_5\text{COCH}_2\text{CH}_2\text{CO}_2\text{H}$ , m. 133°; the  $\beta$ -isomer, m. 184-5°, was similarly prepd. Phenylsuccinic anhydride (8.7 g.) and  $\text{PhMgBr}$  give 2.2 g. of  $\gamma$ -hydroxy- $\alpha,\gamma$ -triphenylbutyric acid lactone, m. 162°;  $\alpha$ - $\text{C}_6\text{H}_5\text{MgBr}$  gives the  $\gamma,\gamma$ -di( $\alpha$ -naphthyl) analog, m. 211°; the acid portion was a brown sirup, whose reduction product b<sub>1</sub> 267-70°. 3-Phenyl-1,2,3,6-tetrahydrophthalic anhydride and  $\text{PhMgBr}$  give 2-phenylmethyl-6-phenyl-1,2,3,6-tetrahydrobenzoic acid lactone, m. 257°; the acid portion could not be purified. C. J. West

Alcoholic ammonia as a reagent in the nitrosubene series. David E. Worrall. *J. Am. Chem. Soc.* 57, 2299-301 (1935).—Isosaxoline oxides are prepd. by adding a small vol. of  $\text{EtOH}$  satd. with  $\text{NH}_3$  to a nitrosubene either alone or mixed with  $\text{PhCH}_2\text{NO}_2$  or  $\text{p-Br-C}_6\text{H}_4\text{CH}_2\text{NO}_2$ ; no reaction was observed with carefully dried  $\text{NH}_3$  and nitrosubene in dry  $\text{Et}_2\text{O}$  after 48 hrs. 4-*p*-Bromophenyl-3,5-diphenyl deriv., m. 172-3°; 3,4-diphenyl-5-*p*-bromophenyl deriv., m. 213-15° (decomp.); 3-phenyl-4,5-bis(*p*-bromophenyl) deriv., m. 160-1°; 3,5-diphenyl-4-anisyl, m. 145-6°; 3-phenyl-4-anisyl-5-*p*-bromophenyl, m. 143-4°; 3,5-diphenyl-4-*p*-bromophenyl deriv., m. 165-6°; 3-phenyl-4-*p*-bromophenyl-5-*p*-bromophenyl deriv., m. 192-3°. Isosaxolones were prepd. by the action of  $\text{EtOH-KOH}$  on the oxides: 3,5-diphenyl-4-*p*-bromophenyl, m. 182-3°; 3-phenyl-4,5-bis(*p*-bromophenyl), m. 179-80°; 3-phenyl-4-anisyl-5-bromophenyl, m. 188-9°; 3,5-diphenyl-4-*p*-bromophenyl, m. 227-8°; 3-phenyl-4-*p*-bromophenyl-5-bromophenyl, m. 204-5°; 3,5-diphenyl-4-*a*-chlorophenyl, m. 127-8°.  $\alpha$ -Nitro- $\alpha$ -phenyl- $\beta$ -phenyl- $\beta$ -benzylaminoethane, m. 137-8°; dil. HCl gives  $\text{NH}_3$ ,  $\text{BzH}$  and  $\text{PhCH}_2\text{NO}_2$ ; this compd. probably results from the reaction of  $\text{PhCH}_2\text{NO}_2$  with a condensation of  $\text{NH}_3$  and

BzH (PhCH(OH)N CHPh) The action of EtOH-NH<sub>3</sub> upon  $\alpha$ -chlorobenzophenylmethane gives  $\alpha$ -nitro- $\alpha$ -phenyl- $\beta$ - $\alpha$ -chlorophenyl- $\beta$ - $\alpha$ -chlorobenzonitrile, m 144-5°. The role of NH<sub>3</sub> in these transformations is discussed. C. J. West

**Pyrolysis.** Elimination of two hydroxyl groups from a cyclic Alexander-Schönberg and Robert Michaelis. *J. Chem. Soc.* 1935, 1403-4.—1,4-Bis(diphenylmethyl)- $\Delta^1$ -cyclohexadiene (Thiele and Balhorn, *Ber.* 37, 1469(1904)) yields with HNO<sub>3</sub> and AcOH Ph<sub>2</sub>C(OH). C<sub>11</sub>H<sub>13</sub>C(OH)Ph (Ullmann and Schaefer, *Ber.* 37, 2303(1904)). Similarly it is believed that the action of HNO<sub>3</sub> in AcOH on chromanorufen (I) yields 5,12-dihydroxy-chromanorufen (II), decomp 260°. (cf. Lieberman and Barrollier, *C. A.* 28, 3391). Heating II at 290-310° gives I, also results on boiling in AcOH. II and Ph-NMe<sub>2</sub> in AcOH (heating 4 hrs) gives 5,12-bis( $\beta$ -dimethylaminophenyl)chromanorufen, pale yellow, decomp 340°. I is unchanged on heating with PhNMe<sub>2</sub>. C. J. West

**Grignard reactions with phthalic anhydrides.** Chaim Weizmann, Ernst Bergmann and Felix Bergmann. *J. Chem. Soc.* 1935, 1367-70.— $\alpha$ -Aryl benzoic acids are conveniently prep'd from RMgX and C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O and derivs, the formation of a HO acid or its lactone can usually be prevented by using excess of the anhydride, i.e., by adding the RMgX to the anhydride; yields are 70-80%. Of the 16 comp'ds prep'd, the following are new:  $\alpha$ - $\beta$ -Naphthylbenzoic acid, m 128° (decomp) as hydrate,  $\alpha$ - $\beta$ -Naphthylphthalide, m 168°;  $\alpha$ -6-methoxy-2-naphthylbenzoic acid, m 168°;  $\alpha$ -9-phenanthrolylbenzoic acid, m 174-5°;  $\alpha$ -5(7)-methoxy-2-benzoylbenzoic acid, from 4-MeOC<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O and PhMgBr, m 167°; 2- $\alpha$ -naphthyl analog, m 190°; tetrachloro- $\alpha$ -4-anisoylbenzoic acid, m 186-7°; tetrachloro- $\alpha$ -4-bromophenylphthalide, m 144-5° (decomp); 2- $\alpha$ -naphthyl- $\beta$ -naphthoic acid, m 228-9°;  $\beta$ -isomer, m 240°; 2-(4'-methoxybenzoyl)- $\beta$ -naphthoic acid, m 234°. Cyclization of some of these comp'ds is difficult because of the ease of sulfonation. C. J. West

**Some bromine derivatives of indene and indan.** H. D. Porter and C. M. Suter. *J. Am. Chem. Soc.* 57, 2022-6(1935).—Indene bromohydrin (I), m 120-8°, with P<sub>2</sub>O<sub>5</sub> in CCl<sub>4</sub> or on heating at 155-60° for 2 hrs, gives 45-55% of 2-bromoindene, b<sub>p</sub> 125-7°, m 39-0° (Jacobi, *C. A.* 25, 1517, considered this the 1-isomer); refluxing with EtONa gives 2-indanone, the Mg deriv, with CO<sub>2</sub> gives indene-2-carboxylic acid, HBr in AcOH gives the dibromide (II), also prep'd in 61% yield from I and 47% HBr by heating 3 hrs on the water bath; Br gives apparently 1,2,3-tribromoindene, d<sub>4</sub> 2.12, n<sub>D</sub> 1.6615, oxidation gives  $\alpha$ -C<sub>6</sub>H<sub>4</sub>(CO<sub>2</sub>H)<sub>2</sub> and hydrolysis yields a dibromosulfolone, n<sub>D</sub> 1.6350. Heating II at 200-100° for 1 hr, gives the 2-Br deriv, (16% yield); refluxing in dry tetralin gives a 36% yield. II and abs. EtOH with C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> refluxed 4 hrs, give 38% of 1-ethoxy-2-bromoindan, b<sub>p</sub> 147-8°, n<sub>D</sub> 1.5515, d<sub>4</sub> 1.344; the structure was confirmed by transformation into 1-indanone oxime with NaNH<sub>2</sub> in liquid NH<sub>3</sub>, followed by steam distn. from 10% H<sub>2</sub>SO<sub>4</sub> and addn of NH<sub>4</sub>OH HCl. Br gives a mixt. of 1,2,3-tribromoindan and 2,2-dibromo-1-indanone; refluxing with 10% H<sub>2</sub>SO<sub>4</sub> gives 1-indanone (III). The prep'n of trans-indene glycol (IV) from I is described. III results in 80% yield by refluxing I with 7% H<sub>2</sub>SO<sub>4</sub> for 10 hrs, while IV in 1 hr, gives 71% of the 2 isomer. C. J. West

**Synthesis of phenanthrene and hydrophenanthrene derivatives II.** The hydrocarbon synthesis. Louis F. Fieser and Emanuel H. Hersberg. *J. Am. Chem. Soc.* 57, 2192-6(1935); cf. *C. A.* 29, 7972.—3,4-Dihydronaphthalene-1,2-dicarboxylic anhydride and butadiene, heated 85 hrs, at 100°, give 63% of 1,4,9,10,11,12-hexahydrophenanthrene-11,12-dicarboxylic anhydride (I), b<sub>p</sub> 160-70°, m 83-5-4°; 2,3-dimethylbutadiene, heated 20-25 hrs at 100°, gives 94-7% of the 2,3-di-Me deriv. (II), b<sub>p</sub> 175-85°, m 95-6°. 2,3-Dimethyl-1,4,11,12,13,14-hexahydrophenanthrene-13,14-dicarboxylic anhydride, m 196-6-5°. 1,2-Dihydrophenanthrene-3,4-dicarboxylic anhy-

dride and butadiene at 100° for 100 hrs, give 76% of 5,6-benzo-1,4,9,10,11,12-hexahydrophenanthrene-1,12-dicarboxylic anhydride, m. 101 5-2°; 2,3-di-Me deriv, m 128-8 5° (68% yield). Soln in 6 N KOH and acidification gives the dicarboxylic acid (III) corresponding to II, m 170-7°; II and MeOH with NaOH give the Me ester of III, m 157-9°; C<sub>6</sub>H<sub>5</sub>N<sub>3</sub> gives the di-Me ester, m 93 5-4°; catalytic reduction of II gives the 1,2,3,4,9,10,11,12-octahydro deriv, m. 117-18°; the corresponding acid, with 0.5 mol C<sub>6</sub>H<sub>5</sub>, m. 183-4°. Definite products could not be obtained from heating II with KOH at 325-420° but I gives hexahydrophenanthrene, b<sub>p</sub> 170-80° (55% yield); Se gives 80% of phenanthrene. Heating a mixt. of tetra- and hexa hydro derivs. from II and KOH gives 2,3-dimethylphenanthrene, m. 78-8 5°; picrate, light yellow, m 146-7°; quinine, orange, m. 237 5-8 5° (quinaxaline deriv, m 208-9°). C. J. West

**Phenanthrene series IX.** Amino alcohols derived from 1,2,3,4-tetrahydrophenanthrene. Frisch Missetig and Alfred Burger. *J. Am. Chem. Soc.* 57, 2189-92(1935); cf. *C. A.* 29, 51061.—1-Keto-2,3,4-tetrahydrophenanthrene (1-tetantherone) gives 90% of the 2-Br deriv, m 84-5° (all m. ps. cor.); 2-dimethylamino deriv (HCl salt) (I), m 218-20° (decomp), 75% yield (picrate, yellow, m 180° (decomp)); 2-diethylamino deriv (HCl salt) (II), m 143-8°, 33%, 2-piperidino deriv, yellow, m 138-40°, 81%; 2-(1,2,3,4-tetrahydroquinoline) deriv (HCl salt), pale yellow, m 226-7° (decomp), 56%; catalytic reduction of I gives 2-dimethylamino-1-hydroxy-1,2,3,4-tetrahydrophenanthrene, m 105-8° (HCl salt, m 223-4° (decomp)); Br deriv (HCl), m 170-81° (decomp); diethylamino analog, m 70-2° (HCl salt, m 221-3° (decomp)); 3,5-di-nitrobenzoyl deriv, pale yellow, m 209-11° (decomp); 2-piperidino analog (III), m 121-6° (HCl salt, m 259° (decomp)); 1,2,3,4-tetrahydroquinoline analog, m 155-6° (HCl salt, m 227° (decomp)); 3-Bromo-4-keto-1,2,3,4-tetrahydrophenanthrene, m 104-5°, 87%; 3-dimethylamino deriv (HCl), m 204-10° (decomp); 3-diethylamino deriv (HCl), m 184-5° (decomp); 3-piperidino deriv (HCl), m 248-50° (decomp); 3-(1,2,3,4-tetrahydroquinoline) deriv (HCl), m 164-6° (decomp); 3-dimethylamino-4-hydroxy-1,2,3,4-tetrahydrophenanthrene (HCl), m 230° (decomp) (Br deriv, m 89-90°, HCl salt, m 177-8°); 3-diethylamino deriv (HCl), m 239 5-40° (decomp) (picrate, yellow, m 206-8° (decomp)); Br deriv (as picrate), yellow, m 173-4° (decomp); 3,5-dinitrobenzoyl deriv, pale yellow, m 216-17 5°; 3-piperidino deriv. (HCl), m 248-7° (decomp) (Br deriv (HCl), m 181-2° (decomp)); 3-(1,2,3,4-tetrahydroquinoline) deriv. (HCl) (IV), m 230-1° (decomp). 1-Hydroxyphenanthrene, m 153°, results in 50% yield from 2-bromo-1-tetantherone with PhNEt<sub>3</sub> for 4 hrs and in 25% yield by heating 1-tetantherone with Se at 295° for 14 hrs and as a by-product from II. Another by-product of II is the comp'd C<sub>10</sub>H<sub>7</sub>OH OC<sub>6</sub>H<sub>4</sub>II, m 119°. 4-Hydroxyphenanthrene (V), m 113°, comp'd. C<sub>10</sub>H<sub>7</sub>OH OC<sub>6</sub>H<sub>4</sub>II, m 107°; this results from V and 4-tetantherone. The effective analgesic dose of III is 20 mg per kg., of IV, 15 mg per kg., comparable with the effective doses of 10 and 20 mg for codeine and pseudocodeine, resp. C. J. West

**Synthesis of substances related to the sterols.** IV. Some derivatives of chrysene. H. J. Lewis, G. R. Ramage and Robert Robinson. *J. Chem. Soc.* 1935, 1412-14, cf. *C. A.* 29, 7906.—In the reduction of 4-MeOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>CHCO<sub>2</sub>Me (*C. A.* 27, 4230), Me  $\beta$ , $\gamma$ -diisopropylidene- $\beta$ - $\beta$  may be dist'd off, b<sub>p</sub> 285°, m 67°; the free acid (I) m 180°. Ring closure of I in C<sub>6</sub>H<sub>5</sub>Cl gives 2,11-diketo-5,14-dimethoxy-1,2,9,10,11,18-hexahydrochrysene-b, m. 220°; this may also be prep'd by hydrolysis of the crude mixt from the reduction. Clemmensen reduction gives 5,14-dimethoxy-1,2,9,10,11,18-hexahydrochrysene b, m 140-1°. Reduction of 50 g 3-MeOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>CHCO<sub>2</sub>Me with Al-Hg in Et<sub>2</sub>O gives mainly Me  $\beta$ -3-methoxyphenylpropionate, b<sub>p</sub> 146°, with 1 g of Me  $\beta$ , $\gamma$ -di-3-methoxyphenylidene- $\beta$ - $\beta$ , m. 139 5°; the free acid (II) m 247-8°, heating II

with 50%  $\text{H}_2\text{SO}_4$  at  $100^\circ$  for 2.5 hrs. gives **2,11-diketo deriv.**, m. about  $350^\circ$ , of 6,15-dimethoxy-1,2,9,10,11,18-hexahydrochrysene, m.  $199^\circ$ . Piperonal and AcOMe with Na give Me  $\beta$ ,4-methylenedioxy-*cinnamale*, m.  $133-4^\circ$ ; the only reduction product is Me  $\beta$ ,3,4-methylenedioxy-*propionalate*, b.  $167-70^\circ$ , m.  $31-5^\circ$ .  $\beta$ ,4-(MeO) $_2$ -C $_6$ H $_4$ CH $_2$ CH $_2$ CO $_2$ Me on reduction yields Me  $\beta$ ,3,4,5-methoxyphenylpropionate, b.  $175-80^\circ$ , m.  $37^\circ$ , and Me  $\beta$ ,7-di-3,4-dimethoxyphenyladipeate, m.  $181^\circ$ ; the free acid m.  $255^\circ$ , 80%  $\text{H}_2\text{SO}_4$  gives the 2,11-diketo deriv., m.  $330^\circ$  (decompn.) of 5,6,13,14-tetramethoxy-1,2,9,10,11,18-hexahydrochrysene, m.  $201^\circ$ . Air oxidation of the reaction product of cis-2,11-diketo-1,2,9,10,11,18-hexahydrochrysene and MeMgI yields 2,11-dimethylchrysene, m.  $237^\circ$ , 1,7,5-trimethoxybenzene compd., reddish orange, m.  $222^\circ$ , styplinate, orange, m.  $207^\circ$  (decompn.).

V. Condensation of phenylsuccinic anhydride with veratrole under the influence of aluminum chloride. Robert Robinson and P. C. Young *Ibid* 1414-16.—Phenylsuccinic anhydride (4 g.), 0 g. veratrole, 7.5 g.  $\text{AlCl}_3$  and 15 cc.  $\text{PhNO}_2$ , allowed to stand 48 hrs., give 84% of  $\beta$ -acetoxy- $\alpha$ -phenylpropionic acid, m.  $142-3^\circ$ , mono-NO $_2$  deriv., pale yellow, m.  $170-0^\circ$ , this contains the 6-nitroveratroyl group. The Me ester, m.  $100-100.5^\circ$ , results by esterification of the acid and also from  $\text{PhCH}(\text{CO}_2\text{Me})\text{CH}_2\text{COCl}$  and veratrole with  $\text{AlCl}_3$  in  $\text{CS}_2$ . Reduction with Zn-Hg and coned. HCl yields  $\alpha$ -phenyl- $\gamma$ -tertiarybutyric acid, m.  $63^\circ$ , with 80%  $\text{H}_2\text{SO}_4$ , there results 1-keto-6,7-dimethoxy-2-phenyl-1,2,3,4-tetrahydronaphthalene, m.  $140-1^\circ$ ; with  $\text{BrCH}_2\text{CO}_2\text{Et}$  and Zn in  $\text{C}_6\text{H}_5$ , there results probably Et 6,7-dimethoxy-2-phenyl-3,4-dihydro-*cinnaphthyl-1-terate*, m.  $159-61^\circ$ , the acid does not give a ppt with  $\text{Br-H}_2\text{O}$  and hence is probably a  $\beta$ , $\gamma$ - and not an  $\alpha$ , $\beta$ -unsat. acid. VI. Robert Robinson and James Walker *Ibid* 1530-3.—Continuation of the work in part V was abandoned when it was found that the condensation of  $\beta$ -methoxyphenylsuccinic anhydride with veratrole was not a smooth process. Reduction of Et 3,4-dihydro-1-naphthylacetate with Na in EtOH gives 68% of  $\beta$ -tetrahydro-1-naphthylaldehyde, b.  $158-60^\circ$ , and not vinyl-dihydronaphthalene. The synthesis of Me 2- $\beta$ ,1'-naphthyl-1-ethyl-2-methylcyclopentan-2-ol-1-carboxylate, b.  $206-14^\circ$ , n $_D^{20}$  1.5510, is described (the intermediate compds. have been described); its methylamide m.  $100^\circ$ ; the ester could not be dehydrated. Hydroxymethylene-cyclohexanone and MeSO $_2$  give the O-Me ether, b.  $75-80^\circ$ , n $_D^{20}$  1.4554; it decomposes rapidly, turning green in a few min. and dark green after 1-2 hrs.; with  $\text{AcCl}$  in  $\text{CH}_2\text{Cl}_2$  and EtONa, followed by condensation and hydrolysis with EtONa, 6-hydroxytetralin-7-carboxylic acid results. The aromatic nucleus of 2-methylchroman could not be reduced catalytically. VII. Wm. Sage Rapson and Robert Robinson. *Ibid* 1533-43.—Et 1-methyl-2-cyclopentene-1-carboxylate (I), b.  $70-1^\circ$ , results from the HO ester and  $\text{P}_2\text{O}_5$  in  $\text{C}_6\text{H}_5$ ; the acid b.  $110^\circ$ . Reduction of the Et ester gives 70% of 1-methyl-2-cyclopentyl-1-carbinol (II), b.  $162-5^\circ$  ( $\beta$ -nitrobenzoate, m.  $67^\circ$ );  $\text{PCl}_5$  in petr. ether gives the chloride, b.  $40-56^\circ$ , which does not condense with  $\text{AcCl}$  in  $\text{NaCO}_2\text{Et}$  in EtOH or  $\text{C}_6\text{H}_5$ . Dehydration of II with  $\text{KHSO}_4$  gives a dihydro-luene(?), b.  $112-13^\circ$ . Electrolytic reduction of 35 g. of m-MeOC $_6$ H $_4$ CHO (4 amps., c. d. 0.025 amp./sq. cm.) for 3 hrs. gives 20 g. m-MeOC $_6$ H $_4$ CH $_2$ OH (III) and 9 g. of 2,1'-dimethoxydihydrobenzo- $\alpha$ , $\alpha'$ -di-Me ether, m.  $112-13^\circ$ . III was converted through the chloride and nitrile to Et m-methoxyphenylacetate, which was reduced with Na and EtOH to  $\beta$ -m-methoxyphenylethylaldehyde, b.  $135-7^\circ$ ; the chloride, b.  $129-30^\circ$ , reacts sluggishly with  $\text{AcCl}$  in  $\text{NaCO}_2\text{Et}$ ; Et  $\beta$ -m-methoxyphenylethylacetate b.  $180^\circ$ ; hydrolysis gives  $\gamma$ -m-methoxyphenylpropyl Me ketone, b.  $169^\circ$  (semicarbazone, m.  $100^\circ$ ); condensation with I did not give a pure  $\beta$ -diketone. The K salt of Et trans-cyclopentane-1-carboxylate-2-cyanoacetate and  $\text{PhCH}_2\text{CH}_2\text{Br}$  give Et  $\alpha$ -cyano- $\alpha'$ -(trans-2-carboxycyclopentyl)- $\gamma$ -phenylbutyrate, b.  $195-200^\circ$ ; hydrolysis with coned. HCl (boiling 30 hrs.) gives  $\alpha$ -cyano- $\alpha'$ -(trans-2-carboxycyclopentyl)- $\gamma$ -phenylbutyric acid, m.  $210^\circ$  (decompn.); boiling with  $\text{H}_2\text{SO}_4$  and AcOH gives  $\alpha$ -(trans-2-carboxy-

cyclopentyl)- $\gamma$ -phenylbutyric acid, m.  $160-1^\circ$ ; the trans-anhydride, m.  $112^\circ$ , on heating at  $250^\circ$  for 15 min., gives the cis-anhydride, which did not crystallize; the cis-acid m.  $133^\circ$ . The trans-acid with  $\text{H}_2\text{SO}_4$  gives 1-keto-2-(trans-2'-carboxycyclopentyl)-1,2,3,4-tetrahydronaphthalene, m.  $161-5^\circ$ ; heating with AcO and AcONa and decoupling of the anhydride gives the cis-isomer, m.  $155-6^\circ$ . The Me ester of the trans-acid m.  $45^\circ$ ; this did not react with  $\text{BrCH}_2\text{CO}_2\text{Et}$  and Zn. Both acids react with  $\text{SOCl}_2$  in  $\text{CHCl}_3$  to yield the trans- and cis-forms of 1-hydroxy-2-(2'-carboxycyclopentyl)-3,4-dihydronaphthalene lactone, m.  $162^\circ$  and  $60^\circ$ , resp. The trans-form monoclinic needles elongated along  $a$ , with the axes [021], [100] developed, the dimensions of the unit cell are  $a = 8.2$ ,  $b = 23.4$ ,  $c = 13.6$ ,  $\beta = 68^\circ$ ; with a density of about 1.315, the no. of mols. in the cell is 8, the cis-form crystallizes in triclinic plates,  $a = 7.27$ ,  $b = 16.75$ ,  $d$  (001) =  $11.0$ ,  $\gamma = 75^\circ$ ,  $d$  1.267, no. of mols. in the unit cell, 4. Catalytic reduction of the trans-lactone yields 2-(2'-trans-carboxycyclopentyl)-1,2,3,4-tetrahydronaphthalene, m.  $107^\circ$ . Et cyclopentan-2-one-1-carboxylate in  $\text{P}_2\text{O}_5$  in light petroleum gives Et 2-chloro-2-cyclopentene-1-carboxylate, b.  $95-8^\circ$ , and a small quantity of the acid, m.  $115-16^\circ$ ; this ester did not condense with  $\text{AcCl}$  in  $\text{NaCO}_2\text{Et}$  or  $\text{CH}_2\text{Cl}_2$  in  $\text{C}_6\text{H}_5$ ; m-HOC $_6$ H $_4$ CHO and  $\text{PhCH}_2\text{CH}_2\text{Br}$  with Na give m-benzoylbenzaldehyde, b.  $215-18^\circ$ , m.  $54^\circ$ , hippuric acid and AcO give m-methoxybenzylidenephénylloxazolone, yellow, m.  $129^\circ$ , hydrolysis gives m-benzoylphenylpyruvic acid, m.  $145^\circ$  but it decomposes on keeping. alk.  $\text{H}_2\text{O}_2$  gives m-benzoylphenylsuccinic acid (IV), m.  $120^\circ$ . Since  $\beta$ -benzoylation could not be avoided in further work methoxylated intermediates were used. The dry Na salt of IV, 6,3-O $_2$ N-(MeO) $_2$ C $_6$ H $_4$ CH $_2$ CO (V) and AcO, heated on the water bath for 24 hrs., give 2-nitro-5-methoxy- $\alpha$ -(m-benzoylphenyl)cinnamic acid, pale yellow, m.  $148^\circ$ , 2-NH $_2$  deriv., m.  $137^\circ$ , m-MeOC $_6$ H $_4$ CH $_2$ CO $_2$ Na, V and AcO give 2-nitro-5-methoxy- $\alpha$ -(m-benzoylphenyl)cinnamic acid, yellow, m.  $148^\circ$ . 2-NH $_2$  deriv., m.  $185^\circ$ , the diazo reaction gives 63% of a mixt. of 44% 2,7-dimethoxyphenanthrene-9-carboxylic acid, pale yellow, m.  $253^\circ$ , and 56% of the 2,5-isomer, pale yellow, m.  $191^\circ$ . Decarboxylation gives 2,7-dimethoxyphenanthrene and the 2,5-isomer, m.  $117^\circ$  (picrate, orange-red, m.  $151-6^\circ$ ), 2,5-dihydroxyphenanthrene, m.  $180^\circ$ , di-Ac deriv., m.  $144^\circ$ . In the prepn. of  $\beta$ -2-hydroxy-1-naphthylethyl Me ketone a by-product is 2-methyl-5,6-(1,2-naphtho)- $\gamma$ -pyran, b.  $190^\circ$ , m.  $41-5^\circ$ . The K deriv. of Et cyclopentanonecarboxylate and octyl bromide, boiled 7 hrs. in  $\text{CaH}_2$ Me $_2$ , give Et 1-octylcyclopentan-2-one-1-carboxylate, b.  $157-65^\circ$  (85% yield) (semicarbazone, m.  $117^\circ$ ), hydrolysis with Ba(OH) $_2$  gives  $\alpha$ -octyladipic acid, m.  $74^\circ$ , and 2-octylcyclopentanone, b.  $135-8^\circ$  (semicarbazone, m.  $183^\circ$ ); reduction of the ketone yields 2-octylcyclopentan-1-ol, b.  $101^\circ$ , b.  $140^\circ$ ; bromide, b.  $135-140^\circ$ . Octyl- $\Delta^1$ -cyclopentene and MeO $_2$ CCH $_2$ CH $_2$ COCl with NaCl or  $\text{AlCl}_3$  give 2-( $\beta$ -carbomethoxypropenyl)-1-octyl- $\Delta^1$ -cyclopentene, b.  $173-7^\circ$ , n $_D^{20}$  1.4518. Work of R. Hurt on cyclopentanone-2- $\beta$ -propionic acid is described. Refluxing the acid with AcCl gives the enolic lactone, b.  $116-7^\circ$ ; cyclopentan-2- $\beta$ -propionic acid lactone, b.  $139-0^\circ$ .  $\text{PhCH}_2\text{CH}_2\text{CH}_2\text{Ac}$  and 85%  $\text{H}_2\text{SO}_4$  at  $0^\circ$  give 74% of 1-methyl-3,4-dihydronaphthalene, b.  $107-8^\circ$ .

C. J. West  
Amino alcohols derived from dibenzofuran. Erich Møsting and Richard A. Robinson *J. Am. Chem. Soc.* 57, 2186-9 (1935).—2-Acetyldibenzofuran (I) and Br in abs. Et $_2$ O at  $0^\circ$  give 55% of the 2- $\omega$ -bromoacetyl deriv., m.  $105-6^\circ$ ; Me $_2$ NH in Et $_2$ O gives 90% of the 2-(2-dimethylamino-1-ketoethyl) deriv. (II), m.  $83-3^\circ$  (HCl salt, with 1 mol.  $\text{H}_2\text{O}$ , m.  $212-35^\circ$ ); the HCl salt of the diethylamino deriv. m.  $200-12^\circ$ ; the 2-piperidino deriv. m.  $97-100^\circ$  (HCl salt, m.  $255-63^\circ$ ); the HCl salt of the 2-ethylamino deriv. m.  $254-6^\circ$  (decompn.). Reduction of 2-isotonitrosoacetyldibenzofuran gives 64% of 2-(2-amino-1-ketoethyl)dibenzofuran, the HCl salt of which decomposes  $251-6^\circ$ . The catalytic reduction of II gives 90% of the 2-[2-(dimethylamino)-1-hydroxyethyl] deriv., m.  $88-0^\circ$  (HCl salt, m.  $173-4^\circ$ ; benzoic acid ester, m.  $99-100^\circ$ );

diethylamino analog, m. 75-6° (HCl salt, m. 157-9°); 2-piperidino analog, m. 116-17.5° (HCl salt, m. 250-1°, benzene acid ester, m. 119°); 2-ethylamino analog, m. 99-101° (HCl salt, m. 219-19.5°), 2-amino analog, m. 132° (90% yield) (HCl salt, m. 261° (decomp)). Catalytic reduction of I gives 90% of 2-(1-hydroxyethyl)-dibenzofuran, m. 63-4°; 2-propionyl-dibenzofuran, m. 101-5-2.5° (semicarbazone, m. 184-6°); 2-[2-(methylamino)-1-ethoxyethyl]-dibenzofuran-HCl, m. 225-50°; Methylbis(2-dibenzofurylmethyl)amine-HCl, m. 235-45°. The NH<sub>2</sub> alics do not give a morphine-like picture in the cat but are generally more analgesic and more toxic than the corresponding NH<sub>2</sub> alics. in the phenanthrene series.

C. J. West

Arsenicals containing the furan nucleus II. Action of chlorine. Some substituted furan arsenicals. Wesley G. Lowe and Chiff S. Hamilton. *J. Am. Chem. Soc.* 57, 2314-17 (1935), cf. C. A. 29, 5109°—Chlorination of luryldichloroarsine, difuryldichloroarsine (I) and trifurylarsine yields 2-chlorofuran tetrachloride, slightly yellow, pungent penetrating odor, d<sub>4</sub><sup>20</sup> 1.620, satd. EtOH-KOH splits off 40% of the Cl; the action of aq. AgNO<sub>3</sub> is complex, varying conditions of temp. and acidity leading to a pptn of 60, 70 and 75% of the total Cl as AgCl. The chlorination product of I gives 8% of difurylarsinic acid, m. 138°, and a very small quantity of trifurylarsinic dichloride, m. 132°. 5-Chloropropionic acid (Na salt) and HgCl<sub>2</sub> give 65% of 5-chloro-2-chloromercaptofuran (II), m. 181°, AsCl<sub>3</sub> in C<sub>6</sub>H<sub>6</sub> gives tri-5-chlorofurylarsine (III), m. 63°, 5-Br analog (IV) of III, m. 106° (40% yield); the action of HgCl<sub>2</sub> upon III in EtOH gives II, IV behaves similarly, these results indicate that the aromaticity of the furan nucleus is less in these compds than in trifurylarsine itself. The chlorination of furan arsenicals is regarded as competitive oxidation of As and the furan nucleus.

C. J. West

Dibenzofuran VII Derivatives of tetrahydrodibenzofuran. Henry Gilman, E. W. Smith and L. C. Cheney. *J. Am. Chem. Soc.* 57, 2095-9 (1935), cf. C. A. 29, 5109°—1,2,3,4-Tetrahydrodibenzofuran (I) yields a 7-NO<sub>2</sub> deriv. identical with the 8-NO<sub>2</sub> compd. of Ebel (C. A. 23, 2439) and the 8-nitrohexahydrodibenzofuran of von Braun (C. A. 17, 1953). Br in AcOH gives 3-nitrodibenzofuran. The amine is also the same as the aminohexahydrodibenzofuran of v. Braun, its Ac deriv. m. 148° (not 123°). I with Ac and SnCl<sub>4</sub> in C<sub>6</sub>H<sub>6</sub> yield a 7-Ac deriv. b<sub>1</sub> 210°, m. 66-7°, again identical with v. Braun's product, I<sub>1</sub> in NaOH gives 57% of 1,2,3,4-tetrahydrodibenzofuran-7-carboxylic acid, m. 217-8° (Me ester, m. 72-5-3°), Br in AcOH gives a quant. yield of 7(or 3)-dibenzofuran-carboxylic acid (Me ester, m. 138-5°). I and CISOH in CCl<sub>4</sub> give 38-3% of 3a,1,2,3,4-tetrahydrodibenzofuran-7-sulfonate, the acid chloride with NHOH yields 77% of the sulfonamide, m. 207.5-8.5°, dehydrogenated to dibenzofuran-3-sulfonamide, m. 241-3°, this was also prepd. from 3-aminodibenzofuran, through dibenzofuran-2-sulfonic acid, waters without melting, and its chloride, m. 148-5°. I and PhLi (p-MeC<sub>6</sub>H<sub>4</sub>Li or BuNa), followed by the action of CO<sub>2</sub> gives 4-8% of the 6-carboxylic acid, m. 197°; Br in AcOH gives dibenzofuran-1-carboxylic acid, m. 207-8°, reduction of this acid with Na and EtOH appears to give 1,2,3,4-tetrahydrodibenzofuran-4-carboxylic acid, m. 168°. The 6-MeO deriv. of I with S at 275° gives 4-methoxydibenzofuran. The various reduced dibenzofurans are discussed, there is no doubt of the existence of the tetrahydro and the perhydro derivs (C. A. 27, 2459), a dihydro deriv has not been definitely established and there is a question about the hexahydro deriv., which may be known as a parent type.

C. J. West

Synthesis of rotenone and its derivatives VII Tetrahydrobutyric acid. Alexander Robertson and Geo. L. Rusby. *J. Chem. Soc.* 1935, 1371-3, cf. C. A. 29, 6597°—Tetrahydrobutanol (C. A. 27, 5739) (5 g.) with 7a(CN), HCN and HCl in Et<sub>2</sub>O gives 4 g. tetrahydrobutyric aldehyde (2,4-dihydroxy-3-isooxymethylaldehyde) (I), m. 112-5°, reddish violet FeCl<sub>3</sub> reaction, semicarbazone, m. 194°, diacetate (II), m. 47-5°. Oxidation of II m

MeCO with KMnO<sub>4</sub> yields the diacetate, m. 140-1°, of tetrahydrobutyric acid (III), m. 203° (Haller and LaForge, C. A. 26, 3253). The 4-Me ether (IV) of I b<sub>1</sub> 180°, reddish violet FeCl<sub>3</sub> reaction, semicarbazone, m. 193°, the acetate is a viscous oil, oxidation of which yields the Me ether of III, m. 154-5°. IV and α-methoxyacetoveratone with HCl in AcOEt give 3,7,3',4'-tetramethoxy-8-isoamylavylum chloride, deep red prisms, the ferrichloride, red plates with green reflex, m. 131-2°. The acetate of asarylaldehyde, boiled with 12% aq. NaOH, satd. with SO<sub>2</sub>, filtered and heated with concd. HCl, yields 2,4,5-trimethoxyphenylpyruvic acid, pale yellow, m. 198° (decomp.), through the oxime there was prepd. 2,4,5-trimethoxyphenylacetone, m. 85°, soln. of the crude oxime in boiling water gives mainly the nitrile.

C. J. West

Indole series. VI. Synthesis of ketotryptophan and further studies of 3-alkylation of oxindoles. Percy L. Julian, Josef Pkl and Frank E. Wanz. *J. Am. Chem. Soc.* 57, 2026-9 (1935), cf. C. A. 29, 3674°—1,3-Dimethyloxindole (49 g.) and bromoacetal (55 g.) with EtONa, refluxed 1 hr., give 55% 1,3-dimethyloxindolylacetal, b<sub>1</sub> 182-5-3.5°, hydrolysis with 5% HCl at room temp. gives a quant. yield of 1,3-dimethyloxindolylaldehyde (I), b<sub>1</sub> 177-8° (semicarbazone, m. 206°), 64 g. I and 35 g. NaHSO<sub>3</sub> in H<sub>2</sub>O-Et<sub>2</sub>O with 25 g. KCN give 40 g. of the cyanohydrin, m. 142°, alc. NH<sub>4</sub>, followed by HCl, gives β-1,3-dimethyloxindolylalanine, m. 188° (decomp.), above its m. p. it yields 1,3-dimethyloxindolyl-ethylamine. Condensation of oxindole with bromoacetal presented difficulties and even 1-methyloxindole did not react smoothly. 1-Methyl-5-hydroxyoxindole, m. 187°, 5-EtO deriv. m. 92°. 3-Acyloxindoles were prepd. by adding 1 mol. oxindole and 12 mols. of ester to a 10% soln. of EtONa contg. 1.3 mols. Na and decomp. the Na salt with dil. HCl. These are catalytically reduced to 3-alkyloxindoles, yields being 50-70%. 1-Methyl-3-acyloxindole, m. 109°, 1-methyl-3-ethyloxindole, m. 109°, 1,3-Dimethyl-3-acyloxindole, m. 79°, 1-Methyl-3-carbethoxyacetyloxindole (II), m. 67°, β-1-methyloxindolylpropionic ester (III), b<sub>1</sub> 160°, 1-Methyl-3-dimethylaminoacetyloxindole, m. 219°, 1-methyl-3-β-dimethylaminoethyl-oxindole (IV), b<sub>1</sub> 185° (picrate, m. 103°); the 5-EtO analogs, m. 190° and b<sub>1</sub> 221° (V) (picrate, m. 157°). 1-Methyl-2-methoxy-3-formyloxindole gives 1-methyl-2-methoxyoxindolylcarbinol, m. 62°. II and III are of interest in the synthesis of ketotryptophan, since oxindole may be condensed with phthalimidomalonic ester, reduced and hydrolyzed. IV and V are related to bufotenine.

C. J. West

Autoxidation phenomena in the indole series P. Pfeiffer and H. L. de Waal. *Ann.* 520, 185-203 (1935).—1-Phenylindan-3-one (I), m. 78°, yields 2-benzal deriv., straw-yellow, m. 158°; anisal deriv., bright yellow, m. 174°, 3',4'-dimethoxy-2-benzal deriv., deep yellow, m. 174°. 2-Isotonitroso deriv., from I and iso-As<sub>2</sub>O<sub>3</sub> with EtONa-EtOH, tuncd. HCl, or simply on standing, decomposes 201-2°, NH<sub>4</sub>OH gives 1-phenylindandione dioxime, pale gray, m. 196-6.5° (decomp.). I and PhNO m. 90% EtOH with NaOH give 80% of the monanil (II) of III, C<sub>11</sub>H<sub>9</sub>ON, deep blue-violet, m. 149-50°, and a little of compd. C<sub>11</sub>H<sub>9</sub>O<sub>2</sub>N, yellow, m. 223°. II with concd. H<sub>2</sub>SO<sub>4</sub> (cooling) gives 75% of 1-phenylindandione (III), m. 137-8°, semicarbazone, yellow, m. 252° (decomp.), azine, straw-yellow, m. 173°. Oxidation of II with H<sub>2</sub>O<sub>2</sub> in EtOH gives the compd. C<sub>11</sub>H<sub>9</sub>O<sub>2</sub>N, citron-yellow, m. 160°, with 20% KOH in a little LiOH this yields an anilide acid, o-HO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>CHPhCONHPh or o-PhNHCO<sub>2</sub>CH<sub>2</sub>CHPhCO<sub>2</sub>CH<sub>2</sub>, m. 192°; warming this with AcOH H<sub>2</sub>SO<sub>4</sub> 1 hr. gives the dicarboxylic acid o-HO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>CHPhCO<sub>2</sub>CH<sub>2</sub>, m. 157-8°. I and p-MeN-C<sub>6</sub>H<sub>4</sub>NO give the dimethylaminoanil of III, deep blue-violet, m. 149-50°, autoxidation yields the isooquinoline deriv., C<sub>14</sub>H<sub>9</sub>CPH(Oh) CO N(C<sub>6</sub>H<sub>4</sub>NMe<sub>2</sub>) CO, orange-red (C<sub>6</sub>H<sub>5</sub>) or orange (EtOH), m. 214.5°, with KOH this yields the isoindole deriv. (IV), C<sub>14</sub>H<sub>9</sub>CHPh N-

( $\text{C}_{12}\text{H}_{11}\text{NO}_6$ )  $\text{CO}_2$ , pale yellow, m.  $270^\circ$  (sublimate, m.  $225-4^\circ$  (decomp.)); heating with  $\text{AcOH-H}_2\text{SO}_4$  for 6 hrs. gives phenylphthalide (VI). IV reacts in  $50\%$  yield from V and  $p\text{-H}_2\text{NCH}_2\text{NHCN}$  (VII). VI and  $p\text{-H}_2\text{NCH}_2\text{NHCN}$  give the compd.,  $\alpha\text{-(MnNCH}_2\text{NHCN)}_2\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{NCH}_2\text{NHCN}$ , yellow, m.  $243^\circ$ . The methanoid of III, blue-white, m.  $118^\circ$ ; amination gives an orange-red compd.,  $\text{C}_6\text{H}_4\text{-OCH}_2\text{N}$ , m.  $201^\circ$ , prepd. from VI and  $p\text{-H}_2\text{NCH}_2\text{NHCN}$  in  $80\%$  yield. C. J. West.

Ergot alkaloids. VI. Lysergic acid. Walker A. Jacobs and Lyman C. Craig. *J. Biol. Chem.* 111, 453-63 (1935). d. c. a. 29,  $265^\circ$ . Dihydrolysergic acid (0.4 g) was ground with  $\text{KOH}$  (2 g) and fused at  $290-300^\circ$  for 20 min. in a stream of  $\text{H}_2$ . The volatile products were condensed in an air trap and then in  $\text{HCl}$ . The material removed from the  $\text{H}_2\text{O}$  soln. of the residual mat. by extraction with  $\text{Et}_2\text{O}$  was combined with the condensate in the air trap and sublimed. The sublimate was dissolved in  $\text{Et}_2\text{O}$  and extracted with  $\text{HCl}$ . Fractional distn. of the part remaining in the  $\text{Et}_2\text{O}$  gave a petr. ether-insol. substance, m.  $192^\circ$ , b.  $240^\circ$ , of undetd. structure, and a petr. ether-sol. substance (pure, m.  $146-50^\circ$ ), apparently 2-methyl-3-furandiol, of which a synthetic prepn. has  $145-50^\circ$ . From the  $\text{HCl}$  ext., after making alk., a substance,  $\text{C}_{12}\text{H}_{11}\text{N}_3$ , b.  $145-50^\circ$ , in  $\text{Et}_2\text{O}$  (petr. ether) (pure, m.  $193-200^\circ$ ), of undetd. structure was obtained. From the original alk. ext., after amination, extn. with  $\text{Et}_2\text{O}$  and distn. up to  $50^\circ$ ,  $p\text{-H}_2\text{NCH}_2\text{NHCN}$  I was isolated as the  $p$ -bromophenacyl ester. The residue remaining from I apparently was a mixt. of methylphenacyl and  $p$ -bromophenacyl. From the  $\text{HCl}$  trap in the fusion  $\text{MnNH}_2$  was isolated. Dihydrolysergic acid gave a me. nitrate, m.  $25^\circ$  ( $\text{Mn-OH}$ ). The bearing of these and earlier observations on the structure of lysergic acid (II) is discussed, and II is assigned the tentative structure of 3-propenyl-4-methyl-5,4-dihydro-1-carboline-3-carboxylic acid. R. C. E.

Fieser-Rosenmund rearrangement of  $N$ -acetylcarbamate. Erich Munster. *J. Am. Chem. Soc.* 57, 2121-3 (1935).  $N$ -Acetylcarbamate (21 g) and 15 g  $\text{AlCl}_3$  in 125 cc.  $\text{PhNO}_2$  gave, after standing 15-20 hrs., 11-13 g crude 3-acetylcarbamate (I) and a mixt. of I, the 1-isomer (II) and carbazole, b.  $130^\circ$ , the distillate consisting of II and carbazole, sep'd. by sublimation at  $112^\circ$  and  $10^\circ$  mm.; II m.  $128^\circ$ ; *aniso.*, m.  $179-80^\circ$ . C. J. West.

Synthesis of certain phenylated benzoxazines and derivatives. Vladimir J. Mareska and Margaret T. Boyert. *J. Am. Chem. Soc.* 57, 2121-4 (1935). The solution of  $\text{PhSO}_2\text{Cl}$ ,  $\alpha$ - and  $\beta$ - $\text{HOC}_6\text{H}_4\text{Ph}$  from the still residues in the prepn. of  $\text{PhOH}$  by fusion of  $\text{PhSO}_2\text{Na}$  with  $\text{NaOH}$  is described, yields being approx. 33, 11 and 1% resp. 3,4- $\text{O}_2\text{N}(\text{HO})\text{C}_6\text{H}_3\text{Ph}$  (I) in concd.  $\text{H}_2\text{SO}_4$  at  $71^\circ$  for 3 hrs. gives 80% of the  $\text{Et}$  salt of 3-amino-4-hydroxy-phenylsulfonic acid, I (8 g) and 5.2 g  $p\text{-H}_2\text{NCH}_2\text{SO}_3\text{H}$  in 5 g.  $\text{PhNO}_2$ , heated 1 day at  $100^\circ$ , give 68% of 3-amino-4-hydroxy- $p$ -phenylsulfonic acid, bright yellow, m.  $114-5^\circ$  (m. ps. cor.); the benzate (II) m.  $159^\circ$  (82% yield). Boiling 3,4- $\text{H}_2\text{N}(\text{HO})\text{C}_6\text{H}_3\text{Ph}$  and 5% excess  $\text{EtCl}$  for 30 min. gives 35% 2,3-dimethylcarbazole, m.  $132-3^\circ$ ;  $p\text{-ONCH}_2\text{COCl}$  gives 32% of the 2,3-dihydro-phenyl analog, m.  $288-5^\circ$  (a by-product is 12% of 3,3'-dimethyl-2,3-dihydro-phenyl, orange-yellow, m.  $210-3^\circ$ ). II and  $\text{SOCl}_2$  in  $\text{AcOH}$  give 63% of 3,3'-amino-2,3-dihydro-phenylbenzoxazine (III), pale yellow, m.  $174-2^\circ$ ; reduction of the  $\text{NO}_2$  compd. gives 75% of the same compd. III and  $\text{NaNO}_2$  in concd.  $\text{HCl}$  at  $0^\circ$  give 42% of 2,3-dimethyl-2-amino-3,3'-phenylbenzoxazine -  $\text{HCl}$ , yellow, amorphous, m.  $130-5^\circ$ ; d. l.  $\text{HCl}$  gives 63% of the 2,3-dihydro-phenyl deriv., cream, m.  $270^\circ$ . III in concd.  $\text{H}_2\text{SO}_4$  with fuming  $\text{H}_2\text{SO}_4$  (80% free  $\text{SO}_3$ ) gives 80% of the *aniso* form, probably  $\text{Ph}(\text{HO})_2\text{C}_6\text{H}_3\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{N}(\text{H})\text{SO}_3\text{H}$  m.

2,3-Dimethyl-2-amino-3-benzoxazine, pale yellow, m.  $119-3^\circ$  (63% yield); 2,3-dihydro-2-amino-3-benzoxazine, pale yellow, m.  $228-9^\circ$  (81% yield); the  $\text{EtOH}$  soln. shows a greenish fluorescence; the *sulfonic acid*,  $\text{C}_{12}\text{H}_{11}\text{O}_4\text{NS}$  with 1 mol.  $\text{H}_2\text{O}$ , decomposes above  $375^\circ$ . C. J. West.

Triarylypyrrolim boronates. W. C. Dover and Robert Robinson. *J. Chem. Soc.* 1935, 138-40. -  $\text{PhBr}$ , said, with  $\text{BF}_3$  and heated at  $120^\circ$  for 15 min., gives 25% of 2,4-bis-triarylmethyl boronate, yellow, m.  $225-6^\circ$ , a mixt. of 4.5 g  $\text{PhBr}$  and 5 g  $\text{PhCOCH}_3$ ;  $\text{C}_6\text{H}_5\text{MgBr}$  gives 61% of the same compd.; the pale greenish-yellow soln. in concd.  $\text{H}_2\text{SO}_4$  exhibits an intense greenish blue fluorescence; it appears to crystallize with  $\text{C}_6\text{H}_5\text{MgBr}$ .  $\text{H}_2\text{O}$  as  $\text{Al-O-Na}$  gives the pseudo base, 2,4-bis-triarylmethylpyrrolim boronate, orange, m.  $345-5^\circ$ , isolates in 1.6% yield from  $p\text{-H}_2\text{NCH}_2\text{CO}_2\text{H}$  and in 5.5% yield from a mixt. of the ketone with  $p\text{-H}_2\text{NCH}_2\text{CO}_2\text{H}$ ;  $\text{CM-CH}_2\text{OH}$  m.  $20^\circ$ . These yields are superior to the  $\text{FeCl}_3$  method of Dittler. C. J. West.

Dipole moments and structures of some quinoline derivatives and the orientation of Clas and Hoffmann's  $\alpha$ -nitroquinoline. Catherine G. Le Fevre and Raymond J. W. Le Fevre. *J. Chem. Soc.* 1935, 147-53. - The dipole moment  $\mu \times 10^{-18}$  of quinoline is ded'd. as 2.13, quinoline 1-N, 6-methoxyquinoline 2.21, 3-methoxyquinoline 2.09, 2,4-dimethoxyquinoline 2.80, 3-methoxyquinoline 2.55, 6-methoxy 4.11, 5-methoxy 3.47. The direction of the moment has been called, the results being tabulated as follows: continuous arrows denoted by  $\rightarrow$  to the  $\text{N}$  and  $\leftarrow$  from the  $\text{N}$ ; 2-N $\rightarrow$  3.35, 3-N $\rightarrow$  1.35, 2,4-N $\rightarrow$  4.17, 3-N $\rightarrow$  3.35, 4-N $\rightarrow$  1.75, 5-N $\rightarrow$  4.13 (the  $\leftarrow$  is considered the more correct for the 3- and the 5-N $\rightarrow$  deriv.). It is concluded that in the quinoline derivs. exist, except the  $\alpha$ -nitro-derivs. compounds, the mobilities, typical of  $\text{C}_6\text{H}_5$  and  $\text{C}_6\text{H}_4$  of the end and of the linkages are so diminished by ring fusion that the skeleton is best formulated as  $\text{C}-\text{C}-\text{C}-\text{C}$  and that:

the component elem. moment, arising from this structure, acts along directions varying from  $15^\circ$  to  $30^\circ$  to the axis of the 3- $\text{C}-\text{C}$  atoms, to meet it at some point outside the mol. on the side of the 5- $\text{C}-\text{C}$  atom. The dipole moment of quinoline is 2.13, of the 1- $\text{Cl}$  deriv. 2.23 and the 2-N $\rightarrow$  deriv. of Clas and Hoffmann (*J. phys. Chem.* 47, 222, 1943) 3.37; it is suggested that this is the 3-N $\rightarrow$  deriv. This is supported by the fact that the component moments of the  $\text{NO}_2$  group and the quinoline nucleus should make an angle of approx.  $71^\circ$ , whereas the 3-N $\rightarrow$  structure should give a value of the order of  $19^\circ$ ; the found value for the 3-methoxy is  $113^\circ$ . C. J. West.

Attempts to find new intermediates. IV. Derivatives of 8-methylquinoline. Wm. O. Kinnick and Thomas W. Wright. *J. Chem. Soc.* 1935, 1457-61; of C. A. 27, 7322. - 3,2-Me $2$ NO  $\text{C}_6\text{H}_4\text{NHCN}$ ,  $\text{FeSO}_4$ ,  $\text{NaOH}$  and 9%  $\text{H}_2\text{SO}_4$  reduced 4 hrs. gave 3-amino-4-hydroxy-phenylsulfonic acid (I), whose  $\text{EtEt}$  salt, light yellow, m.  $205^\circ$ , and pure, yellow, m.  $224-5^\circ$ . I in  $\text{CHCl}_3$  and with  $\text{HBr}$  and heated with  $\text{Br}$ , gives the 3- $\text{Br}$  deriv., m.  $114-17^\circ$  ( $\text{HBr}$  salt, light yellow, m.  $200^\circ$ ). 6-Nitro- $\alpha$ -methyl and  $\text{Br}$  in  $\text{CHCl}_3$  give the 4- $\text{Br}$  deriv., m.  $141^\circ$ ,  $\text{MeSO}_3$  and  $\text{EtO}_2\text{C}$  in  $\text{C}_6\text{H}_5$  give 3-amino-4-hydroxy- $\alpha$ -methyl  $\text{Me}$  ester, m.  $111-11^\circ$ , reduction with  $\text{Fe}$  in concd.  $\text{HCl}$  in  $\text{MeOH}$  gives 4-bromo-2-methoxy-3-phenyl (II), light pink, m.  $78-8^\circ$ ; the  $\text{EtO}_2\text{C}$  reactive salt,  $\text{C}_6\text{H}_5$  salts 4-bromo- $\alpha$ -methyl  $\text{Me}$  ester, m.  $73-4^\circ$ , 6-bromo-4-methyl- $\alpha$ -methyl  $\text{Me}$  ester (III) m.  $117-13^\circ$  (90% yield), reducing gives 9% of 2-amino-3-methyl- $p$ -quinoline, m.  $71-3^\circ$  ( $\text{Ac}$  deriv., m.  $120-4^\circ$ ); the Sandmeyer reaction gives III. I with the Sandmeyer reaction gives the 3- $\text{Br}$  deriv. of I, the 7- $\text{Br}$  deriv. of I m.  $144-5^\circ$ . 6-Nitro-3-methylquinoline yields a 3- $\text{Br}$  deriv., light yellow, m.  $128-9^\circ$ . 3-Bromo-2-methoxyquinoline, refined overnight with  $\text{H}_2\text{SO}_4$ , gives 3-quinolylsulfonic acid, m.  $73-6^\circ$ , 3-N $\rightarrow$  deriv., light brown, m.  $143-9^\circ$ . 3-Nitro-3-bromo-2-methoxyquinoline and  $\text{p}$ -nitro- $\alpha$ - $\text{EtO}_2\text{C}$  give the 3-phenylmethyl deriv., whose  $\text{EtEt}$  salt m.  $216-9^\circ$ .  $\alpha\text{-ONCH}_2\text{NHCN}$ ,  $\text{EtOCH}_2\text{COCl}$   $\text{HCl}$  (IV),  $\text{KOH}$  and a trace of  $\text{O}_2$  in benzene in  $\text{C}_6\text{H}_5$ , reduced 4 hrs., give 3-(4-nitro-2-methylphenyl)phenylbenzoxazine (V), whose  $\text{EtEt}$  salt, light yellow, m.  $177-8^\circ$ ;  $\alpha\text{-N}_2\text{O}_2$  deriv., as the  $\text{p}$ -nitro, light yellow, m.  $134^\circ$ ; 3-(4-nitro-2-methylphenyl)phenylbenzoxazine, yellow, m.  $151-2^\circ$ . The  $p\text{-NO}_2$  same of V, as the  $\text{p}$ -nitro, yellow, m.  $114-4^\circ$ .  $\text{EtNE}$ .

and IV give  $\beta$ -diethylaminoethylpropylamine, whose picrate, yellow, m 133-5°, butylamine analog, b 207-12° (70% yield) (dicarbate, yellow, m 234°); isobutylamine analog, b 191-200° (70% yield) (dicarbate, yellow, m 141°); the following piperidine compds were analogously prep'd: the dicarates form yellow plates,  $\beta$ -piperidinoethylpropylamine, b 220-30°, 60% yield (dicarbate, m 168°); butylamine, b 230-40°, 70% (dicarbate, m 191-2°); isobutylamine, b 230-40°, 70% (dicarbate, m 167-8°); methylamine, b 190-200°, 45% (dicarbate, m 174°);  $\beta$ -piperidinoethylamine, b 200-10°, 65% (dicarbate, m 154°).  $\text{C}_6\text{H}_5\text{Br}$  and  $\text{McNH}_2$  in  $\text{EtOH}$  give 50% of sym-dimethylthietylenediamine, b 150-60° (picrate, m 160°). 8-Bromomethylquinoline and  $\text{Et}_3\text{NCH}_2\text{CH}_2\text{NHMe}$  with  $\text{K}_2\text{CO}_3$  in  $\text{C}_6\text{H}_6$  give 8-( $\beta$ -diethylaminoethyl-methylaminoethyl)quinoline, the tri- $\text{HBr}$  salt of which m 215-16°.  $\beta$ -diethylaminoethylmethylaminoethyl deriv. (tri- $\text{HBr}$  salt, m 218-19°, picrate, yellow, m 131-2°),  $\beta$ -diethylaminoethylpropylaminoethyl deriv. (picrate, light yellow, m 113-15°, dicarbate, deep yellow, m 163-4°), diethylaminoethylbutylaminoethyl deriv. (dicarbate, yellow, m 178-80°),  $\beta$ -diethylaminoethylisobutylaminoethyl deriv. (dicarbate, deep yellow, m 160-71°),  $\beta$ -piperidinoethylpropylaminoethyl deriv. (tri- $\text{HBr}$  salt, m 210°), butylamine analog, m 211-12°, isobutylamine analog (dicarbate, yellow, m 210-11°); methylamine analog (dicarbate, yellow, m 205-6°);  $\beta$ -piperidinoethylaminoethyl deriv. (tri- $\text{HBr}$  salt, m 222°), sym-bis(8-quinolymethyl)dimethylthietylenediamine di- $\text{HBr}$ , m 235°. Bis(8-quinolymethyl)- $\beta$ -diethylaminoethylamine, m 97-8°, picrate, yellow, m 191°. 8-( $\beta$ -diethylaminoethylaminoethyl)quinoline tri- $\text{HBr}$ , m 223-4°. 1,8-Bis(8'-quinolymethyl)aminoethylpiperidine, m 97-8°, picrate, pale yellow, m 228-0°. 1,4-Bis(8'-quinolymethyl)piperazine, with 0.5 mol  $\text{H}_2\text{O}$ , m 153-4°.  $\text{HBr}$  salt, m 265-7°. Although inactive in bird malaria, some of these compds possess marked local anesthetic activity.

## C J West

Phenanthridine series IV. Synthesis of plasmochin-like derivatives. Leslie P. Walls, *J Chem Soc* 1935, 1405-10, cf. C. A. 28, 2803°—3-Nitro-9-methylphenanthridine (15 g) with  $\text{Na}_2\text{CO}_3$  in  $\text{AcOH}$  gives 14.5 g of 3-nitrophenanthridone, red, m above 350°. 5,2-Br-(AcNH) $\text{C}_6\text{H}_4\text{Ph}$  (30 g) refluxed with  $\text{POCl}_3$  for 2 hrs, gives 25 g of 3-bromo 9-methylphenanthridine, m 129-30°; oxidation gives 3-bromophenanthridone, yellow, decomp 302°; heating with  $\text{POBr}_3$  at 180° for 5 hrs gives 3,9-dibromophenanthridine (I), m 170-1°. 2-Nitrofluorenone with  $\text{Na}_2\text{S}$  in concd  $\text{H}_2\text{SO}_4$  gives 2(or 7)-nitrophenanthridone, dark green needles (from  $\text{PhNO}_2$ ), sublimes slowly at 250° and 20 mm in yellow needles, decomp 340°. The 7(or 7)-Cl deriv., green, m 340°. 2,7-dinitrophenanthridone, brown-yellow, m above 340°. 2(or 7)-Aminophenanthridine, m 285°, results by reduction of the  $\text{NO}_2$  deriv. or from 2-aminofluorenone; the diazo reaction gives a mixt. of the 2- and 7- $\text{HIO}$  derivs., which by extraction from  $\text{CH}_2\text{Cl}_2$  give 2- $\text{HIO}$  deriv. m 341-3°, Ac deriv. m 273-4° (decompn), Me ether, m 251° (9-Cl deriv. m 137-5°). The 7- $\text{HIO}$  deriv. m 320-2° (decompn); Ac deriv. m 261-4° (decompn); Me ether, m 271-2° (9-Cl deriv. m 107°).  $\alpha$ -Diethylamino-3-aminopentane dicarbate, yellow, m 134-5°, with 9-chlorophenanthridine this yields 8-diethylamino-methylbutylamino-9-phenanthridine, whose dicarbate, yellow, m 196-7°. The sulfate is a hygroscopic glass. I and  $\text{Et}_3\text{NCH}_2\text{CH}_2\text{NHMe}$  give 3-bromo-9- $\beta$ -diethylaminoethylaminoethylaminoethylamine, analyzed as the di- $\text{HCl}$  salt, which contains 3 mols of  $\text{H}_2\text{O}$ , dicarbate, yellow, decomp 150°. 3-Bromo-9- $\beta$ -diethylamino-methylbutylaminoethylamine forms a dicarbate, yellow, decomp. 217-18°, and a di- $\text{HCl}$  salt. 2-Methoxy-9- $\beta$ -diethylaminoethylaminoethylamine gives a dicarbate, yellow, m 207° (decompn), and a hygroscopic di- $\text{HCl}$  salt. 2-Methoxy-9- $\beta$ -diethylamino-methylbutylaminoethylamine dicarbate, decomp 192-3°, the di- $\text{HCl}$  salt is very hygroscopic. The di- $\text{HCl}$  salts have a sweet taste and some local anesthetic action, they are very sol in  $\text{H}_2\text{O}$  to colorless solns of  $\mu$  about 5, their lack of chemotherapeutic value

appears to be largely explicable on the grounds of their toxicity, in which they compare unfavorably with well-known antimalarials.

C. J. West

Pyrimidines CXLVIII. Action of chlorine on mercaptopyrimidines. James M. Sprague and Treat R. Johnson, *J. Am. Chem. Soc.* 57, 2252-5 (1935); cf. C. A. 29, 6078°.—The corresponding 4-chloropyrimidines yielded the following 2-mercaptopyrimidines: 4-ethoxy-carbonyl, b 175°,  $n_D^{20}$  1.5420, 90% yield, 4-EIO, b 123-4°, m 15403, 88%, 4-ethoxy-5-methyl, b 135-6°,  $n_D^{20}$  1.5365, 90%, 4-ethoxy-5-bromo, b 140°,  $n_D^{20}$  1.5787, 82%; 4-ethylmercapto, b 135-7°,  $n_D^{20}$  1.5974, 92%, 4-ethylmercapto-5-methyl, bp 158-61°,  $n_D^{20}$  1.5900. The action of  $\text{Cl}_2$  upon these compds. in  $\text{H}_2\text{O}$  at 20° gave the following 2-ethylsulfonylpyrimidines: 4-ethoxy-5-methyl, m 67-8°, 80%, 4-chloro-5-methyl, m 67.5-8°, 60%, 4-ethoxy-5-bromo, m 89.5-90.5°, 77%; 4-chloro-5-bromo, m 81-2°, 97%, 4-EIO, b 183-5°,  $n_D^{20}$  1.5225, 50%; 4-Cl, m 57-8°, 84%, 4-chloro-5-carbonyl, m 72.5-3.5°, 60%; 4-ethylsulfonyl, m 87-8°, 63%, 4-amino-5-carbonyl, m 143.5-4.5°, 93%. 2-Ethylmercapto-4-chloro-5-carbonylpyrimidine and  $\text{Cl}_2$  at 5° gave 60% of 2-ethylsulfonyl-4-chloro-5-carbonylpyrimidine (I), very unstable; 15-20% of the reaction gives 2,4-dichloro-5-carbonylpyrimidine (II), m 36-7°;  $\text{EtSO}_3\text{Cl}$  is also formed; at 30-40° there results 69-75% of II, 7% I and 47-75% of  $\text{EtSO}_3\text{Cl}$ . On acid hydrolysis the pyrimidine sulfones yield the corresponding ketopyrimidines.

C. J. West

The alkaloid of chun-shih-hu. K. K. Chen and A. Ling Chen, *J Biol Chem.* 111, 653-8 (1935)—The Szechuan variety of the Chinese drug, chun-shih-hu, contains an av. of 0.52% of total alkaloids and 48 g of dendrobine,  $\text{C}_{11}\text{H}_{15}\text{O}_2\text{N}$ , was obtained from 25 kg. of the powder. Dendrobine  $\text{HCl}$ , m 193°,  $[\alpha]_D^{20}$  -40.3° in  $\text{H}_2\text{O}$ , hydrobromide, m 250-0.5°,  $[\alpha]_D^{20}$  -34.3° in  $\text{H}_2\text{O}$ , hydrosulfide, m 294-4.5°,  $[\alpha]_D^{20}$  -29° in  $\text{H}_2\text{O}$ , nitrate, 198.5-0°,  $[\alpha]_D^{20}$  -30.2° in  $\text{H}_2\text{O}$ , sulfate, m 178°,  $[\alpha]_D^{20}$  -30.7° in  $\text{H}_2\text{O}$ , oxalate, m 137-8°,  $[\alpha]_D^{20}$  -60.8° in alc.; picrate, m 210°, flavanone, decomposes 212°, methiodide, m 246°,  $[\alpha]_D^{20}$  -28.8° in alc.; chlorosulfate, m 183-4°, chloroplatinate, m 283°. All m ps are cor. The Kweichow variety yields no dendrobine, indicating that the chun-shih-hu of commerce consists of several species.

A. P. Lohrop

Structure and configuration of cymarose. Robert C. Filderfeld, *J. Biol. Chem.* 111, 527-35 (1935); cf. C. A. 29, 4741°.—By the prepn of 2 different fully methylated lactones from cymarose (I), the allocation of the OMe group on C atom 3 was confirmed. Methyl- $\gamma$ -cymarone lactone (II) is identical with dimethyl- $\gamma$ -dipioxone lactone (III), hence I has the same configuration as digitoxose (IV) and is 3-methyl-2-deoxy- $\alpha$ -allo-(altro)-hexomethyl-ose. I (2 g) in 50%  $\text{HNO}_3$  (40 cc) after standing 3 days at room temp and removal of  $\text{HNO}_3$  gave the lactone of  $\alpha$ -hydroxy- $\beta$ -methoxyglutaric acid, m 150-2° (iso-BuCO $_2$ Me),  $[\alpha]_D^{20}$  -1° ( $\text{H}_2\text{O}$ ), bi- $\beta$ -methylamide, m 138° (EtOAc),  $[\alpha]_D^{20}$  -55° ( $\text{H}_2\text{O}$ ). Oxidation of I by the method of Hudson and Isbell with  $\text{Br-H}_2\text{O}$  gave  $\gamma$ -cymarone lactone (V), b 110-11°,  $n_D^{20}$  1.4635,  $[\alpha]_D^{20}$  -25° ( $\text{H}_2\text{O}$ ), after 75 hrs no change, phenylhydrazide, m 154°,  $[\alpha]_D^{20}$  2° (MeOH). V methylated with Purdie's reagents gave II, b 78-80°,  $n_D^{20}$  1.4337,  $[\alpha]_D^{20}$  -30° ( $\text{CHCl}_3$ ), phenylhydrazide, m 139°,  $[\alpha]_D^{20}$  -6°. I (10 g) on boiling with 0.25% abs MeOH-HCl (200 cc) 15 min gave a mixt. of  $\alpha$ - and  $\beta$ -Me cymaropyranoside, b 54-64°,  $n_D^{20}$  1.4475, which, methylated by Purdie's method, gave Me methylcymaropyranoside (VI), b 45-8°,  $n_D^{20}$  1.4341. VI was hydrolyzed by heating at 100° in 0.1 N HCl for 10 min and the crude product oxidized with  $\text{Br-H}_2\text{O}$ , giving methyl- $\beta$ -cymarone lactone (VII), b 88-90°,  $n_D^{20}$  1.4509,  $[\alpha]_D^{20}$  30°; phenylhydrazide, m 115-6°,  $[\alpha]_D^{20}$  17.5°. VII on oxidation with concd  $\text{HNO}_3$  at 90-94° for 8 hrs gave a dimethoxyglutaric acid, isolated as the di-N-methyl amide, m 173-4°,  $[\alpha]_D^{20}$  -56° ( $\text{H}_2\text{O}$ ). IV in 0.1% abs MeOH-HCl after standing 1 hr. at room temp gave a mixt. of the Me furanoside and pyranoside of IV, which was directly methylated as

before. The mixt. of di-Me derivs. b<sub>2</sub>, 43-6°. Hydrolysis and oxidation of this as before gave a mixt. of lactones from which III was isolated by distn. at 0.2 mm. All the lactones of this series reduced Fehling's soln. Curves are given for Me glycoside formation of I and IV

R. C. Elderfield

**Partial synthesis of ribose nucleotides II. Muscle lactic acid.** P. A. Levene and R. Stuart Tipton. *J. Biol. Chem.* 111, 313-23 (1935), cf. C. A. 29, 174°. The structure assigned to muscle lactic acid, viz. hypoxanthine 5-phosphoriboside (I) has been confirmed by synthesis. Inosine (II) (5 g.) was added to a soln of anhyd. ZnCl<sub>2</sub> (20 g.) in Me<sub>2</sub>CO (500 cc.) After boiling until all the II was in soln and standing overnight, concn to 60 cc. and addn of Et<sub>2</sub>O gave 10.5 g. of acetone-insoluble ZnCl<sub>2</sub> compd. After decompn of this with Ba(OH)<sub>2</sub>, removal of Zn and excess Ba with CO<sub>2</sub> and extra with hot Me<sub>2</sub>CO, 52% of acetone-insoluble (III), m. 240-5° (MeOH), [α]<sub>D</sub><sup>20</sup> -69.2° (MeOH), [α]<sub>D</sub><sup>20</sup> -88.0° (C<sub>6</sub>H<sub>5</sub>N), was obtained. III with p-MeC<sub>6</sub>H<sub>4</sub>SO<sub>3</sub>Cl in C<sub>6</sub>H<sub>5</sub>N (IV) gave 5-isosylmonosuccinate, m. 183-6° (Me<sub>2</sub>CO), [α]<sub>D</sub><sup>20</sup> 35.9° (IV). The tosyl group of this is in position 5 since it was readily removed by NaI in Me<sub>2</sub>CO. Since it is a ribofuranose, III is the 2,3-isopropylidene deriv. III (3 g.) in 100 cc of IV at -30° was added to a soln of POCl<sub>3</sub> (1 cc.) in 5 cc. of IV at -40°. After standing at -15° for 2 hrs. the mixt. was cooled to -35°, 90% IV (10 cc.) was added dropwise and finally ice. Neutralization with Ba(OH)<sub>2</sub> and concn gave the Ba salt of phosphomonoacetoneinosine (2 g.) This was hydrolyzed by standing at room temp 5 hrs in HCl (effective acidity 0.05 N HCl), giving Ba inosinephosphate, [α]<sub>D</sub><sup>20</sup> -36.80 (0.1 N HCl) identical with natural muscle Ba inosinate. To a soln of adenine (10 g.) in 500 cc of H<sub>2</sub>O contg Ba(NO<sub>3</sub>)<sub>2</sub>, H<sub>2</sub>O (21 g.) was added AcOH (15 cc.) After several days in the dark, concn to 65 cc. gave II in quant. yield after working the mother liquors. The *tn-Ac* deriv. of II m. 239°, [α]<sub>D</sub><sup>20</sup> -38.3° (C<sub>6</sub>H<sub>5</sub>Cl).

R. C. Elderfield

**Cholanthrene and related hydrocarbons.** Louis F. Fieser and Arnold M. Seligman. *J. Am. Chem. Soc.* 57, 2174-6 (1935); cf. C. A. 29, 4370°. The Clemmensen reduction of 4-bromo-1-hydrindene gives 77% of 4-bromohydrindene, b<sub>1</sub>, 118°. The Grignard reaction yields 60% of 4-(α-naphthyl)hydryndene (I), viscous yellow oil, *β*-isomer (II), m. 68-4° (40% yield). Heating I at 400-5° for 25 min. gives 34% of cholanthrene, m. 173-3.5° (cor.), (picrate, reddish purple, m. 167-70° (cor.)); II gives 8,9-dimethyl-1,2-benzanthracene, pale yellow, m. 178.5-7° (cor.), (picrate, purple-black, m. 158-6° (cor.)). The prepn. of fluorenone-1-carboxylic acid and fluorene-1-carboxylic acid is described; the acid chloride of the latter and α-CuH<sub>5</sub>MgBr give 56% of 1-(α-naphthyl)fluorene, m. 112-14°; pyrolysis at 415° gives 60% of 15,16-benzodehydrocholanthrene (III), bright yellow, m. 181-1.3° (cor.); (picrate, brick-red, m. 174.5-5.5° (cor.)). 1-(β-Naphthyl)fluorene, pale yellow, m. 159-62° (81% yield), pyrolysis gives 1,2'-naphtho-1,3-fluoranthene (IV), golden yellow, m. 178-9° (cor.); (picrate, crimson, m. 191-2° (cor.)).

C. J. West

**Hydrogenation under the action of selenium I.** The action of selenium on cholesterol at 230°. Charles Dörte and Vladimir A. Petrov. *J. Chem. Soc.* 1935, 1391-3. Cholesterol with Se at 230° for 25 hrs. gives about 40%

of cholestanone (I); no other single compd. could be isolated; decreasing the time to 10 hrs. gives I with smaller quantities of cholestanol and cholestenone; after 40 hrs. only I was isolated. I and PhNH<sub>2</sub>III, in AcOH gave the tetrahydrocarbazole deriv., m. 180-1°, in 60-70% yield; (picrate, bronze-brown, m. 209-10°). The "surface area" of this deriv. is 43 sq. A, thus supporting the angular structure C. J. West

Acids with uneven no. of C atoms in vegetable oils and fats (Manjunath, Siddappa) 27. Gadusene (Nakamiya) 27. Creatinephosphoric acid (Zeile) 11A.

**Partial oxidation of hydrocarbons.** Stephen P. Burke and Charles I. Fryling (to Doherty Research Co.). U. S. 2,018,941, Oct. 20. For the production of partial oxidation product such as aldehydes, alcs, ketones, etc., a hydrocarbon-contg gas such as a natural gas or C<sub>2</sub>H<sub>6</sub> in admixt with an O-contg gas is heated (suitably in a metal tube) in the presence of a small amt of a lower alkyl ether such as methyl ether which serves to facilitate reaction of a somewhat lower temp. Cf. C. A. 29, 170°, 2174°.

**Stabilizing organic compounds I.** G. Farbenindustrie A.-G. Brit. 432,480, July 22, 1935. Stabilized aq. solns. of aromatic amino hydroxy, polyhydroxy and polyamino compds., basically substituted compds. of the quinoline and acridine series and alkaloids are produced by adding a small quantity of an org. mercapto compd., which may contain 1 or more mercapto groups and should be sol in H<sub>2</sub>O. In an example, 1.79 g. of 8-(α-diethylamino-4-pentylamino)-4-methoxyquinoline is dissolved in N HCl, 60 g. quinine-HCl and 90 g. of sacrosine anhydride are added and the mixt. is dil'd to 150 cc., 0.292 g. of thioctic acid and 11.7 cc. of N NaOH are added and the soln. is made up to 200 cc.

**Organic halogen compounds.** Chemische Fabrik Von Heyden A.-G. Fr. 781,538, July 22, 1935. Stable preps. of org. compds. contg. active halogen are made by dissolving these compds. in Cl substitution products of aromatic compds., e. g., diaryl ethers. Thus, a 3% soln. of chlorophthalimide in heptaehlorodiphenyl ether (I) may be preserved without change for months. Other examples are dichloroamide of toluenesulfonic acid in PhCl, o-chlorotoluene, o-dichlorobenzene or I.

**Chlorinating aliphatic saturated hydrocarbons.** Edgar C. Britton, Gerald H. Coleman and Bartholdi C. Hadier (to Dow Chemical Co.). U. S. 2,018,345, Oct. 22. Cl is caused to react with a sat'd aliphatic hydrocarbon contg. 3 to 5 C atoms, to form a mixt. contg. sat'd. chloro hydrocarbons, HCl and olefinic compds., and the HCl formed during the chlorination is caused to react with the olefinic compds. at a temp. below about 200° to convert the latter into sat'd chloro hydrocarbons.

**Halogenating biphenyl.** Campbell R. McCullough (to Swann Research, Inc.). U. S. 2,019,015, Oct. 29. Biphenyl vapor is mixed with a gaseous halogen such as Cl and heated to above the b. p. of biphenyl but below the temp. at which a flaming reaction would occur. A lower halobiphenyl may be further halogenated similarly. App. is described.

**Separating olefins from other gases.** The Distillers Co. Ltd., Walter P. Joshua and Herbert M. Stanley. Fr. 784,506, July 22, 1935. See Brit. 428,106 (C. A. 29, 60019).

**Alcohols of high molecular weight from esters.** Norman D. Scott and Virgil L. Hunsley (to E. I. du Pont de Nemours & Co.). U. S. 2,019,022, Oct. 29. The reaction of alkali metal and hydrolytic alc. on esters of high mol. wt. may be carried out with substantially no side reaction between the hydrolytic alc. and Na to evolve gaseous H<sub>2</sub> if the ratio between the alc. and the ester added to the reaction mixt. is at all times equal to or not more than 2 moles of hydrolytic alc. for each mole of ester group to be reduced. For example, if the ester to be reduced is a simple ester of a monobasic, sat'd. fatty acid, e. g., methyl stearate, 2 moles of alc. will be used to 1 mole of the ester

The corresponding glyceride, e. g., stearin or olein, will require 6 moles of alc. per mole of glyceride, since the glyceride molecule contains 3 ester groups. Finely divided alkali metal is first preferably suspended in a hydrocarbon material such as xylene and this suspension then agitated with a hydrocarbon solvent soln. (for which also xylene may be used) of the ester treated and the hydrolytic alc. Examples are given of the treatment of methyl laurate, bayberry tallow, cottonseed oil, beef tallow, China wood oil, spermaceti and cacao butter, with details of procedure, and mention is made of similar treatment of abietic acid esters, wool grease, menhaden oil, cod-liver oil, linseed oil and of phenylacetic esters.

Esterifying liquid polyhydroxy aliphatic alcohols by reaction with ketenes. Per K. Frolich and Peter J. Wierwich (to Standard Oil Development Co.). U. S. 2,018,753, Oct. 23. In forming an ester, reaction is effected between a polyhydric alc. such as glycerol and a ketene at a temp. below 100°.

Unsaturated esters. I. G. Farberindustrie A.-G. Brit. 431,328, July 5, 1935. See U. S. 1,993,413 (C. A. 29, 3682').

Acetotetracarboxylic esters. Fritz Hof. Zwißmeyer (to National Amine and Chemical Co.). U. S. 2,017,852, Oct. 22. Esters such as monoethyldiamylacetotetracarboxylate, b<sub>1</sub> (slight decomposition) about 230° and other esters of the general formula R'OOCCH<sub>2</sub>CH(COOR')CHAcCOOR' are viscous liquids or low-melting solids insol. in water, sol. in alc., acetone and other org. solvents, and are obtainable by the reaction of an acetotetracarboxylic ester having the formula, AcCH<sub>2</sub>CO<sub>2</sub>R', with a halosuccinic ester having the formula R'OOCCH<sub>2</sub>CH(COOR')CHAcCOOR', R', R' and R' representing hydrocarbon radicals of which the hydrocarbon radical represented by R' is different from the hydrocarbon radicals represented by R' and R' and X representing Cl or Br can be prep'd by the reaction of an acetotetracarboxylic ester in the presence of Na alcoholate and of an alc. soln. with a halosuccinic ester having the specified general formula, and can be used as plasticizers or modifying agents with synthetic resins, cellulose esters, etc.

Aldehydes from dicarboxylic acids. Otto Drossbach and Adolf Johannsen (to General Aniline Works). U. S. 2,018,350, Oct. 22. For producing an aldehyde such as benzaldehyde from a dicarboxylic acid such as phthalic anhydride, the acid is treated with a reducing gas such as H<sub>2</sub> at 200–400° in the presence of a hydrogenation catalyst activated by addn. of Pb, Bi, Ce, U, Cr, Fe, Cu, Mn or Co or oxides of these metals.

Amines. I. G. Farberindustrie A.-G. (Willy Schmidt and Karl Hutter, inventors). Ger. 618,109, Sept. 2, 1935 (Cl. 12g. 1.01). Addn. to 599,103 (C. A. 28, 5833'). A carboxylic acid or a functional deriv. thereof is treated with H<sub>2</sub> at a raised temp. and pressure in the presence of a hydrogenation catalyst and (1) a reagent which is converted into an amine under the reaction conditions, e. g., a nitrile, oxime or nitro compd., or (2) NH<sub>3</sub> (or an amine) and another compd. which reacts therewith to form an amine, e. g., cyclohexanol or an aldehyde or ketone. In either case, the amine formed *in situ* reacts with the carboxylic acid or deriv. to yield an amine compd. of the hydrocarbon radical derived from the acid. Thus, Me<sub>2</sub>Na<sub>2</sub> and PhCH<sub>2</sub>CN yield PhCH<sub>2</sub>CH<sub>2</sub>NHCH<sub>2</sub>Ph, while Me<sub>2</sub>Na<sub>2</sub> and cyclohexanol and NH<sub>3</sub> yield C<sub>6</sub>H<sub>11</sub>NHCH<sub>2</sub>Ph (other examples are given).

Alkyl amines. I. G. Farberindustrie A.-G. Fr. 784,599, July 22, 1935. Secondary alkylamines contg. more than 8 C atoms are made by causing the corresponding alkyl halides to react with aq. NH<sub>3</sub> or lower primary aliphatic amines. Examples are given of the prep'n of dodecyl (m. 90–1°), didodecyl (m. 58°), didecyl (m. 47.5°), ditetradecyl, methyltetradecyl (m. 28–9°), butyltetradecyl, methylbutyltetradecyl (m. 18–9°), and methylcyclohexylamine, m. 4–5°, and methylcyclohexylamine, b. 151–5°.

Aromatic amines. I. G. Farberindustrie A.-G. (Walter Speyer, inventor). Ger. 618,932, Aug. 31, 1935 (Cl. 12g. 5). Primary or secondary aromatic amines are converted into secondary or tertiary amines, resp., by reaction with aldehydes (or ketones) and esters of HCOOH. The reaction

may be effected at 210–70° under pressure. Examples are given in which (1) *o*-naphthylamine (f), acetone and HCOOH yield *N*-monosopropyl-*I*, b<sub>1</sub> 185–8°, (2) *I*, acetophenone and HCOOH yield *N*-(*o*-methylbenzoyl)-*I*, b. 233–5°, (3) *N*-ethyl-*I*, cyclohexanone and HCOOH yield *N*-ethyl-*N*-cyclohexyl-*I*, b. 168°.

Increasing the color stability of primary aromatic amines such as aniline. Robert P. Weiss and John M. Weiss (to Weiss and Downs, Inc.). U. S. 2,019,032, Oct. 29. About 2% or less of maleic anhydride is added as a color stabilizing agent.

Hydroxyamine bases. Soc. pour l'ind. chim. & Bâle Brit. 432,143, July 22, 1935. Such bases, in monomeric form or of low mol. wt., contg. active CH<sub>2</sub> groups are prep'd by condensing hydroxyaryl compds., or others thereof, that contain more than 1 active CH<sub>2</sub> group, with aromatic amines, the condensation being interrupted preferably as soon as the product shows diminution of soly. in alc. and, in any case, as soon as the product shows diminution of soly. in Me<sub>2</sub>CO. The prod. may be freed from impurities by treatment with inert gases or vapors, e. g., steam, preferably under reduced pressure. Among 9 examples, (1) a soln. of crude cresol in NaOH is treated with CH<sub>3</sub>O and the product is treated with PhNH<sub>2</sub>, monoethylamine or diethylamine in the presence of HCl, (2) polychloromethylbenzenesol (obtained by treating crude cresol with a mixt. of Cl<sub>2</sub>O and HCl) is treated with PhNH<sub>2</sub> in presence of NaHCO<sub>3</sub> and (3) *p*-hydroxybiphenyl is dissolved in NaOH, treated with CH<sub>3</sub>O and the product is treated with PhNH<sub>2</sub> in presence of AcOH.

Salts of *N*-nitroamines. Soc. pour l'ind. chim. & Bâle Swiss 175,350, May 1, 1935 (Cl. 36g). Salts of *N*-nitroamines of nuclear halogenated primary aromatic amines are prep'd by treating the corresponding diazo compd. with an oxidizing agent in a weakly alk. soln. Thus, a suspension of dichloroamine-HCl in HCl, water and ice is diazotized and the resulting diazo compd. filtered off and treated with a NaClO in a weak NaOH soln. to give the Na salt of 2,5-dichlorophenylnitroamine. Other examples are given.

Amine oxide. Soc. pour l'ind. chim. & Bâle, Swiss 175,351, May 16, 1935 (Cl. 36g). Dodecylmethylamine oxide is prep'd by treating dodecylmethylamine with a peroxide oxidizing agent such as O<sub>2</sub>, H<sub>2</sub>O<sub>2</sub> or Caro's acid. The compd. is used in the textile industry.

Transformation products from alcohols. Alexander Wacker Ges. für elektrochemische Industrie G.m.b.H. Fr. 784,656, July 22, 1935. Alcs. are transformed with liberation of H<sub>2</sub> by heating them in the presence of alk. or alk. earth metal alcoholates and hydrogenating or dehydrogenating catalysts such as Co, Ni, Zn, Ag, or their compds. Thus, BuOH is transformed mainly to 2-ethyl-1-hexanol and thus to 2-ethyl-1-hexanoic acid, b. 55–6°, and benzyl alc. to BzH, BzOH and (probably) isohydrobenzoin, m. 122°.

Lactones. Firmench & Cie. Successeurs de la Soc. anon. M. Nafé & Cie. Swiss 175,349, May 1, 1935 (Cl. 26e). Lactones with at least 11 C atoms in a hetero ring are prep'd by heating carboxylic acids of the general formula X—R—COOH in which R represents an aliphatic residue contg. at least 10 C atoms in the chain and X a reactive substituent, in an indifferent medium, the starting materials being strongly diluted. Thus, a dil. soln. of the anhyd. Li salt of 14-bromotetradecanoic-1-carboxylic acid in decalin is heated to boiling in the presence of LiBr as catalyst to give the lactone of 14-hydroxytetradecanoic-1-carboxylic acid. Other examples are given.

Hydrazine-sulfonates. Arthur Zitscher and Wilhelm Seidenfaden (to General Aniline Works). U. S. 2,018,103, Oct. 22. Compds. corresponding to the probable general formula aryl—NHCH<sub>2</sub>Y·NHNH<sub>2</sub>SO<sub>3</sub>—alkali metal, where Y stands for alkyl, alkoxy or halogen, are produced by acting with a reducing agent on the corresponding 2,5-disubstituted 4-acylamino benzene-1-diazosulfonic acid, and may be used for the production of azo dyes. For this purpose, they may be first mixed with combining components contg. a hydroxy or an *o*-alkali metal group, where

the adjacent position is capable of attaching an aryl azo group, provided that neither of the dye components contains a group producing soly. in water. The compus., thus produced, are then brought onto the fibers in the presence of an alkali and the goods, thus treated, are thereafter subjected to a steaming operation. Numerous examples are given.

**Polyuclear phenols and nitration and sulfonation products thereof.** E. I. du Pont de Nemours & Co. Brit. 431,945, July 18, 1935. The phenols are prepd. by condensing PhOH or its homologs with an aldehyde or ketone in the presence of an acid condensing medium, e. g.  $\text{H}_2\text{SO}_4$ , and an acid-sol B compd. The products are dihydroxy-dl- or -tri-aryalkanes. Di(4-hydroxyphenyl)dimethylmethane is best prepd. by using PhOH and  $\text{Me}_2\text{CO}$  in theoretical proportions, 4-5 mols. of  $\text{H}_2\text{SO}_4$  per mol. of PhOH, an acid concn. of 65-70% and keeping the temp. in the early stages at 25-35° and later at 45-55°. About 0.5-5%  $\text{H}_2\text{BO}_3$ , added on the PhOH, is sufficient. The products may be used in making synthetic resins, as antioxidants and polymerization inhibitors for motor spirit, paints and varnishes, as insecticides (either as the phenol or its salts) or dye intermediates, or can be nitrated to form explosives or sulfonated to give wetting, dispersing or emulsifying agents.

**4-Alkyl- and 4-alkyl-dihydroresorcinols.** Max Klunemann (to Hoffmann-La Roche Inc.). U. S. 2,018,213, Oct. 22. 4-R-Dihydroresorcinols (R representing an alkyl or aralkyl group) are produced by subjecting solns of 4-R-resorcinols to catalytic hydrogenation in the presence of at least one equiv. of a strongly basic compd. 4-Ethyl-dihydroresorcinol forms colorless crystals m 100° easily sol. in org. solvents and difficultly sol. in water. Several examples are given.

**Hydrogenating pyridine and its derivatives.** Wilbur A. Lazier (to E. I. du Pont de Nemours & Co.). U. S. 2,019,419, Oct. 29. A compd. such as pyridine or an alkyl pyridine in liquid phase and  $\text{H}_2$  under superatm. pressure and temp. conditions, are brought into contact with a catalyst prepd. by heating a multiple chromate of a N base and a hydrogenating metal such as Cu-Ni, chromate to its spontaneous decompn. temp. and then reducing the resulting compn. in  $\text{H}_2$ . Numerous examples are given.

**Catalytic hydrogenation of pyridine and its derivatives, etc.** Wilbur A. Lazier (to E. I. du Pont de Nemours & Co.). U. S. 2,018,880, Oct. 29. Hydrogenation is effected under superatm. pressure in the presence of a Ni catalyst which may be at least partly in oxidized form together with an oxidized form of a metal such as Cr forming an oxide more acidic than Ni oxide.

**Polymerizing gaseous olefins to form liquid hydrocarbons.** Vladimir Ipatieff (to Universal Oil Products Co.). U. S. 2,018,066, Oct. 22. An olefinic gas is subjected to polymerizing conditions of temp. and pressure in the presence of a solid phosphoric acid catalyst and with such an added amt. of steam that the vapor pressure of the acid at the operating temp. and pressure conditions is balanced by the steam in the gas so that loss of water from the catalyst is substantially prevented.

**Polymerization of isobutylene.** J. G. Farbenindustrie A.-G. Brit. 432,196, July 15, 1935. Polymerization products of much higher mol. wt. and of greater viscosity are obtained when polymerizing isobutylene (I) by means of  $\text{BF}_3$  according to Brit. 401,297 (C. A. 28, 2367) if especially pure I obtained by conversion of iso-Bu or tertiary Bu alcs and subsequent purification by distn. is employed. The low temps. of Brit. 401,297 are no longer necessary, as room temp. or temps. up to 100° may be used. In an example, I obtained by leading iso-BuOH over  $\text{Al}_2\text{O}_3$  at 400° and subsequently distg. at 2-3 atm. in a column 5 m high, is cooled to -15° and  $\text{BF}_3$  led in. An oil of viscosity 250° Engler at 100° is obtained. If the polymerization is at -80°, a product is obtained that has a mol. wt. of 40,000, undistd. I treated under the same conditions giving a product of mol. wt. 10,000-15,000.

**Polymerizing acrylic esters.** Otto Röhm, Fr. 784,095, July 22, 1935. The polymerization of acrylic esters is

regulated by the addn. of relatively small amounts of essential oils or substances which contain unsatd. cyclic bonds of the terpene series, e. g., turpentine oil or colophony.

**Carbohydrate polymers.** Holzhydrolyse A.-G. (Eduard Färber, inventor). Ger. 618,183, Sept. 16, 1935 (Cl. 12a. 6). Aldoses are heated to 120-80° for a few min. with substantially less than 0.1% of mineral acid, without the use of reduced pressure, inert gases or liquid diluents. Polymerization products resembling glucose syrup are obtained. Cl. Ger. 513,126 (C. A. 25, 1266).

**Condensation products from phloroglucinol.** Leopold Laska and Oskar Haller (to General Aniline Works). U. S. 2,018,137, Oct. 22. See Ger. 603,688 (C. A. 29, 817°).

**Solid diazonium salts.** Karl Schnitzspahn (to General Aniline Works). U. S. 2,018,095, Oct. 22. The inorg. acid diazonium salts of 4-halo-2-aminodiphenyl ethers, at least one phenyl nucleus of which may be substituted by methyl or a halogen, are caused to sep. in solid form by adding to their aq. inorg. acid solns an alkali salt of the inorg. acid such as  $\text{Na}_2\text{SO}_4$  or  $\text{KBr}$ . Numerous examples are given.

**Solid diazo compounds.** Soc. pour l'ind. chim. à Bâle, Swiss 177,115 to 123, Aug. 1, 1935 (Cl. 36g). Addns. to 174,081. 4-(4'-Methyl)-phenoxyacetylamin-2,5-diethoxy-1-aminobenzene is diazotized in the presence of  $\text{HCl}$  and the product which is a stable cryst. powder useful for the prepn. of azo dyes (177,115), is salted out. Other starting materials can be used, such as 4-phenoxyacetylamin-2,5-diethoxy-1-aminobenzene (177,116), 4-(3'-methyl)phenoxyacetylamin-2,5-diethoxy-1-aminobenzene (177,117), 4-(2'-methyl)-phenoxyacetylamin-2,5-diethoxy-1-aminobenzene (177,118), 1-amino-2-methoxy-5-methyl-4-benzoylaminobenzene (177,119), 1-amino-2-chloro-5-methoxy-4-benzoylaminobenzene (177,120), 1-amino-2-methoxy-5-chloro-4-benzoylaminobenzene (177,121), 1-amino-2,5-diethoxy-4-benzoylaminobenzene (177,122) and 1-amino-2,5-dimethoxy-4-benzoylaminobenzene (177,123).

**N-Vinyl compounds.** I. G. Farbenindustrie A.-G. (Walter Reppe and Ernst Keyssner, inventors). Ger. 618,120, Sept. 2, 1935 (Cl. 12p. 2). N-Vinyl derivs. of compds. contg. n pyrrrole ring are prepd. by treating the compds. with  $\text{CaH}_2$  in the presence of n base substance, e. g., an alkali hydroxide. The reaction may be effected in a solvent or diluent at 160-90° under pressure. Examples are given of the prepn. of N-vinylpyrrole, b 122°, N-vinylimide, b 70-5°, N-vinylcarbazole, m 62-4°, b 170-80°, and N-vinyltetrahydrocarbazole, b 125-30°.

**Benzene derivative.** Soc. pour l'ind. chim. à Bâle, Swiss 177,262, Aug. 1, 1935 (Cl. 36g). The compd. 1,2-diaminobenzene is prepd. by treating 1,2-dichlorobenzene with aq.  $\text{NH}_3$  at about 150° and 80 atm. in the presence of Cu. The Cu is present in sufficient quantity to cause the formation of a complex Cu salt of the resulting 1,2-diaminobenzene, the Cu being subsequently split off as  $\text{CuS}$ . An example is given.

**Diphenylmethane derivatives.** Berthold Biernert and Robert Held (to General Aniline Works). U. S. 2,018,775, Oct. 29. See Ger. 610,319 (C. A. 29, 3690°).

**Resorcinol derivatives.** William B. Austin, Fr. 784,441, July 22, 1935. Alkyl resorcinols are prepd. by condensing resorcinol with a secondary alc. or an alkyl halide having at least 7 C atoms in the alkyl group, preferably in the presence of a condensing agent. Examples are given of the prepn. of secondary octyl and heptyl resorcinol. Fr. 784,442. Secondary alkyl chlororesorcinols are prepd. by chlorinating secondary alkyl resorcinols or by condensing chlororesorcinol with a secondary alc. or alkyl halide having at least 4 C atoms in the alkyl group.

**Polyhalogen derivatives of pyrene.** Heinrich Vollmann and Hans Becker (to General Aniline Works). U. S. 2,018,935, Oct. 29. See German pat. 600,055 (C. A. 28, 6444°) and French pat. 761,627 (C. A. 28, 4099°).

**Compounds of alkali metals and hydrocarbons.** E. I. du Pont de Nemours & Co. Fr. 784,440, July 22, 1935. Addn. compds. are made by causing an alkali metal to

react with a hydrocarbon of the  $C_nH_{2n}$  series in the presence of a polyether or a mixt of such ethers, and, if desired, an inert diluent. Polyethers signify the completely alkylated products of polyhydric alcs., as well as alkyl orthoformates, methylal or other acetals. Thus, a compd which appears to be 1,4-disodium naphthalene may be prepd.

**Aluminum formate** Oskar Jochem and Theodor Hennig (to Zschimmer & Schwarz chemische Fabrik Dolau) U S 2,019,415, Oct 29. A solid formate of the formula  $Al(HCOO)_3 \cdot 3H_2O$  and which can be recrystallized from aq. solns is obtained by crystn. from an Al formate soln. of at least 1.10 sp. gr.

**Tetraalkyl lead** E. I. du Pont de Nemours & Co. Fr 784,222, July 22, 1935. The mud obtained from the reaction product of Pb-Na and an alkyl halide is steam-distd. in the presence of one or more dispersing agents capable of preventing agglomeration of the Pb in the mud. The distn. is interrupted when the greater part of the tetraalkyl Pb has been removed and a wetting agent is added to the residue so that when the distn. is renewed the whole of the tetraalkyl Pb is recovered. The dispersing agent is preferably a mixt. of minor oil and thio-carbonate, but  $Na_2CrO_4$ ,  $Na_2Cr_2O_7$ , Na silicates or  $Na_2SO_4$  may also be used. The wetting agent may be a sulfonated oil. Cl C A 29, 817.

**Tertiary nitriles** I. G. Farbenind., A.-G. (Max Rochemühl and Gustav Ehrhart, inventors). Ger 616,876, Aug 13, 1935 (Cl 12a 11). Addn to 473,329 (C A 23, 2987). A secondary nitrile of the formula  $RR'CHCN$ , where R and R' are alkyl groups, is treated with a sodium alkyl, e.g., EtNa, to form a compd  $RR'CNACN$ , which is then alkylated (preferably without isolation) as described in Ger 473,329. An example is given in which Na covered with ether is treated in turn with  $HgEt_2$  and  $Ph_3CHCN$  and then, after 1 hr., with  $CH_3CHCl_2$ .  $Et_3(CH_3CHCl_2)CCN$ ,  $b_p 71-74^\circ$ , is obtained.

**Concentrating dilute acetic acid**, etc. Horace F. Oxley and Walter H. Groombridge (to Celanese Corp. of America) U S 2,018,031, Oct 22. The dil. acid is extd. with an org. liquid such as ether, which is a solvent for the acid, the org. liquid is at least partially sep'd. from the ext., and water is removed from the acid soln. so obtained in the form of an azeotropic mixt. with the vapor of another org. liquid such as  $C_2H_5$  of such character that the b. p. of the azeotropic mixt. is higher than that of the extg. agent (the hot azeotropic vapor mixt. being passed in heat exchange with the ext.). Water and  $C_2H_5$  are sep'd., and the  $C_2H_5$  is further used in the process.

**Ascorbic acid** Tadeus Reichstein. Swiss 175,263-4, Aug 1, 1935 (Cl 116a). Addns to 169,855 (C A 29, 1863). d-Ascorbic acid is prep'd by adding HCN to d-xylosone and sapon. the product (175,263). The l form is obtained by using l-xylosone (175,264). A small amt. of a basic substance may be present as a catalyst.

**Ketogulonic acid** F. Hoffmann-La Roche & Co. A.-G. Swiss 174,080, Apr. 16, 1935 (Cl 36a). The compd 2-keto-l-gulonic acid is prep'd by treating l-sorbose with a cyclic ketone and oxidizing the resulting dimethylene ether deriv. in alk. soln. to convert the  $CH_2OH$  group to a  $COOH$  group. The product is dimethylene ether-2-keto-l-gulonic acid. The acid is split off by warming with water. Thus, powd. l-sorbose, cyclohexanone and a little concd.  $H_2SO_4$  are shaken together. The product is diluted with ether and potash soln. added. After drying, the ether and free cyclohexanone are dist'd. off and the residue dist'd. *in vacuo* to give dicyclohexanone-l-sorbose. This is treated with an aq. KOH soln. and HCl and ice to give dicyclohexanone-2-keto-l-gulonic acid, m. 132-33°. This is heated to give 2-keto-l-gulonic acid.

**2-Methyl-3-hydroxyquinoline-4-carboxylic acids** I. G. Farbenind. A.-G. Fr 784,365, July 22, 1935. These are prep'd by heating a halogenated acetone with salts of isatic acids in the presence of alk. earth hydrates. Examples are given of the prep'n. of the acid and its 6-phenyl (m. 246° with elimination of  $CO_2$ ) and 6,8-dichloro (m. 259-60°) derivs.

**Polyhydroxy carboxylic acids from carbohydrates** Oskar

Spengler and Adolf Pfannenstiel. Ger. 618,164, Sept 3, 1935 (Cl. 12a 11). Reducing sugars are treated in aq. alk. soln. with  $O_2$  as distinct from air, at atm. or slightly raised temp. Carboxylic acids having 1 C atom less than the starting material are obtained in 65-70% yield. Examples are given in which glucose, fructose, invert sugar and mannose yield d-arabonic acid, galactose yields d-lyxonic acid, arabinose yields l-threonic acid and maltose yields a glucosidoarabonic acid.

**Anhydrides** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Fr 784,438, July 22, 1935. Anhydrides, e.g., propionic, butyric and caproic anhydride, are made by causing  $Ac_2O$  to react with the fatty acids and if necessary removing by distn. the  $AcOH$  formed during the reaction.

**Acetic anhydride** Consortium für elektrochem. Ind. G m b H (Martin Muggan and Johann Sixt, inventors). Ger 618,270, Sept 6, 1935 (Cl 12a 12). See Fr 780,880 (C. A. 29, 5864a).

**Ethylene oxide** Société française de catalyse generalisée. Brit. 431,966, July 18, 1935. This corresponds to Fr. 771,650 (C. A. 29, 819a).

**Pentaerythritol** Lonza Elektrizitätswerke und chemische Fabriken A.-G. [Gampel]. Swiss 176,918, Aug. 1, 1935 (Cl. 36a). Technically pure pentaerythritol is obtained from the crude material formed by condensing  $AlCl_3$  and  $CH_3O$  by washing off the dipentaerythritol, pressing the crystals, and washing with a sat'd soln. of pentaerythritol. Examples are given.

**o-Dihydroxybenzenes** E. I. du Pont de Nemours & Co., Frederick B. Downing and Richard C. Clarkson. Brit. 432,276, July 24, 1935. Addn to 425,230 (C A 29, 5438). In the process of 425,230, the alk. hydrolyzing agent is partly added as the reaction proceeds, the process, if desired, being conducted continuously.

**Hydroxypyrene** Walter Kern (to Soc. pour l'ind. chim. à Bâle). U. S. 2,018,792, Oct 29. Pyrene monosulfonic acid is subjected to a caustic alkali fusion, and a hydroxypyrene is obtained m. 180-2° and easily sol. in dil. alkalis. Various details and modifications of procedure are given. Cl C A 29, 4776.

**Bromohydroxybiphenyls** Chem. Fab. von Heydel A.-G. (Karl Willy Rüttler and Wolfgang Gundel, inventors). Ger. 616,848, Aug. 6, 1935 (Cl. 12a, 15.01). Addn to 615,133 (C. A. 29, 6247). Mixts. of 3- and 5-bromo-2-hydroxybiphenyl, such as are obtained by brominating o-hydroxybiphenyl, are sep'd. into their components by converting the mixts. into Ca salts, and sep'd. the salts by virtue of their different sol. properties, the Ca salt of the 5-bromo compd. being almost insol. in water. A sp. process is described. The 3-bromo compd. b. 173-8°, the 5-bromo compd. m. 53-4°, b. 180-2°.

**Dibenzoxanthone** Soc. pour l'ind. chim. à Bâle. Swiss 174,643, Apr. 1, 1935 (Cl. 36a). Dibenzoxanthone b. 179-81°, is isolated from the residues of 2,3-dihydroxy naphthoic acid manuf. by extg. the residues insol. in liq. with a solvent of the pyridine series. Cl C A 29, 6944.

**Purifying and decolorizing cinchophen** Ernest F. Grether (to Dow Chemical Co.). U. S. 2,018,354, Oct. 22. An  $NH_4$  alkali metal, alk. earth metal or Mg salt of cinchophen in solid form and which may be assoc'd. with impurities is acidified with more than its chem. equiv. of a concd. liquid water-sol. carboxylic acid such as glacial  $HOAc$ .

**Phenanthrene** Soc. pour l'ind. chim. à Bâle. Swiss 175,343, May 1, 1935 (Cl. 36a). The above is prep'd. by treating  $\alpha, \beta$ -diphenylethane with a dehydrogenating agent such as a metal halide. The reaction takes place preferably in the presence of  $CS_2$ .

**Pregnanolones** Schering-Kahlbaum A.-G. Brit. 431,833, July 16, 1935. These are prep'd. from pregnandiol by (1) esterification to the monoester, oxidation to pregnanolone monoester and sapon., or (2) oxidation to pregnandione, followed by partial reduction, or (3) esterification to the diester, partial sapon. to the monoester and sapon.  $Ac_2O$  is used for esterification,  $CrO_3$  for oxidation and H in presence of Pt catalyst for reduction. Re-

duction may also be accomplished by treatment in the presence of catalysts with compds. that yield H and at the same time form their corresponding oxidation products, e. g., tetrahydronaphthalene, cyclohexanol. An example of each method above is given.

Vanillin. Jemac A.-G. Swiss 175,671, June 17, 1935

ARTHUR W. DOX

Effect of ultraviolet light on enzymic reactions I. Diastase. Sobhanlal Banerjee and H. K. Sen. *J. Indian Chem. Soc.* 12, 379-83 (1935).—The activity of org. catalysts in the decomposition of  $\alpha$ -ketocarboxylic acids is decreased in the presence of ultraviolet light. This retrogression can be retarded by the use of accelerators provided that they serve as filters against the ultraviolet. The diastatic enzyme in malt is known to be rendered completely inactive by ultraviolet light (C. A. 18, 3068) and the protective action of inorg. salts, e. g.,  $MgCl_2$ , has been investigated. It has been observed that several nines, amino acids and  $NH_4$  salts, etc., not only increase the activity of the diastase, but also protect the enzyme from complete destruction by the action of the ultraviolet rays. Expts. with malt diastase with and without catalyst, both sets being irradiated and nonirradiated, were made. Filtered solns. of 0.15-0.2 g. of dry diastase in 100 cc. of  $H_2O$  were prep'd. and the diastatic value was det'd. by the Lintner method. Varying amts. of the enzyme (0.1, 0.2, 0.3 cc., etc.) were added to 10 cc. of 2% starch solns. contg. 1 cc. of 0.1% catalyst soln., previously adjusted to pH 5.6 (neutral to Wisslow's indicator, a mixt. of methyl red and blue) by the addn. of 0.01 N NaOH or HCl. The expts. were carried out in quartz tubes irradiated by a 3000 candle power Hg vapor lamp with a 12 in. arc at a distance of 2 ft. It was found that asparagine,  $PHNH_2 \cdot CH_2CO_2H$ ,  $NH_4$  citrate, gelatin, tyrosine, etc., cause varying degrees of increment of diastatic activity and exert protective action on malt diastase against ultraviolet light. A distinction must be drawn between an accelerator and a protector though it is possible that some substances have both functions. The protective action probably depends upon the capacity of the substance to absorb partially or wholly the destructive wave lengths of the ultraviolet light. C. R. Addinall

Some analyses of thyroglobulin. Abraham White. *Prot. Soc. Exptl. Biol. Med.* 32, 1558-60 (1935), cf. C. A. 29, 4777.—The av. values of 2 analyses expressed as percentages of the ash-free and moisture-free protein are: N 15.88, S 1.46, I 0.75, glutamic acid 6.50, aspartic acid 1.59, tyrosine 3.17, tryptophan 1.8, cystine 2.05, proline 4.47, histidine 0.62, arginine 8.22 and lysine 1.93.

C. V. Bailey

The significance of fumaric acid for the respiration of animal tissue. L. Annau, I. Banga, B. Görsy, St. Huszák, K. Laki, B. Straub and A. Szent-Györgyi. *Z. physiol. Chem.* 236, 1-68 (1935). Introduction, scope, methods. A. Szent-Györgyi. *Ibid.* 1-20.—A theoretical discussion of the papers that follow. The respiration of pigeon thoracic muscle in a modified Thunberg app. indicates a cyclic dehydrogenation, oxidation and reduction of C<sub>4</sub>-dicarboxylic acids: succinic  $\rightarrow$  fumaric  $\rightleftharpoons$  oxalacetic  $\rightarrow$  succinic. Fumarase, one of the most active enzymes known, hydrates fumaric to malic acid but seems to play no part in respiration. Malic acid inhibits the respiration. Influence of C<sub>4</sub>-dicarboxylic acids on tissue respiration. I. Banga. *Ibid.* 20-31.—The apparent increase in respiration when fumarate is added to the tissue is merely a "conservation" of the system or protection from deterioration. The effect is not observed in the first few min., but only after the control has begun to show a decline. Fumarate does not initiate an artificial respiration system; it merely prolongs the activity of the

normal system. It counteracts also the inhibitory effect of malonate. Oxalacetate behaves precisely like fumarate, and likewise hydroxymalate and hydroxymaleate, but acetylenedicarboxylate and the 3 tartarates are inert. Oxidation and reduction of C<sub>4</sub>-dicarboxylic acids. K. Laki. *Ibid.* 31-42.—The dehydrogenation of succinic acid by comminuted pigeon thoracic muscle suspended in phosphate soln. was det'd. by the decolorization of 1-naphthol-2-sulfonate-*endo*-2,6-dichlorophenol and also by detn. of the fumaric acid formed. The curve shows a sharp break at the succinate concn. where the dye is in mol. excess. The max. velocity of dehydrogenation occurs as long as an equiv. of succinic acid is present. This dehydrogenation is a reversible process in which the fumarate can serve as H-acceptor. Here the reaction may be followed by observing the coloration of leuco dye. It is independent of the concn. of fumaric acid as long as the latter is in mol. excess. Both reactions are inhibited by malonate. L-malic acid inhibits aerobic and anaerobic oxidation of succinic acid at the outset, until the fumarase has had time to dehydrate it to fumaric acid or an equil. mixt. Equal inhibition by malate and fumarate indicates equal adsorption on the succinodehydrogenase. Like fumarate, l-malate is a H-acceptor as can be demonstrated by coloration of leuco-methylene blue and leuco-indigocarmine. The reaction is not influenced by co-dehydrogenase. Malate behaves in the same way, and with its reduction product, succinic acid, forms an oxidation-reduction system. It requires no coenzyme for activation. As H donor fumaric acid is most effective in activating fumarate dehydrogenase at the natural fumarate concn. of the tissue, 20 mg. %. Here again the presence of coenzyme does not influence the type of curve. The donor effect of l-malic acid is due to a preliminary conversion to fumaric acid. Malic acid is a feeble H-donor but, like malic acid, inhibits tissue respiration even in low concn. It competes with succinic and fumaric acids for adsorption on the enzyme surface and displaces them without performing their function. Acetylenedicarboxylic acid and *d*-, *l*- and *meso*-tartaric acids are inactive. The neg. leuco dyes such as leuco-neutral red or leuco-indigocarmine. For hydrogenation of oxalacetate the 3 tartaric acids require the very neg. leuco-neutral red. The hydrogenating activation of oxalacetate is strongly accelerated by coenzyme, no effect being obtained in the absence of muscle tissue. It is not inhibited by malonate. Hydroxymalate and hydroxymaleate behave precisely like oxalacetate. Microdetermination of fumaric acid and its application. F. B. Straub. *Ibid.* 42-53.—Two methods were employed for extrn. of the fumaric acid: (a) The tissue suspension was treated with an equal vol. of 96% EtOH, allowed to stand 6-10 hrs. in the refrigerator and centrifuged. An aliquot was acidified with  $H_2SO_4$  and then ext'd. with  $Et_2O$ . (b) The tissue pulp was treated with 20%  $CCl_3CO_2H$ , then filtered or centrifuged and an aliquot ext'd. with  $Et_2O$ . Both  $Et_2O$  and  $Et_2O$  must previously be treated with alk.  $KMnO_4$  and dist'd. to remove reducing substances. The  $Et_2O$  ext. was evap'd. and the fumaric acid in the residue det'd. by titration with 0.01 N  $KMnO_4$ , the latter being added at the rate of 1 drop every 3 seconds until a permanent color was obtained. Added fumaric acid (0.1 mg.) may thus be det'd. within an error of 6 to -4%. The fumaric acid content of muscle is about 10 mg. %. Under aerobic incubation it does not diminish in quantity although it activates respiration, but

under anaerobic conditions a slight gradual decrease occurs. In the presence of malonate a considerable decrease occurs aerobically, but anaerobically the usual slight decrease is inhibited. Added oxalacetate undergoes reduction to fumarate, the recovery of fumarate therefrom amounting to 65%. The micro-method was applied also to the determination of fumarate formed by dehydrogenation of succinate in the presence and absence of malonate. Microdetermination of succinic acid and its application. B. Gossy *Ibid* 51-8.—The method is based on the biol. oxidation of succinic acid by the muscle itself and measurement of the  $O_2$  consumption in a respirometer. The difference in  $O_2$  consumption between parallel detms with and without addn of malonate represents the  $O_2$  consumed by succinic acid. The total error is about -15%. In the presence of malonate the fumarate of muscle is reduced aerobically to succinate, and the succinate oxidation specifically inhibited. Comparative experiments with fumaric acid and malonic acid. E. Annau *Ibid* 58-65.—Respiration by liver and kidney is influenced in the same manner by addn of fumarate and malonate as is that by muscle, only to a smaller extent, especially with kidney. Formation of oxalacetate is also less, and occurs in Ringer soln rather than in phosphate soln. In general the  $O_2$  consumption is greater with tissue sections than with tissue pulp. The formation of acetone bodies, as detd by the  $Na_2Fe(CN)_5$  reaction, occurs in the presence but only slightly in the absence of malonate. In this reaction malonate and fumarate are antagonistic. Tissue sections and tissue pulp show no difference in this respect. Experiments *in vivo*. Istvan Huszák *Ibid* 66-8.—The alterations in respiratory function of animal tissues through the influence of dibasic acids were demonstrated also by intravenous injections in rabbits. Malonate resulted in acetone excretion which reached a max in 30-60 min. Malonate + fumarate gave no evidence of acetone excretion, but the blue nitroprusside reaction characteristic of oxalacetate appeared in 5 min.  $\beta$ -Hydroxybutyrate gave rise to a strong acetone reaction in the urine, and only a faint reaction when fumarate was injected simultaneously. Rabbits injected with oxalacetate gave a faint reaction for  $AcCOH$  in the urine but a much stronger reaction when arsenite was injected simultaneously. Arsenite thus delays the reduction of oxalacetate. This disturbance in tissue respiration may be a possible explanation of the toxicity of  $As$ . The relative non-toxicity of malonate shows that the tissues *in vivo* behave like tissue sections in Ringer rather than in phosphate soln. A. W. Dor.

Liver enzymes III. The aldehydease of the liver Ludwig Reichel and Herbert Kohle. *Z. physiol. Chem.* 236, 147-57 (1935), cf. C. A. 28, 4079.—Aldehydease preps. obtained by repeated pptn. of liver ext. with  $MeAc$ - $Et_2O$ ,  $EtOH$ - $Et_2O$  or  $EtOH$ , show  $pH$  optimum at 7.5-7.8 in the dismutation of  $EtCHO$ . The max. dismutation is effected in 120 min. At 69° the enzyme is completely destroyed. Dismutation is inhibited by  $HClN$ , probably because of cyanohydrin formation. Under anaerobic conditions quinone acts as  $H$ -acceptor and the aldehyde is completely oxidized to acid. Methylene blue is less effective as  $H$ -acceptor, but in high concn. it favors acid formation. Under aerobic conditions it is effective in lower concn., probably because of re-oxidation of the leuco dye adsorbed on the active surface. For detn. of  $EtCHO$  in the presence of quinone and methylene blue the aldehyde was displaced by a current of  $CO_2$  at a temp. of 80° and absorbed in  $NaHSO_3$ . The  $H$ -acceptor present in the cell is cytochrome, which undergoes reduction and then re-oxidation by indophenoloxidase. The latter enzyme is very sensitive and does not withstand the  $MeAc$  and  $EtOH$  treatment, hence it is not present in the prep. By addn. of indophenoloxidase preps. obtained from heart muscle the oxidation of  $EtCHO$  to acid by liver preps. was increased to 100%. The dehydrogenation process by aldehydease thus requires the presence of cytochrome and indophenoloxidase. Among other natural acceptors adrenalinquinone is inactive, but lactoflavin is very effective. With fresh liver in the absence of

$O_2$ , the proportions of  $PrOH$  and  $EtCO_2H$  formed from  $EtCHO$  correspond approx. to a dismutation reaction IV. The alcohol dehydrogenase of the liver. *Ibid* 158-67.—Alc. dehydrogenase preps. obtained from liver ext. by repeated  $MeAc$  pptn. in the presence of  $N_2$  are much less stable than aldehydease preps. and lose their activity in 6-8 weeks *in vacuo* or in a few days when exposed to air. They do not dehydrogenate  $PrOH$  in the absence of  $O_2$ . Contrary to the statement of Battelli and Stern (C. A. 5, 308) they do not carry the reaction beyond the aldehyde stage. The acid formation by fresh liver must be attributed to a dehydrogenation of aldehyde by the aldehydease system. Optimum activity of alc. dehydrogenase is at  $pH$  6.7-7.3 and a max. conversion occurs in 80 min. At  $pH$  7.8 the destruction temp. is 47.5°. The enzyme is not sensitive to  $HClN$ . In the presence of  $O_2$ , methylene blue serves as intermediate acceptor and the reaction is accelerated. Quinone is less effective, probably because of its greater affinity for the enzyme. Among the natural acceptors ascorbic acid is ineffective while adrenalinquinone is active. The oxidation is increased by addn. of dried spleen preps. which contain no dehydrogenase, but the factors responsible have not been detd. A. W. Dor.

Enzymic amyolysis V. Amylophosphatase from barley Ernst Waldschmidt-Leitz and Karl Mayer. *Z. physiol. Chem.* 236, 168-80 (1935); cf. C. A. 29, 8012.—Exts. of barley and malt show in addn. to starch saccharification an enzymic splitting off of  $H_2PO_4$  from org. compds. The dephosphorylating enzyme, designated amylophosphatase, can be freed from the saccharifying enzymes,  $\alpha$ - and  $\beta$ -amylase, by selective adsorption of the latter on kaolin at  $pH$  5. The amylase free amylophosphatase is capable of liberating all of the  $H_2PO_4$  organically combined in starch paste. The reaction, which is optimal at  $pH$  5.6, not only splits off  $H_2PO_4$ , but also results in a proportional decrease in viscosity and a measurable formation of reducing groups. Unlike the amylases, this enzyme is not activated by amylokinase. A similar dephosphorylation and liquefaction of starch paste is effected by amylase-free phosphatase from kidney. But the barley enzyme is the more active of the 2 in proportion to its activity toward glycerophosphate. The final effect of either enzyme is the formation of P-free cleavage products, which, after electro-dialysis and  $EtOH$  pptn., give a pure blue color with 1 and reduce  $NaOI$ . The reducing power corresponds to a chain length of 36 glucose mols. Although the products constitute a mixt., the observation is significant in view of the fact that amyloamylose with amylase yields a crystalline contg. 18 glucose groupings and erythroamylose yields a crystalline hexose. Among the structural units of the starch mol. groupings of 6 glucose mols. or a multiple thereof seem to be of especial significance, and the linkages between them are especially amenable to enzymic cleavage. The P-free dextrin formed by amylophosphatase action is easily split by amylase, more easily in fact than starch paste. It is conceivable that the  $H_2PO_4$  occurs in ester linkage not with one but with several glucoside chains, and thus binds them together. Their cleavage would then decrease the size of the mol. and account for the lowering of viscosity. A. W. Dor.

Iron studies IX. The question of the identity of blood catalase with the easily cleavable blood iron. Georg Barkan and Jutta Oleks. *Z. physiol. Chem.* 236, 197-200 (1935); cf. C. A. 28, 1861.—Blood catalase is not inhibited by a treatment with  $CO$  which diminishes the amt. of Fe cleavable from blood by acid treatment to  $1/2$  the normal value. This is considered further evidence that catalase is not identical with the ionizable Fe of blood. A. W. Dor.

Cytochrome IV. Cytochrome C Karl Zeile. *Z. physiol. Chem.* 236, 212-15 (1935), cf. C. A. 28, 1851.—In its oxidized state cytochrome C has much greater affinity for adsorbents, such as kaolin and silicic acid, than in its reduced state. This property was utilized in detg. the hemin content of cytochrome C. The difference in wt. of cytochrome adsorbed from reduced and oxidized solns. by a given wt. of adsorbent divided into the difference in cytochrome hemin detd. spectrophotometrically in the 2

ad-xebates gives the hemin content of the cytochrome. The values thus obtained averaged 3.4%. By the use of electrophoresis app. the isoelec. point of cytochrome was found to be at  $pH$  8.2. A. W. DOW.

**Prostate phosphatase.** Waldemar Kitchner and Hake Welboren. *Z. physiol. Chem.* 236, 237-42 (1935), cf. C. A. 29, 66135. —A phosphatase is of common occurrence in the urine of males but not in that of females or old persons. It is present in high concentration in the ejaculate, and in the prostate gland which is the source of the enzyme. The other sex glands contain considerably less. The phosphatase is active in acid but not in alk. med. in its several times as active toward phenyl phosphate and  $\alpha$ - and  $\beta$ -glycerophosphate as toward hexosediphosphate. It is completely inactivated by heating 5 min. at 60°. The function of this enzyme is probably not carbohydrate metabolism. A. W. DOW.

**Visual purple.** Otto Brummer, Eugen Baur and Wolrad Kleman. *Z. physiol. Chem.* 235, 257-62 (1935). —Freshly dissected retinas from the eyes of eels and pigs were exd. with abs. MeOH while carefully excluding air, the ext. was treated with an equal vol. of benzene and the soln. sep'd into 2 layers by addn. of H<sub>2</sub>O. The benzene layer cont'd the pigments was washed with H<sub>2</sub>O, conc'd under CO<sub>2</sub> and sep'd with abs. KOH at room temp. The benzene layer was again sep'd by addn. of H<sub>2</sub>O and the cholesterol exd'd out by cooling and further by pptn. of the abs. soln. with diutecum. The benzene soln. of the pigment was then adsorbed on AlO<sub>3</sub> and the pigment identified as  $\beta$ -carotene. The color change during adsorption and the light sensitivity of the adsorbate suggested the desirability of a comparison with visual purple. Photometer readings of the adsorbate in reflected light gave a curve quite similar to that calcd. from the Hoeswa and Raveri data on visual purple. In both instances the max. is at 500 m $\mu$ . The results suggest a possible connection between carotene and visual purple. A. W. DOW.

**Creatinephosphoric acid.** Karl Zeile. *Z. physiol. Chem.* 235, 263-72 (1935). —Attempts were made to synthesize creatinephosphoric acid by 2 methods. The 1st method, a phosphorylation of SC(NH<sub>2</sub>)<sub>2</sub>, MeSC(NH<sub>2</sub>)NH<sub>2</sub> or HN(CNH<sub>2</sub>)<sub>2</sub>, and coupling the product with sarcosine, was unsuccessful. The 2nd method, direct phosphorylation of creatine with POCl<sub>3</sub>, yielded a creatinephosphoric acid isomeric with the natural product from muscle. Condensation of (PbO)POCl<sub>3</sub> with thiourea yielded dihydrothiophosphoric acid, m. 143°. Treatment of this with H<sub>2</sub>O to remove the S took out H<sub>2</sub>S and gave dihydrothiophosphoric acid which exd'd out as lig. salt n. 135°. Treatment of MeSC(NH<sub>2</sub>)NH<sub>2</sub> with (PbO)-POCl<sub>3</sub> yielded merely the salt, *methylenethiophosphoric diphenylphosphate*, long needles, m. 170°. Phosphorylation of creatine in pyridine with POCl<sub>3</sub> gave a creatinephosphoric acid which could not be satisfactorily purified through the Ca salt. Finally, a *creatinephosphoric acid* was obtained by heating creatine in pure POCl<sub>3</sub>. This was purified by repeated recrystn. of the Ca salt after careful removal of excess POCl<sub>3</sub>. It was not identical but was isomeric with the natural product. The 2 substances showed differences in rate of hydrolysis, differences in the accelerating influence of molybdate and differences in dissociation curves. A. W. DOW.

**The actions of coenzyme.** Hans v. Euler and Ragnar Vestin. *Z. physiol. Chem.* 237, 1-7 (1935). —Some unactivated coenzyme no longer activates fermentation but shows diminished activity toward glycolysis, a detn. of the effect of inactivation on the phosphorylation process became desirable. Both active and inactivated coenzyme were found to have practically the same activating effect on the phosphorylation of glycogen by muscle ext. in the presence of hexosediphosphate, and on the formation of lactic acid. Coenzyme thus contains 2 catalytically active groups, the more labile of which influences fermentation and oxidation-reduction, while the more stable group participates in a phosphorylation associated with lactic acid formation. The latter is probably an adenosine acid group. The enzyme system of yeast does not seem to effect a phosphorylation of pyruvic acid or creatine. A. W. DOW.

**Poisoning of fumarase.** Kurt P. Jacobson and Jow Tapachewski. *Genet. anal.* 120, 29-31 (1935), cf. C. A. 29, 4535. —Freshly prep'd. fumarase solns. (from liver juice) were less readily inactivated by AgNO<sub>3</sub> than old preps. L. E. GLICK.

**Problems connected with the principle of humoral transmission of nervous impulses.** O. Loewi. *Proc. Roy. Soc. (London)* B115, 29-31 (1935). —The Ferner lecture.

**Recent advances in science biochemistry.** W. O. Kernick. *Science Progress* 30, 248-252 (1935). —A review of recent work on the biochemistry of molecular contraction with especial reference to the products formed from glycogen. Joseph S. Hightower.

**Photosynthesis in intermittent light, in relation to current formulations of the principles of the photosynthetic mechanism.** G. E. Briggs. *Phil. Mag. (London)* 20, 1-10 (1935). —A review. F. H.

**Mathematical physics of metabolizing systems with reference to living cells.** N. Ruckenstein. *Physica* 6, 341-9 (1935), cf. C. A. 29, 4171. —The effects of forces produced by metabolism on the functions and processes of the living cell are treated mathematically. C. E. P. J.

**The freezing and resuscitating of animals.** M. T. Zarogian. *Isaac Newton* 89, 133-41 (1935). —The blood stream of cold blooded animals is characterized by high CO<sub>2</sub> and avery low O<sub>2</sub>. When conditions are made such that the blood of warm blooded animals contain these materials in the proper ratio, the body temp. of the animal can be lowered without causing death. The lowering of the body temp. of rabbits, fish and other organisms is discussed. A. H. JACOBSON.

**Examination of ultraviolet radiation for use in medicine.** W. W. Cobble. *Phys. Rev. J. Gen. Phys. and Med. Phys.* 1, 1-25 (1935). —The procedure proposed is to det. the ultraviolet solar spectral energy curve by means of a phototube cell (of Ti or Cd, which responds to only a narrow spectral region) and 1 or 2 filters, combinations with the best test. To obtain the intensity in  $mW$  meter the phototube cell and auxiliary e.v.c. current meter (ammeter and amplifier) are calibrated against a standard of ultraviolet radiation (a 110 v. quartz lig. arc lamp) which has been standardized by means of the thermopile and filter. So long as the spectral phototube response remains unchanged, the evaluation of ultraviolet solar radiation of wave length shorter than and including 3137 Å. by means of a phototube cell appears to be just as reliable as a direct measurement with a thermopile and filter. Differences in transmission through the silver-mercurated filters were easily observed with phototube cells Ti No. 4 and Ti No. 2, which differed but slightly in spectral phototube response. After extensive use the spectral phototube response curves of the cells employed in the present research showed no variations comparable to the difference in the spectral response curves of cells No. 4 and No. 2. It is therefore believed that the observed seasonal changes in the transmission of ultraviolet solar radiation through the filters are owing to variations in atmospheric transparency and not to changes in the spectral response curves of the phototube cells. Comparative ultraviolet solar intensities in the tropics (at San Juan) and in higher altitudes (radiant flux, sea-level station, Washington) are discussed in the light of C. J. Jones' Earth-thermometer. J. A. KENNEDY.

**Noteworthy methemoglobin properties.** R. M. Mayer. *Dist. J. gen. anal.* May, 25, 113-22 (1935), cf. C. A. 29, 5511. —Methemoglobin was distinguished from other hemoglobin compds. by spectral sensitivities due to variations of H-ion concn. The 5-band spectrum of the normal zone was transformed to the spectrum characteristic of hemoglobin and then into that of methemoglobin. Pyridine addn. produced brown. Excess KFe(CN)<sub>6</sub> caused a segn. of methemoglobin. Methemoglobin was obtained from oxymethemoglobin as well as from oxhem only by an oxidation process with evolution of the loosely bound N (not bound to porphyrin Fe by a principal valence). FRANK KNOX.

**Proto-syn enzymes. VIII. The proto-syn systems of**

papain. Max Bergmann and Wm F. Ross. *J. Biol. Chem.* 111, 659-66 (1935), cf. *C. A.* 29, 7345<sup>8</sup>.—In natural papain there are 2 different proteolytic enzymes, a proteinase and a polypeptidase, which differ not only in their substrates but also in their behavior on oxidation. The activity of the former is reversible and of the latter not reversible after oxidation. The polypeptidase is inhibited by  $\text{PhNHNH}_2$ , suggesting an aldehyde group, and the effect of I and  $\text{H}_2\text{O}_2$  indicates the presence of an easily oxidized group. It is possible to differentiate between 4 stages of activity for papain: (1) natural enzyme, effective on gelatin, without effect on synthetic substrates (or peptones) but capable of being activated for the latter (by  $\text{H}_2\text{N}_2$ ,  $\text{H}_2\text{S}$  or thioglucose), (2) activated natural enzyme, effective both on gelatin and synthetic substrates, (3) oxidized enzyme ( $\text{H}_2\text{O}_2$  or I), no activity upon either type of substrate but with potential activity for gelatin and (4) enzyme activated after oxidation, effective on gelatin but ineffective and incapable of being activated for synthetic substrates. There is no evidence whether the essential groups of the proteinase and polypeptidase are contained in the same mol or whether the 2 enzymes are 2 sep mol individuals. The synthetic substrates used have been recently described. A P Lothrop

Yeast zymon. I. The effect of some electrolytes upon carbon dioxide production. Homer E. Staveland, L. M. Christensen and Ellis I. Fulmer. *J. Biol. Chem.* 111, 771-83 (1935).—There is an increased amt of inorg phosphate in zymon preps made from yeast which has stood for several days at refrigerator temp and this in part makes these preps more active. The initial max rate of  $\text{CO}_2$  production is increased by appropriate concns of  $\text{NH}_4\text{Cl}$ ,  $\text{MgSO}_4$ ,  $\text{NaCl}$  and  $\text{KCl}$  and the steady concn. rate is also increased by the 1st 3 salts and by  $\text{CaCl}_2$ ,  $\text{NH}_4\text{Cl}$  being the most potent.  $\text{NH}_4\text{Cl}$  and  $\text{MgSO}_4$  increase the rate of  $\text{CO}_2$  production in the presence of added inorg phosphate but the effect of the 2 salts is not additive. A  $\text{pH}$  of 5.8 to 6.2 which is approx the  $\text{pH}$  of the interior of the yeast cell is the optimum  $\text{pH}$  for  $\text{CO}_2$  production. The induction period which occurs when the concn of 21 min is relatively small is shortened by all of the salts which increase the  $\text{CO}_2$  production rate. Twenty six references. II. The effect of ethanol upon the production of carbon dioxide. *Ibid* 785-90.—The production of  $\text{CO}_2$  by dried yeast, yeast juice, living yeast and zymon is increasingly decreased by varying concns of  $\text{EtOH}$  in the order named. A 1.85% alc soln reduces the activity of zymon 50% whereas a concn of 14% is necessary to reduce the activity of dried yeast to the same extent. The sensitivity of zymon is not decreased by the addn of inorg phosphate. Appropriate concns of  $\text{NH}_4\text{Cl}$  not only decrease the sensitivity of zymon toward  $\text{EtOH}$  but actually increase the rate over that produced by the salt in the absence of  $\text{EtOH}$ . III. The effect of some electrolytes and of ethanol upon the phosphate content during fermentation. *Ibid* 791-802.—The optimum  $\text{pH}$  for disappearance of inorg phosphate from a zymon fermentation must be 6.2 to 6.4, the value for hexosephosphate synthesis by living yeast. The time which elapses before the inorg phosphate content reaches a min. value is markedly decreased by electrolytes, the potencies of the cations being in the order  $\text{NH}_4^+ > 1/2\text{Mg} > \text{Na} > \text{K} > \text{control} > 1/2\text{Ca}$ . The time is greatly increased and the min. steady state value of the inorg phosphate content increased by relatively low concns of  $\text{EtOH}$ . The phosphate content of a dried yeast fermentation must be little affected by  $\text{EtOH}$ , an effect similar to that on  $\text{CO}_2$  production.  $\text{NH}_4\text{Cl}$ ,  $\text{KCl}$  and  $\text{NaCl}$ , but not  $\text{MgSO}_4$  or  $\text{CaCl}_2$ , decrease the min. steady state value of the inorg phosphate content when  $\text{EtOH}$  is also present. During autofermentation of zymon the inorg phosphate content increases with time. Any concn of  $\text{EtOH}$  up to 8% causes a slight decrease and  $\text{NH}_4\text{Cl}$  has a similar effect so that the stimulation of  $\text{CO}_2$  production by this salt is not due to increasing the available phosphate.  $\text{MgSO}_4$  and  $\text{Na}_2\text{AsO}_4$  cause a slight increase in phosphate content. The influence of the radicals in R  $\text{NH}_4\text{Cl}$  compds in decreasing the time which elapses before the inorg phosphate content reaches a min. value is in the order  $\text{C}_6\text{H}_5\text{O}_2 > \text{H} >$

$\text{CH}_3$ , the order of increasing dissociation constants of the corresponding amines. Glucosylamine-HCl is itself not esterified by phosphate. A. P. Lothrop

The quantitative changes in the enzymes present in the liver and in various tissues due to impaired renal functions. Sadimura Murata. *Japan J. Gastroenterol.* 7, 69-87 (1935).—The enzymes asparaginase, amylase, glycylglycine and hyaluronidase were estd in the livers of rabbits at daily intervals after extirpation of one or both kidneys. These liver enzymes with the exception of the third seem to increase slightly as the result of nephrectomy. C. M. McCay

Manganese in marine plankton. L. H. N. Cooper. *J. Marine Biol. Assoc. United Kingdom* 20, 201-2 (1935).—The plankton from a cu m. of sea water have 0.5 to 3.7 of Mn. C. M. McCay

Hemolysis in vitro is not reversible. Andrea Manai. *Biochim. terap. sper.* 22, 269-70 (1935).—Hemolysis in hypotonic solns can be stopped by addn of hypertonic liquid to produce isotonic concn. But the process is not reversible. A. E. Meyer

The influence of ascorbic acid on the viscosity of gelatin solutions. Luisa Pozzi. *Biochim. terap. sper.* 22, 356-62 (1935).—The viscosity is decreased by ascorbic acid beyond the effect that can be ascribed to the acidity. The possible relation to scurvy is discussed. A. E. Meyer

Biological action of metals irradiated with the mercury-quartz lamp. V. Effect of irradiated metals on the conduction of the capillaries. V. G. Rudylin. *Acta med. scand.* 86, 88-94 (1935); cf. Goldberg, *C. A.* 29, 4397<sup>1</sup>.—Solns of Fe and Cu irradiated with the Hg-quartz lamp produce capillary dilatation in frogs when injected subcutaneously. Similarly, perfusion of the isolated rabbit ear with such a soln gives evidence of a capillary relaxation. VI. Effect of irradiated iron and copper on the water content of the blood. *Ibid* 95-4.—Intravenous injection of 10 cc. hypotonic soln of Fe or Cu irradiated with the Hg-quartz lamp causes within the 1st hr. a rise in the hemoglobin content of the blood. Similar effects were observed on splenectomized rabbits with an increased no. of erythrocytes. The viscosity of the rabbit serum also increases under this treatment. These results are interpreted as signifying a shifting of water from the blood into the tissues. S. Morgulis

Intracellular proteinases. XVI. Further studies on the activation and inhibition of proteosases. Ernst Machmann and Fritz Heilmert. *Biochem. Z.* 280, 184-203 (1935); cf. *C. A.* 29, 8024<sup>1</sup>.—Full details of the methods for producing activation and inhibition of proteolytic processes are given. The reactions involved, however, are very complicated and no interpretation can be given of them as yet. XVII. Effect of different arsenic compounds on the activity of liver cathepsin. Ernst Machmann. *Ibid.* 204-12.—Arsphenamine activates while solocalvaran and benzazon inhibit the hydrolysis of gelatin by cathepsin. Arsphenamine does not reactivate inactive cathepsin. Furthermore, it inhibits the hydrolysis of chymogen. All cathepsin organ expts give a definite SH-test, except the digestion mixts in which the hydrolysis has been inhibited, where the SH reaction is neg., but no conclusion is drawn as to the relationship between the 2. Neither can any conclusion be drawn as to the effect of As compds because this depends not only on the enzyme prepn but also on the nature of the substrate. S. Morgulis

Effect of ultraviolet light on yeast sucrase. VI. The yeast sucrase-activating wave length region. G. Gorbach and H. Ruess. *Biochem. Z.* 280, 213-16 (1935); cf. *C. A.* 29, 2186<sup>2</sup>.—Brief radiation of yeast autolyzates or dialyzates by wave length 365-366 mμ causes an increased sucrase activity. The blue fluorescence of the enzyme soln is of no consequence since this can be intensified by means of eucalin without increasing the enzyme activity. S. Morgulis

The significance of phosphate esters for the progress and regulation of blood glucolysis. II. Decomposition of hexose monophosphate in hemolyzed blood following phosphorylation in a reaction coupled with the dephos-

phorylation of adenosine triphosphate. Zacharias Dsche. *Biochem. Z.* 280, 248-54 (1935); cf. C. A. 29, 823. When the hexose monophosphate undergoes splitting in hemolyzed blood it is phosphorylated at least to the extent of  $\frac{1}{2}$ , at the expense of  $\text{H}_2\text{PO}_4$  from the hydrolysis of adenosine triphosphate. Since it is possible that a synthesis accompanies this hydrolysis, it is not improbable that the entire  $\text{H}_2\text{PO}_4$  used in the phosphorylation of the hexose monophosphate comes from this source. The velocity of the esterification process varies with the concn of the hexose ester. Both the Embden and the Neuberg esters become phosphorylated at the same rate, therefore, the ketose and aldose components partake equally in this process. The previous idea of D. that the monophosphate breaks up directly into 1 mol. triose ester and 1 mol. triose is now held untenable. The phosphorylation of the hexose monophosphate by transference of  $\text{H}_2\text{PO}_4$  from adenosine triphosphate is, therefore, a very essential phase in the combination of the partial processes of glucolysis, and presupposes a rephosphorylation of the adenylic acid. This has actually been shown to be the case in muscle (Parnas) and in muscle ext. (Meyerhof and Lohman). D. described a mechanism of phosphorylation of adenylic acid in intact red cells as well as in hemolyzed blood, where the decoupling of hexose diphosphate in the presence of 0.05 M NaF is strongly accelerated by pyruvic acid, whereby an increase in the easily hydrolyzable P and a decrease of the directly determinable P is demonstrated. In this process the pyruvic acid changes to lactic acid, and the P ester formed is approx. equal to the lactic acid so formed. The oxidation-reduction process between pyruvic acid and hexose diphosphate or triose phosphate, which is coupled with the resynthesis of adenosine triphosphate, proceeds much more rapidly than the oxidation-reduction between the triose ester mols. The phenomenon has also been observed in minced rat muscle to which pyruvic acid had been added in the presence of NaF. In the fermentation of yeast press juice there is an equivalence between the amt. of  $\text{CO}_2$  set free and the amt. of  $\text{H}_2\text{PO}_4$  esterified as mono- and diphosphates. Instead of the older view, that this results from a coupling of phosphorylation and breakdown of sugar, the coupling is regarded as taking place between partial fermentation processes and the phosphorylation (with inorganic  $\text{H}_2\text{PO}_4$ ) of adenylic acid formed in the phosphorylation of sugar by adenosine triphosphate. This explains the equivalence between the  $\text{CO}_2$  and esterified  $\text{H}_2\text{PO}_4$ , although the esterified  $\text{H}_2\text{PO}_4$  appears partly as mono- and partly as diphosphate of hexose in variable proportions. In blood glucolysis and probably also in muscle glucolysis the rephosphorylation of adenylic acid is coupled with the oxidation-reduction reaction between pyruvic and triose esters, whereas in fermentation the coupling is with the oxidation-reduction reaction between AcEt and triose ester.

Activation of the proteolytic enzymogen system of the stomach. Rich. Ege and Jens Obel. *Biochem. Z.* 280, 265-75 (1935).—Neutral or slightly acid exts. from gastric mucosa contain relatively little preformed coagulating enzyme, but with a H-ion concn. of  $10^{-4}$  to  $10^{-5}$  the enzyme is immediately activated. Such exts. were made from the stomach of a no. of different animals. Activation of the enzyme begins only when the acidity of the ext. approaches a H-ion concn. of  $10^{-4}$ , and its velocity increases with the H-ion concn., but not in the same manner for the different animals. Thezymogen is much more stable in an alk. medium than the active enzyme prepn.

#### S. Morgulis

The state of the glycogen inside the cell. I. A ternary complex from eluipen, nucleic acid and glycogen or dextrin. St. J. v. Przylecki, W. Gledroyé and H. Rafalowski. *Biochem. Z.* 280, 286-92 (1935).—Even within the biol.  $\mu$  range eluipen contains groups which react with glycogen. Furthermore, in a mixt. of eluipen, glycogen and nucleic acid in definite proportions and at pH 7.0 a complex is actually produced consisting of all 3 components. The amt. of nucleic acid must not exceed the available free arginine. In the fish sperm nuclei no such ternary system can be formed.

#### S. Morgulis

Studies on the affinity relationship of animal and plant dipeptidases. W. Grassmann, L. Klenk and T. Peters-Mayer. *Biochem. Z.* 280, 307-24 (1935).—According to Bergmann and Zervas (C. A. 28, 4075), dipeptidase splits only CO-NH combinations which have free  $\alpha$ -amino and COOH groups. While the nature of C chains is of no significance so far as the qual. process of the dipeptide hydrolysis is concerned, this does affect the hydrolysis quantitatively. Expts. were made with dipeptidases from yeast or kidney. Studies of the affinity show that this varies with different substrates: glycylglycine (G-G) < alanyl-glycine (A-G) < leucyl-glycine (L-G). The affinity of (A-G) is 4-10 times as great as that of (G-G) and that of (L-G) is at least 10 times greater than that of (A-G). Although the affinity const. varies with the enzyme prepns., the activity  $\mu$ -curves are shifted uniformly in all instances, and the affinity between enzyme and dipeptide is influenced by the C chain to which the free NH<sub>2</sub> group is attached, increasing with the length of the chain. The nature of C chain bearing the COOH group is less significant in detg. the affinity. For yeast dipeptidase the max. rate of hydrolysis is obtained with the following substrate concns.: G-G 0.125 M, A-G 0.024 M, and L-G 0.024 M. Since amino acids inhibit the peptide hydrolysis and the substrate affinity decreases in the order L-G > A-G > G-G, the inhibiting effect of the amino acid under similar conditions must vary with the nature of the substrate in the order L-G < A-G < G-G, which has been invariably found with both yeast or kidney dipeptidases. Furthermore, independently of the substrate concn., the inhibiting effect increases with the nature of the amino acid as follows: leucine > valine > alanine > glycine.

Transformation of aromatic and of hydroaromatic compounds by microorganisms. II. Transformation of guinic acid and inositol. Konrad Bernhauer and Bruno Gölich. *Biochem. Z.* 280, 394-5 (1935); cf. C. A. 26, 4591.—*B. glaucum* and *Pen. griseofulvum* form protocatechuic acid from guinic acid. Inositol is not changed to an aromatic compd. but the mol. is split with the formation of AcOH and probably also of lactic acid.

#### S. M.

Blood iodine problem. A. Sturm, K. Plötner and K. Maass. *Biochem. Z.* 280, 396-412 (1935).—The tech. problem of blood I detn. is discussed, and the need of special training in carrying out these analyses is emphasized. Blood I values of over 20% found on consecutive days in the quiet, fasting condition are regarded as being definitely hyperthyroid. In myxedema or in congenital athyreosis the blood I remains permanently at the low level of 3-5%.

#### S. Morgulis

The lecithin and polysaccharide symplexes. St. J. v. Przylecki and R. Majmin. *Biochem. Z.* 280, 413-15 (1935).—Studies on lecithin-starch symplexes show that about 50 mols. of lecithin combines with 1 mol. of starch. The lecithin-glycogen symplex contains 60% glycogen and is easily sol. in  $\text{H}_2\text{O}$  or in NaOH. The lecithin-dextrin symplex is also very sol. and contains about 4 lecithin particles to 1 dextrin.

#### S. Morgulis

Blood iodine values. Helmut Doering. *Biochem. Z.* 280, 442-7 (1935).—The blood I values obtained by the open combustion method are considered to be correct. The low values by the Fellenberg method can be reproduced also by the Schwalboid-Reith or by Pfeifer's method, if these are properly carried out. On the other hand, the higher values found by the "closed" combustion procedure are attributed to traces of unused oxidation reagent which in acid medium set free I<sub>2</sub> from the KI. Another source of error in the closed system is the incomplete removal of Cl or Br in the presence of traces of org. impurities.

#### S. M.

Studies on the chemical embryology of *Hynobius*. Makoto Takamatsu. *J. Biochem. (Japan)* 22, 203-11 (1935).—A study of the *Hynobius* egg shows that the relative  $\text{H}_2\text{O}$  contents decrease in the course of development, both in the embryo and in the jelly, but increase in the perivitelline fluid. The latter has a  $\mu$  of about 6.9-7.0. The total ash content reaches a max. at the middle period of development (3-4 weeks) and its compn. is recorded. The total N content of the embryo decreases gradually while the nonprotein N increases. There is a

marked rise in the creatine and creatinine content, after the second week of incubation, while the urea gradually falls to about  $1/2$ , an increase was found in the purine N, also in the arginine and histidine N fraction but most noticeably in the lysine N. The study of the egg enzymes shows a very close similarity to the situation found in the bird or reptile egg, the glycoenzyme and glycerophosphatase activity being especially strong. S. Morgulis

The liberation of arginine in proteolysis. Shigeazu Kamiya. *J. Biochem. (Japan)* 22, 203-77 (1935).—In the digestion of casein or gelatin by pepsin followed by erepsin the total arginine is set free, whereas by the enzymic action of pepsin, trypsin, then erepsin only  $1/2$  of this amino acid is thus liberated. The arginine detm was carried out by means of the highly specific arginase-urease procedure or by means of flavimic acid. The results by both methods agreed. S. Morgulis

Studies on the blood  $pH$  estimated by the glass electrode method II. Effects of anticoagulants on the  $pH$  of the blood. Hisato Yochimura. *J. Biochem. (Japan)* 22, 279-95 (1935). cf. C. A. 29, 44321.—Five %  $K_2CO_3$ , 5% Na citrate, 1% NaF, 2% NaP + 1%  $K_2CO_3$ , 0.5% hirudin or 1% heparin when added to blood in the proportion of 1 to 10 has no effect on the  $pH$  of freshly drawn blood. Addition of the same proportion of 10%  $K_2CO_3$  causes a marked shift in the blood to the alk. side, whereas with 2% NaF, or 3% NaF + 1%  $K_2CO_3$  or 10% Na citrate the shift is to the acid side.  $K_2CO_3$  is the most suitable anticoagulant because it hardly affects the  $pH$  in the concn. used and, by suppressing glycolysis, it prevents the acid change. It is recommended to add 2%  $K_2CO_3$  to blood in the ratio of 1 to 2, to sep. the plasma, especially from leucocytes, at room temp. within an hr. and to estimate the  $pH$  on this plasma. Does the  $pH$  of the blood change during clotting? *Ibid.* 297-302 (1935).—In blood clotting at 16° there is no shift to the acid side. On the contrary, the acid change is found in blood in which clotting has been prevented by means of an anticoagulant. S. M.

The mechanism of anaerobic decomposition of hexose-phosphoric acids by animal tissues III. Simple hydrolysis of hexosephosphoric acids by phosphatase. Takehiko Takahashi. *J. Biochem. (Japan)* 22, 303-21 (1935). cf. Nakamura, C. A. 29, 25891.—Formation of  $ArCHO$  is not apparently a const. phenomenon in the production of hexosemonophosphoric acid from hexose diphosphate by autolyzed tissue. The monophosphoric acid and free sugar can be produced directly by the simple hydrolysis of the ester by phosphatase. S. Morgulis

Chemical studies of the proteins of foodstuffs V. The contents of cystine and tryptophan. Tetsuo Tomiyama. *J. Biochem. (Japan)* 22, 341-2 (1935). cf. C. A. 29, 43801.—Silkworm pupa protein contains 0.86% cystine, 3.83% cystine + methionine, 1.50% tryptophan. The proteins of sardine and of soybean contain of these substances 0.76, 3.90 and 1.40%; and 1.05, 3.01 and 1.25%, resp. S. Morgulis

The Bence-Jones' proteins. Hakoya Tsutsui. *J. Biochem. (Japan)* 22, 343-50 (1935).—The material was obtained from a patient who, on x-ray examn., revealed general atrophy of the entire skeletal system. A protein substance was found in his urine which differed from ordinary protein only by its peculiar heat behavior. The substance was prep'd by warming the urine acidified with  $AcOH$  to 55° and sep'd by centrifuging. The ppt., washed with  $H_2O$  and alc., has 13.50-13.75% N, 0.30-0.41% S and 5.04% ash. Dissolved in 0.1 N  $NaOH$  it has a  $[\alpha]_D^{20} = -95.78$ . Its isoelec. point is at  $pH$  4.72. A complete analysis of its amino acid compn. shows that the diamino fraction in different samples constitutes 20.3-28.6% of the total N. Digestion with pepsin for 4 hrs. results in complete conversion to peptone, subpeptone and proteose. Digestion with trypsin results in the liberation of 41% of the total N as amino N in 48 hrs. S. M.

Oxygen utilization in the vital oxidation of succinic acid in relation to the  $pH$  and oxygen tension. A study of the toxic action of oxygen. Jørgen Lehmann. *Skand. Arch. Physiol.* 72, 79-91 (1935).—At  $pH$  less than 7.4 the max. utilization of  $O_2$  by a succinic acid-succinic dehydro-

genase system is attained at 44-56 mm. Hg (6-8%  $O_2$ ), and at greater tensions, up to 713 mm., the  $O_2$  utilization is neither increased nor inhibited. At  $pH$  greater than 7.4 the max.  $O_2$  utilization is still at the same ("critical") tension but in this case the  $O_2$  at higher tensions inhibits the oxidation progressively with increasing  $O_2$  tension. The toxic effect is exerted on the enzyme only in the presence of the succinic acid, and the injurious effect is irreversible. S. Morgulis

The esterase activity of human blood plasma. Bo Vahlquist. *Skand. Arch. Physiol.* 72, 133-60 (1935).—To decide whether human plasma contains a specific choline esterase or the hydrolysis is brought about by the ordinary lipase, a study was made by various methods. Catephoretically both activities moved strictly parallel in the elec. field and independently of the migration of the albumin and globulin. Similarly quinine, atropyl and physostigmine inhibited the action of the esterase no matter what substrate was employed (acetylcholine, tributyrin or Me butyrate). Parallel detns. of choline and tributyrin esterase activity were made on different individuals under a great variety of conditions. The correlation of all these results was so great that the correlation coeff. was  $0.92 \pm 0.02$ . All 3 modes of attack on this problem indicate, therefore, that there is no specific acetylcholine esterase. The esterase content is not appreciably affected by ingestion of food, muscular exercise, nervous excitement, menstruation or pregnancy. Under conditions of abnormal muscular spasms such as bronchial asthma or ulcus ventriculi the values are relatively low but still within the normal range. Only in tuberculosis is the esterase content abnormally low. The esterases apparently can only act to protect the organism against an accumulation of acetylcholine in the blood. S. M.

The influence of heavy water on the development of amphibian eggs. Hans H. Usung. *Skand. Arch. Physiol.* 72, 192-8 (1935).—A concn. of  $D_2O$  above 5% retards the segmentation of frog eggs, the retardation increasing rapidly with rising concn. At concns. above 30%, normal segmentation no longer occurs, and at 23% development stops at the first or second cleavage division. Eggs from *Bufo viridis* developed normally and hatched in 4 days in 10%  $D_2O$ , but in 30 and 40% the development proceeded normally for 24 hrs., then the eggs all died. The  $O_2$  consumption of *Bufo* eggs from the same batch shows great uniformity. The eggs in 30%  $D_2O$  show the same  $O_2$  consumption as those in  $H_2O$  for the first 14 hrs. of development, when it gradually decreases to zero during the next 24 hrs. S. Morgulis

Osmosis in living cells and change in weight. G. Fallster. *School Sci. Rev.* 17, 136 (1935). O. R.

Some experiments with amylase. C. O. Björling. *Svensk Farm. Tid.* 39, 453-7, 470-4, 483-92, 501-4 (1935); cf. Ohlsson and Rosen, C. A. 29, 12091.—The amylase exd. from ungerminated grain attacks starch and yields maltose and a substance which by all the phys. and chem. tests proved to be starch. A. R. Rose

Phosphate exchange in glucolysis. Hans v. Euler and Ragnar Vestin. *Svensk Kem. Tid.* 47, 231 (1935).—In German. Cozymase loses its function in fermentation if heated but the activation of glucolysis is not altered. In the system Mucic ext. + glycogen + hexose phosphate + cozymase, it makes no difference if the cozymase is heated or not. A. R. Rose

Purification of the active phosphatase found in dog feces. Arthur R. Armstrong. *Biochem. J.* 29, 2020-2 (1935).—A method is described for the prep'n. of a very active phosphatase concg. powder from feces. The yield was 0.1-0.5 g./kg. feces of material concg. 180-185  $\times 10^3$  units per g. (asin by the phenyl phosphate method). The only optimum  $pH$  range for the enzyme was around 9.6. The max. activation by  $Mg^{++}$  was below 0.0003 M. E. W. Scott

Liver glycogen II. Acyl derivatives and "regenerated" glycogens. David J. Bell and Hans Kosterlitz. *Biochem. J.* 29, 2027-30 (1935). cf. C. A. 28, 67351; 29,

823\*—Rabbit and fish liver glycogens did not appear to undergo any degradation when acetylated or benzoated and then regenerated from these acyl derivatives. The org. P contents of these glycogens were low and decreased after the above treatment. Glycogen triacetate and tribenzoate prepd. from fish or rabbit glycogen possessed the same properties. III. The molecular units of fish and rabbit glycogen. David J. Bell. *Ibid.* 2031-5.—Both fish and rabbit glycogens were shown by means of methylation to have the same structure. Hydrolysis of the completely methylated glycogens gave tetramethylglucopyranose, 2,3,6-trimethylglucose and dimethylglucoses and showed that both glycogens were built up of unbranched chains of 12 glucose units. E. W. Scott

The inhibition of respiration by cyanide. Wm. E. van Heyningen. *Biochem. J.* 29, 2036-9(1935).—The respiration of liver, kidney and spleen slices in 0.01 M phosphate-saline medium was inhibited to the extent of 75-85% by 0.001 M HCN and 80-90% by 0.01 M HCN. The discrepancy between these results and the much lower results of Dixon and Elliott (*C. A.* 24, 812) was due to several factors, e. g., the loss of HCN from the media and the high phosphate concn. used by D. and E.

E. W. Scott  
A water-soluble precursor of choline found in the kidney and other tissues. Frederick J. Roth. *Biochem. J.* 29, 2071-6(1935); cf. *C. A.* 29, 6911\*.—An extremely water-soluble substance (I) with chem. properties which indicated that it was the choline ester of sphingosinephosphoric acid was isolated from fresh kidney tissue by pptn. as the  $\text{HgCl}_2$  double salt. The double salt was sol. in cold water (6°) and was purified by repeated pptn. with  $\text{HgCl}_2$ . The water-sol. ester of choline isolated from fresh brain and liver tissue possessed properties similar to I. I had no action on the esterified frog rectus. It was decomposed by acetylation, apparently forming acetylcholine.

E. W. Scott  
Total plasma protein in normal and fasting rats. W. C. Cutting and R. D. Cutter. *Am. J. Physiol.* 113, 150-8 (1935).—A perfusion method for detg. total blood vol. of rats is described. By the use of this method and an estn. of the concn. of protein in the blood, the total plasma protein of a rat can be measured. During fasting the total plasma protein decrease is proportional to time. The protein of lymph resembles that of plasma in its compn. and its probable entrance into the same bodily activities.

E. D. Walter  
Isolation of phosphocholine from beef liver. Fumito Inukai and Waro Nakahara. *Proc. Imp. Acad. (Tokyo)* 11, 260-1(1935); *Sci. Papers Inst. Phys. and Chem. Research* 28, 10-13(1935).—A yield of 0.3 g. of phosphocholine as the cryst. picrate was obtained from 200 kg. of fresh beef liver. The crystals softened at 225° and m. 228°. Elementary analysis agreed well with the theoretical. Expts. indicated that the crystals were an addn. compd. of 1 mol. of picric acid and 2 mols. of phosphoric choline ester. The picrate of the synthesized compd. showed no depression of m. p. when mixed with the picrate of the naturally isolated substance. R. P. W.

Ricinuspapase, its nature and specificity. Herbert E. Longenecker and D. E. Haley. *J. Am. Chem. Soc.* 57, 2019-21(1935).—A dry, stable and highly active prepn. of Ricinus papase (I) has been obtained from bulked castor beans by extr. the fat with low-boiling petr. ether, pulverizing and sifting the residue of the bean through a 60-mesh sieve. With 0.1-g. sample, a sample freshly prepd. showed 86% hydrolysis of olive oil, while a sample 10 years old showed 17-49% hydrolysis. A  $\text{H}_2\text{O}$ -in-oil emulsion appears to be desirable for I action; the formation of this emulsion is aided by shaking and by lower temps. of incubation. Rates of hydrolysis of a variety of oils of vegetable and animal origin are reported for study on the nature of action and specificity of I. Under the exptl. conditions, I catalyzed the hydrolysis of the following oils, listed in order of decreasing percentage hydrolysis after a given time: peanut, castor, corn, cottonseed, soybean, rape, olive, linseed, neat's-foot, peach kernel, coconut, whale, fish and sperm. An analysis of the data on the

1 basis of the no. of moles hydrolyzed reveals that I showed no specificity in its attack on glyceride mols. contg. C chains of different lengths. C. J. West

Occurrence of decomposition products of chlorophyll III. Isolation of pyropheophytin from beef bile. Paul Rothenmund. *J. Am. Chem. Soc.* 57, 2179-80(1935). cf. *C. A.* 29, 839\*—Pyropheophytin (I) was found in beef bile under physiol. conditions, its quantity changed only very slightly with the season of the year, traces of copropheophytin (II) were also always present. The sepn. from phylloerythrin and from other pigments in bile was performed by fractionation of an  $\text{Et}_2\text{O}$  ext. of the pigment with  $\text{HCl}$ . It is assumed that the occurrence of I in beef bile is due to decompn. of chlorophyll, while the presence of II is accounted for by the decompn. of hemoglobin. No evidence for the presence in bile of other chlorophyll porphyrins could be obtained. neither was it possible to demonstrate the occurrence of other porphyrins from blood pigment. C. J. West

Action of light rays (ultraviolet) on the skin and accumulation of cholesterol. Angel H. Roffo. *Compt. rend.* 201, 566-8(1935); cf. *C. A.* 29, 507\*—White rats which had their backs or ears exposed to the sun or ultraviolet showed a marked increase in cholesterol as compared with those areas not exposed. Julius White

Acid base equilibrium [of the blood] and Henderson's equation D. D. Van Slyke *Bull. soc. chim. biol.* 17, 1184-6(1935)—Reply to Reding, *et al.*, C. A. 29, 2989<sup>2</sup>. L. E. Gilson

The Donaggio reaction G. Sollazzo<sup>1</sup> and V. Cortese. *Boll. chim. farm.* 74, 625-37(1935).—Expts. confirmed the Donaggio phenomenon as one of pure colloidal protection, caused by a thymine-molybdate lake. Pos. urines showed no diminution in reaction after putrefaction for 15-30 days but became neg. when subjected to the action of pepsin and AcOH. A substance giving a pos. reaction was isolated from pos. urines by pptn. with abs. alc. This substance was water sol. and was pptd. with NaCl, FeCl<sub>3</sub>, tannic and picric acids but gave no xanthoproteic or biuret reactions.

Helen Lee Gruelch  
Gravimetric method for the determination of fat and cholesterol in blood G. Gorbach and R. Kadner. *Mikrochemie* 18, 266-71(1933)—Bang's methods (C. A. 12, 2333, 13, 2216) for detg. fats and lipids in blood have been much used and have undergone various modifications (cf. Rappaport, C. A. 29, 1477<sup>2</sup>). In this paper a new microextn. app. is described which permits further improvement. Details concerning the procedure are given.

W. T. H.  
Sugar determination by the ferricyanide electrode Philip A. Shaffer and Ray D. Williams. *J. Biol. Chem.* 111, 707-23(1935)—A method is described for the detn. of reducing sugars by the ferr-ferrocyanide electrode by which satisfactory results are easily and conveniently obtained over a wide range of sugar concns., if interfering substances are absent. Blood sugar may be detd. on as small a quantity as 0.02 to 0.05 cc. of blood if the filtrates are prepd. by Zn(OH)<sub>2</sub> pptn. and the method gives approx. correct values for "true sugar". The method is applicable to the analysis of similar quantities of other solids. It is not advocated as a substitute for satisfactory titrimetric or colorimetric procedures unless the no. of analyses to be made, the vol. of blood available or other circumstances justify its choice. For only occasional analyses or in the hands of workers not somewhat familiar with the technique of potential measurements, it would be less satisfactory than the standard methods now generally used.

A. P. Lothrop  
A new method of extraction of nucleoproteins V. Ducceschi and A. Cardin. *Biochim. therap. sper.* 22, 265-8(1935)—Pancreas tissue was kept with 10 parts of a 1% formaldehyde soln. at 37° for 24 hrs. The following extn. gave a purer product than extn. of untreated pancreas.

A. E. Meyer  
Gastric analysis by fractionated testing Marie Permentier, R. Letulle and G. Bergé. *Presse méd.* 43, 581-3(1935)—The technique is described and the advantages are pointed out.

A. E. Meyer  
Colorimetric methods for the determination of urinary protein, plasma protein, urinary and plasma albumin and for the serial salting out of these proteins Hilding Berglund and Walter de M. Scriven. *Acta Med. Scand.* 80, 82-7(1935)—Measure 1-10 cc. urine into a 15-cc. centrifuge tube calibrated at 10 cc. Dil. with H<sub>2</sub>O, if necessary, to 10 cc. vol. Add 1 cc. 50% trichloroacetic acid, leave 10 min. at room temp. and 10 min. at 50°, centrifuge 10-30 min. to pack down the coagulum, decant, wash 4 times with 4% trichloroacetic acid, mixing each time and leaving in a water bath at 50° before centrifuging. Dissolve the ppt. in 1-2 drops 10% NaOH and dil. to the 10-cc. mark with H<sub>2</sub>O. Det. N by the Folin-Wu method in an aliquot. To calc. the mg. % N in urine divide 400,000 (if the standard was set at 20) by the product of the unknown colorimeter reading, vol. of urine analyzed and vol. of the aliquot. To det. the albumin fraction in the urine, weigh out 11.02 g. anhyd. neutral Na<sub>2</sub>SO<sub>4</sub> into a 50-cc. vol. flask, add 5 cc. buffer of pH 7.0 and 10-40 cc. urine, depending upon the protein concn. Dil. to the mark, keep at 45° and shake frequently until the salt has all dissolved. Leave at room temp. and adjust the vol., then after 1 hr. filter through double thickness until a clear filtrate is obtained. Det.

the N in a 5-10-cc. aliquot of the filtrate. For plasma the procedure is as follows: Dil. 1 cc. plasma to 100 cc. in a vol. flask, det. the total N in 2 cc. and correct for the non-protein N. Measure another sample, usually 1 cc., into a 50-cc. flask, add 2 cc. pH = 7.0 buffer and sufficient Na<sub>2</sub>SO<sub>4</sub> soln. to give a final concn. of 22.05%. Mix well, let stand 1 hr. at room temp. and filter until clear. Det. the N in the filtrate. The stock Na<sub>2</sub>SO<sub>4</sub> soln. is prepd. by dissolving 650 g. of the cryst. salt in 1 l. Det. by titration of 20 cc. the amt. of 0.1 N NaOH required for neutralization. Add the calcd. amt. to 980 cc. and make up to vol. Det., by igniting the residue from 2 cc., the exact concn. and calc. the no. of cc. to prep. 50 cc. of 22.05%. The stock soln. should be kept at about 40°. For the fractionation of the urinary protein, measure into each of five 50-cc. vol. flasks 5 cc. of the buffer and 5.35, 7.1, 8.9, 11.02 and 12.1 g. Na<sub>2</sub>SO<sub>4</sub>, add to each 10-40 cc. urine (depending upon protein concn.), keep 1 hr. at 37°, filter clear and analyze 5-10 cc. of the filtrate for N. Total N - N fraction 1 = fibrinogen N; N fraction 1 - N fraction 2 = euglobulin N; N fraction 2 - N fraction 3 = pseudoglobulin-I N; N fraction 3 - N fraction 4 = pseudoglobulin-II N; N fraction 4 - N fraction 5 = albumin-I N and N fraction 5 = albumin-II N. S. M.

An approximately quantitative method for the determination of stereoporphyrins I. Boas. *Biochem. Z.* 280, 227-31(1935)—The acetone and alc. employed in the purification of feces dissolve out appreciable quantities of porphyrin which should not be neglected. The various porphyrins (copro-, deuto-, and proto-porphyrin) are extd. from the ether soln. by shaking with 0.1, 0.4 or 2 to 5% HCl, resp. The no. of times this must be repeated with a specified amt. of the acid until the soln. no longer shows the absorption band is utilized as a measure of the particular porphyrin.

S. Morgulis  
Volumetric determination of hemoglobin Istvan Rusznayk and E. B. Haiz. *Biochem. Z.* 280, 242-7(1935)—Sat. a measured quantity of defibrinated blood with CO, drive off excess CO with N<sub>2</sub>, set the bound CO free with K<sub>4</sub>Fe(CN)<sub>6</sub>, and the CO is carried off in a stream of N<sub>2</sub> into a soln. of KBr in PdCl<sub>2</sub> (reaction: PdCl<sub>2</sub> + CO = Pd + COCl<sub>2</sub>) which causes the sepn. of an equiv. quantity of metallic Pd. The finely divided Pd is taken up in a measured amt. of standard 0.02 N KBrO<sub>3</sub> and acidified. An equiv. amt. of Br<sub>2</sub> is set free which reacts forming Pd-Br<sub>2</sub>. The excess Br<sub>2</sub> is detd. titrimetrically with 0.02 N Na<sub>2</sub>AsO<sub>4</sub>. One cc. 0.02 N KBrO<sub>3</sub> = 0.224 cc. CO and 1.34 cc. CO = 1 g. hemoglobin. The calcn. is, therefore, (a - b) × 22.4/1.34 = g. % hemoglobin, where a and b = cc. Na<sub>2</sub>AsO<sub>4</sub> soln. used in the blank and the detn., resp.

S. Morgulis  
Method for the determination of carbon in biological fluids F. Lauenstein and K. Voit. *Biochem. Z.* 280, 276-85(1935)—A combustion train is described for oxidizing org. material in a slow stream of dry, CO<sub>2</sub> free air, and passing the CO<sub>2</sub> formed through Ba(OH)<sub>2</sub>. The amt. of Ba(OH)<sub>2</sub> used up is measured by titration with 0.01 N HCl with Tashiro's mixed indicator. The acid is added until an intense red color is produced and the excess is titrated back with 0.01 N NaOH until the color changes to a grass green. The prepn. and method for keeping of the Ba(OH)<sub>2</sub> soln. are discussed.

S. Morgulis  
A systematic study of the value of different hypophysis stains with comments on the number of the anterior lobe epithelial cells and their reciprocal relations A. L. Burgdorf. *Endokrinologie* 16, 148-60(1935)—Three types of staining on formalin fixed material, namely, hematoxylin-eosin, methylene blue-eosin and staining of the colloids (Kraus), are sufficient for all purposes of detn. In normal human hypophyses the relation between the acidophile, chief and basophile cells is 30.8:45.8:23.4. The granules of both chromophile cell types (acidophile and basophile) are specifically secretory in nature.

S. Morgulis  
Barbiturates. XI Further contributions to methods of barbiturate research Charles R. Linegar, James M. Dille and Theodore Koppanyi. *J. Am. Pharm. Assoc.* 24, 847-52(1935); cf. C. A. 29, 888<sup>1</sup>—Two practical methods

of clearing highly colored urines for the purpose of detg. barbiturates are described: (1) Add 2 g. Na molybdate per 25 cc. of urine and sufficient 20-30%  $H_2SO_4$  to produce a heavy green ppt., filter and ext. the filtrate with  $CHCl_3$  as usual, the method does not destroy barbiturals and is effective in removing pigments from certain concd. urine specimens, but is inferior to the following one. (2) Add 5 cc. of 10% Cu sulfate soln. to 25 cc. of urine, make alk. with 10 cc. of 10% Na tungstate soln., mix, filter, add 4 cc. of 5%  $H_2SO_4$  to 30 cc. of filtrate, let stand about 20 min., filter and ext. 25 cc. of filtrate with  $CHCl_3$  as usual. Urine has a limited buffering capacity manifested in the conversion of Na barbital into the acid form even in alk. urines; the amt. of barbital so converted is inversely proportional to the amt. of Na barbital originally added to the urine. Large vols. of blood (after Folin-Wu pptn.) can be extd. with  $CHCl_3$  without obtaining interfering materials in the ext. even after concn. The liquid-air method of direct extn. of barbiturates can now be applied to the central nervous system after removing the phospholipides from the  $CHCl_3$  ext. with  $Me_2CO$ . A. P. C.

The estimation of ascorbic acid by titration. Earle W. McHenry and Murray Graham. *Biochem. J.* 29, 2013-19 (1935) cf. C. A. 29, 5472<sup>1</sup>.—Important modifications in the titration procedure of Harris and Ray (C. A. 27, 4279) were described, i. e., soln. of the indophenol (I) in a phosphate buffer  $pH$  7.2, its standardization against  $FeSO_4 \cdot (NH_4)_2SO_4$  soln. of this soln 15-20 times when small amts. of ascorbic acid (II) were estd., triple extn. of the sample with 3%  $CCl_3CO_2H$  and addn. of KCN in small amts. during the extn. Interfering plant pigments were removed (1) by titration of the ext. over  $CHCl_3$  which reddened as soon as excess I was present or (2) by extn. of the ext. with  $BuOH$  or  $AmOH$  before titration. Vegetable tissues contained appreciable amts. of reversibly oxidized II. Several vegetables gave an increased titration value after short heating or after acid hydrolysis, presumably because of the liberation of II from a water-sol. compd. insol. in the extg. soln. E. W. Scott

A microchemical test for choline and its esters in tissue extracts. Frederick J. Booth. *Biochem. J.* 29, 2064-6 (1935).—Choline (I) in 1:50,000 concn. in tissue exts. could be identified as the periodide. Florence's reagent (1.65 g. KI, 2.54 g. I, water, 30 g.) 3 drops was added to 1 drop of the unknown. Acetylcholine gave the test after 2 min. hydrolysis with 1% NaOH. The water-sol. precursor of I gave no ppt. with Florence's reagent. The sensitivity of this test for choline could be increased 100-fold by concn. of the tissue ext. E. W. Scott

The new color reaction of vitamin A. Jeno Rosenthal and János Erdelyi. *Biochem. J.* 29, 2112-13 (1935); cf. C. A. 29, 5470<sup>1</sup>, 6265<sup>1</sup>.—In reply to Anderson and Levine (C. A. 29, 4798<sup>1</sup>), R. and E. point out that guaicol (I) must be added to the new color test for vitamin A (II) when a detn. of II is carried out, since carotene does not give a color when I is present and the color obtained is quite stable and easily measured. E. W. Scott

Urobilin. A practical modification of the technic of the Schlesinger reaction in urine analysis. O. M. Maghaccia. *Dis. med.* 6, 224 (1933); *Anal. Assoc. Quim. Argentina* 23, 10B (1935).—Place the sample in a centrifuge tube, add an equal quantity of 10% alc. soln. of  $Zn(OAc)_2$  and centrifuge. In the clear portion of the liquid there will be a fluorescence when urobilin is present. E. M. Symmes

Detn. of moisture in small quantities of substance (Erdős) 7. Methods of observing electrophoresis of bacteria, blood corpuscles, etc. (Waelisch) 2.

## C-BACTERIOLOGY

LAWRENCE H. JAMES

Relative productivities of certain culture media. R. E. Noble. *J. Am. Water Works Assoc.* 27, 1143-60 (1935).—Mass inoculation is not sufficiently sensitive, nor are 4 or 5 tests of value. The quant. measure of productivity

should be based on 30 or more tests. Buffered lactose broth, generally, is just as productive as standard lactose broth. Brilliant green lactose bile broth, brilliant green lactose bile agar and ferrocyanide-citrate agar were among the media tested. D. K. French

Selective media for coliform aerogenes isolation. C. C. Ruchhoeft and John F. Norton. *J. Am. Water Works Assoc.* 27, 1134-42 (1935).—Of all the trial media studied standard lactose broth showed the biggest productivity. Brilliant green bile medium has been studied as a confirmatory medium. Of the other media only the fuchsine broth and possibly the methylene blue-bromocresol purple broth are considered worthy of further study. D. K. French

Sugar decomposition of dysentery bacilli. A. Uchida. *Japan Z. Mikrobiol. Path.* 29, 031-41 (1935).—U. found that the  $pH$  increased from 7.9 to 8.2 15 days after the cultivation of various dysentery types in peptone water without sugar. I. S. Yun

Bacterial decompos. of the rubber in the latex of *Hevea* (Spence) 30. Analysis of small quantities of gas (Bruce) 7.

## D-BOTANY

THOMAS G. PHILLIPS

Plant-growth substances. XVI. The constitution-specificity of heteroauxin. Fritz Kögl and D. G. F. R. Kostermans. *Z. physiol. Chem.* 235, 201-16 (1935), cf. C. A. 29, 7997<sup>1</sup>.—Heteroauxin (indole-3-acetic acid) has the same physiol. action as the more complex auxins a and b in deflecting the growth of oat coleoptiles. The only grouping it has in common with the other 2 auxins is the  $CO_2H$ . However, auxins a and b are rendered inactive by esterification with  $MeOH$ , while the  $Me$  ester of heteroauxin retains more than  $1/2$  the activity of the free acid. With increasing size of alkyl groups in the  $CO_2H$  the activity decreases at about the same rate, and with a secondary alkyl ( $Me_2CH$ ) the decrease is much greater than with primary alkyl ( $Pr$ ). Possibly the activity of the esters is due to a partial sapon. whereby the active acid is liberated. On the other hand, a comparison of auxin a with heteroauxin shows that both have disson. constn. of the same order of magnitude. A no. of derivs. were prepd. for the purpose of detg. the effect of various substituents, or other modifications, on the activity of heteroauxin. By esterification of indole-3-acetic acid with  $CH_3N$ ,  $MeCHN$ , and  $EtCHN$ , the  $Me$ ,  $Et$  and  $Pr$  esters were prepd. as oils and purified as picrates, m. 123°, 84° and 105°, resp. The  $iso-Pr$  ester was obtained from the Ag salt and  $Me_2CHI$  (picrate, m. 100-1°).  $Me$  2,3-dihydroindole-3-acetate (picrate, m. 178°) was obtained by hydrogenation of  $Me$  indole-3-acetate in  $EtOH$  with  $HCl$  and  $PtO_2$  catalyst, and saponid. to the free acid (picrate, m. 163°).  $Me$  2-methylindole-3-acetate, m. 65°, was obtained by  $CH_3N$  methylation of the free acid. 2-Ethylindole-3-acetic acid, m. 100-1°, was prepd. by condensing homolevulinic acid with  $PhN_2H$ , and refluxing the phenylhydrazine in  $EtOH$  with  $H_2SO_4$ , and 5-methylindole-3-acetic acid, m. 151°, by the same treatment of the hydrazine from  $Et$  formalpropionate and  $p$ -tolylhydrazine. The latter gave a  $Me$  ester which formed a picrate m. 122-3°. Other derivs. tested for biol. action were 2,5-dimethylindole-3-acetic acid, m. 172-3° obtained from levulinic acid and  $p$ - $MeC_6H_4N_2H_5$ , and reduction with  $SnCl_4$ ,  $\alpha$ -( $\beta'$ -indolyl)-propionic acid, m. 102° (picrate, m. 145-7°),  $\beta$ -indolylcarboxylic acid,  $\beta$ -indolylpropionic acid,  $\alpha$ -indolylcarboxylic acid,  $\beta$ -indolyl-lactic acid and  $\beta$ -indolylpyruvic acid. In general, where the acids had biol. activity, this was diminished or destroyed by esterification, and hydrogenation of the indole ring destroyed activity. Where the  $\alpha$ - $Me$  deriv. was active the  $\alpha$ - $Et$  deriv. was inactive. Since tryptophan is undoubtedly the parent substance from which heteroauxin is derived, some of the intermediate products might be expected to show activity. The derived pyruvic acid was highly active, while the lactic acid was inert. Methylation in the benzene ring is less deleterious than methylation in the pyrrole ring. It appears that there are "sensi-

tive regions" in the mol. in which the slightest alteration diminishes activity, while other regions are comparatively indifferent.

A. W. Dox

Recent advances in science plant physiology. Walter Sides. *Science Progress* 30, 314-17 (1935).—A review of recent work on growth hormones in plants. J. S. H.

Carrying out the Went auxin test in daylight. H. Söding. *Ber. deut. botan. Ges.* 53, 331-4 (1935).—A procedure obviating the use of a dark room is described. L. P. M.

Callus and root formation by  $\beta$ -indolylacetic acid. F. Laibach. *Ber. deut. botan. Ges.* 53, 339-44 (1935).— $\beta$ -Indolylacetic acid in lanolin applied as a paste (cf. C. A. 28, 3443) is active in inducing callus formation and in the initiation of roots. Lawrence P. Miller

A test method for the determination of the callus forming action of growth-substance pastes. F. Laibach and O. Irschich. *Ber. deut. botan. Ges.* 53, 467-77 (1935).—The increase in thickness of a decapitated *Vicia faba* epicotyl (under strictly specified conditions) is taken as a measure of the callus forming potency. The effect of various concns of  $\beta$ -indolylacetic acid (I) is shown by a curve. An increase in thickness of 10% (a 1/10 unit) under the conditions of the method is produced by a concn of 73  $\gamma$  (I) in 1 g. paste. Lawrence P. Miller

Comparative investigations on growth stimulants in nature plants. Friedrich Boas. *Ber. deut. botan. Ges.* 53, 495-511 (1935).—Exts. of various plants were active in inducing growth of yeast and in increasing the yield of *Aspergillus niger*. Among the most effective were *Isucum album* and *Malticaria chamomilla*. L. P. Miller

The annulling of the growth-substance effect by living plant parts. P. Kormann. *Ber. deut. botan. Ges.* 53, 523-7 (1935).—Agar blocks which induce bending in the oat coleoptile because of having taken up growth substance from the oat or corn plant become inactive or have greatly reduced activity if parts of plants of a different species from that which originally furnished the growth substance are placed in contact with the blocks for a no. of hrs. before the test is made. Lawrence P. Miller

Chlorosis of *Hydrangea hortensis*. J. D. Wilson and H. A. Rummels. *Ohio Agr. Expt. Sta. Bi-monthly Bull.* 173, 143-6 (1935).— $\text{CuSO}_4$  in combination with  $\text{Ca(OH)}_2$  and water (Bordeaux mixt.) was not alone effective in increasing transpiration rates in plants, since the sulfates of Ni, Fe and Mn caused nearly as great an increase when applied to *Calceol* as did Bordeaux mixt. Mixts. contg.  $\text{ZnSO}_4$ ,  $(\text{NH}_4)_2\text{SO}_4$ , and  $\text{K}_2\text{SO}_4$  were considerably less effective. The ppts. of these various mixts. settled in the reverse order of their effectiveness in increasing transpiration rate, e. g., the mixt. contg.  $\text{CuSO}_4$  increased the rate of water loss most, but its ppt. settled most slowly; whereas that of the one contg.  $\text{K}_2\text{SO}_4$  settled most rapidly, and the mixt. caused the smallest transpirational increase. C. R. Fellers

Preliminary study of the effect of a series of temperature changes upon respiratory activity of apples during the post-climacteric in senescent decline. Charles A. Eaves. *Sci. Agr.* 16, 28-39 (1935).—The weighed tub method of estg.  $\text{CO}_2$  in a moving air stream was entirely satisfactory for respiratory studies upon relatively large samples of apples. Respiratory activity of the control lots stored at 3°, 10°, and 18° was characterized by a rise in  $\text{CO}_2$  output to the climacteric followed by a decline. The length of life of the apple and the onset of climacteric in terms of  $\text{CO}_2$  output are in inverse ratio to the rise in temp. The onset of fungal invasion caused a rise to the curve of respiration. Sharp initial upward temp. gradients 3-15° resulted in a heavy depletion of effective substrate as shown by excessive lowering of respiratory activity. C. R. Fellers

The osmotic and suction pressures of some species of the mangrove vegetation. R. E. Cooper and S. A. Pasha. *J. Indian Bot. Soc.* 14, 109-20 (1935).—Expts. were carried out on *Acanthus ilicifolius* L., *Sonneratia apetala* Ham. and *Avicennia officinalis* L. The osmotic and suction pressures were highest in the leaves, medium in the stems and lowest in the roots. There was a marked increase in the pressures of each species from Aug. to Oct.

during the dry season; the pressures ranged from approx. 40 to 90 atm. and were very high as compared to other plants. The osmotic pressure of the sea water surrounding the plants was approx. const. (25 atm.) throughout the season. The osmotic pressure of the soil soln was 20-485 atm. K. D. Jacob

Respiration of the roots and leaves of the rice plant (*Oryza sativa* L.). F. Baptista. *J. Indian Bot. Soc.* 14, 159-65 (1935).—The roots evolved 82-200 mg. and the leaves 163-400 mg.  $\text{CO}_2$ /hr./100 g. of dry wt. There was a marked fall in the rate of respiration soon after transplantation; the max. was reached about the middle of Sept. and the rate soon decreased sharply. K. D. J.

Carbohydrate nitrogen ratio of the shoots of some tropical trees. R. H. Dastor and M. R. Raut. *J. Indian Bot. Soc.* 14, 269-89 (1935).—Analyses were made of the shoots of *Bombax malabaricum* DC., *Cassia remigera* Wall., *C. fistula* Linn. and *Persea indica* Boer. During the vegetative and reproductive phases the carbohydrate content was higher than at any other period during the year. The N content showed a continual increase from the beginning of the vegetative phase to the end of the flowering period and then decreased sharply. The N content of *B. malabaricum* decreased at the end of the vegetative period. In the 2 species of *Cassia* the C:N ratio was highest during the vegetative phase and lowest in the reproductive phase. The vegetative and reproductive phases of *B. malabaricum* and *P. indica* were not characterized by different C:N ratios. In all species the ratio was very low during the termination of vegetative and reproductive phases. The high carbohydrate content during the vegetative phase is due to photosynthetic activity and during the reproductive phase to the upward flow of carbohydrates from places of storage. K. D. J.

The effect of wounding on respiration in the stamens of *Arachis glandulosa*. A. B. Saran. *J. Indian Bot. Soc.* 14, 294-304 (1935).—The max. output of  $\text{CO}_2$  was obtained from leaves wounded just after 2.5 hrs. of starvation. The effect of wounding gradually decreased as the period of starvation was increased from 2.5 to 72 hrs.; it then increased at 96 hrs. of starvation. Injection of a 1.5% glucose soln into the leaves increased the  $\text{CO}_2$  output from the wounded leaves when the leaves had an initial respiration value of 4.7 rog.  $\text{CO}_2$ /hr. but had no consistent effect when the respiration value was 6.4 rog. K. D. Jacob

Cyanoglucosides in white clover. B. W. Doak. *N. Z. J. Agr.* 51, 189-62 (1935), cf. C. A. 27, 5574; 29, 1851.—The percentages of HCN found in various types of white clover during the 1933-34 and 1934-35 seasons were somewhat lower than those previously reported for the same types grown under N. Zealand conditions, only a few samples contained more than 0.01% HCN. During the 1934-35 season the lower HCN limit of those lines certified as mother-seed lines was in the neighborhood of 0.005%. There was no evidence that white clover contg. 0.013% potential HCN is toxic to livestock. K. D. Jacob

Leaf carotenes. G. MacLennan. *J. Biol. Chem.* 111, 75-84 (1935).—In C. A. 29, 7391<sup>1</sup>  $\alpha$ -carotene in line 2 should read  $\beta$ -carotene and  $\beta$ -carotene in line 4  $\alpha$ -carotene. A. P. Lotherop

Carotene. IX. Carotenes from different sources and some properties of  $\alpha$ - and  $\beta$ -carotene. Harold H. Strain. *J. Biol. Chem.* 111, 85-93 (1935).—In C. A. 29, 7391<sup>1</sup>  $\alpha$ -carotene in line 6 should read  $\beta$ -carotene and  $\beta$ -carotene in the same line  $\alpha$ -carotene. A. P. Lotherop

Iodine contents of ten species of Chinese marine algae. Pei-Sung Tang and Pao-Chun Whang. *Chinese J. Physiol.* 9, 285-90 (1935). L. A. Maynard

Method for determining germinative capacity without making a germination test. Aleksander Gurevich. *Ber. deut. botan. Ges.* 53, 303-18 (1935).—The method depends on the ability of living cells (through respiratory activity) to reduce dimethylbenzene to nitrophenylhydroxylamine which gives a purple color with  $\text{NH}_3$ . Details of the appearance of the tissues which have been treated with these reagents in viable and nonviable seeds of wheat and rye are given.

Results obtained by the use of this method were in good agreement with actual germination tests. L. P. M.

Secretion of oil by orchid blossoms. Leopoldine Müller. *Ber. deut. botan. Ges.* 53, 349-54 (1935).—Blossoms of *Dendrobium nobile*, *D. pierardii* and *D. crumenatum* secrete a fatty oil. Droplets obtained from the inner side of the lobellum of *D. nobile* also contain a volatile oil.

The nutritive economy of the beech (*Fagus silvatica* L.). Ernst Glimm. *Ber. deut. botan. Ges.* 53, 368-77 (1935).—Thirty-three 110-yr. old trees about 35 m. high and having a vol. of wood of about  $2\frac{1}{2}$  cu. m. were analyzed at intervals throughout a nonheating yr. During the winter months each tree (exclusive of the buds) contained an av. of 41.8 kg. carbohydrate (including hemicelluloses), 6.1 kg. fat and 23.2 kg. crude protein. From 60 to 80% of these reserves were in the wood, half or more of this in the mature wood. At the beginning of March the trunk begins to thaw out and changes take place in the relative moisture contents of the tissues. The fats and fatty acids begin to be utilized and after 2 months (and before the leaves come out) 90% of these reserves have disappeared. From May 16 to June 1 an av. of 1.1 kg. of adipic acid was laid down in the leaves and twigs daily. Of the 37 kg. of carbohydrate used during the appearance of the leaves and growth in height about  $\frac{1}{4}$  comes from reserves and  $\frac{3}{4}$  is produced by photosynthesis. The newly formed leaves contain 4.3 kg. protein,  $\frac{1}{2}$  of which is obtained from reserves. The mineral constituents are furnished largely by the branches and twigs. During the period of yellowing of the leaves (Oct. 12-20) 6.1 kg. carbohydrate and 2.6 kg. protein are translocated into the tree and lost due to leaf fall amounts only to 1.7 kg. carbohydrate, 0.4 kg. fat and 1.8 kg. protein. Figures are also given for the changes in wt., vol. and food reserves of the buds during the year. For a study of the effect of heating (90-100°) yr. old trees were analyzed. Of a reserve of 11.1 kg. carbohydrate 27.25 kg. was used during the active growth period. During flowering and fruiting an addnl. 40-45 kg. obtained from all parts of the tree including the roots was withdrawn; the lichen wood lost 86.7% of its reserve, the mature wood of the trunk 48.8%. The carbohydrate/protein ratio of the beech is usually about 5:1; in the process of heating the tree loses 40-50 times as much carbohydrate as protein. Lawrence P. Miller.

The formation of precipitates in plant cells. A. Welter. *Ber. deut. botan. Ges.* 53, 377-411 (1935).—The small globular or granular ppt., which are formed when living cells contg. tannin are treated with basic substances are true ppts., which are formed in the same way as inorg. globular ppts. If plants take up Cu from soln. many of them will form spherules in the epidermal cells of the leaves. These contain Cu as a constituent. Similarly in inorg. spherules (cf. C. A. 29, 2421) these Cu spherules arise from a drop around which a membrane forms. The pptn. takes place within the membrane from the membrane surface toward the center. It shows a web-like structure. The ppts., which form when plant parts are treated with 1 N HCl are spherules which result either from the reaction between substances which are sepl. in the living cell, as e. g. Ca phosphate spherules, or they are formed by the withdrawal of water from drops by the HCl, resulting in a membrane around the drops within which pptn. takes place while water diffuses out, as e. g. inulin spherules. Starch grains do not grow by apposition and are not spherocrystals but spherules. They have a membrane which can be brought out clearly by treatment with dil. KOH and have the structure characteristic of spherules.

Gold in Zea mays. B. Nemec. *Ber. deut. botan. Ges.* 53, 440-2 (1935).—Corn grown in Oslany (West Slovakia) on andesitic soil contained about 1 mg. Au per kg. No Au was found in *Vicia faba major* from the same locality.

Optimum conditions for the accumulation of citric acid with some considerations of a theory of citric acid formation. T. Chrzastaw and L. Peyron. *Biochem. Z.* 280, 325-30 (1935).—The selection of the proper strain of mold

is very essential for obtaining a large yield of citric acid, and also of its purity. The largest amt. of citric acid is formed by maintaining a fairly const. concn. of 20% sucrose, which must contain 0.3%  $\text{NH}_4\text{NO}_3$ , 0.1%  $\text{K}_2\text{HPO}_4$  and 0.1%  $\text{MgSO}_4$ , also a few drops of  $\text{HCl}$  per l. Zn salts are injurious in any concn. The best procedure is to culture the spores directly in the sugar soln. By changing the sugar soln. the max. production of citric acid is finally attained. It is very desirable in neutralize partially the citric acid with  $\text{CaCO}_3$ , but the fermentation mixt. must remain acid at all time. The fermentation should be carried out at 24-30° for 7-11 days. The hypothesis that quinic acid is an intermediate product in the formation of citric acid is regarded as untenable. S. Morgulis.

Independence of the carbon dioxide assimilation of green plants from the presence of small amounts of oxygen and a reversal of the assimilation by carbon monoxide. Hans Gaffron. *Biochem. Z.* 280, 317-69 (1935).—Mol.  $\text{O}_2$ , either in the free or in the bound state, is not required for the initiation of the  $\text{CO}_2$  assimilation by green plants. Expts. with algae, *Chlorella* and *Scenedesmus*, in the dark, both in the presence of sugar or of  $\text{O}_2$  absorbing reagents, demonstrate this. Only when the sojourn in the dark is protracted is there evidence of an inhibition of assimilation. The expts. with these algae further demonstrate that  $\text{CO}$  strongly influences their assimilatory process, which may vary from a completely reversible to an irreversibly injurious effect. The reversible, light-sensitive action of the  $\text{CO}$  is compared to its effect on the catalase in the absence of  $\text{O}_2$ , and the observed action of the  $\text{CO}$  is regarded as a specific reaction with the enzyme which in the Blackmann reaction produces likewise a liberation of  $\text{O}_2$ . This occurs only after an anaerobic period in the dark, either because the concn. of the photochem. intermediate "peroxide" product is too small for the  $\text{CO}$  to affect its displacement from combination with catalase or because the compl. reacting with  $\text{CO}$  is generally combined with  $\text{O}_2$ . The results are still not easily accounted for, and it is possible that the inhibition of catalase by  $\text{CO}$  may also involve an inhibition of the production of a primary photochem. substance. S. M.

Mold sterols. 1. Sterol formation by *Aspergillus niger*. Konrad Bernhauer and Georg Patzelt. *Biochem. Z.* 280, 343-67 (1935).—Synthesis of sterols runs parallel with the development of the mycelium, which indicates that they play a physiol. function in the molds. Preliminary expts. show that the aicln. of crotonaldehyde to fermenting yeast results in a definite increase in the  $\text{SiCl}_4$  reaction. On molds these expts. could not be repeated because crotonaldehyde is very toxic for them. The possibility of formation of sterol by polymerization of crotonaldehyde or  $\beta$ -methylcrotonaldehyde is discussed. S. Morgulis.

The estimation of starch in plants with special reference to woody plants. J. T. Sullivan. *J. Assoc. Official Agr. Chem.* 18, 621-30 (1935).—A procedure is described for the extn. of starch in plants; it is based on the extn. of the starch with slightly alk.  $\text{CaCl}_2$  soln. and its pptn. by  $\text{I}_2$ . The difficulties encountered in ppts. the starch iodide in presence of  $\text{CaCl}_2$  are avoided by removing the  $\text{CaCl}_2$  and substituting  $\text{Ni}(\text{NH}_4)_2\text{SO}_4$  as the flocculating agent; the double pptn. necessary tends to purify the starch ppt. The conditions that must be observed to obtain the max. yield of starch by  $\text{I}_2$  extn. involve the concn. of the  $\text{CaCl}_2$ , the duration of the boiling and the degree of fineness to which the sample is ground. When the proper conditions are used the yield of starch obtained by one extraction agrees with that obtained by successive extrns. under less drastic conditions, which indicates that all the starch has been brought into soln. Recovery of potato starch, alone or when added to plant material, indicates that no starch is lost during the process. The quantities of starch obtained by this method represent the true starch values more closely than those obtained by enzymic methods. The application and importance of a more accurate method to the study of the physiology of woody plants are indicated. A. Papineau-Contant.

The algin of algae. Peter Khosin. *Monatsh. Chem.* 14d,

47, 210-20(1935), cf. C. A. 29, 2576<sup>4</sup>.—Ash-free, bark-free algae contain 27% lignin. The analysis indicates a glycerol group where the terrestrial lignins have an aldehyde. This explains the granular gray-white  $\beta$ -naphthylamine ppt instead of the usual fine yellow ppt. The precursors xylose and hexose are 1:1 as in the Coniferæ (C. A. 28, 5500<sup>4</sup>). K. speculates on the relation of lignin chemistry to evolution. A. R. R.

Comments on Holmberg's article "Thioglycolic acid as a lignin reagent." Peter Klason. *Swensk Kem. Tid.* 47, 220-3(1935), cf. C. A. 24, 6007<sup>4</sup>.—Thioglycolic acid reacts with lignin aldehyde groups but some lignins do not have these. Cf. preceding abstr. A. R. R.

Influence of weather conditions on the nitrogen content of wheat. II. J. W. Hopkins. *Can. J. Research* 13, C, 127-33(1935), cf. C. A. 29, 3000<sup>4</sup>.—Supplementing a previous statistical study, coeffs designed to weight observed temps in proportion to their assumed effect on respiration were computed from the daily observations for three 3-week periods extending from July 1 to Sept. 1. After allowing for the effect of May and June rainfall there was a moderate but significant partial correlation ( $r = +0.33$ ) between N content and the sum of the temp coeffs for the last 2 periods. There was a pos. correlation ( $r = +0.74$ ) between height of crop and yield of grain, and a neg. correlation ( $r = -0.60$ ) between height and N content. The partial correlation between N content and yield, after eliminating variations in both assoc., with height, was negligible ( $r = -0.07$ ), suggesting that reductions in yield due to restriction of the later stages of translocation did not result in significant modification of the N content of the grain. Results of the investigation as a whole are briefly discussed. J. W. Shipley.

A study of moisture changes in standing grain. R. K. Larmour, W. F. Geddes, J. G. Malloch and A. G. McCalla. *Can. J. Research* 13, C, 134-57(1935).—A study of the moisture changes in standing grain during and after the ripening period was conducted at Winnipeg, Saskatoon and Edmonton in 1932 and 1933 with a view to obtaining information on the problem of combine harvesting. Grain was found to be fit for binding 4 to 17 days earlier than for straight combining. There was no evidence that fully ripened grain at moisture contents of 11-13% can absorb sufficient moisture at night, owing to the higher relative humidity, to exceed 14.4% and become tough. The rate of moisture loss in wet mature grain is much greater than the moisture loss, through the same range, in immature grain. J. W. Shipley.

Superiority of silver nitrate over mercuric chloride for surface sterilization in the isolation of *Ophiobolus graminis* Sacc. F. R. Davies. *Can. J. Research* 13, C, 163-73(1935).—It has been difficult to isolate *Ophiobolus graminis* from plant parts previously surface sterilized by the commonly used  $Hg_2Cl_2$  method, although *Helmintosporium sativum* and *Fusarium spp.* are readily isolated following its use. When a  $AgNO_3$  method of surface sterilization was substituted, *O. graminis* was isolated with considerably more success than had previously been obtained. These results can be explained by the difference in reaction of the above-mentioned fungi to these chemicals. When similar concns of these chemicals were added to nutrient agar,  $AgNO_3$  proved less toxic to *O. graminis* than  $Hg_2Cl_2$ , whereas the reverse was true for *H. sativum*. J. W. Shipley.

Biochemical studies on "Sotetsu," the Japanese sago plant. II. The chemical constituents, especially the sex differences of "Sotetsu" stems. Kotaro Nishida and Antonio Yamada. *Bull. Agr. Chem. Soc. Japan* 10, 193-6(1934).—The cortex has greater sugar, fat, fiber and ash contents and peroxidase activity than the pith, but the cortex has more starch only in the case of male shoots. The more recently flowering female shoots are lower in polysaccharides and higher in sugar, protein, ash and peroxidase activity than other shoots. J. T. S.

The visible structure of the secondary wall and its significance in physical and chemical investigations of tracheary cells and fibers. I. W. Bailey and Thomas Kerr. *J. Arnold Arboretum* 10, 273-300(1935).—The struc-

tural pattern of the secondary wall is clearly visible in some fiber-tracheids and libriform fibers of certain dicotyledons and in them may be observed the effects of specific chem. and mech. treatments. The cellulose matrix of the secondary wall is continuous but interspersed with noncellulosic material, as lignin, and 2 continuous interpenetrating systems may result. Either system may be dissolved without modifying the pattern of the remaining system. The patterns and orientations are discussed and illustrated by photomicrographs. J. T. Sullivan.

Chemical composition of certain pasture species at flowering and maturity. R. E. Shapter. *J. Council Sci. Ind. Research (Australia)* 8, 187-94(1935).—Data are given for the protein, fiber, ether ext., N-free ext., sol. and insol. ash and  $P_2O_5$  contents and the dry matter produced in 11 grasses, 4 legumes and 5 miscellaneous species. J. T. Sullivan.

Chemical studies on *Rhizopus japonicus*. Hoshik Lun. *J. Faculty Agr., Hokkaido Imp. Univ.* 37, 185-209(1935).—The fungus *Rhizopus japonicus* Vuillemin was cultivated in Raulin's soln. contg. sucrose and tartaric acid as the only org. substances. The compn. of the dried fungus is: protein 38.8, crude fat 9.7, crude fiber 7.7, N-free ext. 42.2, ash 5.5, total N 5.8 and nonprotein N 3.6%. The mineral compn. of the ash was also detd.

From the ether ext. of 1 kg. of dried fungus there were isolated ergosterol 1.08, fungistrol 2.55, palmitic acid 7.6, stearic acid 1.16 and phosphatides 1.19 g. The unsatd. acids were mainly oleic and a small quantity of linoleic. The ergosterol, after irradiation, had an antirachitic value on rats. After removal of the ether-sol. substances, the fungus was extd. with 95% alc. and from this soln. there were isolated mannitol 16.3, sucrose 0.8, trehalose 0.26,  $NH_4Cl$  0.15, adenine (as picrate) 0.13, hypoxanthine 0.076, histidine (as picrate) 0.027, betaine (as hydrochloride) 0.14, and stachydrin (as Au chloride) 0.012 g. The fungus contained 14.03% mannose, 1.54% fructose and some glucose. From the residue after the ether and alc. extn. there was isolated 29.7 g. of protein which is nearly insol. in  $H_2O$ , NaCl soln. and alc., easily sol. in NaOH and is pptd. by acid. It contains N 15.25, H 8.752, C 53.233, S 0.211, P 1.288 and O 21.256%. It is a phosphoprotein and L. suggests the name *Rhizoprotein*. It is rich in basic amino acids, tyrosine and tryptophan. The ratio of cystine S to total S is 1/8, the I value is 16.167% and the isoelec. point is  $pH$  2.95-3.02. The digestive coeffs. of the fungus by Bergheim's method are 72.1 for nitrogenous substances, 78.6 for carbohydrates and 74.2 for ash. Nutrition exps. were pos. for vitamins  $B_1$  and  $B_2$  and neg. for A and C. A growth-promoting substance toward yeast was present. J. T. Sullivan.

Rain or B deficiency in swedes (O'Brien, Dennis) 15. Maturity of fruit (Hinton) 12.

## E—NUTRITION

PHILIP B. HAWK

Identity of natural vitamin D from different species of animals. Ottar Rygh. *Nature* 136, 552-3(1935).—The liver and body fat of 18 species of fish, whale, a cow and a human female were examd. for vitamin D. No difference was found between them in antirachitic effect on chicks, 70-80 international (rat) units per chick per day being required. The results confirm those of Dols (*Dissert. Wageningen* 1935, cf. C. A. 28, 6178<sup>9</sup>) but not those of Bolls, et al. (C. A. 29, 1455<sup>4</sup>). None of the preps showed max. absorption in the ultraviolet at 260-70  $m\mu$ , no rotation in EtOH soln. and the degree of esterification with phthalic anhydride and pyridine after 10 days was 100%. Maleic anhydride had no effect upon the present vitamin D. There is no evidence that the vitamin D in all the fats investigated is not the same. Philip D. Adams.

Effect of a low-calorie, low-protein diet on blood proteins. Windsor C. Cutting and Richard D. Cutter. *Proc. Soc. Exptl. Biol. Med.* 32, 1053-6(1935).—Twenty-six normal subjects subsisted for 2 days on a 500-calorie protein-free diet with fluids and activity unrestricted.

The plasma values before and after the exptl. period were: protein (per 100 cc.) 7.4 g., 7.74 g.; vol. 236 cc., 2055 cc.; total protein 170 g., 156.5 g., resp.: the protein fractions were unchanged. The subjects were hungry; they drank little water and lost 2 lb. in wt. C. V. B.

Effect of diet upon blood phosphorus partition of rats with and without insulin. Natalie Van Cleve and Agnes Fay Morgan. *Proc. Soc. Exptl. Biol. Med.* 32, 1636-41 (1935).—Rats aged 28 days were kept for 28 days on a standard diet or on a diet rich in fat or in carbohydrate, in the fasting state the animals were injected with 3U/kg. of insulin and 1/2 hr. later the pooled whole blood of each group showed a decrease in inorg. P only in the high-fat diet, the org. P tended to increase; total P, acid-sol. P and lipid P were practically unchanged. C. V. B.

The specific effect of ascorbic acid on the anemia of scurvy. D. Melville Dunlop and Harold Scarborough. *Edinburgh Med. J.* 42, 476-82 (1935).—The daily oral administration of 60 mg. of ascorbic acid for 17 and 19 days in 2 patients suffering from scurvy caused a marked increase in the red blood count and hemoglobin content.

Rachel Browne

Supplementing soil with iron and copper for the prevention of anemia in young pigs. L. H. Moe, W. A. Cralt and C. P. Thompson. *J. Am. Vet. Med. Assoc.* 40, 302-11 (1935).—A litter of pigs having access to 50 lb. of soil to which 9 g. of  $\text{FeSO}_4$  and 1.5 g.  $\text{CuSO}_4$  were added maintained a higher hemoglobin level and were significantly heavier 3-4 weeks after birth than pigs having access to no soil or soil without the added Fe and Cu.

Rachel Browne

The antirachitic effect of ultraviolet radiation transmitted by a smoky atmosphere. Hugh M. Barrett. *J. Ind. Hyg.* 17, 199-210 (1935).—The irradiation from a quartz Hg arc lamp, after passage through a concn of smoke similar to that encountered in the urban atm., fails to prevent the development of rickets in rats fed on a rachitic diet. A. L. Elder

Spectrum analysis of hen eggs and chick tissues. W. F. Drea. *J. Nutrition* 10, 351-52 (1935).—Spectrographic analysis of material evapd. to dryness in  $\text{SiO}_2$  and Pt dishes showed that a no. of elements pass from the feed or water into the hen's blood, from there to the egg, and finally into all of the chick's tissues and chick's blood. These are Al, Ba, Ca, Cu, Fe, Mg, P, K, Si, Na, Sr, Ti, V and possibly Rh. Of the 'trace' elements, Al, Ba, Cu, Sr, Ti and Zn were quite uniformly distributed among the tissues. The 'trace' elements more concd. in the hen's blood or egg, and of probable physiol. significance, are Ba, Fe, Sr and V. The presence of considerable V in the blood, femur, heart, kidney and lung of both hen and chick suggests that it may have a hematopoietic function. Whereas Cr, Pb and Mo were found in the hen's blood, only traces were present in the eggs. Mn was present in greater quantity in the yolks as compared with the hen's blood and was absent from the egg white and egg shell. It was concd. in the liver and appeared in slightly lesser amts. in the kidney and gizzard. Mn is of probable nutritional importance. C. R. Fellers

Effects of increasing calcium content of a diet in which calcium is one of the limiting factors. H. C. Sherman and H. L. Campbell. *J. Nutrition* 10, 363-71 (1935).—The Ca content of the dry rat diet was increased from 0.2% to 0.35% by the addn. of  $\text{CaCO}_3$ , and the effect on successive generations of rats noted. High Ca intake was followed by a more efficient utilization of the food, better growth, earlier maturity, several indications of higher adult vitality, a longer period between the attainment of maturity and the onset of senility, and an increase in life expectation of the adult. Infant mortality was decreased as a result of the increased Ca intake. The effect on females was less marked than with males. Conclusion: The level of Ca intake most conducive to optimal well-being is significantly higher than that required for normal growth and maintenance. C. R. Fellers

Calcium and phosphorus needs of preschool children. Amy L. Daniels, Mary K. Hutton, Elizabeth M. Knott, Olive E. Wright and Mary Forman. *J. Nutrition* 10,

373-88 (1935).—The Ca needs of normal children of preschool age can be met by foods contg. 45-50 mg. of Ca per kg., or between 7 and 9 mg. per cal., providing sufficient vitamin D is allowed. P needs, on the other hand, can be met by food contg. between 60 and 70 mg. per kg., or between 9 and 11 mg. per cm. C. R. Fellers

Effect of deficient diets on the total ash, calcium and phosphorus content of bones. Ruth Yeager and Jet C. Winters. *J. Nutrition* 10, 389-97 (1935).—The bones of rats stunted by means of cal., protein and lysine deficiency showed a much larger percentage of total ash, Ca and P than was present in the bones of normal animals of the same wt. but a smaller percentage in each case than is found in the bones of normal animals of the same age. Stunting by means of a low-salt diet resulted in loss of total ash, Ca and P so that the percentages in the bones of the animals so stunted are considerably smaller than those characteristic of normal animals of the same wt. and greatly reduced in comparison with those of normal animals of the same age. There is some indication that Ca P ratio in bones depends to some extent on the amts. of Ca and P present in the diet. C. R. Fellers

Augmentation of the toxicity of fluorosis in the chick by feeding desiccated thyroid. Paul H. Phillips, Honora E. English, and E. B. Hart. *J. Nutrition* 10, 399-407 (1935).—The chick possesses a high tolerance to F administration. Approx. 70 mg. of F per kg. of body wt. is necessary to inhibit growth in baby chicks. This level of F intake inhibits growth through restricted feed consumption. Intraperitoneal injections of F also restricted feed consumption, indicating that the reaction to F is systemic in nature and independent of any reaction via the digestive tract. The tolerance of intraperitoneal injections of NaF soln. were distinctly lower, 64 mg. of F per kg. body wt. were lethal while 35-40 mg. per kg. of body wt. retarded growth. The feeding of desiccated thyroid in amts. greater than 350 mg. per kg. of body wt. definitely retarded growth, while levels of 200-225 mg. were without effect. Feed consumption was not restricted by desiccated thyroid feeding. Nontoxic levels of desiccated thyroid were made toxic by chronic fluorosis induced by NaF feeding in the growing chick. Growth was greatly retarded and the survival period shortened. F ingestion definitely enhances the toxicity of desiccated thyroid and vice versa. C. R. Fellers

Tankage as a source of protein for dairy cows. J. G. Archibald. *Mass. Agr. Expt. Sta., Bull.* 321, 8 pp. (1935).—High-grade tankage can be safely used as a protein concentrate for dairy cows. C. R. Fellers

Minimum vitamin A requirements with particular reference to cattle. H. R. Guilbert and G. H. Hart. *J. Nutrition* 10, 409-27 (1935).—The total storage of vitamin A and carotene in the liver and body fat of cows 2-18 years old, which had access to green feed in abundance throughout life, was estd. at 0.6-0.7 g. in the younger animals and up to 3.6 g. in the aged cows. From 67 to 93% of the storage was in the liver. The amt. in the other organs was negligible. In the liver the form was vitamin A, whereas in the fat, carotene predominated. The daily withdrawal of vitamin A from the body store when cows were placed on a vitamin A-deficient ration was approx. 9-11 mg. The percentage of carotene recovery by a cow from alfalfa was about 2.7%. Reserves above a certain level are but slowly accumulated. Subcutaneous injections of carotene into a vitamin A-deficient calf caused the disappearance of corneal lesions and improvement in phys. condition. However, wt. gains did not occur. The injected carotene was poorly utilized by the animal's body. Night blindness was the first detectable clinical symptom of vitamin A deficiency and constituted a delicate index upon which min. requirements could be based. The daily carotene requirement of the bovine is 26-33 mg. per kg. live wt. Carotene intake at the level of 29 mg. per kg. daily prevented or cured clinical symptoms and promoted normal wt. increases, yet it resulted in no storage. When the intake fell below this level, night blindness resulted, and wt. gains decreased. Vitamin A deficiency that had progressed to the point of night blind-

ness and convulsions did not inhibit the occurrence of estrus or reproduction (in 1 case). Vitamin A requirement is related to body wt. rather than to energy requirement and the min amt required for mammals is 20-30 mg per kg per day. The requirement is considerably higher for both turkeys and chickens. C. R. Fellers

Vitamin C VII. Germination of seeds and vitamin C 6 Effect of light on the production of vitamin C during germination. Tomuji Matsuoka. *Mem. Coll. Agr. Kyoto Imp. Univ.* No. 35, 1-10(1935).—See C. A. 27, 2180 VIII. Chemical nature. 1 Separation of vitamin C from cabbage juice. *Ibid.* 11-23.—See C. A. 27, 2986 IX. Chemical nature. 2 Vitamin C and ether. *Ibid.* 25-30.—See C. A. 27, 3505 X. Chemical nature. 3 Nucleoside and vitamin C. *Ibid.* 31-8.—See C. A. 27, 4282 XI. Physiological studies. 1. Antiscorbutic value of vitamin C and method of administering. *Ibid.* 39-47.—See C. A. 28, 2750<sup>1</sup> XII. Chemical nature. 4 Vitamin C in the liver and adrenal of cattle. *Ibid.* 49-56.—See C. A. 28, 2759<sup>1</sup> XIII. Chemical nature. 5 Extraction of vitamin C and the solvents. *Ibid.* 57-61.—See C. A. 28, 2759<sup>1</sup> XIV. Chemical nature. 6 Extraction of vitamin C and pH value of the solution. *Ibid.* 65-70.—See C. A. 28, 2759<sup>1</sup> G. G.

Vitamin C XV. Physiological studies on vitamin C 2 Antiscorbutic value of vitamin C and its administration. Tomuji Matsuoka. *Mem. Coll. Agr. Kyoto Imp. Univ.* No. 35, 71-80(1935); cf. preceding abstr.—With guinea pigs the best time to begin the scurvy-cure test is on about the 22nd day of the feeding of the basal ration, when the animals are in the middle degree of scurvy. After 30 days of feeding, when the animals were heavily afflicted they required a large amt of vitamin C and the cure was not effective. Subcutaneous injection of vitamin C ext. prep'd from radish juice did not cure scurvy. The same prep'n given by mouth cured scurvy. Intravenous injection was more effective than subcutaneous injection but not as effective as oral administration. The amt. of vitamin C necessary to prevent scurvy apparently is related to the amt. the pigs have been taking before the test. With guinea pigs previously fed green grass alone, the administration of 30 g. of green grass did not prevent scurvy. Those fed 20 g. of grass per day with the basal diet for 3 generations needed only 15 g. of grass per day to prevent scurvy. XVI. Enzymes and vitamin C. I. *Ibid.* 81-92, cf. C. A. 28, 2707<sup>1</sup>—Vitamin C ext. from Japanese orange juice activated diastase to a slight extent. The orange juice itself had a greater diastase-activating power which seems to be due to impurities containing a coenzyme and inorg. salts. The digestion of casein with pepsin was inhibited by orange juice and by vitamin C. The digestion of olive oil with pancreatic lipase was not influenced by orange juice or by vitamin C. XVII. Chemical nature of vitamin C. 6 Change of content of vitamin C in barley. *Ibid.* 93-108.—As judged by scurvy-prevention expts. with guinea pigs, vitamin C in the seeds of barley increases markedly on about the 3rd day of germination, and gradually increases in the plant until the blooming period. From the blooming period to opening there is a decrease in content of vitamin C, caused by lack of production of vitamin C, and by its transformation into other substances. Juice obtained from barley plants in the blooming period and preserved in an atm. of CO<sub>2</sub>, after removal of impurities, retained its vitamin C content. Vitamin C is produced in barley grown in the dark but the content is greatly increased when it is grown in the light. By following Kogl's method (C. A. 27, 2424) which tests for the study of growth production it was found that vitamin C has no auxin-like properties. E. D. Walter

Presence of vitamin C in Bioplastin Sero. E. Ferrara. *Rass. chim. terap.* 34, 282-9(1935).—Bioplastin Sero, even in small doses, protects white rats from anemias. A. The protective action was shown to be due to vitamin A and carotenoids. H. Lee Gruchel. Studies of relationships between nutritional deficiencies and (a) facial and dental arch deformities and (b) loss of immunity to dental caries among Sambo Islanders

and Florida Indians. Weston A. Price. *Dental Cosmos* 77, 1033-45(1935).—The subjects were Melanesians, Polynesians and Florida Indians. The dietary of the mother during gestation and lactation and of the child during the growth period det. the degree of reproduction of the ancestral phys. pattern. Nutritional deficiency could change the racial pattern in even a single generation, and tended to reduce the immunity to certain diseases. Joseph S. Hephurn

The influence of calcium carbonate in the feed of laying hens, upon digestion. G. Davis Buckner and Amanda H. Harms. *Poultry Sci.* 14, 380, 375, 380(1935).—The results indicated less digestion of N-free ext. and more digestion of protein in the presence of an abundance of CaCO<sub>3</sub> in the ration. K. D. Jacob

Variations of egg-yolk color and characteristics produced by feeding and environment. W. P. Albright and R. B. Thompson. *Poultry Sci.* 14, 373-5(1935).—When hens that normally produced eggs with light yellow yolks were fed on pigmented feeds, such as green alfalfa, alfalfa hay and yellow corn meal, the yolk color abruptly changed to a dark orange which persisted as long as the pigmented materials were fed. The yolk color was influenced by the administration of fat sol. dyes but other dyes had no effect. K. D. Jacob

A preliminary report on the vitamin G requirement of turkeys. G. F. Heuser. *Poultry Sci.* 14, 376-8(1935).—Turkey rations for the 1st 4 weeks should contain a min vitamin G equiv. of approx. 16% of dried skim milk. During the 2nd 4-week period the vitamin G requirement drops to the equiv. of about 10% of dried skim milk. After 8 weeks of age the requirement is not greater than the equiv. of 7% of dried skim milk. The quant. requirements for the 1st 2 periods of 4 weeks each are in direct proportion to the relative growth rate, indicating that the need for the growth-promoting phase of the vitamin G complex is directly related to the rate of growth. K. D. Jacob

Vitamin A content of West Indian shark (*Carcharias* sp.)-liver oil. Conrado F. Asenjo, Luz M. Dalman and Joseph H. Axtmayer. *Puerto Rico J. Pub. Health and Trop. Med.* 11, 158-62(1935).—The vitamin A value of the oil from these sharks caught during the month of July was found to be slightly greater than 13,300 Sherman units per g. Thirteen references. J. A. Kennedy

Dietary factors in the production of dental disease in experimental animals, with special reference to the rat. I. Dental caries. J. D. King. *Brit. Dental J.* 59, 233-41, 305-16(1935).—Diets of corn starch, rice starch, cane sugar or finely ground yellow maize with deficiency of vitamins and mineral salts did not produce abnormalities in the molar teeth of rats after long exptl. periods. There was a high incidence of Gram + lesions in decalcified sections of the dentine of the lower molars of rats fed on diets composed mainly of coarse yellow maize or whole brown rice while teeth of the upper jaw were relatively free from such defects. The lesions occurred in the neighborhood of the summits, on the anterior aspect of those cusps which had a pronounced forward inclination, and at the base of deep fissures. Frances Krasnow

Egg yolk and bran as sources of iron in the human dietary. F. H. McCollum, Vahleisch, Esther H. Funnell, Grace MacLeod and Mary Swartz Rose. *J. Am. Dietetic Assoc.* 11, 331-4(1935).—Expts for 2 nine day periods on 2 young women showed that the Fe of egg yolk and of bran are of equal efficiency as sources of Fe. A. Le V.

The preparation and nutritional value of hepatoflavin. T. J. Stare. *J. Biol. Chem.* 111, 567-75(1935).—With both rats and chicks liver flavin added to a vitamin-B<sub>12</sub> deficient diet does not prevent the appearance of dermatitis but another substance is present in liver which does prevent this condition. Both the flavin and the unknown substance (vitamin B<sub>12</sub> complex) are necessary for growth. The procedures of Kuhn, Stern, Karrer and others for the prep'n of flavin have been considerably shortened. The principal modifications are the pptn. in alc. soln. by bot. Ba(OH)<sub>2</sub>, the pH fractionation of the Ag pptn., and

the extn. of the Ag ppt. with hot dil. AcOH and H-S rather than with AcOH alone.

A. P. Lothrop  
The substitution of diethoxyethylamine (cystine amine) for cystine in the diet of the white rat H. H. Mitchell. *J. Biol. Chem.* 111, 699-703 (1935).—No evidence was obtained that cystine amine can perform the functions of cystine in promoting growth in paired feeding expts. with white rats. On the contrary its addn. to a cystine-deficient diet definitely depresses its growth-promoting value and definitely impairs the appetite of the animal consuming it. A severe restriction of food intake in a paired feeding expt. does not invalidate the comparison of rations, it merely delays the appearance of the effects of differences in nutritive value. Cf. Sullivan, Hess and Schrell, *C. J.* 25, 3696 and Jackson and Block, *C. J.* 27, 524.

A. P. Lothrop  
The biological value of mixed cereal proteins Wm H. Adolph and Fa-Wu Cheng. *Chinese J. Physiol.* 9, 245-52 (1935).—The various protein sources were compared at a 10% protein level with growing rats. By use of the N balance method mixts of kaoliang, soybean and maize (1), wheat and cowpea (2), maize and soybean (3) and maize, soybean and millet (4) showed a higher biol value than millet alone. By use of growth per g. of protein as a measure, (1), (2) and (4) proved superior to millet, kaoliang, soybean or cowpea alone, while (3) proved equal to millet and soybean and superior to kaoliang and cowpea.

L. A. Maynard  
Effect of steaming compared to baking on the nutritive value of wheat bread, Wm H. Adolph and Yung-Tu Tsui. *Chinese J. Physiol.* 9, 275-84 (1935).—The 2 kinds of bread were of equal value for growth in rats and did not differ as regards rate of passage from the stomach or speed of absorption. The digestibility coeffs. obtained in expts with men were not different for the 2 breads. Expts *in vivo* showed a more rapid digestibility of the carboxylate and protein of the baked bread than of the steamed bread, particularly in the crust portion.

L. A. Maynard  
The interrelationship of vitamins and other dietary constituents I. Vitamins A and D and other dietary constituents in relation to the formation of urinary calculi I. C. Hou. *Chinese J. Physiol.* 9, 299-300 (1935).—In diet deficient in vitamin A but very rich in vitamin D all rats showed urinary calculi. The frequency was much lower on a diet free from D. Diets low in A, when high in protein or low in Ca and P, favored calculi formation. On a high cereal diet supplemented with cod-liver oil no calculi developed.

L. A. Maynard  
Behavior of ascorbic acid of inanition tissues Emilio Martini and Arturo Bonisone. *Arch. sci. biol. (Italy)* 11, 167-74 (1935); cf. *C. A.* 29, 2580<sup>9</sup>.—In fasting guinea pigs the tissue contents of ascorbic acid are diminished, the ratio of dehydroascorbic/ascorbic acid is not increased as it is in exptl. scurvy. Glutathione, and in general, those substances that reduce I<sub>2</sub> in acid media except ascorbic acid do not vary appreciably. The administration of ascorbic acid can probably retard death from starvation, but death is probably not due to ascorbic acid deficiency in the tissues.

P. F. Mettels  
Effect of small additions of cystine to the diet on the metabolism under quantitative or qualitative and qualitative protein undernutrition, Luis Lorente. *Biochem. Z.* 279, 76-81 (1935).—In all expts. on rats on a protein-poor diet, whether the protein was lentil or casein protein, there was a neg. N balance and the urinary C/N and Vakot-O/N quotients were high. On the addn. of 0.0075 g. pure L-cystine per animal and per day the neg. balance became somewhat less but the effect on the urinary quotients was not entirely clear. In general the high quotients were slightly reduced or remained unaltered by the addn. of the small amt. of cystine.

S. Morgulis  
Detoxication processes in the rabbit during B-avitaminosis. Teki Kumon. *J. Biochem. (Japan)* 22, 213-24 (1935).—The synthesis of glycine with benzoyl, phenylacetic or phenylpropionic acid is not materially different in normal or in vitamin B-lacking rabbits. On the administration of hippuric acid, by subcutaneous injection, the excretion of benzoic acid in the urine is very

much diminished during B avitaminosis, although the liver and kidney of both normal and avitaminotic animals possess the hippuric acid-splitting enzyme to the same extent. The formation of conjugated ethereal sulfates following the administration of phenol or indole, is always less in the avitaminotic rabbits and there is also less urinary indican than in the normal animal. Both the normal and the B-avitaminotic rabbit have the same ability of forming glucuronates, but the methylation of pyridine is somewhat decreased during the avitaminosis.

S. Morgulis  
Enzyme action in the avian organism during B-avitaminosis S. Tsunoo, M. Takamatsu, T. Kamachi and M. Inazumi. *J. Biochem. (Japan)* 22, 225-31 (1935).—The pancreatic esterase and the liver amylase are more active in the B-avitaminotic animals than in the normal ones, but the kidney phosphatase action is somewhat weaker in the former.

S. Morgulis  
The relation of vitamin C deficiency to the strength of skin capillaries Gunnar Falk, Karl-Ove Gedde and Gustav I. Goldin. *Upsala Lakareforen Forh.* 38, No 1, 1-24 (1932-1934).—Vitamin C deficiency was measured on 89 children in the district of Norrbotten, just north of the Arctic circle. Marked deficiency in vitamin C intake was observed in about 20% of these school children. Children of school age require a larger vitamin C intake per kg. of body wt. than do adults.

James C. Munch  
International vitamin standards E. M. Nelson. *J. Assoc. Official Agr. Chem.* 18, 610-11 (1935).—A brief explanation of the present status of international standards for vitamins A, B<sub>1</sub>, C and D. A Papineau-Couture.

The chemistry of the vitamins II Katharine J. Coward. *School Sci. Rev.* 17, 94-100 (1935). Cf. *C. J.* 29, 6282<sup>9</sup>.

O. Rennuth  
The use of grape juice for weight reduction Report of a series of 31 cases F. Damrau. *Clin. Med. Surg.* 42, 477-80 (1935).—Grape juice before meals leads to weight reduction, apparently because of its content of grape sugar. The latter gives rapid relief of hunger and consequently lowers the total consumption of food.

T. H. Rider  
Dietary protein in relation to sterility I. J. Cunningham and C. S. M. Hopkirk. *New Zealand J. Sci. Tech.* 17, No 1, 429-32 (1935).—The fertility of male and female rats receiving 15-82% protein was tested. The growth rate on all diets was good. All the diets were adequate to promote fertility of the females. Diets contg. 67-82% protein or 15-18% protein derived largely from corn and gelatin induces sterility in males, causing damage to the germinal epithelium of the testicle closely resembling the changes produced by inanition, deficiencies of vitamins A or E or by complete deprivation of fats.

W. Gordon Rose  
A fat-soluble growth factor required by blowfly larvae II. Identity of the growth factor with cholesterol Ralph P. Hobson. *Biochem. J.* 29, 2023-26 (1935), cf. *C. J.* 29, 5893<sup>9</sup>.—Purified cholesterol (I) supplied an essential growth factor required by blowfly larvae. From the exptl. results, I itself was the fat-sol. factor necessary. The larvae did not require fatty acids or fat-sol. vitamins present in the nonsterol fraction of the unsaponifiable residue.

E. W. Scott  
The effect of feeding cacao shell to cows on the vitamin D content of butter (milk). Stanislaw K. Kon and Kathleen M. Henry. *Biochem. J.* 29, 2051-56 (1935).—Cacao shell, a by-product of chocolate manuf., contained 35 I. U. of vitamin D per g. The shell fat contained 300 I. U. per g. and possessed 40% of the total activity. The feeding of cows on 2 lb. of cacao shells daily for 1 month increased the vitamin D content of the butter from the winter to the summer level.

E. W. Scott  
The nature of the "sporogenous vitamin," an essential growth factor for Cl sporogenes and related organisms. Alwin M. Pappenheimer. *Biochem. J.* 29, 2057-63 (1935).—A high active growth prepri (I) was obtained by extg. the saponifiable plus nonsaponifiable fraction of mare's urine in pyridine-ether soln. (1:1) with concd. HCl. I was purified by prepri. of a Me ester which could be distd. at low pressure. The ester upon sapon. gave an

unsatd. hydroxy acid (mol wt. about 200) which promoted visible growth on a medium of known compn. in concns of 0.04% per ml. The differences between this growth factor and those essential to plants and other microorganisms were pointed out. E. W. Scott

The effect of different percentages of protein in the diet on bachelors and virgin rats. James R. Smonker. *Am. J. Physiol.* 113, 151-65 (1935). cf. C. A. 25, 5938. —The order of efficiency of diets containing different percentages of protein as determined by the total distance run (in revolving cages) was 14.2%, 5104 > 18.2%, 5041 > 22.2%, 3691 > 26.3%, 3842 > 10.3%, 3361 miles. The duration of sexual life was greatest in the 14.2% group and least in the 10.3 and 26.3% groups. The life span of both sexes was shortest in the 26.3% group. It was longest in the males of the 14.2% group and in the females of the 14.2% group. E. D. Walter

Goat-milk anemia. G. O. Kohler, C. A. Elvehjem and E. B. Hart. *Am. J. Physiol.* 113, 279-84 (1935). cf. C. A. 25, 5918. —The anemia produced in young rats by restricting them to a diet of whole goat milk was cured by the addition of Fe and Cu salts. The growth of rats fed goat milk mineralized with Fe, Cu and Mn was much inferior to that obtained with cow milk mineralized in the same manner. The deficiency in goat milk for growth was not corrected by the addition of cod liver oil, yeast, liver or creatine vitamin B<sub>1</sub>. Normal growth was obtained by the addition of brain tissue. The addition of a better grade of alfalfa hay to the diet of the goats caused a definite improvement in the growth-promoting properties of the milk. E. D. Walter

The effect of viosterol upon oxygen consumption of frog muscle. Samuel Gelfan. *Am. J. Physiol.* 113, 454-6 (1935). cf. C. A. 27, 5735. —Isolated muscles from frogs receiving daily injections of viosterol have a greater O<sub>2</sub> consumption than the controls. E. D. Walter

Feeding experiments with decomposition products of proteins. IV. Silvio Maveda. *Proc. Ind. Acad. (Tokyo)* 11, 238-60 (1935). cf. C. A. 25, 3444. —By catabolism from crotonic acid Et ester according to Abderhalden and Heras (C. A. 25, 4382),  $\alpha$ -amino- $\beta$ -hydroxybutyric acid (I) was prepd. and its growth-promoting ability affirmed. Feeding expts. showed that rats lost weight on a synthetic diet in which proteins were entirely replaced by the mixt. of purified amino acids, but that the same diet supplied with 1% of I caused consistent increase in body weight. Im 230° with decarbox. and gives a typical violet coloration with ninhydrin. R. P. Walter

## F—PHYSIOLOGY

HOMER W. SMITH

Extraction of estrin from female urine after acidification with various acids. W. Kenneth Cuyler. *Proc. Soc. Exptl. Biol. Med.* 32, 1352-5 (1935). —When 750 cc. of female stock urine was acidified with 50 cc. of either H<sub>2</sub>SO<sub>4</sub> or HCl or AcOH or 15 g. of CCl<sub>3</sub>COOH or tartaric acid, the yield in rat units of estrin per l. was 0, 4, 6, 9.3 and 18.6, resp. C. V. Bailey

Amino acids in human skin. H. C. Eckstein. *Proc. Soc. Exptl. Biol. Med.* 32, 1573-4 (1935). —The outer layers of human skin were successively extd. with cold 90% alc., Et<sub>2</sub>O and CHCl<sub>3</sub>; the material was then digested with conc. pepsin for 72 hrs. and for a similar period with conc. trypsin; the residual dry product contained 6.1% of ash and 14.2% of total N. With the Van Slyke partition method the residual product contained arginine 5.91, lysine 4.68, histidine 0.64, cystine 3.32, tyrosine 3.42% and tryptophan 1.8%. Basic amino acids of human skin. Richard J. Block. *Ibid.* 1574-5. Cornified epithelium from the sole of the foot and scales from patients with exfoliative dermatoses were washed and extd. with hot alc., Et<sub>2</sub>O and digested with conc. pepsin-HCl; 14 g. of the dry residual product yielded arginine 6.0, histidine 0.82, lysine 4.3 and cystine 3.4%. The mol. ratios of histidine:lysine:arginine in true keratins are 1:4:12 (cf. C. A. 25, 5413), the ratios in this material and in that of Eckstein

are 1:6:7; evidently the process of keratinization was not completed. C. V. Bailey

Relation of potency of anterior pituitary-like hormone to hydrogen-ion concentration. C. A. Elden and Marvel-Dare Fellows. *Proc. Soc. Exptl. Biol. Med.* 32, 1567-69 (1935). —The urine of pregnant women was most potent in anterior pituitary-like action at pH 6.1-7.3; in this range 0.75 cc. of fresh urine injected intravenously in the rabbit caused rupture of Graafian follicles in approx. 15 hrs. in 3 out of 5 test animals. Above and below this range the potency decreased greatly; no ruptured follicles were found after the injection of as much as 5 cc. of urine at pH 12.0. The hormone may be protein-like in nature or carried down with the foreign protein at the isoelec. point of 6.1. The potency of normally acid or alk. urine was restored by adjusting the pH; potency was permanently decreased in artificially alkalinized urine. The findings do not detract from the value of the Friedman modification of the Aschheim-Zondek test (C. A. 24, 2170) in which 5-10 cc. of urine is always used. C. V. Bailey

Absence of follicle-stimulating hormone in primates of young pigeons. Oscar Riddle and James P. Schooley. *Proc. Soc. Exptl. Biol. Med.* 32, 1610-14 (1935). Effects of complete and incomplete hypophysectomy on basal metabolism of pigeons. Oscar Riddle, Guinevere C. Smith and Clarence S. Moran. *Ibid.* 1614-18. —Within 10-20 days after complete hypophysectomy the basal metabolism of the adult pigeon was decreased 35% when measured at the animal's crit. temp. (30°), at 20° the decrease was only 17%. When 10-25% of the gland remained in the body the basal metabolism at 30° was maintained, when less than 4% was present the effect was similar to that found in complete absence of the gland. Such tests must be conducted at the animal's crit. temp. C. V. Bailey

Further purification of galactin, the lactogenic hormone. W. H. McShan and C. W. Turner. *Proc. Soc. Exptl. Biol. Med.* 32, 1655-6 (1935). cf. C. A. 27, 4289. —Obtain the isoelec. ppt. at pH 6.5-5.5 from the alk. digest of fresh or desiccated anterior pituitary glands of sheep, cattle or dogs, wash repeatedly with acetone, dry in a desiccator and grind to a fine powder. Ext. 4 g. of the powder with 2 vol. of glacial AcOH, centrifuge and decant into 12 times its vol. of Et<sub>2</sub>O, repeat until the extract is colorless, mix the white flocculent ppt. with acetone, let stand 45-60 min., centrifuge, decant, desiccate and grind to a fine powder. The product has approx. 10 fold the concn. of the active principle. C. V. Bailey

Relationship of the parathyroid gland to calcium metabolism. DeForest P. Willard. *Ann. Surgery* 102, 351-6 (1935). Rachel Brown

Chemical constitution of sex hormones. J. H. Blackwood. *Glasgow Med. J.* 6, 113-25 (1935). —A review with 53 references. Rachel Brown

The Zondek-Zandberg pregnancy test. With special reference to reaction I. Mabel E. Potter. *J. Obstet. Gynaecol. Brit. Empire* 42, 645-50 (1935). —No relationship exists between the amt. of prolactin A excreted by a pregnant woman and the continuance of the pregnancy to term. Rachel Brown

Basal heat production of the Rhesus monkey (*Macaca mulatta*). Nathan Rakieten. *J. Nutrition* 10, 357-62 (1935). —The av. basal heat production of 11 adolescent Rhesus monkeys was 608 Cal per sq. m. per 24 hrs. A similar heat production was found for males and females. Two expts. on 1 animal which received 35 mg. of Na amyltal per kg. gave results almost identical with those obtained on it under normal basal conditions. C. R. Fellers

Is the work of the kidney, due to the excretion of urea, a factor in specific dynamic action? A. G. Eaton, Shirley C. Cordill, J. L. Gonaux and Vera Clav. *J. Nutrition* 10, 429-37 (1935). —Metabolism expts. on 4 human subjects show that the work done by the kidney in the excretion of the urine during rapid excretion of urea is not a material factor in the sp. dynamic action of proteins. The data do not rule out the kidney as a possible seat for other

reactions dealing with the increased heat production following ingestion of proteins or amino acids. C. R. F.

Effect of male hormone on the protein and energy metabolism of castrate dogs. Charles D. Kochakian and John D. Murlin. *J. Nutrition* 10, 437-59 (1935).—Male hormone prepd. from urine gave a marked drop in urinary N with a subsequent increase both of which are due to changes in urea N. Other urine constituents show no significant changes. Creatine is not excreted by castrate dogs fed on a creatine-free diet. The decrease in urinary N does not begin until the 1st day after the injection. After reaching a max., further injections only maintain the decreased protein catabolism at this level. It is more efficient to use small repeated doses than single large doses. The heat production of thin castrate dogs is unaffected while that of a fat castrate dog is slightly raised by 10% after repeated injections. The fat metabolism is slightly increased, the protein metabolism decreased, and the carbohydrate metabolism is unaffected in the thin dog, but is decreased in the fat dog. A slight but significant wt. gain occurred in dogs during injection. This added wt. was lost as soon as the injection ceased.

C. R. Fellers

Perfusion of the hind quarters of the dog. Noël Dressing, Henri Bénard and Félix Pierre Merklen. *Compt. rend. soc. biol.* 119, 1373-5 (1935).—The hind quarters, in muscular repose, were perfused with de-aerated blood. The O consumption was 50-100 cc./kg./hr. There was no increase in urea, even when glycine was added to the blood, and little or no change in polypeptides and uric acid. Blood glucose slowly decreased and lactic acid remained stationary or sometimes decreased slightly. Galactose added to the blood was apparently utilized to some extent.

L. E. Gilson

Endocrinology of the pregnant cat. R. Courrier and Gaston Gros. *Compt. rend. soc. biol.* 120, 5-7 (1935).—In the cat ovulation occurs 20-27 hrs. after the first copulation. Nidation occurs 13-14 days later. The gestation period is 64 days. If the corpus luteum or the ovaries are removed before nidation has occurred nidation is prevented. If removed after nidation but before about the 46th day of gestation interruption of pregnancy by expulsion or resorption of the fetuses results. (In some cases the fetuses were resorbed while the placentas continued to grow.) After the 46th day of gestation the operation has no effect on the pregnancy. Aetion of folliculin in the pregnant cat. *Ibid.* 3-9.—The injection of 500-1000 rat units of folliculin before nidation causes abortion; after nidation it has no such effect. L. E. G.

Synthesis of aspartic acid from fumaric acid in the liver. Kurt P. Jacobsohn, João Tapadinhas and F. B. Pereira. *Compt. rend. soc. biol.* 120, 33-6 (1935).—A dog liver was perfused with de-aerated blood contg. NH<sub>4</sub> fumarate and acetate. About 10% of the fumaric acid was converted to aspartic acid. The latter was isolated from the deproteinized perfusate as its insol. Cu salt. L. E. G.

Remote effects of denervation of the adrenal on the secretion of adrenaline. J. A. Sgroso. *Rev. soc. argentina biol.* 11, 139-40 (1935); *Compt. rend. soc. biol.* 120, 270-2 (1935).—One adrenal was denervated, then studied 1-3 months later by connecting the vein of the operated gland to the jugular of another dog. Nicotine, candicine and cocaine produced adrenaline discharge, but less than normal. Yohimbine did not suppress the effect of candicine. Centrripetal elec. stimulation of the vagus, brachial and sciatic nerves had no effect on the gland. L. E. G.

Progress and problems of endocrinology. R. G. Hoskins. *J. Am. Med. Assoc.* 105, 948-51 (1935).—Discussion.

F. P. Griffiths

Effect of thymus extract (Hanson) on the early eruption and growth of the teeth of white rats. M. T. Darrett. *Dental Cosmos* 77, 1088-93 (1935).—Thymus ext. caused very early eruption of the teeth and a marked acceleration in their growth.

Joseph S. Hepburn

Studies of the *pu* of normal resting saliva. II. Diurnal variation. Robert E. Brawley. *J. Dental Research* 15, 79-80 (1935); cf. *C. A.* 29, 7428<sup>a</sup>.—The normal resting

saliva of 3405 normal healthy individuals (both sexes, ages 3 weeks-101 yrs) was tested colorimetrically for *pu* at intervals throughout the day. The av. normal value was 6.75, slightly higher values occurred 1 hr. before breakfast (6.8) and 1 hr. before lunch (6.83), and slightly lower values 1 hr. after breakfast (6.73) and 1 hr. after lunch (6.68). No significant difference existed between the av. value in the morning (6.76) and in the afternoon (6.74). The diurnal variations were independent of age and sex. III. Effects of vitamins A and D in school children. *Ibid.* 87-8.—The subjects were school children, aged 11-17, av. 13, yrs; 164 served as controls, while a daily dose of 6 tablets, each contg. 1500 units vitamin A and 2450 units vitamin D, was administered to each of 113 subjects for a period of 1 yr. At the end of 6 months the av. *pu* of the normal resting saliva was 6.76 in the expt. proper and 6.73 in the controls. At the end of 1 yr, the av. *pu* was 6.79 in the expt. proper and 6.78 in the controls. No significant difference existed between the 2 groups.

Joseph S. Hepburn

Iron content of teeth of normal and anemic rats. Sarah Ratner. *J. Dental Research* 15, 89-92 (1935).—The av. Fe content of the upper incisors was 0.014% in 8 rats fed an anemia-producing ration for 121 days, and 0.029% in 6 control litter mates fed a complete ration. When the incisors were first treated with 0.1 N NaOH soln. to remove hemoglobin from the dental pulp, the Fe content of the teeth proper was 0.0126% in the anemic rats, and 0.0202% in the controls. A relationship apparently existed between the Fe content of the teeth and their color. J. S. H.

Chemical regulation and the hormone concept. Julian S. Huxley. *Biol. Rev. Cambridge Phil. Soc.* 10, 427-41 (1935).—A review.

E. H.

Preparation of feeds for cattle as it affects digestibility and absorption. E. A. Silver. *Agr. Eng.* 16, 257-9, 270 (1935).—Crude fiber and crude protein deaths were made on samples of the rumen contents of 4 steers and on the alfalfa hays which were fed. The 1st samples, taken before feeding and representing the residue from previous feedings, always contained a relatively high percentage of crude fiber and a low percentage of crude protein when compared with the analyses of the hays fed. The 2nd samples, representing a mix of the 1st hay eaten and the residue in the rumen, contained less crude fiber and more crude protein than the previous sample. The subsequent samples, taken every 2 hrs., showed, in general, a rise in crude fiber content and a reduction in crude protein content of the material the longer it remained in the rumen.

K. D. Jacob

Plasma lipides of normal men at different ages. Irvine H. Page, Lsben Kirk, Wm. H. Lewis, Jr., Wm. R. Thompson and Donald D. Van Slyke. *J. Biol. Chem.* 111, 613-39 (1935).—The plasma lipides were determined by the gasometric methods of Kirk, Page and Van Slyke (*C. A.* 28, 6755<sup>5</sup>). Variations in age from 20 to 90 yrs. have no determinable influence on either the amt. or the compn. of the plasma lipides. Part of the amino and nonamino N obtained in the petr. ether exts. appears to be derived from substances other than phosphatides. The following results for lipides in normal plasma from 66 subjects in mg. per 100 cc. of plasma were obtained: total cholesterol 232 ± 62, free cholesterol 82 ± 17, phosphatides 181 ± 71, neutral fats 225 ± 137, total lipides 735 ± 216. The cholesterol values range much higher than those of Boyd (*C. A.* 27, 5092, 29, 1810<sup>4</sup>) and of Gardner and Gainsborough (*C. A.* 21, 2706) but no explanation is apparent.

A. P. Lochrop

The effect of age on the plasma calcium content of men. Esben Kirk, Wm. H. Lewis, Jr., and Wm. R. Thompson. *J. Biol. Chem.* 111, 611-2 (1935).—The Ca detns. were made by the gasometric method of Van Slyke and Sendroy (*C. A.* 24, 392) and the subjects were all normal males in so far as could be ascertained by clinical examn. They were part of the group who provided the plasmas for the accompanying study of plasma lipides (cf. preceding abstr.). No effect of age changes up to age 85 was observed and the variations between age classes were no greater than would be expected by the variations within

age classes. The mean for age class varied from 9.8 to 10.6 mg per 100 cc. A. P. Lothrop

The lipid content of the jelly of Wharton. Eldon M. Boyd *J Biol Chem.* 111, 667-9 (1935).—The total lipid content of the jelly of Wharton from the umbilical cord, one of the least active of all the body tissues, varied between 116 and 330 mg % with a mean value of 269, percentages much lower than those of any other tissue of the body. The total lipid was composed on the av of 57% phospholipide, 26% neutral fat, 15% free cholesterol and 2% cholesterol esters. The results are additional evidence in favor of Bloor's hypothesis regarding the relationship between lipid compn and physiol activity. The almost uniform absence of cholesterol esters suggests that large percentages of this lipid characterize degenerating rather than inactive tissue. A. P. Lothrop

Blood chemistry of swine II. Further studies of blood changes following the ingestion of glucose. Donald F. Eveleth and Margaret W. Eveleth *J Biol Chem.* 111, 753-6 (1935); cf *C A* 28, 3779<sup>1</sup>.—The feeding of glucose to fasting swine increases the serum Mg and oxalic acid and decreases the inorg phosphate and Ca. It seems likely that oxalic acid may be a decomposition product of disintegrating sugar and the marked increase in serum Mg definitely points to some relationship of Mg in glycogen formation. A. P. Lothrop

The copper content of urine of normal children. Allan Ross and I. M. Rabinowitch *J Biol Chem.* 111, 803-5 (1935); cf *C A* 27, 3514.—Cu appears to be a const. constituent of the urine of normal children (50 subjects) and is present in amts varying between 0.04 and 0.52 mg per l (av 0.2) and between 0.02% and 0.62 mg per day (av. 0.16). The concns agree very closely with those found in adults but the av amt. per day is appreciably smaller. A. P. Lothrop

The existence in the blood and the urine of substances promoting liver function II. The urine. Nobuo Mizuta and Tatsuo Matsura *Japan J Gastroenterol.* 7, 67-68 (1935); cf *C A* 29, 6638<sup>1</sup>.—In normal human and rabbit urine are phenolic-like substances which promote the excretion of azolochsin-G from the liver of rabbits poisoned with U nitrate or cantharidin. These urinary substances are thermostable in acid or neutral medium but readily destroyed by heating with alkali. C. M. McCay

The significance of the liver for the metabolism of lactic acid. Inkei Ohashi *Japan J Gastroenterol.* 7, 83-103 (1935).—Normal livers perfused with lactic acid split the d form more effectively than the dl-form. Livers impaired by the usual agents as  $\text{CHCl}_3$  decrease in their utilization of lactic acid. C. M. McCay

The functional innervation of the bone marrow. Piero Fosà *Arch sci biol (Italy)* 21, 133-46 (1935).—Bone marrow is provided with unmyelinated vasoconstrictor nerve fibers. It is possible to produce vasoconstriction and vasodilation which vary the vol of the organ; such variation in vol det. the outpouring of blood cells into the circulation and especially the immature cells. The spinal nerves act through the sympathetic fibers. In the marrow there are pain sensory fibers that could be the center of a neurogenic or neuro-hormonal regulation of hemopoiesis. Cutting the nerve fibers stimulates activity. P. F. Metidli

Glycolysis in maternal and fetal blood. G. Tessaro *Arch sci biol (Italy)* 21, 197-200 (1935).—Fetal blood has a more active glycolysis than maternal blood. P. F. Metidli

The chemistry of muscular contraction. R. Margaria *Arch sci biol (Italy)* 21, 213-31 (1935).—A review of the literature. P. F. Metidli

The calcium content of the red cells in human blood. Paolo Larizza. *Biochim terap. spec.* 22, 280-5 (1935).—The erythrocytes contain less Ca than serum and consequently than the whole blood. The av value is 3 mg in 100 g. A. E. Meyer

Blood lactic acid in the dextral abdominal syndrome. F. Rabbini *Biochim terap. spec.* 22, 317-17 (1935).—The lactic acid was increased in cases with cholecystitis. A. E. Meyer

1 The relationship between body weight, body surface and respiratory exchange. Alfio Falaschini *Biochim terap. spec.* 22, 329-50 (1935).—Expts. on rats showed that an individual factor influences the metabolism besides surface and wt. The metabolism in younger animals is always more active than in older ones. A. E. Meyer

The biological reaction of lability in human sera. G. Vannini Scuderi *Biochim terap. spec.* 22, 351-5 (1935).—Normal human serum, stable in respect to colloids, causes a decrease of the surface tension of the serum in rabbits after intravenous injection. Labile sera produce an increase of the surface tension. Antitoxins which may be present in the serum have no influence on the reaction. A. E. Meyer

Functional relationship between epiphysis and anterior hypophysis II. Action on magnesium, phosphate and calcium contents of the blood. Salvatore Fiandaca. *Biochim terap. spec.* 22, 363-8 (1935).—Though an aq ext of the pineal gland has no direct action on the Mg and P in the blood, it prevents the increase caused otherwise by pituitary exts. The Ca is not affected by either ext. It is concluded there is a certain antagonism between both glands. A. E. Meyer

Hypophyseal-endocrine interrelations; Hypophysis and parathyroids. R. Rivoire *Presse med.* 43, 528-30 (1935).—A review. A. E. Meyer

Recent progress in the knowledge of hormones. Bernardino Houssay. *Rev. farm (Buenos Aires)* 77, 233-46 (1935).—A review. A. E. Meyer

Colloid-osmotic pressure measurements in arterial and venous blood during parturition. R. Kessler and Friedrich Paulsen *Acta Med Scand* 86, 100-26 (1935).—The oncotic pressure of serum is about 33 mm  $\text{H}_2\text{O}$  higher than that of plasma, this difference being practically const. under physiol. and pathol. conditions. The oncotic pressure undergoes regular changes during birth. During the period of dilation the blood of the capillaries becomes somewhat thinned out but as the parturition progresses this diln becomes less. In neuropathia gravidarum the oncotic pressure shows the usual variations of pregnancy but the difference between arterial and venous pressure is very great, being 48 mm  $\text{H}_2\text{O}$ . S. Morgulis

The organ of histidine in the urine from pregnant women. Regine Kapeller-Adler and Fritz Haas *Biochem Z* 280, 232-41 (1935).—No evidence was found of the participation of the placenta in the liberation of histidine. Expts. with ground kidney showed that this had no effect on added histidine but liver from males and females, as well as from patients with severe liver damage, or from operatively castrated women destroys it quite actively. Up to 60% of 50 mg added histidine may be thus destroyed by 1 g liver. However, the liver from pregnant women exerts practically no such action. Evidently, the histidinase activity is inhibited and the unchanged histidine appears in the urine. In pregnant animals, on the other hand, the histidinase retains its activity so that no histidine appears in their urine. S. Morgulis

Occurrence of bromine in the normal organism. Theodor Leipert. *Biochem Z* 280, 416-33 (1935).—The Br content of normal blood ranges from 0.16 to 0.40 mg %, that of the plasma being somewhat higher (0.18-0.45 mg %). The Br is retained largely in the erythrocytes but its distribution, like that of the Cl, is also affected by the  $\text{CO}_2$  tension of the blood. The amt. of Br in the blood is too small to affect the Cl content. The Br is all in the form of its ions and no evidence could be found of a compd with protein or other org. substance. Although the excretion of Br through the urine, like that of the Cl, depends upon its concn. in the blood, the Cl/Br ratios of the blood and urine are not similar. The Br always accompanies Cl in the intermediate metabolism, gastric juice secretion, deposition in the tissues, etc., and tissue diuretics lead to a washing out of Br. Milk feeding brings about a shift in the Cl/Br ratio of the organism which manifests itself in a lowering of this ratio in the urine, while the newborn shows in the urine much higher

ratios which are in good agreement with the Cl/Br ratio of the blood (umbilical).

**S. Morgulis**  
Calcium and phosphorus metabolism of the chick embryo. Tatsumi Kamachi. *J. Biochem. (Japan)* 22, 189-197 (1935).—Embryos were injected with  $\text{CaCl}_2$ ,  $\text{Na}_2\text{HPO}_4$ , or  $\text{Yatokoun}$  (a com.  $\text{Ca}$  fructose-phosphate compd.) and the allantoin fluid as well as the embryo were analyzed for  $\text{Ca}$  and  $\text{P}$  at intervals. Such treatment resulted in a diminished  $\text{Ca}$  content and, since there has been no change in the  $\text{Ca}$  content of the allantoin fluid, it is assumed that the mobilization of  $\text{Ca}$  from the shell had been inhibited. Treatment with the  $\text{Yatokoun}$  resulted in a greater  $\text{P}$  content, not observed with the  $\text{Na}_2\text{HPO}_4$ .

**S. Morgulis**  
Histidine formation from arginine in the incubated chick egg. Tatsumi Kamachi. *J. Biochem. (Japan)* 22, 199-202 (1935).—Evidence is presented to show that arginine injected into developing chick embryos is partly converted to histidine.

**S. Morgulis**  
Experimental study of the ligation of the rat sperm duct. Stephan Leiter. *Endokrinologie* 16, 160-74 (1935).—No changes in the testes of the rat follow the ligation of the vas deferens.

**S. Morgulis**  
Hormone studies on corpus luteum cysts. Arthur V. Prolstner. *Endokrinologie* 16, 174-9 (1935).—Prolan B and folliculin, but no lutin, were found in the corpus luteum cystic fluids.

**S. Morgulis**  
Physiology of the colon. II. The iron elimination in the intestinal canal of dogs. Ragnar Nicolaysen. *Scand. Arch. Physiol.* 72, 126-32 (1935); cf. *C. A.* 29, 8374.—During Fe hunger the isolated colon of the dog excretes 0.03-0.06 mg. per day and the rest of the intestinal canal about 2 mg., but no Fe is eliminated through the urine. After an injection of Fe, a small part appears in the urine, whereas the excretion through the intestine is unaffected.

**S. Morgulis**  
The relative choline-esterase activities of serum and organs from the blood of certain species. Edgar Itedman and Ellen Stedman. *Biochem. J.* 29, 2107-11 (1935).—A method is described for the estn. of choline-esterase (1) applicable to whole blood, corpuscles or tissue. A Barcroft differential app. was used. The blood serums of the ox, sheep and goat were deficient in 1, although it was present in appreciable amts. in the corpuscles. Corpuscles from the cat, fowl and duck contained no 1. 1 was absent in the cerebrospinal fluid of the cat and man but occurred in considerable amts in the brain.

**E. W. Scott**  
The linkage of chemical changes in muscle extract Dorothy M. Needham and Wm. E. van Heyningen. *Biochem. J.* 29, 2040-50 (1935); cf. *C. A.* 29, 40954.—By use of dialyzed frog and rabbit muscle exts. it was shown that in the presence of  $\text{Mg}$  and adenylic acid (I), added creatine (II) was converted to phosphocreatine (III) during the breakdown of phosphoglyceric acid (IV). The synthesis involved the reaction of IV (or phosphopyruvic acid) and I to form adenylicphosphate (V) and pyruvic acid, followed by the action of V on II giving III and I. Evidence was cited to show that the coenzyme function of I and V was due to their ability to act resp. as phosphate acceptor and donor.

**E. W. Scott**  
A water-soluble precursor of choline in the human placenta. David H. Smyth. *Biochem. J.* 29, 2067-70 (1935).—Aq. exts. of human placenta contain a water-sol substance contg. choline (1 mol.) bound to  $\text{H}_2\text{PO}_4$  (1 mol.) and an amino group (1 mol.). The presence of free choline also in the placenta was demonstrated by Florence's test. The choline compd. was apparently the same as that isolated from the kidney by Booth and Milroy (*C. A.* 29, 6314).

**E. W. Scott**  
The metabolism of amino acids. V. The conversion of proline into glutamic acid in the kidney. Hans Weidner and Hans A. Krebs. *Biochem. J.* 29, 2077-81 (1935); cf. *C. A.* 29, 80307.—Prolin (I) and hydroxyproline (II) with  $\text{NH}_3$  gave an acid amide similar to glutamine (III) in the presence of rabbit kidney slices. When  $\text{As-O}$  was added to the medium contg. kidney tissue, I gave  $\alpha$ -ketoglutaric acid (IV) and  $\text{NH}_3$ . The oxidation of I in the kidney was therefore formulated as follows. I

**E. W. Scott**  
The role of glutathione in muscle glycolysis. Robert Gaddie and Corbet P. Stewart. *Biochem. J.* 29, 2101-6 (1935).—Dialyzed muscle exts. produced lactic acid (I) from glycogen (II), glucose, hexosediphosphoric acid or an equimol. mixt. of pyruvic acid (III) and glycerophosphoric acid in larger amts. when reduced glutathione (IV) was also present than when  $\text{Mg ions (V)}$  and adenylicphosphate (VI) were the only coenzymes present. In the absence of IV,  $\text{MeCOCHO (VII)}$  accumulated, the addn. of IV diminished the amt. of VII or prevented its accumulation. When VI was omitted IV and V allowed the production of I from II by muscle exts., but in this case the omission of IV caused no increase in the amt. of VII. During the formation of I, VII accumulated and then disappeared in part. The amt. lost was not fully accounted for by conversion to I.

**E. W. Scott**  
Estimation of muscle hemoglobin. Rodger H. Watson. *Biochem. J.* 29, 2114-21 (1935).—The hemoglobins of finely minced muscle (5-6 g.) mixed with sand were quantitatively removed by 2 extns. with  $\text{M/15}$  phosphate buffer,  $\text{pH 6.6}$ , (12-14 ml.). The exts. were sepd. by centrifuging and the hemoglobins were obtained by adsorption on kieselguhr, elution with 0.1%  $\text{NH}_4\text{OH}$ , adsorption on  $\text{Al(OH)}_3$  and final elution with  $\text{NH}_4\text{OH}$ . The relative concns. of blood and muscle hemoglobins in a soln. could be detd. by the Hartridge reversion spectroscopy and consequently the muscle hemoglobin could be estd. in muscle conts. blood. The detn. of hemoglobin by conversion to acid hematin was found suitable for muscle ext. The method of quant. extn. gave results about 30% lower than those of Whipple (*C. A.* 20, 2599). A small no. of muscle hemoglobin detns. were given.

**E. W. Scott**  
The relation of the parathyroid hormone to the state of calcium in the blood. Franklin C. McLean, B. O. Barnes and A. Baird Hastings. *Am. J. Physiol.* 113, 141-9 (1935); cf. *C. A.* 29, 22171.—A study was made of the state of  $\text{Ca}$  in the serum in conditions approximating hypo- and hyperfunction of the parathyroid glands. Hypofunction was simulated by thyroparathyroidectomy, hyperfunction by subcutaneous injection of the parathyroid hormone. Most of the expts. were done on cats, with a few observations upon chronic latent tetany in the dog. Conclusion: Removal of the parathyroid glands leads to a reduction in  $\text{Ca}$  concn. of the plasma, injection of parathyroid hormone to an increase. Acute postoperative parathyroid tetany, in the cat, was observed only when the  $\text{Ca}^{++}$  concn. in the serum was 0.65 mM. per kg.  $\text{H}_2\text{O}$  or below, and then only irregularly. The symptoms of hyperthyroidism may appear, in the cat, when the  $\text{Ca}$  concn. in the serum rises above 1.7 mM. per kg.  $\text{H}_2\text{O}$ , and death may occur at concns. between 1.7 and 2.0 mM. per kg.  $\text{H}_2\text{O}$ . Chronic latent tetany, in the dog, is accompanied by a chronic lowering of the  $\text{Ca}$  concn. in the plasma. The use of  $\text{Na}$  polyanethanesulfonate as an anticoagulant does not affect the ionization of  $\text{Ca}$ , and plasma so obtained from dog blood is not toxic to the frog heart.

**E. D. Walter**  
The relative significance of electrolyte concentration and tissue reaction in water metabolism. H. A. Davis and Lester R. Dragstedt. *Am. J. Physiol.* 113, 193-9 (1935); cf. *C. A.* 29, 48174.—A study was made of the ability of normal and dehydrated dogs to retain 0.9%  $\text{NaCl}$  and 5% glucose solns. when injected intravenously. Three types of dehydration were produced: (1) by simple  $\text{H}_2\text{O}$  deprivation, (2) dehydration plus severe electrolyte loss and marked alkalosis resulting from loss of gastric juice from a special fistula (*C. A.* 24, 4554) and (3) a similar  $\text{H}_2\text{O}$  and electrolyte loss plus an acidosis resulting from loss of pancreatic juice through a special fistula (*C. A.* 25, 5453). Normal animals excreted the injected fluids most readily and completely. Group I retained both glucose

and NaCl salts better than any of the others. Groups 2 and 3 did not retain injected H<sub>2</sub>O much better than normal controls. Group 2 retained H<sub>2</sub>O somewhat better than group 3. Group 3 animals were depleted of base, chiefly Na ion, still they did not retain injected 0.6% NaCl as well as those in group 2. E. D. Walter

The specific gravity of the blood of normal rabbits and cats and splenectomized rabbits before, during and after emotional excitement. L. B. Nice and H. L. Katz. *Am. J. Physiol.* 113, 245-8 (1935); cf. C. A. 28, 2764. The sp. gr. of the blood of normal rabbits and cats showed an immediate and marked elevation during emotional excitement. Peripheral blood showed a greater sp. gr. increase than central blood. Splenectomy raised the basal level and diminished the sp. gr. increase of excited blood. Recovery of the sp. gr. to the normal level is gradual and was delayed in the splenectomized group. Complete recovery was obtained within 30-40 min. after the excitatory period. The factors accounting for these changes are discussed. E. D. Walter

Correlated studies of calcium, inorganic phosphorus, and serum phosphatase in normal animals and in animals influenced by irradiated ergosterol. Smith Freeman and Chester J. Farmer. *Am. J. Physiol.* 113, 279-29 (1935); cf. C. A. 26, 4302. Toxic doses of irradiated ergosterol increase serum Ca and (or) inorg. P and decrease the serum phosphatase activity in dogs and rabbits. Bleeding causes a decrease in phosphatase activity. In dogs, after the initial lowering, the phosphatase remains rather constant. A beef heart (high protein) diet induces a low phosphatase activity, while a bread and meal (high carbohydrate) diet causes a high phosphatase activity. The serum phosphatase of dogs fed irradiated ergosterol shows an inverse relationship to the serum Ca and (or) inorg. P. The results suggest that an inverse relationship exists between the activity of serum phosphatase and the acid sol. org. P of whole blood. E. D. Walter

Basal metabolism and iodine excretion during pregnancy. Lena Enright, Vera V. Cole and F. A. Hutchcock. *Am. J. Physiol.* 113, 221-8 (1935). Growth of the fetus and supplementary tissues plays an important part in producing the increased metabolism which accompanies pregnancy. With adolescent girls, however, there appears to be another factor which stimulates the metabolism and results in a greater rise than that which occurs with more mature women. The use of iodized salts furnishes an adequate supply of I during pregnancy. There is a marked increase in I excretion in the 3rd week ante partum which suggests a possible change in the thyroid function. In 6 out of 7 cases the vital capacity increased during pregnancy, and in all 7 cases there was a progressive increase in tidal air during the latter part of pregnancy which was followed by a decrease after parturition. E. D. Walter

Plasma protein determinations in lactating women. Suber C. Itasca and Winifred F. Ruman. *Am. J. Physiol.* 113, 235-7 (1935). Considerable losses of protein in the milk have no apparent effect on the blood proteins, which are in all cases normal quantities. E. D. Walter

Influence of the ovarian hormones, estrin and progesterin, upon the menstrual cycle of the monkey. Geo. W. Corner. *Am. J. Physiol.* 113, 239-50 (1935). Progesterin has the definite property of inhibiting the menstrual flow in the monkey. Simply maintaining the estrin level by injections of Progesterin-B or crude follicular estrin is not sufficient to prevent the onset of natural menstruation. E. D. Walter

An assay of three hormones present in anterior pituitaries of seven types of cattle classified for age, sex and stage of reproduction. Robert W. Bates, Oscar Riddle and Ernest L. Lehr. *Am. J. Physiol.* 113, 239-64 (1935). Seven classes of cattle hypophyses (embryos, veal, steers, bull, nonpregnant cow, early pregnancy cow and late pregnancy cow) were assayed for their content of prolactin, follicle-stimulating (F. S. H.) and thymotropic hormones. Thymotropic hormone was found in fairly equal quantity in the 7 types except that low values were obtained from the glands of embryos (5-7 months) and adult steers. F. S. H. in assays uncomplicated by

the "augmentation" phenomenon, was found in greatest amt. in glands from cows in early pregnancy and least in adult steers. Nearly equal amts. of prolactin (25-35 units) were found in the anterior lobes of veal calves, adult steers, adult bulls and in nonpregnant cows. Large amts. were present in cows in early pregnancy (58 units) and late pregnancy (44 units). A much larger amt. (784 units) was found in the whole glands of 5-7 month embryos. E. D. Walter

Basal metabolism and urinary nitrogen excretion of Oriental women. Abby H. Turner and Francis G. Benedict. *Am. J. Physiol.* 113, 291-5 (1935); cf. C. A. 26, 5613. The basal metabolism of 10 well-nourished foreign-born Oriental women students who had been living for 1-3 years in the United States, in an American college environment and partaking of an American college diet, averaged 12% below the prediction standard and was lower than that of 6 American college males. The low basal metabolism cannot be ascribed to a low-protein metabolism. E. D. Walter

Relation of the suprarenal cortical hormone to nitrogen metabolism in experimental hyperthyroidism. Giles A. Koelke and Edward C. Kendall. *Am. J. Physiol.* 113, 335-49 (1935); cf. C. A. 16, 2719. Administration of thyroxine to a suprarenalctomized dog receiving a low maintenance dose of cortical hormone produces a neg. N balance. The hormone of the suprarenal cortex exerts a sparing action against the effect of thyroxine on N metabolism. The neg. N balance can be lessened and a pos. balance sometimes can be maintained by giving, with the thyroxine, sufficiently large amts. of cortical hormone. Expts. show that the amt. of cortical hormone administered is one of the factors which sets the amt. of loss of N produced by a given dose of thyroxine. The results suggest that the effect of thyroxine on N metabolism may be indicative of the amt. of cortical hormone available in the body of the dog. E. D. Walter

Excretion of inulin, creatinine, xylose and urea in the normal rabbit. Bernard L. Kaplan and Homer W. Smith. *Am. J. Physiol.* 113, 354-60 (1935); cf. Sarnom, C. A. 29, 7441. The inulin, creatinine, xylose and urea clearances in the normal rabbit are reported. All of these clearances increase with increasing urine flow, and fail to reach a const. value at urine flows that are maximal under the conditions of these expts. Simultaneous clearances of inulin and creatinine are equal, regardless of urine flow or plasma level of creatinine. The change in the inulin and creatinine clearances in relation to changing urine flow is interpreted as indicating a corresponding change in glomerular activity. The xylose and urea clearances are considerably less than the creatinine-inulin clearance. Administration of H<sub>2</sub>O by mouth or by injection in excessive amts. leads to oliguria, convulsions and death. This, coupled with the physical relationship between glomerular activity and H<sub>2</sub>O excretion, should be considered in all renal function studies in the rabbit. E. D. Walter

Fetal carbohydrate metabolism following adrenalectomy, insulin and glucose experiments on the mother. E. L. Crevier. *Am. J. Physiol.* 113, 453-4 (1935); cf. C. A. 29, 7439. Adrenalectomy of the mother rat produced significant depletions in the glycogen content of the maternal and fetal livers. In 19 cases there was an av. reduction of the hepatic glycogen of 70% in the mother and 45% in the fetus, compared to 12-hr. fasted controls. Injections of cortico-adrenal ext. in pregnant rats failed to cause changes in the carbohydrate values studied. Administration of insulin to the mother was followed by decreases in maternal and fetal liver glycogen similar to those after adrenalectomy. Injections of glucose into the mother increased the glycogen concn. in the fetal liver, as well as in that of the mother. The placental glycogen was relatively unaffected by the exptl. procedures used. The fetal muscle glycogen showed no significant change except a slight rise after glucose injection in the mother. E. D. Walter

A histamine-like substance in the gastric juice. Charles L. Brown and Ralph G. Smith. *Am. J. Physiol.* 113

455-63(1935).—The method of extn. of histamine from tissues used by Best and McHenry (C. A. 25, 2450) was applied to human gastric juice, obtained by continuous aspiration. The presence of a histamine-like substance in the gastric juice was demonstrated by biol. methods.

E. D. Walter

Liberation of ammonia by the brain following the natural state of excitation. Joseph Kahn and Alme Lubov Chekoun. *Compt. rend.* 201, 505-6(1935).—The  $\text{NH}_3$  absorbed by the brain of the fish at  $15-16^\circ$  during normal respiration was  $1.14 \text{ mg per br.}$ , during dyspnea,  $1.63 \text{ mg.}$  At  $19-20^\circ$  these values increased to  $1.68$  and  $2.51$ , resp. The fish *Carassius* placed in a stream of running  $\text{H}_2\text{O}$  for  $1.5-2 \text{ hrs.}$  at  $3-4^\circ$  gave an  $\text{NH}_3$  value of  $0.68 \text{ mg.}$  Hence a lowering of temp. caused a 50% decrease in  $\text{NH}_3$ .

Julius White

Precursors of coprosterol and the bile acids in the animal organism. O. Rosenheim and T. A. Webster. *Nature* 136, 474(1935).—Cholesterone (I) added to a rat diet poor in cholesterol (II) gave rise to a large excretion of fecal coprosterol (III). This is in accord with the idea of R. and W. I and coprostanone and not II are the intermediate precursors of III formed from the intestine by bacterial reduction.

Julius White

Hormones and their use in cosmetics (Brugmans) 17.

## G—PATHOLOGY

H. GIDEON WELLS

Caisson disease and its relation to tissue saturation with nitrogen. Charles W. Shilling, James A. Hawkins, B. Polak and Raymond A. Hansen. *U. S. Naval Med. Bull.* 33, 434-44(1935).—The N satn. of the tissues is definitely related to the incidence of caisson disease. Forty-six cases are presented.

Philip D. Adams

Placental immunity. I. A method of determining lossage of placental globulin in measles prophylaxis. Samuel Karelitz, Charles K. Greenwald and A. J. Klein. *Proc. Soc. Exptl. Biol. Med.* 32, 1359-62(1935). Cf. C. A. 18, 11891.—Globulin extd. from the placenta contains the measles antibody and diphtheria antitoxin. Globulin extd. from immune human blood serum is equally effective in measles prophylaxis as the equiv. amt. of the blood serum, which is given in doses of  $8-40 \text{ cc.}$  By comparing the titer of diphtheria antitoxin of pooled 1-cc. specimens of maternal blood serum with that of the globulin extd. from pooled placentas, one obtains equivalents which det. the dose of globulin in measles prophylaxis. II. Comparison of maternal circulating blood immunity with that of placental fluid. Samuel Karelitz and Charles K. Greenwald. *Ibid.* 1362-5.—The fluid expressed from the human placenta has the same diphtheria antitoxin titer as that of the maternal blood serum. This fluid from pooled placentas may be used in place of the pooled maternal blood serum in detg. the dose of placental globulin in measles prophylaxis.

C. V. Bailey

Positive flocculation tests in rabbits inoculated with flocculate from human syphilitic serum. F. Rytz. *Proc. Soc. Exptl. Biol. Med.* 32, 1501-4(1935).—Rabbit serum gave pos. flocculation tests for at least 2 months after the 1st injection of flocculate from human syphilitic serum; the flocculate thus obtained caused the formation of "flocculins" in another rabbit when injected intravenously. The serum of a rabbit injected with 360 flocculate units developed 1260 units in excess of the no. injected.

C. V. Bailey

Flocculation of some serums by orthophosphoric acid solutions. Pio Gori. *Arch. ist. biochim. ital.* 7, 61-8 (1935).—When serums of different species of animals, dilid. with  $\text{H}_2\text{O}$  (1:10), are mixed with a sufficient quantity of  $\text{H}_3\text{PO}_4$  (0.315 per 1) and warmed to  $80^\circ$  for 5 min., a flocculation is produced. The concn. of  $\text{H}_3\text{PO}_4$  necessary to produce optimum flocculation is, between certain limits, const. and characteristic for serum of each species (pig, horse, cattle, sheep). Results are more const. when old serum is used.

E. S. C. B.

Diagnostic value of phosphatase determinations in the study of bone tumors. Channing C. Simmons and Ch-

ford C. Franseen. *Ann. Surg.* 102, 555-62(1935).—Plasma phosphatase was consistently increased in metastatic carcinoma and osteogenic sarcoma.

R. B.

A serological study emphasizing the hydrogen-ion concentration of the blood—in conjunction with the red-cell sedimentation test, leucocytic index and complement-fixation test. K. T. Sasano. *Am. Rev. Tuberculosis* 32, 458-74(1935).—The  $\text{pH}$  accepted as normal for health appears too broad. To obtain basic and comparable  $\text{pH}$  values it is suggested that they be detd. on fasting blood early in the morning. This is important since exercise affects the  $\text{pH}$  values. The  $\text{pH}$  values of the blood of ambulatory tuberculosis patients do not vary significantly from the values obtained in nontuberculous cases and in normal controls. Strict bed-cases have, as a rule, more alk. blood than ambulatory cases. No definite correlation was found among the  $\text{pH}$  of the blood, sedimentation rate of erythrocytes, the leucocytic reaction and the complement-fixation test for tuberculosis.

H. J. Corper

Liver-function tests in productive and exudative pulmonary tuberculosis. F. Meythaler and C. Pelz. *Beitr. klin. Tuberk.* 85, 696-700(1934).—Comparative tests of the liver function using the levulose tolerance and the primary paradoxical insulin hyperglycemia according to Bürger were performed on 40 cases of pulmonary tuberculosis. Both methods revealed in nearly all the cases consistent deviations from normal in the carbohydrate metabolism of the liver, which was attributed to liver injury in the form of fatty degeneration. It is suggested that carbohydrate and insulin be used to combat the disturbed liver function.

H. J. Corper

The Meuncke serum reaction in tuberculosis. F. Böhm and G. Grüner. *Beitr. klin. Tuberk.* 86, 37-44 (1935).—Three types of Meuncke reactions were tried in tuberculosis, and the centrifugation method was found unsatisfactory because of too many sources of error. Coincident microreactions proved valuable especially in questionable cases. Pleural, ascitic and sputum fluids proved unsatisfactory for test. Of 293 patients with undoubted tuberculosis 255 (87%) gave a pos. test. Two explanations are given for neg. findings in definite tuberculosis, either the body has lost its power to form antibodies or has not reached the stage of antibody production, or else overproduction of antibodies has resulted in flooding the body so that a detn. of free antibodies is not possible. Au-treated patients showed a weak reaction, while tuberculin treatment resulted in strong reactions. The serums of 80 nontuberculous patients gave neg. reactions; only in typhus fever were pos. reactions obtained. Two cases of nsthma were also pos. The Meuncke reaction was found to be as sensitive as the Betvedka reaction.

H. J. C.

The value of the so-called phytotoxic index in pulmonary tuberculosis. Julian L. Garcia and Garcia-Minon. *Beitr. klin. Tuberk.* 86, 45-8(1935).—The phytotoxic index is indicated by the toxic action of certain drugs on plant protoplasm. In place of drugs the authors use the serum from tuberculous cases and add this to salt solns., detg. the inhibitory or enhancing effect of the serum on the growth of lupine. The phytotoxic index is the fraction, av. growth of the test group = 100 divided by the av. growth of the control group. The normal is 76. The serums from over 100 cases of tuberculosis (about 220 tests being made) in various stages of the disease were tested and correlated with the clinical, röntgenologic and lab. data. The phytotoxic index possessed no sp.-diagnostic value but is valuable in prognosis combined with röntgenologic and lab. data. In benign forms of tuberculosis figures between 42 and 76 were found. In evolutive caseo-fibrous cases, the phytotoxic index was increased (80 to 100). It is therefore, believed that the phytotoxic index shows a direct relation to the severity of the tuberculous disease. In advanced stages of the disease the serum contains substances, of unknown nature, stimulating the growth of lupine roots. Conc'd tuberculin added to the salt mixt. retards the growth of the roots in definite relation to its concn.

H. J. Corper

Iron deposition in tuberculous tissues. Bernhard Steinhilber. *Beitr. klin. Tuberk.* 86, 84-98(1935).—

5 S repeated Menkin's work (C. A. 28, 7368) on the deposition of Fe in caseating tubercles which in rabbits was found to retard the disease process. In human tuberculous tissues he found Fe present only where deposited prior to tuberculous changes. Tuberculous guinea pigs fed Fe preps showed no special deposits of the Fe in the tuberculous tissues. The liver, spleen and lungs contained large amts of Fe, but the tubercles in these organs remained free from Fe. Only where Ca impregnation of tuberculous caseation occurred, was Fe found. A favorable influence of the administration of Fe on the course of the tuberculosis was not noted. Intravenous injection of FeCl<sub>3</sub> into tuberculous rabbits also revealed no effect on the disease. These findings do not agree with those of Menkin.

H. J. Corper

Carbohydrate assimilation in various forms of tuberculosis in childhood, especially with pulmonary infiltrations. E. Mahr. *Z. Tuberk.* 72, 1-11 (1935).—The alimentary blood-sugar curve in children was studied in relation to pulmonary tuberculous infiltrations. In the majority of cases there was a prolonged blood-sugar curve with marked retardation to starvation levels; paralleling the resorption of the infiltration the blood-sugar curves returned to normal. The same deviations were found in cases of erythema nodosum. The carbohydrate tolerance in inactive tuberculosis and in extrapulmonary cases of tuberculosis did not deviate from normal. In hilum gland tuberculosis high blood-sugar values attained. The levulose-tolerance tests showed a marked retardation in the blood-sugar fall in all forms of active tuberculosis, as an expression of the injury of liver cells by toxins, tissue protein disintegration products and also partly as an expression of amyloid changes.

H. J. Corper

The vital capacity and alveolar carbon dioxide tension in pulmonary tuberculosis. Experimental studies. Antonino Rusi. *Z. Tuberk.* 72, 161-75 (1935).—The vital capacity and alveolar CO<sub>2</sub> tension were studied in 50 cases with pulmonary tuberculosis, part of them with pneumothorax and part taking the regular sanatorium cure, and some treated medicinally. The well-known facts were verified that in pulmonary tuberculosis the vital capacity was diminished, the CO<sub>2</sub> tension reduced and arbitrary apnea diminished.

H. J. Corper

Sulfur metabolism in cystinuria. James C. Andrews and Alexander Randall. *J. Clin. Investigation* 14, 517-24 (1935).—The metabolism of various compounds in the cystinuric organism has been studied with the following results: The cystine output is unchanged by administration of NaHCO<sub>3</sub> or Na citrate but daily administration of alkali does prevent deposition of cystine calculi. Administration of glycine and glutamic acid in equiv. amts. is without effect on the rate of cystine excretion. Administration of L-cystine by mouth results in practically complete oxidation of the S from the cystine but administration of D-cystine is followed by slightly less efficient oxidation. Cystine acid is neither oxidized by the normal nor by the cystinuric organism. After administration of D-methionine, there was observed: (1) no significant increase in cystine excretion, (2) no excretion of homocystine and (2) definite but very slight excretion of methionine. The increase reported by Brand and co-workers in the apparent cystine content of these urines is confirmed. In C. A. 29, 4923 instead of "Cystine is excreted unoxidized by cystinuric and by normal subjects. The cystine content of cystinuric urines, etc." read "Cystine acid is excreted unoxidized by cystinuric and by normal subjects. The cystine content of cystinuric urines, etc." E. J. C.

Porphyria in clinical porphyria. W. Hoerburger and H. Fink. *Z. physiol. Chem.* 236, 139-49 (1935).—The porphyria isolated from the urine of patients suffering from porphyria due to Pb poisoning and to arylphenylamine poisoning was identified by its fluorescence curve as coproporphyrin III, whereas that from a clinical case of acute gastric pain, flatulence and diarrhea was found to be coproporphyrin I.

A. W. Dox

The immuno-chemical system sheep blood-antisherp blood serum. Edward Brumms. *Arkiv Kemi, Mineral. Geol.* 12B, No. 10, 3 pp (1935); cf. C. A. 28, 6475.

1 The highly purified Forssman antigen, unobtainable in clear water soln., is completely dissolved after the addition of bile acids. It is resistant to proteolytic enzymes (papain, trypsin), HNO<sub>3</sub> and Ph isocyanate. Diazomethane reacts with the antigen in an ethereal medium, the antigen losing much of its immunological capacity, possibly because of the carbonyl groups in the antigen mol. After the influence of proteolytic enzymes (trypsin, papain) the Forssman antibody loses its immunological activity. The antibody is pptd at pH 5.5, pptn. occurring only in the absence of electrolytes. The purified antibody is completely stable at 37° within the pH range 5-10. Complete inactivation of the antibody is obtained by HNO<sub>3</sub>, indicating the presence of free amino groups in the antibody mol. Quant. loss of activity is also caused by Ph isocyanate.

Edward Eagle

Serum gelification reactions in human leprosy. G. Fabiani. *Compt. rend. soc. biol.* 120, 13-14 (1935).—In leprosy, tuberculosis, syphilis and kala-azar the addition of 2 drops 40% HCHO or 0.1 cc. lactic acid to 1 cc. serum usually causes gelification. In leprosy the gelification time ranges from a few min. to several hrs.

L. E. C

Variations observed in Weltmann's reaction for cancer. Dismutation of the band of coagulation. C. Carrière, P. Martin and J. Driessens. *Compt. rend. soc. biol.* 120, 31-2 (1935); cf. C. A. 29, 2933.

L. E. C

Value of the formal gelification and formal-substance reactions in the diagnosis of canine leishmaniasis. P. Cartana. *Compt. rend. soc. biol.* 120, 63-5 (1935).—Neither reaction is specific.

L. E. C

Blood amino acids in surgery. Adriañ J. Bengola, Carlos Velasco Suarez and Remo S. Ferracani. *Rev. med-quir. psicol. J. medicina* 6, 245-60 (1935).—Lesions of the liver are accompanied by an increase in aminoacids. Major surgical operations, regardless of the anesthetic used, usually cause an increase in aminoacids for a few days and the increase is greater if there are post-operative complications. Tissue destruction is probably responsible for the increase. A summary of 45 case reports is given. Twenty-five references. The amino acid contents of the blood cells and plasma and their relation to surgical operations. Remo S. Ferracani. *Ibid.* 261-5. In 9 of 25 diversified surgical cases the operation was followed by a decrease in the cell amino acids/plasma amino acids ratio; in the other 16 cases the ratio increased. In all cases the total blood amino acids increased. Presumably the permeability of the cells to amino acids was changed but the mechanism is uncertain. The nature of the nutrient and the anesthetic used do not seem to be factors.

L. E. C

The treatment of milk allergy and its basic principles. Bret Ratner. *J. Am. Med. Assoc.* 105, 934-6 (1935).—The proteins of the whey fractions, lactalbumin and lactoglobulin, are usually responsible for allergy. Heating or evap. milk causes coagulation of these proteins and greatly reduces the ability of the milk to produce sensitivity or induce allergy. In cases where allergy is reported as due to casein, error is commonly caused because of the use of impure casein preps in testing for sensitivity. Twenty-five references.

F. P. Griffiths

The so-called mosaic fungus as an intercellular deposit of cholesterol crystals. A. M. Davidson and P. H. Gregory. *J. Am. Med. Assoc.* 105, 1262-4 (1935).—The mosaic sometimes associated with skin infections and often confused with true hyphae is shown to consist of aggregations of cholesterol crystals. The relationship of the deposits to ringworm infection is not known.

F. P. Griffiths

Levulosemia in hepatic disturbances. P. De Lucia and E. Claar. *Minerva med.* 1935, II, 345-59. A transitory levulosemia of 70-140 mg/100 was produced 30-60 min. after the ingestion of 40 g. levulose in 300 cc. H<sub>2</sub>O by normal persons or patients with other than hepatic diseases. Thirty-three % of the persons with altered hepatic function showed a levulosemia greater than 140 mg. which persisted 4-5 hrs.

Helen Lee Gruel

Method of increasing the sensitiveness of animal tumors to x-rays. S. Russ and G. M. Scott. *Proc. Roy*

*See* (London) B115, 316-20 (1935) —Expts. on over 200 tumors on rats showed that a marked increase in sensitivity to the effects of x-rays without apparent toxic effect was produced by either injection of thorotrast into the tumor or injection of well-established growing tumors of rat sarcoma vitally stained with Evans blue into either the tumor or another part of the body. Vital new red and anastomosing blue did not have this action on the tumors.

Joseph S. Repture  
Local factors influencing dental caries: A study of organic matter associated with enamel. Paul Pines. *Bull. Dent. J.* 59, 372-91 (1935) —Examin after staining of grooves in occlusal surfaces of unerupted teeth did not prove conclusively the existence of a surface layer. Examine 1944 on the org. material removed from the enamel indicated its keratin nature in some respects. Attempts at decomposition of the keratinous material were unsuccessful. *Streptococcus* was not found in materials from carious lesions or in saliva from mouths known to contain carious teeth. Decalcification of enamel was shown to proceed at different rates depending upon whether the destruction was proceeding across or along the enamel rods. The effect on tooth-sections, synthetic saliva and lactic acid was negligible. An acid-resistant matrix has been demonstrated in enamel.

Francis Krasnow  
A microchemical study of human biliary calculi. Thomas W. Ray. *J. Biol. Chem.* 111, 689-97 (1935) —"Analysis of a large no. of human biliary calculi shows there is no essential quantitative difference between the types referred to as cholesterol-pigment-Ca stones and cholesterol-pigment stones. Hence there is no quantitative basis for the present classification of these 2 varieties. Some of the former stones contained even more cholesterol and less mineral matter than some of the latter. Furthermore some stones of supposedly coprostanic nature proved to be remarkably alike. There is a surprising regularity in the way the constituents are deposited in some stones but as a rule these substances are laid down without order. Stones from the same gall bladder were found to be very similar from a chemical standpoint." *Mg*, *Ca* and *Pb* were found in about half of the stones; *Fe* was always found, frequently in both the ferrous and ferric form, and *Ca* and *P* are constant constituents. *Ascorbic acid* appears in both types.

A. P. Lech  
The metabolism of inorganic salts and water in hepatic animals. III. 1. The metabolism of inorganic salts. (3) Perfusion experiment of the extirpated liver. Livio Sengen. *Jap. J. Gastroenterol.* 7, 134-17 (1935); cf. C. A. 29, 6947 —Rabbit livers were perfused with  $\text{CCl}_4$  and then perfused with  $\text{CaCl}_2$ ,  $\text{MgCl}_2$ ,  $\text{KCl}$  and  $\text{NaCl}$  solutions. The amt. of cations fixed by the tissue was found to be identical for each salt. IV 2. The metabolism of water. *Ibid.* 111-14 (1935) —Very few data indicate that ligation of the common bile duct in rabbits or injury to the liver with  $\text{CCl}_4$  increases the  $\text{H}_2\text{O}$  of the liver, kidneys, intestines and brain.

C. M. McCav  
Sero-hematological investigations on malignant neoplasms. XII. New research on the first reaction. G. D'Alessandro and R. Infonzo. *Buchon. Arch. Sper.* 2, 298-306 (1935); cf. *Fabrics*, C. A. 29, 3914 —The cheilanthum test can be made more evident by previous lysis of the serum. The fibrinogen can be substituted by fibrin, but this does not effect an increased stability. Neoplastic serums have a higher content of small volumes. The ability of the serum-fibrin complex in serums of neoplasms of the bile tract is attributed to a change in the ionic metabolism.

A. E. Meyer  
Calcium, phosphorus and alkali reserve in the nutrition osteoporosis caused by starvation. Giuseppe Nazzari. *Buchon. Arch. Sper.* 2, 383-9 (1935) —Rabbits receiving 5% lactate by mouth develop a bone disease resembling rickets. The *Ca* in the blood increases, the *P* decreases and the alkali reserve is diminished.

A. E. Meyer  
Hyperlipidemia and cholesterolemia. Jans Blij and Chris Stamp. *Acta Med. Scand.* 85, 12-21 (1935) —It is shown that the hyperlipidemia in nephrotic subjects bears no relation either to the hypoproteinemia or to the anuria condition. Crystallinuria, or the urea and creatinine

clearance, and cholesterolemia proceed in a parallel manner, but the urinary cholesterol does not depend upon the blood cholesterol content, or upon diuresis. There is a relationship between the cholesterol and protein excretion, but this is not marked by any degree of constancy.

S. Margolis  
Lactic acid formation in accumulated and irradiated tumor tissues. Walter Hartmann. *Buchon. J.* 280, 153-55 (1935) —The lactic acid formation of tumor tissue depends upon the content of the carbohydrate (blood sugar, glycogen) and upon the disappearance of lactic acid even under anaerobic conditions. Tumor tissues are more sensitive to the effect of radiation than is normal tissue, the inhibition of lactic acid-forming activity not being a measure of the cell necrosis because the formation of lactic acid from some sources may remain unchanged.

S. Margolis  
Breast is the organ of the mammary. Th. Lorenz and O. Winkler. *Buchon. J.* 280, 614-41 (1935) —The *Er* in the organism of the mouse, like that of the normal, is entirely in the form of *Er* ions. The wide range of variation in the blood *Er* values points to an alimentary origin, while the generally low values are obviously associated with the low *Cl* activity in the *Er* deficient diet. In the mouse as well as in the normal individual the blood *Er* content decreases and the *Er* content of the plasma increases after a meal. This excludes the necessity to postulate the presence of an endocrine regulatory mechanism in the hypochloric *Er*. Incidentally the *Er* content of the hypochloric from mouse plasma shows at least a degree of variation as that from normal individuals.

S. Margolis  
The effect of parathyroid hormone and of tuberculin on the serum and tissue calcium of guinea pigs. Geoffrey C. Linder. *Buchon. J.* 28, 215-217 (1935) —The effect of parathyroid hormone on the *Ca* of the serum in the presence of *Al* and on the *Ca* distribution of the bone, brain and liver of normal and tuberculous guinea pigs was studied. The injection of large doses of *Al* caused no significant increase in the serum *Ca* of normal animals, but gave a noticeable increase when tuberculous animals were used. No difference in the degree of bone decalcification was observed in either case. I caused no *Ca* increase in the brains of normals, but some increase in those of tuberculous animals. Liver *Ca* was increased by injections of *Al* and by tuberculous infection and in the latter case it was further increased by *Al*. E. W. Scott.

The protein fractions of serum as different antigens. I. Parvizi. *Folia Biol.* 1935, 142; *Abstr. anal. chim.* Argentina 23, 68 (1935) —Two globulins of different antigenic nature, as shown by anaphylactic shock, were obtained. To obtain each globulin, serum with 13.5%  $\text{Na}_2\text{SO}_4$  at 55°, wash with 14%  $\text{Na}_2\text{SO}_4$ , repeat 4 times at 0° and electrolyze to  $\lambda = 1.7$ . For second globulin, serum with 21.5%  $\text{Na}_2\text{SO}_4$  at 55°, wash the precip. with 22%  $\text{Na}_2\text{SO}_4$ , repeat 4 times at the same time washing the cream as before, once with 13.5%  $\text{Na}_2\text{SO}_4$ , dissolve the final precip. in distilled  $\text{H}_2\text{O}$ , dialyze and electrolyze to  $\lambda = 1.7$ . The  $\alpha$ -globulin was obtained by the method of Paul and Stenberger (C. A. 23, 247) and that of Howe (C. A. 13, 75), supplemented by electrolysis to  $\lambda = 1.7$ , as compared to  $\lambda = 1.7$  and pseudoglobulin.

E. M. S.  
Blood regeneration in severe anemia. Fractions of kidney, spleen and heart compared with standard liver fractions. F. S. Roberts-Robbins, G. S. Wallen and G. H. Wiegand. *Am. J. Physiol.* 113, 47-70 (1935); cf. C. A. 24, 5345 —Expt. evidence indicates that there are several factors, rather than a single factor, responsible for the potent influence of these fractions upon the regeneration of red cells and hemoglobin in eryth. anemia due to blood withdrawal in dogs.

E. D. Water  
Quantitative theory of the precipitin reaction. IV. The reaction between crystalline egg albumin and its homologous antibody. Michael Heidelberger and Forster E. Kendall. *J. Exp. Med.* 62, 677-721 (1935); cf. C. A. 23, 5129 —A quantitative theory of the precipitin reaction based on the laws of classical chemistry has now been found applicable to the crystalline egg albumin-antibody system. Equations derived from the theory permit the calculation of

the behavior of an anti-egg albumin serum over most of the reaction range after a few quant. analyses have been made for the N pptd. The empirical relation, shown to have advantages in the dye-antidye system, may also be used for the Ea-A reaction. Serum from the same animal after successive courses exhibits progressive changes which have been described graphically and quantitatively. These changes are believed to consist in the formation of more and more antibody capable of reacting with a large no. of chemically different groupings in the antigen mol. Evidence is presented that anti-egg albumin is not homogeneous, and that even after prolonged immunization the antiserum contains much low-grade antibody, incapable of forming ppts. unless more reactive precipitin is present. Factors affecting the equivalence point ratio are discussed.

C. J. West

Further observations on the blood cholesterol of rabbits in relation to atherosclerosis. Kenneth B. Turner and Emily H. Bidwell. *J. Exptl. Med.* 62, 721-32 (1935); cf. C. A. 27, 4310.—The action of KI in preventing a significant rise in the blood cholesterol (C) of rabbits fed C was temporary. After about 4 months it lost its effectiveness and the blood C rose. In rabbits with hypercholesterolemia resulting from long-continued C feeding, the administration of KI caused a marked rise in the blood C. On the other hand, dried whole thyroid given to such animals produced a sharp fall in the blood C. This fall was temporary and was followed by a rise to new high levels. In thyroidectomized rabbits fed C and KI, both thyroid and thyroxine delayed but did not prevent a rise in blood C. Even with the hypercholesterolemia in these animals, however, the incidence of atherosclerosis was low. Age apparently played a part in detg. the response of the blood C to C feeding. In a group of old rabbits when compared with a younger group the rise in the C of the blood was greater and the subsequent return toward normal was slower when the feeding was stopped.

C. J. West

Physiological reversal of effects of adrenaline hypertension. Raymond-Hamet. *Compt. rend.* 201, 510-2 (1935) Julius White

## H—PHARMACOLOGY

A. N. RICHARDS

Comparative chemotherapeutic studies of arsenoxide (3-amino-4-hydroxyphenylarsenoxide) and neoarsphenamine. Geo. W. Raiziss and Marie Severac. *Am. J. Syphilis and Neural* 19, 473-80 (1935).—The max. tolerated dose for arsenoxide (I) intravenously to rats is 0.018 g. and for neoarsphenamine (II) is 0.400 g. per kg. body wt. The min. trypanocidal dose of I is 0.0025 g. and of II is 0.020 g. per kg. body wt. Hence, the therapeutic indexes are 7.2 and 20, resp. The max. tolerated dose of I and II in rabbits is 0.011 g. and 0.200 g. per kg. body wt., resp. The min. curative dose of I and II in exptl. rabbit syphilis is 0.012 g. and 0.040 g., resp. The therapeutic indexes are therefore 0.92 and 5. Philip D. Adams

Differential biological reaction of cobaltous compounds and certain cobaltic complexes (cobalthammes). Jean-Marie Le Goff. *Compt. rend.* 201, 531-2 (1935).—Injection of a cobaltic complex or cobalthammes produces different effects than those previously reported for CoCl<sub>2</sub> (C. A. 22, 1403, 3459). The organism possesses not only the power of differentiating cobaltous compounds and cobaltic complexes but is able to distinguish N and Co in cobalthammes. Philip D. Adams

The influence of thyroid in the healing of wounds. Howard L. Puckett. *U. S. Naval Med. Bull.* 33, 510-16 (1935).—Desiccated thyroid (I) per os seems to increase the rate of healing of superficial wounds in young rats. Daily administration for 3.5 months produced no harmful effects. When I is used over a long period of time its effects on healing become less pronounced, and repeated wounds on the same animal apparently decrease the rate of cicatrization. Philip D. Adams

Physiological activity of some pyrocatechol derivatives. Michael G. Mulinas and Raymond L. Osborne. *Proc. Soc. Exptl. Biol. Med.* 32, 1344-6 (1935).—Pyrocatechol, ethylpyrocatechol and especially chloroacetylpyrocatechol

possess sympathomimetic powers in which the inhibitory effects predominate. In agreement with Dakin the catechol nucleus is, in great part, responsible for the typical sympathomimetic activity of adrenaline. The 3,4-position of the aryl hydroxyls, a 2-C side chain, a hydroxylated  $\beta$ -C, and substituent of some indifferent mol., preferably an amine, are contributory factors in the formation of a typically sympathomimetic drug. C. V. Bailey

Physiology of pyrimidines. VIII. Metabolism of isobarbituric acid in the rabbit. Wm. J. Conway and Leopold R. Cerecedo. *Proc. Soc. Exptl. Biol. Med.* 32, 1600-1 (1935); cf. C. A. 27, 3729, 3732.—In the rabbit as in the adult dog and in man pyrimidines are partly broken down into urea and partly conjugated with H<sub>2</sub>SO<sub>4</sub>. C. V. Bailey

Effects of phenacetin and aspirin respectively upon action of phenobarbital. Alfred Gilman and Henry G. Barbour. *Proc. Soc. Exptl. Biol. Med.* 32, 1634-6 (1935).—In the rat the administration of 50 mg./kg. of Mg phenobarbital produced symptoms of excitement and then depression for several hrs.; the addn. of an equal dose of acetylsalicylic acid nullified these effects, the addn. of 5 times the dose of phenacetin in no way diminished the activity of phenobarbital, it diminished the toxic effects when the latter was given in large doses. C. V. B.

Lecithin in experimental arteriosclerosis. Preliminary study. Wm. G. Downs, Jr. *Am. Med.* 41, 460 (1935).—In expts with rabbits the addn. of relatively small amounts of lecithin to the diet prevented the occurrence of exptl. arteriosclerosis of high cholesterol diet origin. R. B.

The biological effects of beryllium. Russell N. Loomis and Emul Bogen. *Am. Rev. Tuberculosis* 32, 475-80 (1935).—Although among many salts tried (*Trans. Nat. Tuberc. Assoc.* 1932, 28, 163) none exerted a definitely favorable influence on the course of exptl. tuberculous guinea pigs, Be in the form of basic tartrate or the chloride in doses of 1 and 5 mg. (or 10 mg. of the basic salt) accelerated the development of tuberculosis in the treated guinea pigs. The same effect was noted whether the animals were infected with large or small doses of virulent human tubercle bacilli and whether infected subcutaneously or by inhalation. Oral administration of the Be did not appear to be effective. Repeated injections and larger doses gave the more const. results. Admin. in media or with bacilli did not affect the growth of the bacilli. The basic chloride, the nitrate, the tartrate, the phosphate and the lactate all gave similar results. The nitrate and a suspension of the insol. carbonate gave no perceptible effect. The Be rickets reported in rats (Guyatt, Kay and Branson, C. A. 27, 5585) were not observed in these guinea pigs. H. J. Corper

The effects of the inhalation of hydrogen fluoride. II. The response following exposure to low concentration. Willard Machie and Karl Kottmiller. *J. Ind. Hyg.* 17, 223-9 (1935); cf. C. A. 28, 2788.—The lower limit of toxic concns. of HF in air lies between 0.03 and 0.0025 mg. per l. Lungs and liver are most severely and consistently affected. III. Fluorine storage following exposure to sub-lethal concentrations. Willard Machie and E. W. Scott. *Ibid.* 230-40.—Distribution of fluorides in ashed tissue was detd. by treating with perchloric acid, and titrating the F with 0.026 N cerous nitrate or 0.003 N Thimite. In animals exposed to fluorides, F was found in high concns. in the bones and in instances of prolonged exposure in the teeth. A. L. Elder

Pharmacological properties of ergobasine, a new alkaloid from ergot. E. Rothlin. *Compt. rend. soc. Biol.* 119, 1302-4 (1935).—Ergobasine, C<sub>21</sub>H<sub>25</sub>O<sub>5</sub>N<sub>3</sub>, [α]<sub>D</sub><sup>20</sup> = +90°, acts on the uterus like ergotamine. It is hypertensive but not sympatholytic. It accelerates respiration. It has little or no effect on glucemia and does not produce gangrene at the site of injection. The lethal doses are: for white mice, intravenously, 0.145; rat subcutaneously, 0.5; rabbit, intravenously, 7.5; cock, intramuscularly, more than 10 mg./kg. These doses are about 4 times those of ergotamine. Cf. Stoll and Burckhardt, C. A. 29, 5219, where the formula for ergobasine, by mistake, is given C<sub>21</sub>H<sub>25</sub>O<sub>5</sub>N.

L. E. Gilson

Pharmacological reactions of the melanocytes of detached scales of *Carassius vulgaris*. J Verne and V Viter. *Compt. rend. soc. biol.* 119, 1312-13 (1935).—Scales from live carp were placed in hanging drops of serum of various vertebrates. Posterior hypophysis ext (II) caused expansion of the melanocytes, ephedrine (II) and adrenaline (III) caused contraction. Upon standing [several days] sensitivity to II disappeared before sensitivity to III. Nicotine suppressed the sensitivity to III and ergotamine inverted the response to III. I acts directly on the melanocytes and they react even if detached from the scale. II and III act through the nerve fibers and their effect is greatly decreased if the scales are cut into small pieces. They have no effect on isolated melanocytes. L E Gilson

Treatment of arterial hypertension by intravenous injection of octyl alcohol. I. Pezzangora. *Compt. rend. soc. biol.* 119, 1331-32 (1935).—The patients were given 15 injections, on alternate days, of 10-15 cc of a 1:100,000 soln. of octyl alcohol in distilled water. A decrease in blood pressure was produced in essential hypertension cases but not in cases of stable hypertension with cardio-renal complications. Diuresis was increased. L E Gilson

Opposed action of the hydrogen and hydroxyl ions on pharmacodynamic reactions of the autonomic system. Action on uterine tonus. M Tiffeneau and D Brown. *Compt. rend. soc. biol.* 119, 1380-2 (1935).—At  $\text{pH}$  8.4 the tonic action of adrenaline, histamine or posterior hypophysis ext. on the isolated uterus was considerably greater than at  $\text{pH}$  7.4. At  $\text{pH}$  8.3 the action was greatly reduced or even inverted. L E Gilson

Effects of hydrogen and hydroxyl ions on the anesthetic action of propyl bromide on fish. M Tiffeneau and D Brown. *Compt. rend. soc. biol.* 119, 1382-4 (1935).—Immersion for 5 min in a 1/750 soln. of lactic acid decreased the time required to produce anesthesia when the fish were transferred to a 1/1500 soln. of  $\text{PrBr}$ , while immersion for 5 min. in a 1/3000 soln. of  $\text{Na}_2\text{CO}_3$  prolonged the time required. L E Gilson

Action of periplocoside. T. Solacolu, G. Balcacanu, V. Vanu and G. Hermann. *Compt. rend. soc. biol.* 120, 3-52 (1935); cf. C. A. 29, 2198<sup>1</sup>.—In dogs weighing 15-16 kg. the intravenous injection of 2-7 mg. periplocoside caused a general and recurrent increase in arterial pressure, suppression of urinary secretion, dilation of the kidneys, decrease in spleen vol. and slowing of respiration. L E Gilson

Chlorine of the livers of hyperthyroidized animals. I. L. Parhon and M. Cahane. *Compt. rend. soc. biol.* 120, 52-53 (1935).—In 6 out of 8 animals given repeated injections of thyroid ext. the Cl content of the liver was lightly increased. L E Gilson

Blocking of the reticuloendothelial system and adrenal-chloroform syncope. Constantin C. Velluda and can Gabriel Russu. *Compt. rend. soc. biol.* 120, 57-58 (1935).—Blocking with curarine of Chinese ink prevented the syncope (in dogs) and decreased the hypertensive action of the adrenaline. L E Gilson

Action of sodium bicarbonate on the production of hyperglycemia by pilocarpine and by ligation of the portal vein. Victor Papilian and Victor Preda. *Compt. rend. soc. biol.* 120, 58-60 (1935); cf. C. A. 29, 3725<sup>1</sup>.—Intravenous injections of  $\text{NaHCO}_3$  inhibit the production of hyperglycemia by pilocarpine but do not affect the hyperglycemic action of pilocarpine; hence the mechanism of the 2 actions must be different.  $\text{NaHCO}_3$  prevents the increase in glucose which usually follows ligation of the portal vein. L E Gilson

Histopicrographic study of the fixation of manganese during experimental chronic intoxication by manganese dioxide. A. Polcard. *Rev. soc. argentina biol.* 11, 153-7 (1935); *Compt. rend. soc. biol.* 120, 364-6 (1935).—Rats were given  $\text{MnO}_2$  in their food over long periods. There was some accumulation of Mn in the testicles, brain, lungs, liver and renal cortex but not in the renal medulla. After the feeding of  $\text{MnO}_2$  was discontinued Mn disappeared from the liver and kidneys first. L E Gilson

Pharmacological difference between the tinctures of

*Strophanthus hispidus* and *S. kombé*. Nicoletta Sabatucci. *Scienza farm.* [2], 3, 49-63 (1935).—Tests made by the isolated toad heart method of Galatá (*Boll. soc. biol. sper.* 1, No 4 (1925)), the pigeon emesis method of Ilanahá (C. A. 24, 1428) and the frog method of Focke showed the tincture *S. kombé* to be much more active in each case. L E Gilson

Parathyroid extract and viosterol treatment of radium poisoning. L. F. Craver and H. Schlundt. *J. Am. Med. Assoc.* 105, 959-60 (1935).—Alternate periods of administration of parathyroid ext. with low-Ca diets or viosterol with high-Ca diets did not cause marked increases in the amounts of Ra eliminated by 3 patients suffering from Ra poisoning. J P Griffiths

The relationship of drug therapy to agranulocytosis. Roy R. Kracke and Francis P. Parker. *J. Am. Med. Assoc.* 105, 960-6 (1935).—Amidopyrine, dipyrophenol and closely related drugs cause agranulocytosis. Indiscriminate use of amidopyrine or proprietary drugs which contain it should be avoided. A list of preps containing amidopyrine is given. Seventy-five references. F P Griffiths

How drugs act. H. Raymond Ing. *Science Progress* 30, 252-7 (1935).—A review (26 references), with considerable attention to the relationship of drug action to the humoral transmission of nerve impulses. J. S. H.

Sedatives in dentistry. H. T. Roper-Hall. *Brit. Dental J.* 59, 177-86 (1935). Frances Krasnow

The action of prostigmine on the cardio-vascular apparatus. Leonardo Donatelli. *Arch. sci. biol.* (Italy) 21, 210-12 (1935).—This substance acts peripherally on the intracardiac vagal endings and centrally on the bulbar pressor centers. Atropine counteracts the functional disturbances. P F Meludi

The treatment of Addison's disease with common salt. G. Micalizzi, A. Collazo and J. Jimenez. *Presse med.* 43, 505-7 (1935).—Most cases of Addison's disease improve upon medication with NaCl and the use of cortical hormone can be restricted. Immediate effects are alleviation of the Na-Cl disequilibrium, the dehydration and the acidosis. A E Meyer

Vagotonin in hypertension. P. Bernal. *Presse med.* 43, 507-10 (1935).—The action is gradual and without danger. A E Meyer

Pharmacology of *Troxil divaricata* Spreng. var. *Discolor* Griseb. Luis Fiorani. *Rev. farm.* (Buenos Aires) 77, 223-6 (1935).—The botanical description is given. The drug contains tannins, saponins and an alkaloid. It causes sensory and motor paralysis in animals. It is used in chronic arthritis as a diaphoretic and diuretic. A E Meyer

Poisonous gases. Carlos L. Carbonacci. *Rev. medica* (Buenos Aires) 1935, II, 908-1018.—A toxicological review. A E Meyer

The sugar-excretion threshold of rabbits treated with tansular extract. Chikara Tateishi. *J. Biochem.* (Japan) 22, 251-61 (1935).—It is stated that tansular ext. stimulates the sugar assimilation since the sugar-excretion threshold of rabbits is lowered by a small dose and raised by a large dose of this ext. Administration of cholic acid still further promotes the lowering effect of the ext. S. Morgulis

Arrow poisons. XII. C. G. Santesson. *Skand. Arch. Physiol.* 72, 93-102 (1935); cf. C. A. 29, 1510<sup>1</sup>.—Arrow poisons from the Belgian Congo region apparently contain the alkaloid erythrophiline. On the frog, *R. temporaria*, it produces symptoms of nausea, weakness and typical cardiac effects. The m. l. d. for the frog is 21.6 mg. of the crude poison per kg. The arrow poison from Borneo, which is the juice from bark of *Anharis lauraria*, produces typical cardiac effects and the m. l. d. dose (of different samples) ranged from 3 to 10 mg. per kg. The upas poison, also from Borneo, was investigated and it is thought to contain the *Anharis* poison, and a dose of 0.066 mg. of this kills a 31-g. frog in 1 1/2 hrs. The m. l. d. of this poison (Punan poison) is about 2.81 mg. per kg. corresponding to 4% anharin. S. Morgulis

Effect of cyanic acid on the respiratory metabolism of the organism. Knud O. Møller. *Skand. Arch. Physiol.* 72, 103-14 (1935).—Rabbits under urethan anesthesia

receiving subcutaneous injections of NaCN show a quick, but transient rise in the  $O_2$  consumption. In rabbits receiving continuous injections of NaCN this initial rise occurs only occasionally, while in those inhaling the gas there is no increase at all. From this it is concluded that a sudden increase in HCN concentration is the condition responsible for the initial rise in  $O_2$  consumption. S. Morgulis

The effect of methylene blue and of the combination hydrocyanic acid-methylene blue on the respiratory metabolism of the rabbit. Knud O. Møller. *Skand Arch Physiol* 72, 115-25 (1935).—Intravenous injection of methylene blue in amounts of 3-30 mg. per kg. causes a strong increase in the  $O_2$  consumption of the rabbit which varies with the injection dose. The larger doses also cause a rise in the body temp. Intravenous injection of 40-50 mg. per kg. causes a relatively smaller increase in the  $O_2$  consumption than the smaller doses, but a greater rise in the body temp., and lead more frequently to death. The intravenous injection of 20 mg. per kg. either 45 min. before or 15 min. after an injection of 7 mg. NaCN per kg., which is strongly lethal, entirely removes the inhibition of oxidation and the rabbits remain alive. Injected 20-25 min. after the NaCN administration methylene blue restores the  $O_2$  consumption to the normal value, but does not save the animals from death. The methylene blue begins to exert its effect invariably within less than a min. after the injection. S. Morgulis

Dehydrogenation processes in the tissues of animals treated with thyroxine. M. Reiss, L. Schwarz and F. Fleischmann. *Endokrinologie* 16, 145-8 (1935).—Experiments with the methylene blue procedure show that the organs (kidney, liver and muscle) from animals treated with thyroxine have a stronger anaerobic dehydrogenation activity than those from untreated animals. A similar increase was noted in the liver from fasting or fatigued animals, and this increased activity of the liver tissue is attributed to an accumulation of donor substances resulting from glycogen mobilization. S. Morgulis

Cardiac output in man after the administration of  $\alpha$ -dinitrophenol. E. Nyman and A. Palmblom. *Skand Arch Physiol* 72, 160-74 (1935).—Single or repeated doses of 4 mg. per kg. in adult human subjects caused a pronounced increase in the  $O_2$  consumption without affecting the minute vol. of the heart. The increased  $O_2$  consumption must, therefore, be attributed to the opening up of capillaries. The cardiac output per beat actually decreases indicating a weakening of the heart action. S. Morgulis

The injection treatment of varicose veins. F. E. Greenbaum. *Clin. Med. Surg.* 42, 480-3 (1935).—A combined solution of quinine and Na morphinate in which the alkali-insoluble alkaloid is peptized by the soap is reported to be of value in the obliterative injection treatment of varicose veins. T. H. Rider

The trypanocidal action of styryl selenazole compounds. C. H. Browning, R. Gulbrausen and V. McCarty. *J. Pharmacol.* 54, 36-70 (1935).—Mol. proportions of 1-methylthioazelenazole methoxide (I) and  $\beta$ -acetyl- $\alpha$ -methylbenzaldehyde were boiled in abs. alc. 2 hrs. A deep violet color and a violet-brown ppt. developed. The ppt., 1-( $\beta$ -acetylaminostyryl)benzo-selenazole methoxide (II), m. 285°. Similarly I condenses with  $\beta$ -dimethyl- $\alpha$ -methylbenzaldehyde to give a greenish black product 1-( $\beta$ -dimethylaminostyryl)benzo-selenazole methoxide (III), m. 250° (decolor). Both products were sulfonated with chlorosulfonic acid in  $H_2OAc$ , the sulfates being yellow and cryst., recrystg. from  $H_2OAc$ , easily sol. in water and not pptd. by alkali. No analyses or controls are given for the sulfonates, but they were halogen free. II had a temporary therapeutic effect at the rate of 0.001 g. for an uninfected mouse weighing 20 g. In the same dose III was without effect. The more sol. sulfonate of III showed no effect in max. tolerated dose while the sulfonate of II produced only variable results. T. H. Rider

Alcohol injected intravenously. Rate of disappearance from the blood stream in man. Henry W. Newman and Windsor C. Cutting. *J. Pharmacol.* 54, 371-7 (1935).—Max. alc. concn. after intravenous injection is linear and

the amt. required to maintain blood alc. at a const. level is the same regardless of the level. Conclusion: The metabolism of alc. in man proceeds at a const. rate, regardless of blood concn. T. H. Rider

The evaluation of gonadotropic hormone preparations on the basis of the rat mouse ratio assay. Warren O. Nelson and Milton D. Overholser. *J. Pharmacol.* 54, 378-92 (1935).—The relative activities as detd. on mice and rats for gonad. stimulating preps. including exts. of pituitary glands, pregnancy urine and pregnant mare serum varied considerably between a ratio of 5:1 and 1:3 for mouse and rat, resp. Conclusion: Variations are due to varying proportions of follicle-stimulating and luteinizing factors. The rat-mouse assay ratio offers a method of differentiating between anterior pituitary and anterior pituitary-like gonadotropic hormone complexes. T. H. Rider

The pharmacologic action of ergotocin, a new ergot principle. M. Edward Davis, Fred L. Adair, K. K. Chen, and Edward E. Swanson. *J. Pharmacol.* 54, 398-407 (1935).—Ergotocin may be assayed by the U. S. P. cock's comb method, by isolated uterine response (but not the Broom-Clark method). It has little inhibitory action on adrenaline. Ergotocin maleate has a m. d. of 230 mg. per kg. in mice, and 80 mg. per kg. in guinea pigs by intravenous injection. Other pharmacol. actions are described. T. H. Rider

Cumulative poisoning by lanadign, ouabain and digitoxin in dogs. R. C. Li and H. B. Van Dyke. *J. Pharmacol.* 54, 415-25 (1935).—Relative potencies were ouabain 10, lanadign and digitoxin 1 in the frog and 4:1:1, resp., in the dog. Cumulative activity was greatest for lanadign, least for digitoxin, the effect of repeated doses of digitoxin in dogs being clearly different in dogs and cats. T. H. Rider

Ketogenesis-antiketogenesis. I. The influence of ammonium chloride on ketone body formation in liver. Norman L. Edson. *Biochem. J.* 29, 2082-94 (1935).—The effect of  $NH_4Cl$  on ketogenesis in the liver was studied with the tissue slice technique. Micromethods for the detn. of  $\beta$  ketonic acids, both manometrically and volumetrically, and  $\beta$ -hydroxybutyric acid were described. Anan's (C. A. 28, 4078) statement that  $NH_4Cl$  increased the production of acetoacetic acid (I) from pyruvic acid in the liver was confirmed. In the absence of substrate  $NH_4Cl$  increased the formation of I in the well-nourished liver but not in the starved liver where I was already being formed rapidly. The fatty acids, regardless of the no. of C atoms, caused increased production of I and this was further accelerated by  $NH_4Cl$ . Fatty acids contg. an even no. of C atoms formed 3 times as much I as those having an odd no. The effect of  $NH_4Cl$  was inhibited by glycerol. E. W. Scott

A pharmacodynamic study of berberine sulfate. Mario Soto and N. Pedro Sívori. *Rev. asoc. med. Arg.* 47, 109-14 (1933); *Anal. asoc. quim. Argentina* 23, 11B (1935).—An exptl. study on frogs and guinea pigs. The nervous system and the respiration are depressed. The action of berberine sulfate on the circulatory organs and respiration. *Ibid.* 114-21.—A exptl. study on dogs, with cardio- and pneumograms. E. M. Symmes

Poisoning by magnesium hyposulfite. Leonidas L. Silva. *Rev. asoc. med. Arg.* 47, 200-6 (1933); *Anal. asoc. quim. Argentina* 23, 12B (1935).—The min. intravenous lethal dose of Mg hyposulfite in rats is 0.25 g./kg., in dogs 0.30 g./kg. There is no narcosis. F. M. S.

Poisoning by carbon monoxide and psychosis. Nereo Rnjap and Jose Belbey. *Rev. asoc. med. Arg.* 47, 386-92 (1933); *Anal. asoc. quim. Argentina* 23, 12B (1935).—A study of cases. E. M. Symmes

Poisoning by barbital. Treatment by coramine. Alfredo Buzo and Guido Costa Bertani. *Rev. asoc. med. Arg.* 47, 398-401 (1933); *Anal. asoc. quim. Argentina* 23, 11B (1935).—A description of cases treated, with recovery. E. M. Symmes

Is apiole actually toxic? Frappi. *Rev. med. Lat. Am.* 1933, 825-9; *Anal. asoc. quim. Argentina* 23, 12B (1935).—Apiole causes poisoning and lesions in the liver

and kidney, sometimes fatal. The drug is difficult to obtain pure.

**J. M. Symmes**  
Acid-base changes in the serum of the dog associated with the hyperthermia of dimorphol administration. Edward Munterler, Victor C. Myers, Wayne H. Darnell and Carla Form. *Am. J. Physiol.* 113, 186-92 (1935); cf. C. A. 26, 5051.—Oral administration of 1,2,1-dimorphol in nonfatal doses was followed by a decrease in bicarbonate concn. and an increase in chloride concn. in the serum. The serum total base changes were variable and appeared to depend on the dose given. The serum pH remained within normal limits but tended to be lowered from the control level when larger doses were given. After subcutaneous injection of either a nonfatal or fatal dose of the drug both the serum bicarbonate and chloride decreased. The serum total base concn. tended to decrease after a nonfatal injection, while it tended to increase after the fatal dose injection. In both cases there was a definite increase in the undetected acid concn. The serum pH remained within a narrow range. Despite this fact it is believed that hyperventilation probably played a prominent part in the changes observed in the acid-base balance.

**J. D. Walter**  
A comparison of the effects of sympathin and adrenaline on the iris. W. B. Cannon and A. Rosenblueth. *Am. J. Physiol.* 113, 251-8 (1935); cf. C. A. 27, 4288; 29, 7440.—The results of experiments on the iris of the cat are discussed. Tentative conclusion: Sympathin I, unlike adrenaline, may affect not only the dilator but also the constrictor muscle of the iris. The differences between cardio-pulmonary and hepatic sympathin may be attributed to the presence of sympathin I in the former and its absence from the latter.

**E. D. Walter**  
Differential depression of vasomotor mechanisms by adrenaline. Leland C. Wyman and Caroline Tunt Soden. *Am. J. Physiol.* 113, 271-8 (1935); cf. C. A. 26, 5345.

**E. D. Walter**  
The influence of adrenaline on the blood sugar, lactic acid and inorganic phosphorus of completely hypophysectomized dogs. I. L. Chaikoff, F. L. Reichert, L. S. Read and M. E. Mathes. *Am. J. Physiol.* 113, 306-11 (1935); cf. Chaikoff, et al., C. A. 29, 7502A.—As judged by the 3 blood constituents (blood sugar, lactic acid and inorg. P), completely hypophysectomized dogs are capable of responding to adrenaline. The responses, however, were diminished as compared to those of normal and control animals. The significance of the abnormal adrenaline reaction of the completely hypophysectomized dog is discussed.

**E. D. Walter**  
The influence of sodium fluoride upon the basal metabolism of the rat under several experimental conditions. Paul H. Phillips, H. E. English and E. B. Hart. *Am. J.*

*Physiol.* 113, 441-9 (1935); cf. C. A. 28, 1079A.—F in the form of NaF does not lower the basal metabolic rate of the normal rat. NaF enhances the toxicity of hyperthyroidism induced by feeding desiccated thyroid. Insofar as the hyperthyroidism of toxic goiter and that induced by the administration of desiccated thyroid are identical, to that extent NaF therapy is contraindicated. A ration containing a combination of 0.15% NaF and 0.25% desiccated thyroid rapidly produces an exhaustion of body wt. and a fatal collapse, while either substance alone has no marked effect and is not fatal.

**F. D. Walter**  
Pharmacological studies of "Sensio," a Chinese drug from the dried skin secretion of toads. IV. The action of  $\psi$ -bufotalin, the active component in Sensio, and  $\psi$ -bufotalin bromide. Yoshito Kobayashi. *Proc. Imp. Acad. (Tokyo)* 11, 298-300 (1935); cf. C. A. 29, 1515A.—The min effective dose in rabbits and with perfused guinea-pig hearts is about equal for  $\psi$ -bufotalin bromide (I) and  $\psi$ -strophantidin (II). The m. l. d. of (I) in cats according to the Hatcher method is 240 times greater than the m. l. d. for (II). This unusually favorable ratio for the bromide does not hold for the  $\psi$ -bufotalin. The cumulative effect of (I) is slight. A possible structural formula for the compd is proposed.

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

Chemical composition of some foodstuffs of Northern Argentina. P. Mazzocco. *Rev. soc. argentina Biol.* 11, 34-17 (1935).

**L. E. Gilson**  
Vitamin contents of some common food materials in China. Chao-Yü Chen. *Science (China)* 19, 1211-51 (1935).

**C. L. Tseng**  
Some differences in the values obtained by the chemical and biological assays of vitamin C in certain foods. H. C. Hou. *Chinese J. Physiol.* 9, 291-8 (1935).—Good agreement between the 2 methods was obtained with oranges but with vegetables a lower value was obtained by the biol. method than by the chem. method.

**L. A. M.**  
Certified colors for foods are standardized materials. J. R. Hall. *Food Ind.* 7, 545-6 (1935).—The av. amt. of pure dye in the 15 permitted food colors is 90%. The other 10% is largely water of crystal and salt. Only actual experience and trial with a food product will insure securing the proper shade of color. In the dry state, these dyes will keep indefinitely, but the presence of moisture,

light and high temps. is detrimental. Glycerol makes a good preservative for food colors. The use of 1-2 oz. of citric or tartaric acid per gal. of color soln. is suggested, but the addn. of 0.25 oz. of  $\text{BzONa}$  is required for good keeping quality. The presence of reducing substances such as  $\text{SO}_2$ , bleaching agents and Fe is very destructive to most food colors.

**C. R. Fellers**  
Chemical reactions involved in food spoilage. J. Gangl. *Oesterr. Chem.-Ztg.* 38, 146-51 (1935).—A discussion of the anaerobic fermentation of carbohydrates, the development of rancidity in fats and the decompn. of proteins, and of the chem. tests for detg. the extent of these processes.

**W. Gordon Rose**  
Report on (the analysis of) cereal foods. J. A. LeClere. *J. Assoc. Official Agr. Chem.* 18, 560-2 (1935).—A brief discussion of the importance of suitable methods for the analysis of cereal products.

**A. Papineau-Couture**  
Determination of moisture in cereal products by distillation with tetrachloroethane. J. M. Tucker and T. E.

Burke *Analyst* 60, 663-7(1935).—The purpose of this investigation was to find a suitable method for detg. the low  $H_2O$  content of baked cereal products, the results of which could be correlated with baking losses. The results of the expts. described show that distn. with  $CaH_2Cl_2$  (b.  $140^\circ$ ) gives values which are in some cases the same but usually higher than those obtained by drying at  $98.5^\circ$ . The essential conditions are fairly rapid distn. and sufficient solvent to leave a mobile residue when all  $H_2O$  has been removed. The method is not reliable when considerable quantities of invert sugar are present. W. T. H.

A modification [in the form of the apparatus] of the Göttinger method for testing the quality of wheat, Georg Gliemeroth *J. Landw.* 83, 227-33(1935), cf. Engelle, *C. A.* 29, 6969<sup>a</sup>.—A dome-shaped flask is attached above the original sample flask to permit the immediate passage of  $CO_2$ . The principal function of the gas is unchanged. The results with the new type of flask were more concordant than those obtained with the former flask in which trapping of gas under the cover often occurred.

John O. Hardesty  
Kernel texture as an indicator of quality in hard red spring wheats. O. S. Aamodt and J. H. Torrie, *Can. J. Research* 13, C, 70-83(1935).—The gray wooded soils found at Fallis, Alberta, provided a satisfactory means of obtaining a differentiation in kernel texture in hard red spring wheats. Correlation studies showed that the varieties behaved more or less similarly from year to year in kernel texture, protein content and loaf vol., but not in partial baking score. Kernel texture was indicated as being a better measure of partial baking score than protein content, while the latter was the better index of loaf vol. A close relation was found between the kernel texture of the varieties grown at Fallis and both the partial baking score and loaf vol. of the same varieties grown at Edmonton. In the case of protein content detd. on the Fallis material no such relation was obtained. The wheat-kernel fermentation test was found to be of little value in differentiating between the baking quality of hard red spring wheat varieties. J. W. Shipley

Mass poisoning by wheat infected with *Lohium temulentum*. Julius Orient *Pharm. Monatsh.* 16, 191-3(1935).—Workers reporting cases of poisoning by wheat so infected are mentioned. It is found that uninfected wheat (sp. gr. 0.70-0.80) can be sown from infected wheat (sp. gr. 0.67) by flotation in  $H_2O$ . Of wheat and oat samples collected in 7 localities 8.3-23 and 22-56%, resp., were found to be infected. Chemistry, reactions, symptoms and treatment of poison cases are discussed.

H. M. Burlare  
The value and uses of bran. R. A. Lehmann *Mühle* 72, 1301-3(1935).—Analyses and digestibility values are given for various types of wheat and rye bran used in feeding swine and ruminants. Clifton L. Brooke

Nitrogen distribution and carbohydrate partition in Philippine rice bran. Joaquin Marañon and Luz Cosme, *Philippine J. Sci.* 57, 289-94(1935).—High grade Philippine rice bran that contained no hulls was analyzed and the composition ascertained. The bran contained a considerable amt. of carbohydrates (44.50%). The N in the bran (2.264%) corresponded to 14.15% protein by calcn. Investigation of the N distribution showed that the major portion of the nitrogenous substances in rice bran consisted mostly of protein, which is composed largely of non-basic N. The bran had a rather high content of starch (24.16%) and, in addn., contained small amts. of other carbohydrates such as pentosans, nonreducing sugars, gums and also crude fiber. Fourteen references.

F. L. Dunlap  
Grain conditioning. Heinz Gehle *Mühle* 72, 1027-30(1935).—The radiator conditioner is claimed superior to the warm-air conditioner, especially for soft wheats, which require higher temp. and shorter time than hard wheats. Expts. on German wheat using a lab. conditioner in which the wheat was slowly heated to  $40^\circ$  and then rapidly raised to  $50^\circ$  effected a marked improvement in baking quality. An electrical experimental conditioner. Otto Halmteuer, *Ibid.* 1029-32.—A lab. conditioner is

described which is heated by passing an elec. current through grain between 2 parallel plates. In one form of the app. the voltage can be varied from 100 to 2000 v., facilitating the study of conditioning at high temps. and short time. The present status of grain conditioning. Hermann Annen, *Ibid.* 72, 1031-4.—The milling advantages derived from conditioning are uniformity in milling quality of different wheats, making it possible to grind soft and hard wheats together, toughening of the bran, better mellowing of endosperm resulting in cleaner scpn. from the bran, decreased power consumption, improved sifting and purifying. The improvement in baking quality resulting from conditioning of soft wheats is due to hardening of the gluten and not, as often claimed, to increased enzymic activity. The gluten of hard wheat cannot be softened by conditioning. Diastatic activity of sprouted wheat can be reduced by suitable treatment. Expts. with the elec. expt. conditioner (cf. above) at temps. between  $40^\circ$  and  $60^\circ$  show a linear increase in gluten swelling no and shortening of the gluten with increasing temp., optimum gluten quality being obtained at  $55^\circ$ . Hard and soft wheat conditioning and its control. Ernst Bernher, *Ibid.* 1033-6.—Hard wheats with strong gluten should be conditioned at low temp., since their gluten needs no further strengthening. Hard wheat gluten cannot be made softer or more extensible even by long tempering at high moisture content, and the swelling rate of the gluten is not influenced thereby. Wheats with long dough development time are especially suited for strengthening soft wheat mixes. Soft wheat conditioning is to be considered from the standpoint of gluten hardening, and the extent of hardening is shown by the decrease in extensibility of the gluten. The farinograph and lementograph do not show the most important changes in gluten quality resulting from conditioning. Dough softening should not be interpreted as gluten softening. Gassing power and diastatic activity are not appreciably influenced by normal heat treatment or tempering, evidence to the contrary is based on tests of the finished flours, whose phys. differences due to conditioning lead to false conclusions. Proteolysis is of minor importance even in wheat mixes containing sprouted kernels. Dough softening is seldom or never the result of proteolytic degradation of the gluten, but is due to excessive starch degradation and hardening of the gluten. The wheat kernel contains no highly active proteolytic enzymes. Influence of conditioning on the extensibility of dough. Edwin Zeigler, *Ibid.* 1035-8.—Curves obtained with the Chopin extensometer and the farinograph are used to show that low extensibility can be increased and excessively high extensibility decreased by conditioning with warm air. Determination of the conditioning effect. Otto Halmteuer, *Ibid.* 1037-40.—Tests for changes in milling quality of grain effected by conditioning include milling tests on a simple attrition mill and stock analyses with detns. of both wt. and vol. of the sieve fractions and tests of the individual fractions. Baking tests should be combined with detns. of extensibility. Conditioning yesterday and today. Leo Hopf, *Ibid.* 1039-44.—Hard wheat conditioning has nothing to do with drying, its function is to transfer moisture from the exterior to the interior of the kernel and bring about the desired changes in gluten quality and kernel structure by the aid of heat. Soft wheat conditioning is simply an improved form of drying, moisture is transferred from the interior to the exterior of the kernel, and only enough is restored to the interior to alter the gluten quality and structure in the manner desired. Detailed procedures are given for conditioning of hard and soft wheats, and the effect of conditioning on different types of gluten is described. A combined grain peeling and conditioning process. Otto Kettner, *Ibid.* 1043-6(1935).—The app. is illustrated and described. Yield, keeping quality and color of flour, and aroma and flavor of bread are improved by peeling and conditioning of the grain (wheat or rye). Power consumption and cost of milling are lowered, and the grain mills more rapidly. Sound flour can be produced from musty grain, since the outer layers of the kernel are entirely removed. The preparation of grain (for milling)

in small and medium-sized mills. F. Alroth. *Ibid.* 1047-8 Conditioning. Leo Hopf. *Ibid.* 1129-32.—Polemical with Annen and Berliner (cf. above). The disputed softening of hard wheat gluten by conditioning is actually an increase in extensibility resulting from heightened water absorption and hyper-swelling of the gluten. Berliner's claim that the softening of dough attributed to proteolysis is due to starch degradation is inconsistent with the fact that starch-free gluten washed from sprouted wheat flour becomes soft and runny upon standing, in the same manner as dough. The decrease in elasticity of gluten during dough fermentation demonstrates gluten degradation. Zeigler's laminograms (cf. above) show at what temp. the gluten begins to break down under the influence of heat; this is not shown by the swelling no.

Clinton L. Brooke

Quality and keeping properties of flour from wheat grown on the black and gray soils of Alberta. O. S. Aamodt and A. G. McCalla. *Can. J. Research* 13, C, 160-7 (1935).—Weight per bushel and milling yields of hard red spring wheats grown on the black soil at Edmonton were the same as for the same varieties grown on the gray soil at Lethbridge. Grade, protein content and baking quality of Edmonton-grown samples were superior. The flour from most of the Edmonton-grown samples retained its quality for at least 2 years after milling, but flour from most of the Lethbridge-grown samples had deteriorated so much during storage for 10 months that it was unfit for bread-making. Flour from Reward showed less deterioration than that from any other standard variety grown at Lethbridge. It also had the best original baking quality, and is the only one of the recommended varieties considered satisfactory for the gray soil area.

J. W. Shipley

Nitrogenous matter of wheats and flours. A. Leyte. *Ann. agron.* [N.S.] 5, 72-83 (1935).—The classification of wheats by the relationship gliadin/glutinin gives different and much less precise results than those by the extensometer. The mechanical properties of a dough are similar to those of its gluten. Chemicals which can modify it (the least energy necessary to tear apart 1 g. of dough) produce great variations in the gliadin/glutinin relationship. The values for it and gliadin/glutinin relationships are changed in opposite directions. Mechanical properties of gluten are a function of the pH of its medium and are partly dependent on its nonnitrogenous content. They are not changed by a preliminary ether extraction. Flours, doughs, gluten and their solns. are sensitive to the action of certain oxidizers, reducing agents, antioxidants and proteolytic precipitants. The transformations seem due to reactions similar to autooxidation and autooxidation. An unknown substance (non-sensitive to chloroform but which reacts with traces of  $\text{Na}_2\text{SO}_4$ ,  $\text{NaOH}$  and  $\text{KCN}$ ) gives gluten its mechanical properties. Cystine and cysteine may be important.

F. W. Marsh

Report on viscosity of flour. Tentative method for viscosity determination of acidulated flour-suspension. C. G. Harrel. *J. Assoc. Official Agr. Chem.* 18, 577-92 (1935).—The study was undertaken to verify some of the results of Bayfield (C. A. 28, 2214; 29, 2219) and of Reiman (C. A. 28, 4706). The procedure proposed by Bayfield was slightly modified by specifying: (1) const. wt. of protein instead of const. flour wt., (2) making up the suspension by means of a standard-size mortar and pestle with a stirring time of 2.5 min. instead of 45-60 sec., (3) the introduction of a 60-min. digestion period, and (4) the measuring of the viscosity in a MacMichael viscometer standardized at different temps. by means of a 60% sucrose soln. Judging by the close agreement in collaborative work the proposed method for making the suspensions seems to be satisfactory. The results of the collaborative work between different labs. were not encouraging. The discrepancies were of about the same magnitude whether the results were recorded in a MacMichael viscometer or in centipoises; this does not mean that the standardization of the instrument is unnecessary, because there is a definite tendency for some collaborators to be high or low on all tests. The results submitted by collaborators on the standardization with the same sugar-glycerol solns. sent

out showed no better agreement between different labs. It is possible that the lactic acid used in different labs. was of different character even though the normality was the same.

A. Papineau-Couture

Report on (the determination of) ergot in flour. C. L. Brooke. *J. Assoc. Official Agr. Chem.* 18, 592-3 (1935).—For the detn. of ergot *per se* Okoloff's modification (C. A. 23, 3799) of Hoffmann's reaction was found the most satisfactory method. For detg. the amt. of alkaloids present, the Alport-Cocking modification (C. A. 27, 562) of the colorimetric reaction of *p*-dimethylaminobenzaldehyde and  $\text{H}_2\text{SO}_4$  with ergot alkaloids was found satisfactory. Quant. extn. of the alkaloids or other constituents is the major problem involved in any detn. of ergot in flour, in the extn. of the ergot alkaloids, good results were obtained by a modification of Musset's method (*Pharm. Zentralhalle* 40, 353 (1899)) in which the flour, after exposure to  $\text{NH}_3$  vapor for several hrs., is percolated with  $\text{H}_2\text{O}$  from which the alkaloids are extd. and eventually transferred to 1% tartaric acid. A. Papineau-Couture

Report on (the determination of) color in flour. H. K. Parker. *J. Assoc. Official Agr. Chem.* 18, 593-8 (1935).—From a study and discussion of the various methods of detg. the color value of flour, it is concluded that extn. methods are valuable for carotenoid pigment content, while reflectance methods are better suited for the study of flour color as a whole and they include the brilliancy factor, which is important in the judgment of flour quality.

A. Papineau-Couture

Report on (the determination of) ash in flour, macaroni products and baked products, chlorides in baked products, and moisture in baked products containing fruit. L. H. Bailey. *J. Assoc. Official Agr. Chem.* 18, 662-3 (1935). cf. C. A. 29, 6187.—To det. salt-free ash in alimentary pastes, deduct from the total Cl the Cl normally present in semolina or flour, calc. the balance of the Cl to NaCl and subtract the result from the total ash or the detn. of  $\text{H}_2\text{O}$  in baked products contg. fruit (fruit cake, fig newtons), good checks were found by drying for 1 hr. at  $130^\circ$  in an air oven, and also by drying for 3 hrs. in a vacuum oven at  $98-0^\circ$ , but the latter procedure gave appreciably lower results than the former, drying in vacuum at  $70^\circ$  for 5, 8, 11 and 15 hrs., resp., also gave closely agreeing results, but const. wt. was not obtained, and the results were much lower than those obtained by drying at  $98-0^\circ$ . Dried fruits high in sugar content cannot be dried to a const. wt., and since fig newtons and fruit cake contain large proportions of fruit, the method cannot be expected to give satisfactory drying results with such products.

A. Papineau-Couture

Report on (the determination of) the hydrogen-ion concentration (of flour). Rowland J. Clark. *J. Assoc. Official Agr. Chem.* 18, 663-6 (1935). cf. C. A. 28, 6487.—The previously described method was studied collaboratively on samples of flour, bread, cake and macaroni. The agreement of all the collaborators on flour and macaroni was very close, there being only 0.2 pH difference between the max. and min. results. The agreement among collaborators on bread and cake was not very close, there being 0.6 pH difference between max. and min. results, indicating that the bread and cake samples were not properly prepd. for distribution, possibly too coarsely ground, not sufficiently mixed, or contained too much moisture, thereby permitting deterioration. All collaborators used the same method of prep. the exts., and although they seemed to experience no difficulty with its actual operation, turbid solns. resulted and caused errors; it would therefore be well to centrifuge and filter the ext. solns. instead of allowing them to settle and decanting, to reduce the turbidity as much as possible. A. P.-C.

Report on (the determination of) diastatic value of flour. M. J. Blish. *J. Assoc. Official Agr. Chem.* 18, 566-0 (1935). cf. C. A. 28, 6187.—The previously described method was studied collaboratively. The results of 14 of the 17 collaborators showed satisfactory concordance, those of the other 3 being decidedly low; this agrees with the collaborative study conducted by Sandstett (C. A. 29, 2155). From a discussion of possible sources of error and

variability it is concluded that (1) for best results the titration should be carried out as soon as possible after the sample is removed from the boiling water bath; (2) the acidity of the  $\text{H}_2\text{SO}_4$  should be 3.58 = 0.03 N; (3) in cases where a 5-cc. aliquot of the clarified flour ext. contains more reducing sugars than the specified quantity of  $\text{K}_2\text{Fe}(\text{CN})_6$  will take care of, a smaller aliquot must be taken, but it is inadvisable to use less than a 3-cc. aliquot and in any case the ratio of flour to buffer soln. must not be altered; (4) flours undergo no reduction in diastatic activity over long periods when stored under refrigeration (approx. 0°), but changes have been found to occur in a few weeks at room temp. A. Papineau-Couture

A study of the Kjeldahl method. IV. Metallic catalysts and metallic interferences. R. A. Osborn and J. B. Wilkie. *J. Assoc. Official Agr. Chem.* 18, 604-9 (1935), cf. *C. A.* 28, 5002. A study of the effect of each of 39 metals upon the accuracy of the detn. of the N content of a gluten flour showed that Hg is the most satisfactory catalyst, its only disadvantage being the necessity of pptg the Hg as sulfide following digestion and preceding distn of the  $\text{NH}_3$ ; no other catalyst appears to require this treatment. The possibility of poisoning from volatile Hg vapors during digestion was not considered. Of the 39 metals studied in concns. of 0.003 M, 10 or 12 catalyzed the Kjeldahl digestion of a gluten flour. From a practical standpoint the safest and best catalysts appear to be Hg, Te, Ti, Fe and Cu. In ordinary amts., or under less violent conditions of digestion, Se, Mo, V, W and Ag may be suitable as catalyst. When present in larger amts., Se, V and  $\text{KMnO}_4$  clearly interfere with the accuracy of the detn. Results confirm the interference of Pt as well as the need of pptg Hg as sulfide before distn. Mixed catalysts are not recommended with digestion of flour samples. A. Papineau-Couture

Report on (the determination of) flour bleaching chemicals. Dorothy B. Scott. *J. Assoc. Official Agr. Chem.* 18, 570-2 (1935), cf. *C. A.* 23, 6487. The tentative official A. O. C. method for the detn. of Cl in bleached flour was modified by extg. with f.f.  $\text{H}_2\text{SO}_4$  rather than 1:3, 3 changes were made in the Kent-Jones and Herd method (*C. A.* 24, 3436). 50 cc. of 4% a/c. NaOH was used instead of 20 cc. to hydrolyze the fat and as a fixative for Cl, the acid exts. were not concd., and no NaCl was added for coagulation. The 2 methods as thus modified gave closely agreeing results on amts. of 2-250 mg. Cl. A collaborative study of S's test for the detection of  $\text{Br}_2\text{O}$  (*C. A.* 28, 5139) showed that the method offered no difficulties and gave reliable results. From a crit. study of S's method, Nicholls' method (*C. A.* 27, 1411) and Munsey's method (*C. A.* 29, 7508), it is concluded that a more satisfactory method than any of the 3 can be worked out. A. Papineau-Couture

Report on (the determination of) crude fiber in baked products. R. G. Capen. *J. Assoc. Official Agr. Chem.* 18, 573 (1935); cf. *C. A.* 28, 6489. A further study of the official A. O. C. method for crude fiber in grain and stock feeds as applied to baked products not contg. fruit (whole wheat crackers, ginger cookies and cakes) gave concordant results in all cases. A. Papineau-Couture

Report on (the determination of) milk solids in milk bread. V. I. Munsey. *J. Assoc. Official Agr. Chem.* 18, 573-7 (1935). Collaborative study of the Hartmann and Huling citric acid method (*C. A.* 27, 5431) gave highly unsatisfactory results (no details of results given), which are believed to be attributable to the small quantity of material used in the detn. and to the incomplete extn. of the citric acid in the alc. solvent in the short time prescribed. A method is described for extg. the butter-fat content of bread, it is based on total extn. of the fat after acid hydrolysis and treatment of the fat similar to the Reichert-Meissl no. detn. (use a 1-g. sample and titrate with 0.02 N alkali), the value thus obtained being designated as the "fat no."  $C = A(B - 1.0)/31.5$  and  $D = 7.71(B - 1.0)/2.3 \times 31.5$ , in which A = percentage of total fat on dry basis, B = "fat no.," C = percentage of butter fat on dry basis, D = percentage of milk solids on dry basis, 71.5 = "fat no." of butter fat, 1.0 = "fat no."

on fat from water bread, 7.75% = milk solids on dry basis in milk bread, 2.3% = milk fat on dry basis in milk bread. A collaborative study of the method yielded fair results, the spread of the "fat no." was greater than desirable, which is attributed to failure to conform to the details of the procedure, as the method is essentially empirical.

A. Papineau-Couture  
(Detection of) soybean flour in smoked meat products. Charles H. LaWall and J. W. E. Harrison. *J. Assoc. Official Agr. Chem.* 18, 644 (1935); cf. *C. A.* 28, 5140. The previously described tests were applied to frankfurters contg. 1, 3 and 10% soybean flour and manufd. commercially under known conditions. Neither cooking of the frankfurter in the casing, as usually practiced, nor smoking affected the final test based upon liberation of  $\text{NH}_3$  from urea by the urease naturally present in soy; if, however, the soy flour is first made into a stiff paste and heated above 100° or under pressure, all of the urease is destroyed, so that a neg. test does not necessarily indicate absence of soy flour; pos. tests should always be confirmed by identifying the characteristic cell structures.

A. Papineau-Couture  
Milk-fat globules. Henry J. Apple. *J. Am. Vet. Med. Assoc.* 40, 331-2 (1935). Photomicrographs are given of milk-fat globules from 3 breeds of goats, 4 breeds of cows, human and homogenized cow's milk. R. Brown

Detection of formaldehyde in milk. T. McLachlan. *Analyst* 60, 752 (1935). In detecting  $\text{HCHO}$  in milk by the Hekner method, it is sometimes hard to get accurate results if the  $\text{H}_2\text{SO}_4$  contains an impurity such as  $\text{SO}_2$ . It is well, therefore, to add a trace of  $\text{Fe}^{+++}$  salt and to test each shipment of acid to see if it is satisfactory. The addn. of a little  $\text{KMnO}_4$  sometimes serves to make the acid more sensitive but the effect is only temporary. W. T. H.

Approximate determination of milk solids, including lactic acid, in condensed buttermilk and related products. Joseph W. E. Harrison. *J. Assoc. Official Agr. Chem.* 18, 645-6 (1935). Condensed buttermilk and similar products are sold on a basis of the total solids contents, and custom has established that the lactic acid content be viewed as a milk solid. Use of the usual drying method for detg. total solids is impossible because part of the lactic acid is volatilized and also because charring occurs at 100°. Distn. methods gave variable results. Loss by volatilization and charring due to lactic acid can be prevented by addn. of ZnO, the following technique being suggested: weigh 2-5 g. of sample in a tared flat-bottomed dish contg. approx. 2 g. of recently ignited ZnO, add 5 cc.  $\text{H}_2\text{O}$ , mix well and dry at 100° for 3 hrs. Sand may also be incorporated if desired. The result for solids thus obtained can be corrected for loss of  $\text{H}_2\text{O}$  liberated by neutralization of the lactic acid by the ZnO by adding  $1/10$  of the lactic acid detd. by titration. A. Papineau-Couture

The methylene blue reduction test, its efficiency and interpretation under Philippine conditions. Jose B. Uchancan. *Philippine J. Sci.* 57, 293-319 (1935). Statistical examn. of the results on 142 samples of milk indicate a high degree of efficiency and dependability in the methylene blue reduction test. Philip D. Adams

Mineral constituents in fresh and canned milk. A. J. Hermano and Sagrario Claravall. *Philippine J. Sci.* 57, 323-8 (1935). Forty-five samples of natural sterilized milk (canned), evapd. and powd. milk, sweetened condensed milk, fresh goat, cow and carabao (water buffalo) milk were analyzed for Ca, P, Fe and water, fat, ash, protein and lactose. Fresh cow milk gave a higher percentage of ash and Ca than natural sterilized milk. Carabao milk had the lowest ash content (0.64%) but the ash had the highest amt. of Ca (27.99% CaO), and also more fat and protein than other natural fresh milks. Toggenberg goat milk had a higher Ca content than any other breed of goats. Klum and Molico (powd. whole milk) had the highest percentage of fat. Philip D. Adams

Effect of different methods of mixing milk. H. Barkworth. *J. South-Eastern Agr. Coll. B. ye, Kent No.* 36, 129-30 (1935). In sampling milk, either dipper-samples or bucket-mixing gave, in general, a fat content lower than that obtained with an unmixd sample. C. D. Jacob

**The freezing of milk and cream.** F. Bruce Baldwin and J. J. Doan. *J. Dairy Sci.* 18, 629-33(1935).—When whole milk is partially frozen in an undisturbed condition, the fat content in the frozen and unfrozen portions over the entire range of freezing is dependent upon the creaming phenomenon and its speed relative to the speed of freezing, and to some extent upon the size and shape of the container. When the creaming ability of milk is destroyed (as by heating or homogenization) the fat content of the unfrozen portion increases progressively with the degree of freezing, while that of the unfrozen portion decreases at first, but approaches the fat percentage of the original milk as the degree of freezing approaches 100%. Increasing fat content retard diffusion of milk constituents into the unfrozen portion, and at 25% fat such diffusion is practically nil.

**Frozen milk.** Angel Mantovani. *Rev. facultad quim. ind. agr. (Univ. nac. litoral, Argentina)* 3, 34-53(1934).—Milk which is pasteurized for an hr at 63° and then poured into Sn molds in contact with a CaCl<sub>2</sub> bath at -35° to -30° is frozen in 12-15 min. The product is homogeneous in appearance. Chem. analysis of sections of this product compared with that of cakes frozen over an 8-hr. period are given to show that only the former have uniform compns. The bacterial count shows no change in a month. Practical advantages of dealing with frozen milk are given.

**Relative economies of different forms of milk as sources of protein, calcium and phosphorus.** M. M. Kramer and Bernier L. Kuerth. *J. Am. Dietetic Assoc.* 11, 318-21(1935).—Graphs are presented to show the cost of 1 g protein, Ca and P from different forms of cow milk, at a range of market values.

**The composition of commercial dried whey.** W. L. Davies. *J. Soc. Chem. Ind.* 1935, 338-41T.—The proximate analyses, N distribution, and partial analyses of the ash of 19 samples are reported. The av. results show fat content 1.18, ash 7.54, chloride as NaCl 2.23, crude protein 12.5, titratable acidity 2.38%, calcd as lactic acid.

**Vitamin-A assay of ghee.** B. N. Banerjee and S. D. Banawala. *Agr. Live-stock India* 5, 382-8(1935).—The characteristics of pure samples of Indian ghee, prep'd from buffalo, goat and cow butter, were: sapon. value 220.4-236.2, I value 26.5-37.9, acid value 0.38-1.10, unsaponifiable matter I 64-3.86%, n<sub>D</sub> 1.4531-1.4549 and J<sub>10</sub> 0.9172-0.9206. Goat ghee and buffalo ghee were pure white but gave a trace of yellow color in the Lovibond tintometer and were rich in vitamin A. Pure ghee from all sources gave a pos. reaction with the Carr and Price SbCl<sub>5</sub> test, the blue value amounting to 16-22 units per g of fat; the blue color was completely masked by the presence of as little as 10% of adulterant (hydrogenated vegetable fat). Ghee substitutes had lower sapon. values (187-200) and higher I values (75-60) and  $\eta$  than the pure materials. Of the pure materials, goat ghee had the lowest acid value, I value and  $\eta$  and the highest sapon value; it had the lowest carotene value but the highest blue value.

**Kaufmann's thiocyanogen value of Indian butter fat (ghee).** U. D. Budhalakoti and K. C. Mukherji. *J. Indian Chem. Soc.* 12, 455-8(1935).—The hnoic acid content of butter fats as det'd. by thiocyanogen and I values is fairly const. (cf. Arup. C. 26, 3853) and can be relied upon for estg. the purity of butter-fat samples. Authentic samples of butter or butter fat (ghee) from various Indian sources were exam'd for the percentage of hnoic acid content which was found by multiplying the difference between the I value (W<sub>1</sub>'s method) and the thiocyanogen value (Wizoff's modification of Kaufmann's procedure) by 1.104. The range of I values varied from 30 to 50. The hnoic acid content was fairly const. (3.5-5.4). One sample submitted contained no hnoic acid and was probably a hydrogenated oil or fat sold as vegetable ghee.

**Effect of beet tops on the flavor and odor of milk.** G. M. Trout and G. E. Taylor. *Mich. Agr. Expt. Sta. Quarterly Bull.* 18, 37-41(1935).—Approx. 1700 samples of

milk from Guernsey, Jersey and Holstein cows were exam'd. for beet flavor. The beet-top flavor became noticeable in the milk of cows when the animals were fed at least 25 lb. daily. The flavor was most objectionable in night milk and was worst when only beet tops were fed. The supplemental feeding of grain or hay decreased the beet flavor. The flavor was most pronounced when the tops were fed shortly before milking. The presence of frozen or decompd. beet tops in the stable had a deleterious effect on the flavor and odor of the milk. Beet-top flavor did not develop or become pronounced when the milk was held in storage 24-48 hrs. Aeration made the odor and flavor less objectionable but did not eliminate it entirely. Pasteurization of the milk caused a change in flavor but did not produce good quality milk from the off-flavored product. Under ordinary conditions of feeding beet tops, the quality of the milk is insufficiently affected to merit rejection.

**Fishy flavor in butter.** B. Segal. *J. S. African Chem. Ind.* 18, 42-3(1935).—The development of fishiness is due to chem. production of Me<sub>2</sub>N from lecithin, present in the butter in varying quantities depending on the method of manufacture.

**Differences in the lactic acid percentages in butters.** E. O. Whittier and C. S. Trimble. *Ind. Eng. Chem., Anal. Ed.* 7, 389-90(1935).—Sweet-cream butter can be distinguished from sour-cream butter by a lactic acid detn. Storage of butter has no effect on the lactic acid content.

**The estimation of salt in butter.** F. H. McDowall and C. L. MacDonald. *New Zealand J. Sci. Tech.* 17, 417-19(1935).—The following method is proposed for the accurate checking of butter samples contg. approx. the (British) legal limit (1.5-2.0%) NaCl. 50 ml H<sub>2</sub>O is added to 5 g. butter dissolved in 15 ml Me<sub>2</sub>CO. A small amt. of powder, CaCO<sub>3</sub>, is added, and the soln. is titrated with 0.12 N AgNO<sub>3</sub>, with K<sub>2</sub>CrO<sub>4</sub> as indicator.

**Determination of butacetyl and methylcarbinol.** C. R. Barnicoat. *Analyst* 60, 653-62(1935).—Various workers have det'd. butacetyl in butter but the values obtained range from 2-4 p. p. m. (in highly flavored butters) to 0.05-0.5 p. p. m. All published methods for detg. (AcO)<sub>2</sub> and its precursor (hereafter called carbinol) are based on the sepn. of (AcO)<sub>2</sub> by distn. and pptn. as Ni salt of dimethylglyoxime. First, the conditions most favorable for a complete pptn. of the Ni comp'd were studied. A satisfactory reagent is a mixt. of 4 ml 20% Ni<sub>2</sub>SO<sub>4</sub> HCl, 4 ml 20% NaOAc soln and 2 ml of 5% NiCl<sub>2</sub> soln free from Co and Fe. For carrying out the conversion of (AcO)<sub>2</sub> to the monoxime, the monoxime to the dioxime and finally the pptn. as Ni comp'd it is best to heat for several hrs at 80-90° and then let stand overnight at 70-80°.

The second reaction is slow. The  $\rho_{\text{H}}$  should at the last be 7 or higher. Three days should be allowed for the ppt. to form completely. To sepn. carbinol + (AcO)<sub>2</sub> from butter, distil 400 g. of the sample with steam in a flask contg. 500 ml of 0.1 N H<sub>2</sub>SO<sub>4</sub> which is sat'd. with NaCl and also contains 4% of FeCl<sub>3</sub> to oxidize the carbinol to (AcO)<sub>2</sub>. To obtain this last comp'd. alone, distil in an atm. of CO<sub>2</sub>. In both cases, the distillate is passed into a receiver contg. the Ni reagent. The precautions necessary in weighing the Ni ppt. and the possibility of making the ppt. serve for the colorimetric detn. is shown when the ppt. weighs less than 1 mg. The procedure recommended gives consistent results which are a little low but the final conclusion drawn is that in the present state of our knowledge it is difficult to det. whether (AcO)<sub>2</sub> has been intentionally added to butter.

**The effect of soybeans in the rations of dairy cows upon the vitamin A value of butter.** J. W. Wilbur, J. H. Hilton and S. M. Hauge. *J. Dairy Sci.* 18, 661-5(1935).—Soybeans apparently suppress the transference of vitamin A from the ration to the butter. Roasting the soybeans does not prevent the action. It is possible to produce butter of fairly high vitamin A value even when soybeans are used in the rations of the cows provided roughage of high vitamin A potency is fed.

**Retarding rancidity.** Colored transparent cellulose

wrappers Willard L. Morgan. *Ind Eng Chem*, 27, 1257-90 (1935) — Blue and invisible ultraviolet light actually accelerates the development of rancidity in such materials as potato chips, crackers, cakes, butter, candies, nuts and soaps, whereas other visible light such as red and yellow have little effect. Consequently rancidity-retarding wrappers may be of any visible color except blue. Highly protective yellow transparent cellulose films have been developed and utilized for food packaging. A large no. of specially prep'd cellulose films of a wide variety and shade of colors were used in detg. which rays in sunlight are accelerators of rancidity. The time at which rancidity first became evident in taste and odor compared with the time required for rancidity to develop in some of the same lot of potato chips simultaneously exposed in uncolored transparent cellulose was used to establish a ratio indicating the rancidity-retarding value of the films. Under the same exposure conditions various lots of foodstuffs which gave a neg. Kreis test developed rancidity at widely different rates. It is believed that this and other espil. difficulties and the failure to appreciate the autocatalytic effect of small amts. of ultraviolet light transmitted by the filters used by various other investigators have been the source of the confusion and conflicting claims which have been published. F. I. Dunlap

Firm white of fresh and storage eggs H. J. Almqvist and F. W. Lorenz. *Poultry Sci*, 14, 340-1 (1935) — The percentage of firm white in storage eggs had a pos. high correlation with that of the fresh eggs from the same hens. Eggs with higher percentages of firm white showed a lower percentage of liquefaction of the firm white during storage. K. D. Jacob

Refractometric estimation of the total solids content of whole eggs and of yolks M. Irene Bailey. *Ind Eng Chem, Anal Ed*, 7, 385-6 (1935) — The percentage of total solids of whole eggs and yolks when plotted against the indices of refraction shows straight-line relationships. Equations are derived to be used in routine work. Amy Le Vesconte

Yolk-fat C. H. Lea. *Dept. Sci. Ind Research, Rept. Food Investigation Board* 1934, 53-9 (1935) — Detn. of the free acidity of the  $\text{Et}_2\text{O}$  ext. of the yolks of eggs stored for 3-6 months at 0° indicated that the method is not sufficiently sensitive to be of much service as a measure of incipient decomposition of eggs in shell. The peroxide values obtained were without significance, since the deep yellow color of the extd. oil renders a small zero error in the  $\text{Na}_2\text{S}_2\text{O}_8$  titration practically inevitable. Storage at 10° and 20° yielded slightly higher figures for the free acidity of the fat, but only in those cases where decomposition was already obvious. A. Papineau-Couture

The  $p_n$  of the white of egg E. C. Smith. *Dept. Sci. Ind Research, Rept. Food Investigation Board* 1934, 50-2 (1935) — On storage the  $p_n$  of egg white increases from an original value of 7.47 to 9.2-9.5 because of loss of  $\text{CO}_2$ . The loss of  $\text{CO}_2$  can be restricted or prevented by maintaining a suitable partial pressure of  $\text{CO}_2$  (e.g., 10% at 20-5° or 3% at 0°) in the surrounding atm., and in this respect the egg white behaves very much like a 0.1 N  $\text{NaHCO}_3$  soln. It would appear that the quality of the white is best preserved by maintaining the  $p_n$  between 7.5 and 8.0, but other aspects of storage may require a compromise at a higher or lower  $\text{CO}_2$  concn. than is indicated by this consideration alone. A. Papineau-Couture

Bound water in thick and thin white T. Moran. *Dept. Sci. Ind Research, Rept. Food Investigation Board* 1934, 52-3 (1935) — The amts. of water unfrozen in thick and thin white at different temps. were detd. by the colloidion-sac method (C. A. 29, 1927). Conclusion: The high viscosity of thick white is due to its structure, which, in a new-laid egg, is readily observable to the naked eye. A. Papineau-Couture

Acid cure for meat Lloyd A. Hall. *Food Ind*, 7, 533 (1935) — A typical formula for an acid meat-pickling brine consists of  $\text{NaNO}_2$  0.9,  $\text{NaNO}_3$  0.6,  $\text{NaCl}$  97.65 and anhyd. citric acid, 0.85%. The acid speeds the conversion of  $\text{NaNO}_2$  to  $\text{HNO}_2$ , the latter being the element which combines with the hemoglobin to form the red

coloring which gives cured meat its appetizing and attractive appearance. In curing processes where nitrate is used, bacterial action reduces the nitrate to nitrite. A liquid pickle is preferred to the use of the solid salts. The use of an acid provides for a regulatory influence on the bacterial actions which take place in the pickling soln. C. R. Fellers

Detection of meat reddening chemicals. A. Beythim. *Pharm. Zentralblatt*, 76, 545-7 (1935) — The addn. of  $\text{NaH}_2\text{PO}_4$  and  $\text{NaOAc}$  to meat is discussed from the standpoint of their possible detection. The German food law now proscribes the use of the acids and salts in connection with meats, but fails to include  $\text{NaOAc}$  as an addn. product, the presence of added  $\text{NaOAc}$  may be possibly detected through an increase in alkali of the ash. W. O. E.

Chemical changes in the fat of bacon. C. H. Lea. *Dept. Sci. Ind Research, Rept. Food Investigation Board* 1934, 76-7 (1935), cf. C. A. 23, 51461 — The yellowing of bacon fat appears to be a secondary reaction involving the peroxide, but the mechanism of the change as it occurs in the tissue remains as yet undecided. A. P. C.

Analysis of fish I. Tests for the condition of the oil of fish flesh Maurice E. Stanby. *J. Assoc. Official Agr. Chem.*, 18, 116-21 (1935) — The following simple, rapid method for the extn. of oil from mackerel (*Scophor scombrus*), without risk of decomposition, is presented to 20 g. of finely ground fish flesh (free from skin and bones) in a 150-cc. shaking bottle add 25 g. anhyd.  $\text{Na}_2\text{SO}_4$  and 100 cc.  $\text{Et}_2\text{O}$  (neutral to phenolphthalein), shake mechanically for 30 min.; det. fat by filtering a 20-cc. aliquot and evap. on the water bath in a tared beaker; titrate free acid in another 20-cc. aliquot, using the official A. O. A. C. method without removing  $\text{Et}_2\text{O}$ , det. the peroxide volumetrically in a 3rd 20-cc. aliquot by Wheeler's method (C. A. 26, 3124) as follows: add 50 cc. of a freshly prep'd mixt. of 60% c.p. glacial  $\text{AcOH}$  and 40% U.S.P.  $\text{CHCl}_3$  followed immediately by 1 cc. of sat'd.  $\text{KI}$  from a pipet, shake with a rotary motion for exactly 1 min., quickly add 100 cc. of 0.03% starch soln. and immediately titrate with 0.01 N  $\text{Na}_2\text{S}_2\text{O}_8$ ; moles of peroxide (M) per 1000 g. of oil = 0.5 (cc.  $\text{Na}_2\text{S}_2\text{O}_8$ ) (normality)/(wt. of oil). Application of the method was found to be valuable in appraising the condition of fresh and frozen mackerel. In a series of tests it was found that 1000 M varied as follows: fresh 0-0.6, slightly rancid 0-21.4, rancid 18.4-36.4, extremely rancid 33-201. A. Papineau-Couture

Tin and lead in canned fish H. Amphlett Williams. *Analyst*, 60, 683-5 (1935) — About 150 samples of canned fish, selected at random, were exam'd. for Sn and Pb and 20 samples were reported adversely. The suggestion is made that 0.1 grain per lb. can be adopted as a limit for the quantity of Pb which canned fish shall be allowed to contain. Twelve samples contg. more than 2 grains of Sn per lb. were found. W. T. II

Studies on maturity of fruit IV. The catalase and oxidase activity of apples in storage as affected by conditions during growth J. C. Hinton. Univ. Bristol Agr. Hort. Research Sta., *Ann. Rept.* 1934, 29-52, cf. C. A. 27, 4271 — Catalase activity of stored apples increased during storage, but in 3 cases it subsequently decreased during the later stages of storage. The rate of increase in catalase activity was highest during the early part of storage and it fell more or less rapidly during the storage period. The fall was proportionate to the value of the max. early rate, being more rapid in those cases where the early rate was higher. The later the date of picking the apples, the higher was the early rate of increase in catalase activity and the steeper was the subsequent fall in rate. With the Newton Wonder variety, differences in the rate of change of catalase during storage were such as to suggest that fruits on ringed trees matured more slowly than fruits from similar but not ringed trees. In fruit of the Allington Pippin variety (1) grown under grass cover, (2) grown under clean cultivation and (3) grown on trees on which fruit thinning was carried out, changes in catalase activity during storage were not sufficiently uniform to suggest differences in the rates of maturation of the fruits. There were indications that unusually low temps. prevailing for

some days prior to picking cause a decrease in the catalase activity of the fruit. Oxidase activity of apples decreased markedly but slowly during storage and also during ripening on the tree. Differences in oxidase activity during storage could not be definitely correlated with differences in the cultural treatment of the trees. V. The effect of conditions during growth on the process of softening and on the loss of total weight in apples during storage. *Ibid.* 53-53.—The rate of softening of apples during storage was correlated with the degree of maturity of the fruit at the time of picking. The rate was lower in fruit from trees (1) growing under grass cover, (2) which had been bark-ringed or (3) upon which fruit-thinning had been carried out, than in fruit from the control trees or from trees grown under clean cultivation. The rate of loss of total wt. during storage of the fruit diminished as storage proceeded, over the greater part of the storage period, and it the final stage of storage increased again in the majority of the samples. The behavior of the sample was only approx. defined by the initial rate of loss of wt. The variance with respect to loss of wt. increased as the samples were picked at later dates. The rate of loss of wt., to the extent to which this rate diminished in storage and the variance of the samples were all related to the stage at which the samples had been picked. There seemed to be very little relation between the loss in wt. during storage and the H<sub>2</sub>O content of the fruit. VI. The effect of conditions during growth on some chemical constituents of apples in storage. *Id.* 54-105.—The total N content decreased during storage. The rate of decrease was greatest during the early part of storage and was influenced by the stage of maturity at which the fruit was picked. With increasing stage of maturity the rate of loss of N in storage increased up to a certain point, after which the rate of loss again decreased. The acid hydrolyzable fraction decreased markedly during storage but in many cases underwent an increase toward the end of storage life. The rate of loss of sucrose decreased between succeeding picks in the Allington Pippin series but tended to increase between picks in the Newton Wonder series. There was evidence that the loss of sucrose ceased at a time when a residual amt. was still present, this residual amt. increased with succeeding picks. The amt. of increase of reducing sugars in storage and the length of time during which increase in value took place were less with succeeding pickings in each case. The rate of increase in reducing sugars in storage decreased with succeeding pickings in all cases. The ratio of reducing sugars to sucrose increased during storage in all cases. K. D. Jacob.

Report on (the determination of) pectic acid and electro-metric titration acidity. W. L. Roberts. *J. Amer. Official Agr. Chem.* 18, 591-602 (1935).—A collaborative study was made of 4 methods: (1) electrometric titration with H<sup>+</sup> electrode, (2) electrometric titration with quinhydrone electrode, (3) titration with phenolphthalein as inside indicator and (4) titration with arocluum as outside indicator, for the detn. of the following colored fruit solids: (1) strawberry preserves, (2) raspberry preserves, (3) orange conc. and (4) powder consisting of acid, sugar and amaranth. There was good agreement between the H<sup>+</sup> electrode and quinhydrone electrode titrations in all instances, the phenolphthalein titration was consistently higher and the arocluum titration consistently lower than the 2 electrometric methods, as was to be expected as the arocluum end point is at pH 7, the phenolphthalein end point at pH 8.3 and the electrometric end point at about pH 7.9. While the agreement on the basis of a 25-cc. aliquot was good in most cases, it was rather poor when called on the basis of a 100-g. sample, this could be corrected somewhat by the titration of aliquots containing larger portions of sample. In spite of the fact that hydroquinone is oxidized in alk. soln. in presence of air, the quinhydrone electrode gives good results if the titration is carried out rapidly (within 5 min.). The excellent agreement of the 2 electrometric methods up to pH 8 proves the accuracy of both methods, when the titration is carried out to the equivalence pt. of pH 7.9. A. Papineau-Couture.

Changes in the pectin of fruits during storage. T. N.

Morris. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 200-3 (1935); cf. C. A. 29, 2411.—Previous tests were repeated and more precise data obtained with the help of a jelly-strength tester and the results (which must not be taken as absolute) indicated that: (1) there was a slow loss of setting power with raspberries and gooseberries frozen raw at -10°, and even at -20° a slight loss was indicated; with apples there was no marked change. (2) the setting power was completely lost when raw raspberries and gooseberries were treated with SO<sub>2</sub>, but ext. from apples appeared definitely to have gained in setting power, (3) the setting power was unchanged during cold storage after previous treatment by heat, and showed an increase in each case during storage at ordinary temp. with SO<sub>2</sub> after previous heating and cooling. It is suggested that the increase noted in setting power in presence of SO<sub>2</sub> may represent a stage in the slow conversion of pectin to pectic acid under the influence of the mineral acid. A. Papineau-Couture.

Preservation of fruit with sulfur dioxide. Effect of hot and cold methods on residual sulfur dioxide content in jam. Vernon L. S. Charley. *Univ. Bristol Agr. Hort. Research Sta., Ann. Rept.* 1934, 253-63.—Plums processed in the cold with 100 and 2000 p. m. of SO<sub>2</sub> gave jams which contained 20 and 70 p. m. of SO<sub>2</sub>, resp. With this process the use of Ca(HSO<sub>3</sub>)<sub>2</sub> resulted in a lower residual figure, but the data with K<sub>2</sub>SO<sub>3</sub> and cold no significant deviation from the ordinary H<sub>2</sub>SO<sub>4</sub> method. A considerable increase in residual SO<sub>2</sub> (84-120 p. m.) was observed in jams made from hot-processed pulp. The skins of the whole fruits preserved in the cold by the stronger soln. became toughened and this condition persisted in the jam, the weaker soln. of SO<sub>2</sub> did not greatly affect the texture of the fruit. The hot-processed pulp yielded darker jams in which the fruit was completely disintegrated. The skins of cold-processed plums contained much more SO<sub>2</sub> (320-485 p. m.) than did the skins and flesh. K. D. Jacob.

Some principles of apple storage. Franklin Kidd. *Horticultural Education Assoc. Yearbook* 2, 34-42 (1933).—A difference of 1°F. in the air storage temp. may result in 10% difference in storage life. Safe temps. range from 34° to 40°F. depending on the variety of apples. Control of the compn. of storage atm. is in the direction of reducing the concn. of O<sub>2</sub> and allowing a limited accumulation of CO<sub>2</sub>. Safe atm. range from natural air to 5 to 10% CO<sub>2</sub> and 2.5 to 15% O<sub>2</sub>. Humidity is largely self-controlling. Oiled wrappers control superficial mold or skin browning. Irvin C. Feestel.

Fruit products. IV. Experiments on the clarification of unfermented and fermented apple juice. Vernon L. S. Charley. *Univ. Bristol Agr. Hort. Research Sta., Ann. Rept.* 1934, 245-54, cf. C. A. 23, 223.—Pectin-decomposing enzymes (Pectinase and Filtrapol) had a considerable effect in increasing the ease of filtration of apple juice which had been exposed to the action of the enzyme for 24 hrs. The effect on filtration was more important than differences in clarity in the stored juices or ciders raised by the enzymes. A proteolytic enzyme (Maltolysin) greatly increased the ease of filtration of mixed cull apple juice but had comparatively little effect on juice of the Anne Elizabeth variety. Excellent clarification of the juices was obtained by the addition of gelatin (8-10) and tannin (4-5) g./100 gal. No outstanding differences due to the treatments were observed in the samples which had been bottled for 15 months. When apple juice, later fermented into cider, was treated with enzymes considerable removal of pectin occurred but this was not always followed by any appreciable clarification of the juice; filtration after 24 hrs. was carried out with much greater speed and economy when compared with juices which had not been treated with such enzymes. No significant differences were observed in the filtered samples. K. D. Jacob.

Experiments on the improvement of the juice from culinary and dessert apples by maceration with pressed bitter-sweet pomace. Progress report. II. P. T. H. Pickford. *Univ. Bristol Agr. Hort. Research Sta., Ann. Rept.* 1934, 209-12; cf. C. A. 23, 6885.—The bitter-sweet

character of Bramley's Seedling juice was considerably enhanced by contact with Dabinett pomace. No significant differences were obtained by pressing the juice immediately with the Dabinett pomace or by macerating the juice with the pomace for 14-26 hrs. The rate of fermentation of the macerated juices was approx. the same and was considerably slower than that of the untreated juice and of the juice which was pressed immediately with the Dabinett pomace. The treated juices contained less malic acid than did the untreated juice, but the treatments had no pronounced effect on the sp. gr. of juices or on the ciders made therefrom. K. D. Jacob

Vitamin C content of apples. S. S. Zilva, F. Kidd, C. West and E. O. V. Perry. *Dept. Sci. Ind. Research, Rept. Food Investigation Board 1934, 164-5 (1935)*; cf. C. A. 29, 242<sup>a</sup>.—The vitamin C potency of the red peel of Bramley's Seedling apples is much greater than that of the green peel, the higher potency being located near the skin. Tests carried out on the "roy" variety of Bramley's Seedling showed that the potency of the skin was not different from that of the blushed side of the "green" variety. No difference between the 2 varieties could be found with the pulp. Apples gathered in mid-Sept. were stored in pure O and in pure N (contg. less than 0.5% O) in containers continuously ventilated with these gases at 1 in. up to the middle of Dec. Biol. tests carried out (after peeling) by the prophylactic method in doses of 3 g. failed to reveal any difference between the stored apples, their potency remaining that usually possessed by freshly gathered fruit. A. Papineau-Couture

Preservation of vitamin C in canning fruits and vegetables. S. S. Zilva, T. N. Morris and E. O. V. Perry. *Dept. Sci. Ind. Research, Rept. Food Investigation Board 1934, 203-5 (1935)*.—Ascorbic acid was added to runner beans (which do not contain much vitamin C), to spinach (a fairly good source of vitamin C), to apple and to apple jelly, with the aim of producing products which would have an antiscorbutic potency of the same order as a good natural source of vitamin C, such as the citrus fruits. After canning the products were examd. prophylactically by the biol. method, with the following results: *Runner beans*—About 25% of the added ascorbic acid was destroyed, most of it had been taken up by the solids, the liquid being practically inactive. *Spinach*—The solids alone showed definitely less activity than when the liquor was present; the loss of ascorbic acid was not estd. but could not have been great. *Apple*—As with the beans, the loss was of the order of 25%. *Apple jelly*—The loss was estd. at 10-20%. A. Papineau-Couture

Identification of ethylene among the volatile products of ripe apples. R. Gane. *Dept. Sci. Ind. Research, Rept. Food Investigation Board 1934, 122-3 (1935)*; cf. C. A. 29, 232<sup>b</sup>.—*Mimosa pudica* and *Ruscus communis*, both of which are sensitive to C<sub>2</sub>H<sub>4</sub> at concns. of 8-0.1 p. p. m., showed the effects characteristic of C<sub>2</sub>H<sub>4</sub> when placed in a confined space with apples. Similar results were obtained with tomato plants and sunflower seedlings, less response was obtained from *Salvia splendens*. Apples at 15° were ventilated with a current of pure N, after 20 days O was mixed with the issuing gas stream till it had the same N:O ratio as fresh air, and pea seedlings were grown in the resulting atm.; growth was normal in that the curvature and swelling which are characteristic effects of C<sub>2</sub>H<sub>4</sub> were absent. In another expt., in which bananas were used as the biol. indicator, acceleration of ripening occurred. It is as yet uncertain whether production of C<sub>2</sub>H<sub>4</sub> is completely stopped in the absence of O or only greatly reduced. C<sub>2</sub>H<sub>4</sub> is not produced by ripe apples that have been killed by freezing, there is, however, enough C<sub>2</sub>H<sub>4</sub> present in the tissues of an apple frozen in a closed container to affect the growth of pea seedlings, provided that the thawed fruit and seedlings are again kept in a closed space.

Containers for apple juice and cider. I. Wooden vessels. A. The suitability of various coniferous woods. P. T. H. Palford. *Univ. Bristol Agr. Sci. Res. Sta., Ann. Rept. 1934, 213-16*.—Small samples of wood (prime clear British Columbian pine, Siberian red fir,

Archangel white fir, New Zealand kauri pine and Louisiana red cypress) were immersed for 6 months in bottles of blended, sharp, sweet and bittersweet ciders, resp., stored in a cool place. All the woods adversely affected the flavor of the ciders. Although none appeared to be of outstanding promise, it is possible that Archangel white fir and Louisiana red cypress may prove serviceable if some initial treatment can remove the woody flavor. K. D. Jacob

Cider. D. W. Stewart. *Chemistry & Industry 1935, 879-81*; cf. C. A. 28, 6212<sup>a</sup>.—The chem. changes taking place during cider making are discussed. The presence of potash salts of org. acids and phosphoric acid contributes to the prophylactic and therapeutic value of cider. J. S. Hicks

Enzymic hydrolysis of starch in pectic extractions from apple pomace. Gen. L. Baker. *Dept. Agr. Expt. Sta., Bull. 192 (Ann. Rept. 1934), 27 (1935)*; cf. C. A. 28, 6871<sup>a</sup>.—This report deals with mixts. of known amts. of pectin and sol. starch in dil. solns. Pectin has a natural inhibiting effect on diastatic enzymes. More diastase is required when the concn. of pectin in the soln. is increased. The optimum temp. for starch hydrolysis in pectin solns. is 30°. The optimum pH for the reaction is 3.0-3.5 when speed of hydrolysis of the starch without destruction of the jelling properties of the pectin is considered. The time required for complete hydrolysis is increased as the pH decreases. Hydrolysis of pectin is greatest at pH 4.0-5.0. The increased hydrolysis of pectin is due partly to the increased activity of pectic enzymes in the diastase prepn., and partly to the natural effect of the pH on pectin. Conditions favorable for the hydrolysis of starch are far from optimum when used in a pectic environment. C. R. F.

Vitamin G content of commercially canned tomato juices. Charles F. Poe and Esther L. Gambill. *J. Am. Dietetic Assoc. 11, 343-5 (1935)*; cf. C. A. 29, 341<sup>a</sup>.—A detn. of the vitamin G content of 18 brands of tomato juice showed little variation from 100 units per lb.

Acidity and resistance to rotting in oranges. J. Barker, C. R. Furlong and N. E. Holmes. *Dept. Sci. Ind. Research, Rept. Food Investigation Board 1934, 158 (1935)*.—Acidity, total solids and rotting by *Penicillium* were detd. in navel oranges from Bierr's exptl. orchard (South Australia). In these samples, grown under the same climatic conditions and presumably having the same handling, high acidity was assocd. with low wastage, and with each decrease in acidity there was an increase in wastage. A. Papineau-Couture

The use of aluminum cans for fruits. T. N. Morris and J. M. Bryan. *Dept. Sci. Ind. Research, Rept. Food Investigation Board 1934, 195-7 (1935)*.—Canning tests were carried out on gooseberry, strawberry, raspberry, red currant, black currant, white cherry and black cherry with plain drawn Al cans and also similar cans that were given 1 coat and 2 coats, resp., of lacquer. All the plain cans became H-swells in a comparatively short period (many had gone in 1 month). In single-lacquered cans only strawberries have so far (4 months) shown any resistance. The tests in double lacquered cans have not proceeded long enough for the results to have any value. Success with Al cans for fruits which give trouble is likely to be even more dependent on the perfection of the lacquer coating than in the case of tinplate. Comparison of ordinary rolled sheet Al and of "drawn" Al showed that the latter was corroded slightly more than the former in 0.5% citric acid, but the difference was not striking. A. Papineau-Couture

Corrosion of steel and binnacle by actual extracts of fruits. T. N. Morris. *Dept. Sci. Ind. Research, Rept. Food Investigation Board 1934, 180-3 (1935)*; cf. C. A. 29, 853<sup>a</sup>.—Steel strips 3 × 1 in. were immersed for 3 days at 25° in sterile exts. of various fruits, the pH values of the exts. were measured, the loss in wt. of the strips and cc. of H<sub>2</sub> produced were detd., and the theoretical H<sub>2</sub> was calcd. from the loss in wt. The most noteworthy results were: (1) although of relatively low acidity, cherry ext. of pH 3.1 formed a bronze-colored deposit which stopped further

corrosion, and when buffered with Na citrate to pH 4.07 it formed a loose yellow deposit which was nonprotective, (1) there appears to be a fairly close correlation between corrosion and the rate of formation of H<sub>2</sub>-swells and perforations by the various fruits tested. Addition of citric acid to cherry ext. reduces corrosion; addn. of 25% sucrose to the ext. slightly reduces corrosion over the whole pH range, but the reduction through the addn. of acid was of about the same order, whether or not sugar was present. Strips of tinplate 3 × 1 in. were rubbed with emery to remove the Sn longitudinally from half the surface, and were immersed in fruit exts like the plain steel strips. The figures for dissolved Fe indicate the fruits which may be expected to give trouble through the formation of H<sub>2</sub>-swells, and those for dissolved Sn those fruits which either suffer severely from discoloration or cause heavy detinning of the cans, on the whole, fruits producing high corrosion of Sn produce low corrosion of Fe, and vice versa. A. P. C.

Experiments on the determination of the quality of potatoes. K. Rathack. *Ernähr. Pflanze* 31, 321-7 (1935).—New methods are given for the detn. of the cooking quality factor, the resistance to cutting and the increase in firmness accompanying increases in the time of cooking. A loaded were allowed to cut through a cube of cooked potato of given diam. gives a measure of the resistance to cutting. A pos. relation exists between the resistance to cutting and the starch content. The value was neither influenced by the starch:protein ratio nor the protein or fiber contents. The value for the cooking quality factor decreases with the loss in wt. during storage but is independent of the starch content and the starch:protein ratio. Much changes in the starch grain during cooking are discussed. The mineral content of the tubers was the chief factor influencing the flavor. John O. Hardesty.

The vitamin C content of two varieties of Chinese amaranth, Hsien Tsai and Hsiang-Chuan Hsien. *Chinese J. Physiol.* 9, 253-6 (1935).—By chem. titration the av. value obtained for the red amaranth was 0.25 mg. of ascorbic acid per g. of the fresh vegetable and that for the green amaranth was 1.09 mg. By biol. assay the ascorbic activity of the red amaranth was about 1/4 of that of Sunlight orange juice, the potency of 2 g. of red amaranth being about the same as that of 1 cc. orange juice. One g. of the green amaranth exerted a somewhat greater ascorbic effect than 1 cc. of orange juice. L. A. M.

Laboratory control improves quality of carbonated beverages. Laurence P. Geer. *Food Ind.* 7, 541-2 (1935).—Bacterial and chem. control of containers, ingredients and finished products insure high-quality, sterile beverages. C. R. Fellers.

When standard analysis (in coffee) does not help. A. B. Kennedy. *Food Ind.* 7, 540, 572 (1935).—Pitfalls in the chem. analysis of coffees are outlined. C. R. F.

Microscopic methods for the detection of karaya gum, gum tragacanth and agar-agar. J. D. Widman. *J. Assoc. Official Agr. Chem.* 18, 637-8 (1935).—Methods which have been used by W. for the microscopic detection of karaya gum and gum tragacanth in catsup, and agar-agar in presence of gelatin in mayonnaise and salad dressing, and in canned chicken are outlined. It is essential that the analyst first become thoroughly familiar with the properties of the various gums and with the foods in question, because no set procedure can be given which will apply to all products. It should be noted that the microscopic method does not apply to most sol. gums. A supplementary test for karaya gum consists in treating 1 drop of the product with 1-2 drops of chloroformic iodide reagent, which stains the gum masses somewhat greenish, the U. S. P. I. test can be used for distinguishing agar-agar from the other gums generally used in foods. A. P. C.

Volatile oils in mace and nutmegs. Joseph I. Chavenger. *J. Assoc. Official Agr. Chem.* 18, 111-116 (1935).—West Indian mace and nutmegs give a volatile oil which may be recognized by its low d and n and higher Volatile oil distd. from nutmegs has a greater pos. α than that distd. from the corresponding mace, this may be due to a loss from the mace of the more volatile fractions of oil, which would give a greater α. Shrivelled East India nut-

megs give a larger percentage of volatile oil than do the mature sound ones. The loss of volatile oil from ground mace and nutmegs is relatively rapid, amounting to approx. 80% in 2 months. The volatile oils obtained from ground mace and nutmegs that have been exposed in the lab. show a definite increase in d., n., acid and ester nos. and a distinct decrease in α, these results should be valuable in detg. the conditions under which these products are handled. The characteristics of the volatile oil should serve in the identification of unknown samples of mace and nutmegs. A. Papineau-Couture.

Production and marketing of groundnut in the Madras Presidency. K. Raghavachari. *Madras Agr. J.* 23, 379-63 (1935).—When they were stored in cans for 6 weeks, undried groundnut kernels became highly rancid (acid value 101-175) and were subject to attack by fungi and insects. Deterioration in storage was entirely prevented by drying the kernels at steam-oven temps. K. D. J.

The microscopic examination of cattle foods. Some oil-containing seeds. S. T. Parkinson. *J. South-Eastern Agr. Coll. Wye, Kent No.* 36, 7-30 (1935), cl. C. A. 28, 6876.—The characteristics are given of the various portions of the seeds of castor-oil bean (*Ricinus communis* L.), cotton (*Gossypium hirsutum* L.), curcas (*Jatropha curcas* L.), candle nut (*Alseodaphne moluccana* Willd.), hemp (*Cannabis sativa* L.), kapok (*Eriodendron anfractuosum* D. C.), sesame (*Sesamum indicum* L.), cacao (*Theobroma cacao* L.), sunflower (*Helianthus annuus* L.), niger (*Guzotia oleifera* D. C.) and madia (*Madia sativa* Mol.). K. D. Jacob.

The composition, nutritional value and digestibility of pasture grasses, experimental investigation of grazing mares on the pastures. Hans Nietsch. *Landw. Jahrb.* 84, 525-75 (1935).—The fluctuation in the compn. of pasture grasses over a period of years was largely due to the weather conditions, the greatest fluctuations occurring in the wettest years. The digestibility of the grasses was decreased at this time, especially in relation to the crude fiber and N-free ext. content. Analyses made in May, July and September showed the highest crude protein in September, but the percentage of digestible protein did not vary with the season. K. C. Beeson.

The conservation of grass—hay, silage or dried grass. Arthur Crichton. *Trans. Highland & Agr. Soc. Scotland* 47, 50-63 (1935).—Samples of well-dried, good-quality, mixed pasture grass, cut in the summer and autumn, resp. contained dry matter 88.8, 90.3; protein 13.1, 17.9, oil 4.1, 5.9, sol. carbohydrates 44.5, 37.2; fiber 20.9, 20.8, and ash 6.2, 8.2%. K. D. Jacob.

Grass drying in hop oasts, 1933-4. A. H. Burgess and N. L. Tinley. *J. South-Eastern Agr. Coll. Wye, Kent No.* 36, 119-21 (1935).—Pasture grass was cut on May 24th to June 5th (at approx. the flowering stage) and dried in 12-layers in hop oasts for 8 hrs. at 165°F. The dry material contained crude protein 13.66-14.56, EtO ext. 2.95-3.40, fiber 20.55-27.51, ash 6.46-7.45, carbohydrate 43.23-47.17 and H<sub>2</sub>O 5.20-7.86%. On storage of the material the H<sub>2</sub>O content increased to 16%. In an 8-week expt. with sheep the dried grass compared favorably with a mixt. of concentrates of equal analysis. K. D. Jacob.

Harvesting soybeans for hay. C. J. Willard, L. J. Thatcher and J. B. Park. *Ohio Agr. Expt. Sta., Bi-monthly Bull.* 175, 148-54 (1935).—Soybean hay should be cured to a moisture content of below 30% to insure freedom from storage deterioration. The protein content of the hay is lowest at the stage when the pods are just forming. After this stage, the protein slowly increases. C. R. Fellers.

High- vs. low-protein grain with pasture. Russell L. Horwood, G. W. Putnam and J. G. Wells, Jr. *Mich. Agr. Expt. Sta., Quarterly Bull.* 18, 22-4 (1935).—In a feeding trial cows fed a grain mixt. contg. 16.7% digestible crude protein produced 496 lb. more 4% milk than those receiving a grain mixt. contg. 9.3% digestible crude protein. The 3.6% difference is not significant. C. R. F.

Sweet clover silage as a feed for dairy cows. I. T. Atheson and G. C. Anderson. *Idaho Agr. Expt. Sta., Bull.* 214, 3-11 (1935).—Feeding trials showed that sweet clover was practically equal to corn silage for body wt.,

milk and fat production in dairy cows. The silage did not taint the milk or butter from the cows fed sweet clover.

C R Fellers

**Vitamin A content of pasture plants** IV. White blossom sweet clover (*Melilotus alba* Desv.), orchard grass (*Dactylis glomerata* L.), and meadow fescue (*Festuca elatior* L.) under pasturage conditions and fed green. Ella Woods, F W Atkeson, I W Slater, C. D. Arndt and R F Johnson. *J Dairy Sci* 18, 639-45 (1935); cf. C. A. 29, 7520\*—Second year and first-year white blossom sweet clover contained, resp., 242 ± 10 and 500 ± 30 rat units of vitamin A activity per g when sampled under pasturage conditions and fed green. Under similar conditions orchard grass and meadow fescue contained, resp., 275 ± 13 and 250 ± 17 rat units. Philip D Adams

**The preservation of silage** W D Reid. *New Zealand J Agr* 51, 139-43 (1935)—Expts were carried out on the preservation of grass silage in drums and pits with addn of fresh whey, 11Cl, molasses and cultures of *Lactobacillus bulgaricus*, *Streptococcus thermophilus*, *S. lactis* and a cheese starter. The quality of the silage was materially improved by addn of either *Lactobacillus bulgaricus*, whey, 11Cl or molasses. The most economical treatments were whey (0.5-4.0%) and molasses (0.5-1.0%), either alone or combined. Molasses treated silage usually had a pleasant odor, retained a freshly cut appearance, and when combined with *Lactobacillus bulgaricus*, 11Cl or whey reduced the objectionable acids and odors to a min.

K D Jacob

**Comparative feeding tests on dairy cows, of easilage prepared from sugar-beet tops and leaves, and grass silage prepared according to the Dutch method** J C de Ruyter de Wildt. *Verzorg landb Onderzoek Rijkslandbouwschool* No 41C, 211-61 (1935)—Sugar-beet tops and leaves were buried in a pit 4 × 10 × 0.5 m. Thirty-three % of the org matter was destroyed in 3 months (Oct to Jan). Practically all of the carbohydrates were destroyed. Feeding expts on dairy cows indicate that this material was equiv to grass silage, based on the total nutrients present in each feed. W Gordon Rose

**Apple pomace silage** A I Perkins and C F Monroe. *Ohio Agr Expt Sta., Bi-monthly Bull* 173, 154 8 (1935)—Ohio apple pomace contains approx 23 % dry matter, 1.6% protein and 18.6% digestible nutrients. It is readily ensiled either alone or along with corn silage. Greater use of apple pomace is advocated as a cattle feed.

C R Fellers

**Notes on locust meal as a poultry feed** F M Fronza. *Philippine Agr* 24, 425-7 (1935)—The locust meal contained moisture 7.23, fat 17.27, ash 9.87, protein 30.72, fiber 10.32 and carbohydrates 18.91%. A L Mehning

**Chemical research and the [packing] industry** (McDowell) 13. Paint in the food industry (Barry) 26. Ultraviolet light as an aid on the farm—feeding stuffs (Grant) 15. Anethole [residue as silage] (Vunshenk) 17. Date growing in Arizona (Albert, Hukeman) 15. Detn of Hg in leafy vegetables (Winkler) 7. N economy in agriculture (Virtanen) 15. Effect of temp changes on respiratory activity of apples (Iaves) 11D. Bacteriol examn of oysters (Fisher, Acker) 14. Lecithin and oil mixts from soybean sludge (U. S. pat. 2,018,781) 27. App for irradiating milk, etc., with ultraviolet rays (U. S. pat. 2,018,372) 1. Inhibiting the interior corrosion of sealed metallic containers such as cans contg foods (U. S. pat. 2,018,682) 9. App for drying or wiping fruits to remove spray residues (U. S. pat. 2,019,087) 15. Emulsions [used as salad oil] (Brit. pat. 431,642) 13. App for condensing milk, fruit juices, vegetables or beef (U. S. pat. 2,018,049) 1. App for filling tins contg foods with inert gas heavier than air (U. S. pat. 2,019,422) 1. Dust [flour, feed, starch] disasters (Trice) 24

**Food preparations** **Chemische Fabrik H. Sander & Co** A-G. Ger 618,482, Sept 9, 1935 (Cl. 63/4). Materials contg vitamins, e. g., bran or yeast, are oxid. for several hrs with water at 55-60°, and the exts are steri-

lized by heating them several times to 60°. Oils or fats e. g., cod liver oil or oleomargarine, are then mixed with the exts to produce liquid or pasty food preps.

**Food product** **Léon Badosa-Guardiola**. Fr. 784,551 July 22, 1935. Almonds are peeled, ground to a very fine powder, sugar and water are added and the whole is emulsified.

**Caramel mixture for use in preparing foods** **Teresa T Speed** U S 2,019,305, Oct. 29. Dry, finely sub divided caramel of the highly hygroscopic, water-sol type is used with a more quickly sol., less hygroscopic material including sugar sufficiently dry not to cake when the mixt is kept in a dry air tight container under com. conditions.

**Containers such as fiber cans for foods, etc** **II Chester Aument**, U S 2,019,242, Oct. 29. Fibrous material such as paper is used having its fibers said with a non-adhesive acacia gum. App. is described.

**Apparatus for manufacturing flakes, etc., from plastic materials containing vegetable matter, e. g., cereals** **Axel U Sirmmark**. Brit. 431,504, July 2, 1935.

**Wheat flour** **Edward J. Miller, Harry L. Goodwin and Edgar M. Miller** U S 2,018,065, Oct. 29. Wheat berries are cracked to release the germ, the impure material and the germ are moved in a relatively thin layer through which a slight draft of air is uniformly forced so that impurities lighter than the germ and flour forming stock are carried away by the air, the aeration of the germ is maintained until the germ is set, and the germ and stock for the formation of flour are then crushed. An arrangement of app is described.

**Bread** **Conrad Pietrkowski**. Ir. 784,033, July 22, 1935. To the flour or dough is added a nourishing medium for the yeast in a form such that the yeast can consume it gradually and so produce a sufficient and durable amt of CO<sub>2</sub> during the fermentation and baking. Thus, 100-500 g of a mixt contg glucose 20, sucrose 30 and raffinose 60% is added to 100 kg. of flour.

**Bread, milk products** **Alexander Axelrod**. Brit 431,087, July 1, 1935. Addn to 342,083 (C. A. 25, 4635). See Ir. 770,464 (C. A. 29, 6171).

**Shortening agents for dough, etc** **Herbert Schou**. Brit. 431,063, July 1, 1935. Dough for use in making cakes, pastry, bread, etc., is mixed with a shortening agent consisting of an emulsion having a fatty continuous phase and an aq dispersed phase. Suitable emulsions are prep'd by mixing an oil or fat, e. g., a mixt. of soybean oil and lard, with an oil-sol emulsifying agent, e. g., Pabgard's emulsion oil, then adding an amt. of H<sub>2</sub>O less than 0.2 the amt. of oil or fat and emulsifying the mixt. The H<sub>2</sub>O may contain sugar, salt or albumin and may be replaced by milk.

**Apparatus for determining the fermenting power of yeast in dough** **Brabender G m b H**. Ir. 784,585, July 22, 1935.

**Milk product suitable for use in making baked foods, etc** **Alexander Axelrod** U S 2,018,391, Oct. 22. Skim milk is subjected to peptonization by use of *Micrococcus casei liquefaciens* or *Streptococcus liquefaciens* and to lactic acid fermentation, the lactic acid fermentation being prevented from detrimentally influencing the peptone formation by limiting the milk-sugar content of the milk and subsequently adding organisms producing lactic acid, and the product may be dried. Various details of procedure are given.

**Apparatus for irradiating milk, etc** **Henning A Trebbk** (to Ilanovis Chemical and Manufacturing Co) Brit 432,011, July 18, 1935.

**Heat-exchange apparatus suitable for freezing or cooling milk, etc** **Clifford Morrow** (to H. H. Miller Industries Co) U S 2,018,462, Oct. 22. Various structural and operative details.

**Evaporating milk** **John B M Knutsen**. Brit 432-075, July 19, 1935. Pre-evap'd milk from a vacuum cone unit is sprayed through a nozzle together with warm dry H<sub>2</sub> from a generating system supplied to an annular ring of nozzles into a drying chamber wherein dried powd milk is deposited, the temp. of the milk in its

successive treatments being that of normal fresh milk. App. is described.

Device for neutralizing sour cream. Charley Jorgensen. U. S. 2,018,173, Oct. 22. A neutralizing agent is atomized with air which is then injected into a body of cream near the bottom of the latter. Various structural details are described.

Packaging cheese. Charles F. Doane. U. S. 2,018,137, Oct. 22. A large cheese, to prevent growth of mold on it, is cut into comparatively small pieces which are covered with material such as paraffin paper so as to leave a space around the pieces retaining preservative gases generated from the cheese, and the pieces are loosely contained and sealed in a container.

Fish extracts. Hans Schmalfuss and Hans Werner. Brit. 431,143, June 27, 1935. An ext. for human nutrition is prepd. from the flesh of whales, fish or other sea animals, preferably comminuted, by adding  $H_2O$ , and heating the mixt. slowly to 80–96°. The liquid ext. is sep'd so as to obtain it free from fat and albumin by filtration through a moistened filter or by centrifuging and is condensed under reduced pressure.

Apparatus for mixing air or inert gases with lard or the like. Oscar C. Schmidt (to Cincinnati Butchers' Supply Co.). U. S. 2,018,618, Oct. 22. Various structural, mech., and operative details.

Drying malt sirups, other sirups, vegetable juices, molasses residues, etc., for use in feeds or fertilizers, etc. Lawrence W. Lewis. U. S. 2,018,797, Oct. 29. A nonhygroscopic product is obtained from a sirup or the like to which an alkali such as lime or NaOH is preliminarily

added to reduce the stickiness of the material, which may then be spray dried.

Maraschino cherries. Win. K. Tucker (to Calif. Packing Corp.). U. S. 2,019,030, Oct. 29. Cherries are subjected to the action of  $SO_2$  to reduce natural coloring matter, washed free from  $SO_2$  and then treated with a hypochlorite soln. to bleach out remaining coloring material.

Invert sugar for making confections. The Nulomoline Co. Ger. 618,324, Sept. 6, 1935 (Cl. 53f 3). See Brit. 573,413 (C. A. 27, 3015).

Processing coffee. Patrick T. Clary. U. S. 2,017,892, Oct. 22. After roasting coffee beans, moisture is added (as by spraying water on the roasted beans) and the resulting steam is confined in contact with the roasted coffee beans, which also may be treated with added substances such as salt. App. and various operative details are described.

Coffee substitute. Edward Jalowetz and Max Ilanburg. Fr. 784,172, July 22, 1935. A cereal is steeped and aerated, then heated in a current of steam until the temp. in each grain reaches the value necessary for dextrinization or transformation of the starch to paste. The water in the grain is then evapd. and the grain roasted.

Cereal beverages. Ronald B. McKinnis (to Continental Can Co., Inc.). Brit. 431,804, July 16, 1935. Cereals are prep'd for ready ext. by subjecting the roasted cereal tissues mixed with saccharine material to mech. pressure for rupturing the cells without completely disintegrating them. Thus roasted wheat, rye, corn, etc., may be mixed with molasses and passed between hot rollers.

## 13—CHEMICAL INDUSTRY AND MISCELLANEOUS INDUSTRIAL PRODUCTS

(PLASTICS, RESINOIDS, INSULATORS, ADHESIVES, ETC.)

HARLAN S. MINER

Chemical research and the chemical industry. Charles H. MacDowell. *J. Western Soc. Engrs.* 40, 163–72 (1935).—A general review of the history of chemistry and research with particular reference to the development in the packing industry.

Chemical industries in Finland. Heikki Soini. *Suomen Kemistilehti* 8A, 80–9 (1935).—The present state of the industry and the possibilities for future development are discussed.

Advances in the field of recovery of volatile solvents. E. E. Jukola. *Nitrocellulose* 6, 47–9, 65–6 (1935), cf. C. A. 28, 2429A.—A review.

Chemical warfare and its defense. Ugo Zanini. *Scienza farm.* [2], 3, 90–4, 133–41, et seq. (1935).—General and descriptive.

The initiation and development of the defense against gas, 1915–1918. II. Evolution of the defense. Paul Murphy. *Ind. Chemist* 11, 353–6 (1935), cf. C. A. 29, 4476A.

Possibility of using carbon monoxide as a war gas. Mielenz. *Gaschutz und Luftschutz* 5, 203–7 (1935).—A discussion of Hanne's article on the same subject (cf. C. A. 29, 6324A). A large part of Hanne's article is quoted. M. disagrees with Hanne in the latter's conclusion that CO will occupy a prominent place as a war gas in future wars.

Protection against toxic gases and dusts. P. R. Weldon. *Australian Chem. Inst., J. & Proc.* 2, 220–36 (1935).

Influence of the breathing resistance of a gas mask on the capacity of the mask wearer for performing work. Heinrich Herbst. *Chem.-Ztg.* 59, 823–4 (1935).—Modern gas masks with smoke filters have breathing resistances of 15–18 mm. water compared to the 5–6 mm. of the older masks. H. feels that manufacturers must reduce this for industrial use of the masks, as the efficiency and capacity of the wearer is too low. According to H.'s work he classifies masks with a breathing resistance of 20 mm. and more and 10% or less capacity for work of the wearer as unserviceable,

with 11 to 18 mm. resistance and 54–15% capacity for work as bad, with 7–10 mm. resistance as av., and 4–6 mm. resistance as good. Masks having 15 mm. resistance cut down the work capacity of the wearer after 5 hrs. to 1/3 that of the wearer of a 5-mm. resistance mask.

Engineering control of occupational diseases. J. J. Bloomfield. *Am. J. Pub. Health* 25, 1190–1204 (1935).

Bakelite's anniversary. James A. Lee. *Chem. & Met. Eng.* 42, 540–3 (1935).

Synthetic resins from hydrocarbons. H. I. Waterman, J. J. Leenderse and H. L. Lichtenberg. *Chem. Weekblad* 32, 342–3 (1935).—A light cracked gas-oil distillate, initial b. p. 25°, 80% at 110°, contg. 40% crude benzene, Br no. 88,  $n_D^{20}$  1.4625,  $d_4^{20}$  0.8051, mol. wt. 75, was kept for 4 to 5 hrs. at room temp. with 3%  $AlCl_3$ . A 30–40% yield of resin was obtained; by distn. 40–50% light benzene distillate was recovered after a little  $H_2O$  had been added to the reaction product for hydrolysis.

Stable spongy emulsions can be made of up to 75% resin from the product by addn. of ammoniacal water. These emulsions can be worked up with ammoniacal rubber latex (75% rubber) and pptd. together by  $AcOH$ . The mixts. can contain up to 83% resin. From the powd. dried resin mixed with powd. wood (up to 75%) pressed objects are made. The resin is sol. in benzene, ether, turpentine and pyridine, not in  $EtOH$ ,  $Me_2CO$  or  $H_2O$ . The results confirm work of Thomas and Carmody (C. A. 26, 6163).

Electrical temperature control in alkyl-resin manufacture. C. S. Ferguson. *Am. Paint J.* 19, 11, Convention Daily (Oct. 29, 1935).

Frequentite, an insulating material for high-frequency techniq. E. Albers-Schönberg and J. Gringold. *Stemag. Nachr.* No. 10, 3–13 (1933); *Referatart. Substanzliteratur* No. 537 (1934).—Frequentite, V282, is a ceramic material with a base of pure magnesium silicate. Details as to its properties and characteristics are given.

Mineral wool and vermiculite as insulation. John A. Schaeffer *Ind Eng Chem* 27, 1293 (1935) (1935).—The relation of thermal insulation to air conditioning, which is in a rapid state of development, is discussed. The greatest advance in insulating materials has been in the use of mineral wools which are Ca silicates or Ca Fe silicates artificially changed to the fibrous state. They are unique in combining the properties of low cond., chem. stability, and ability to withstand high temp. The use of mineral vermiculite that has been expanded by heat as an insulator is increasing, especially in industrial installations. A table of the d and cond. of common insulating materials is given, also a three-dimensional chart showing cond. of mineral wool as a function of d. and mean temp.

R. H. Baechler

Determination of the heat conduction in insulating materials. Bertil Stalhane *Tid Färme, Ventilations- och Sanitetstekn* 6, 5-9 (1935).—A Ni wire is used in the detn. of the heat conduction of the material. The wire is electrically heated and the variation of the resistance of the wire is observed. With the aid of some theoretical calcs it is possible to det. the heat conduction. It is detd. for sand, concrete, cork, masonry and other materials with different water contents.

J. W. Hloist

A "soldering" paste and general cement. H. E. Watson *School Sci. Rev.* 17, 137 (1935).—Make collodion varnish by dissolving celluloid in Am acetate and stir in aluminum powder. The mixt. sets quickly to a fairly hard mass, and since it is plastic in the intermediate stage, it can be molded and worked neatly.

O. Remmuth

Summary of the most important literature references on wetting agents in chronological order. Kurt Brass and A. Beyrodt *Monatsh. Chem. Ind.* 50, 247 (1935).—A list of references covering the years 1913-35.

L. S.

The age of mineral utilization. John W. Finch. *Min. Cong. J.* 21, No. 10, 10-11 (1935).—A statistical survey of the economic importance of metals and other mineral products in modern life.

A. L. Kaye

Considerations in developing a mineral-wool industry. Charles F. Fryling and Orval White *Chem & Met Eng* 42, 570-3 (1935).

E. II

Detection of the break point in the determination of retentivity of activated charcoal. Franz Krczil *Z. ges. Schweiß-Sprühverfahren* 30, 318-20 (1935).—Tests previously used are described and their limitations are discussed. The lower limits of detectability by odor or irritation of eyes or mucous membranes are given for a no. of solvents, industrial gases and war gases. An app. is described in which the increase in weight of an absorption vessel, caused by the absorption of the first traces of gas which pass the charcoal being tested, produces an elec. contact which warns the operator of the break point. The sensitivity of the app. can be varied over wide limits by varying the length of the cantilever spring.

A. L. Kibler

A study of the mineral composition of mine dust. T. L. Walker *Can. Mining J.* 56, 470-8 (1935).—The proportions of the common minerals, particularly of quartz and muscovite, were detd. Various means of checking the minerals present is given. The particles consist mostly of those with a diam. of less than 3 microns. The percentage of quartz has been detd. by means of the x-ray. Also in *Univ. Toronto Studies, Geol. Ser.* No. 38, 5-11 (1935).

W. H. Boynton

Stability of bleaching powder in packages, and of its preparations designed for use in war gas attacks. C. A. Rojahn and K. Zietan *Pharm. Ztg.* 80, 938-40 (1935).—Numerous data are presented showing the behavior of bleaching powder, Dakin's soln., bleaching powder salves and other preps. in relation to war gas attacks.

W. O. L.

Comparative x ray and dilatometric investigations on dental filling materials. K. Endell and U. Hofmann *Zahnärztl. Rundschau* No. 37 (reprint), 6 pp. 1934; *Referat-karte Schickliteratur* No. 1017 (1935).—Filling materials used for teeth can be divided into 2 groups: (1) those which show a comparatively high expansion at 700°, but which practically do not expand on setting. (a) quartz filler with a 0.7% expansion at 700°. (b) quartz masses having

0.9-1.1%; (c) cristobalite masses with an expansion of 1.3% at 700°. (2) Filling materials with thermal and setting expansions. These materials have a total expansion of about 1.6%. Chem. analysis does not show in what crystal form  $\text{SiO}_2$  is present, and only x rays show whether the filling contains quartz or cristobalite. The expansion of filling materials owing to setting and heating are shown in curves.

M. V. Kondody

A nonflammable pyrethrum spray for use in airplanes. C. L. Williams and W. C. Dreessen *U. S. Pub. Health Repts.* 50, 1401-4 (1935).—A mixt. of 1 part pyrethrum ext. in kerosene (contg. 2% pyrethrins) and 4 parts  $\text{CCl}_4$  (contg. no pyrethrins) killed 100% of the mosquitoes (*Aedes aegypti*) with 5 min. exposure. By ordinary tests this mixt. is nonflammable. Kerosene ext. contg. 0.4% pyrethrins is about as effective against *Aedes aegypti* as one contg. 2%.

J. A. Kennedy

Red squill investigations. M. G. O'Connor, R. E. Buck and C. R. Fellers *Ind Eng Chem* 27, 1377-8 (1935).—Red squill is an ideal and specific raticide. The chem. nature of the poison is unknown, so a biol. assay must be used for standardization. A simplified method is described. Rats preferred baits prepd. from meat, fish or cereal, and the addn. of various essential oils did not increase the amt. consumed. Canned red squill bait was found convenient and effective in field tests.

E. R. Rushton

Effects of fumigants on paper. Charles G. Weber, Merle B. Shaw and P. A. Back *J. Research Natl. Bur. Standards* 35, 271-5 (1935) (Research Paper No. 828).—Normal fumigation with HCN gas,  $\text{C}_2\text{H}_5\text{Cl}$ ,  $\text{CCl}_4$ ,  $\text{CS}_2$ ,  $\text{CH}_3\text{CH}_2\text{O}$ ,  $\text{CO}_2$ , or  $\text{HCOOMe}-\text{CO}_2$  had no significant

effects on representative book and writing papers. These effective fumigants, all of which are commercially available, can be safely used for ridding valuable books and documents of destructive insects.

W. J. Peterson

Fire prevention and protection in chemical industries. Bernard P. Flood *Ind Eng Chem* 27, 1305-8 (1935).

G. C.

Polynuclear phenols and nitration and sulfonation products (in making resins and as wetting, dispersing or emulsifying agents) (Brit. pat. 431,045) 10. Acetone carballic esters (as plasticizers or modifying agents with synthetic resins) (U. S. pat. 2,017,882) 10. Cellulose ester films, plastic compns., etc. (Brit. pat. 432,404) 21.

Gas masks. Reginald P. Howes. Brit. 431,671, July 12, 1935.

Plastic compositions. Studien- und Verwertungs-G m. b. H. Ger. 618,182, Sept. 3, 1935 (Cl. 39b 22). A carbonaceous fuel, e. g., coal, brown coal, peat or lignin is treated at a temp. up to about 80° with a phenol and/or an amine, e. g.,  $\text{PhNH}_2$ , with the addn. to the mixt. or to the product, of 3-5% of rubber, caled. on the product. The product is then molded under heat and pressure, with or without addn. of fillers, etc. The rubber may be taken as a soln. or emulsion, and may contain a vulcanizing agent. Sp. processes are described.

Plastic compositions. Studien- und Verwertungs-G m. b. H. (Franz. Ischer and Otto Horn, inventors). Ger. 618,231, Sept. 4, 1935 (Cl. 39b 22). A carbonaceous fuel, e. g., coal, brown coal, peat or lignin, is treated at about 80° with an org. base, e. g.,  $\text{PhNH}_2$ ,  $(\text{C}_2\text{H}_5\text{OH})_2$ , or pyridine, and the product is molded under heat and pressure, with or without the addn. of fillers, etc. Sp. processes are described.

Plasta composition. John P. Henharen. Fr. 781,902 May 24, 1935. A compn. for making linoleum, outcloth, succatives, wall coverings, insulating compns., etc., is made by heating ordinary resin to about 149° until the  $\text{AcOH}$  is liberated, adding a catalyst and continuing the heating to about 282°, introducing rubber and agitating and heating until the rubber is dissolved. The catalyst is Co resinate or other appropriate linoleates or resins.

Films from plastic materials. I. G. Farbenind. A.-G. Fr. 784,283, July 22, 1935. The plastic material (cellulose deriv., casein, synthetic resin, etc.) is applied in powder form to the inner face of an endless band which passes round a molding cylinder, so that the powder is molded under high pressure and at any desired temp. to form a film which is removed from the band after molding.

Seasoning sheet pyroxylin plastics, etc. John H. Clewell and Lloyd V. Wemple (to DuPont Visceloid Co.) U. S. 2,019,115, Oct. 29. For removing a water-sol. volatile solvent such as *air* from a material contg. nitro-cellulose of a N content of about 10.4-12.2% and also contg. a plasticizer such as camphor, the material is subjected to a preliminary air treatment, then to a water treatment, and then to a final air treatment (various details of the treatments being described).

Artificial resins Aug. Nawack A.-G. and Richard Hessen. Brit. 432,190, July 19, 1935. This corresponds to Fr. 763,580 (C. A. 28, 5639).

Synthetic resins Victor H. Turkington and Wm. H. Butler (to Bakelite Corp.) U. S. 2,017,877, Oct. 22. A resinous reaction product which is compatible with linseed oil, etc., is formed from  $\text{Cl}_3\text{C}$  and a hydroxy-biphenyl such as *o*- or *p*-hydroxybiphenyl. Turbulent also may be used.

Synthetic resin Geo. W. Seymour (to Celanese Corp. of America) U. S. 2,017,993, Oct. 22. A synthetic resin which is compatible with org. cellulose derivs. is prep'd by treating  $\text{PhOH}$  100 with  $\text{SCl}_2$  175 parts at temps. below  $20^\circ$  and then removing uncombined  $\text{SCl}_2$  (as by evapn.) at temps. not substantially above room temps. and hardening the resin by fusing it.

Synthetic resin Richard D. Kitean (to General Elec. Co.) U. S. 2,019,349, Oct. 29. An aq. colloidal suspension of an alkyl resin which may be used as a binder with mica, etc., is obtained by heating in an aq. medium an alkyl resin which has not been converted to the final infusible form in the presence of clay.

Synthetic resins Sydney L. M. Saunders. Brit. 431,951, July 18, 1935. Resins are prep'd by dissolving a fusible phenol-aldehyde condensation product in a partial ester of a monobasic org. acid with a polyhydric alc. and condensing the product with a polybasic org. acid or anhydride. The partial ester, which contains at least 2 OH groups, is derived from acids such as  $\text{AcOH}$  or  $\text{BzOH}$  or the acids derived from fats, vegetable oils or naturally occurring resins. The products, which are sol. in vegetable oils, may be used in the manuf. of varnishes and coating compns. In examples, a resin derived from *o*-cresol or *p*-tert-butylphenyl and  $\text{CH}_3\text{O}$  in the presence of an alk. catalyst is dissolved in glyceryl monofolate and the product condensed with phthalic anhydride.

Synthetic resins Sydney L. M. Saunders. Brit. 432,103, July 22, 1935. Resins are prep'd by the condensation, in the presence of a heat-treated vegetable oil, of a polybasic org. acid or anhydride with a partially esterified polyhydric alc. contg. at least 2 free OH groups, the acid constituent being a monobasic acid derived from an oil or a natural resin, which resin, oil or partial ester may be heat-treated prior to the condensation. The products are sol. in heat-treated vegetable oils. Natural resins or their esters and dyes or pigments may be added. In an example, the monoglyceride of linoleic acid is condensed with phthalic anhydride in the presence of heat-treated wood oil to yield a product that may be dried with a hydrocarbon and mixed with a drier to give a varnish.

Synthetic resins Sydney L. M. Saunders. Brit. 432,158, July 22, 1935. Divided on 432,103 (preceding abstr.). Resins are prep'd by condensing a partially esterified polyhydric alc. contg. at least 2 free OH groups, the acid constituent being a monobasic acid, e. g.,  $\text{AcOH}$ ,  $\text{BzOH}$ , or an acid derived from a vegetable oil or a naturally occurring resin, with the product obtained from the incomplete condensation of a polybasic org. anhydride and a polyhydric alc. in the presence or absence of a vegetable oil, which may be heat-treated, a natural resin or an esterified resin. The partial ester may be heat-treated before condensation or it may be made from a heat-treated oil.

The products, in conjunction with pigments, dyes, nitro-cellulose or cellulose acetate may be used in the manuf. of lacquers. In an example, a monoglyceric ester of linoleic acid is condensed with an initial condensate of glycerol and phthalic anhydride and the product may be dissolved in a hydrocarbon with the addition of a drier.

Synthetic resins. Wilhelm Kraus. Brit. 432,374, July 25, 1935. Condensation products are prep'd by causing novolacs to react with condensation products derived from  $\text{CH}_3\text{O}$ ,  $(\text{CH}_3)_2\text{N}$ , and urea or mixts. of urea and other compds that can react with  $\text{CH}_3\text{O}$ . The novolacs, and also the urea-aldehyde condensation products, are prep'd under acid conditions. The products may be mixed with filling or fibrous materials, e. g., cellulose, at any stage of the process of manuf. and then molded. In examples, a novolac prep'd from  $\text{PhOH}$ ,  $\text{CH}_3\text{O}$  and  $(\text{COOH})_2$  is mixed and caused to react with a condensation product of (1) urea (with or without the addn. of thiourea),  $\text{CH}_3\text{O}$  and  $(\text{COOH})_2$ , that has been subsequently mixed with  $(\text{CH}_3)_2\text{N}$ , or (2) urea,  $\text{CH}_3\text{O}$ ,  $(\text{CH}_3)_2\text{N}$ , and  $(\text{COOH})_2$ , with or without the addn. of urethan or acetamide, to yield resinous products. Cf. C. A. 29, 2261.

Synthetic resin Soc. pour l'ind. chim. A. Bâle. Swiss. 175,914, June 1, 1935 (Cl. 41). Addn. to 172,079 (C. A. 29, 5547). A resin suitable for making lacquers, synthetic masses, etc., is obtained by condensing  $\text{PhNH}_2$  with linseed oil, subjecting the product to the action of anhyd.  $\text{CH}_3\text{O}$ - $\text{PhNH}_2$  and treating the resulting product with  $\text{CH}_3\text{O}$ . An acid condensing agent may be present.

Synthetic resins Glasureit-Werke M. Winkelmann A.-G. (Richard Weithöner, inventor). Ger. 618,731, Sept. 6, 1935 (Cl. 12a 20 02). The manuf. of resins, by heating glycerol and phthalic anhydride with a drying oil and a monobasic org. acid, is improved by pretreating the mixt. with a small proportion of a halogen, e. g., 1-2%, calc'd on the oil. Alternatively, the oil may be pretreated with the halogen. The latter may be used in admixt. with an inert gas. Examples are given.

Synthetic resin molding compositions. Allgemeine Elektricitäts-Ges. Ger. 618,343, Sept. 7, 1935 (Cl. 39b 22). See Brit. 390,354 (C. A. 28, 6041).

Synthetic resins from aromatic amines and formaldehyde. Allgemeine Elektricitäts-Ges. (Hermann Burmeister, inventor). Ger. 618,110, Sept. 2, 1935 (Cl. 12g 9). Addn. to 598,444 (C. A. 28, 5694). *p*-Naphthylamine is used as the amine in the process of Ger. 598,444.

Resins from cracked tar and petroleum pitch. Clarence R. Wise and David F. Edwards (to Standard Oil Development Co.) U. S. 2,018,771, Oct. 29. The initial material is treated with  $\text{H}_2\text{SO}_4$ , anhyd.  $\text{AlCl}_3$ , anhyd.  $\text{FeCl}_3$ , or anhyd.  $\text{ZnCl}_2$ , the sludge is removed to obtain an acid tar, the latter is treated with solid adsorbent material such as decolorizing clay and is then subjected to vacuum distn. until a solid resin is obtained as a distn. residue. Cf. C. A. 29, 5897.

Resinous urea-formaldehyde products. Arthur M. Howald (to Toledo Synthetic Products, Inc.) U. S. 2,019,453, Oct. 29. An initial product is formed by heating urea with an excess of  $\text{CH}_3\text{O}$  in a slightly acid soln., the soln. is rendered slightly alk., addn. urea is added, and the soln. is conc'd by evapn. The resulting product is suitable for making molded articles.

Resinous condensation product of urea and formaldehyde. Bernard M. Marks (to Dupont Visceloid Co.) U. S. 2,019,354, Oct. 29. A resinous compn. which is suitable for making molded articles is produced by causing urea 1 to react with  $\text{CH}_3\text{O}$  1.0-2.5 mols., with the compn. formed by reaction of  $\text{H}_2\text{S}$  with an aldehyde such as  $\text{CH}_3\text{O}$  in aq. soln. and having a pH of about 4.0-7.5 until a reaction product contg. combined S is obtained, and with addn. urea 1 mol. per each 1.0-2.5 mols. of the compns. Various details and modifications are described. Cf. C. A. 29, 6669.

Resinous coating compositions. Horace H. Hopkins (to E. I. du Pont de Nemours & Co.). U. S. 2,018,557, Oct. 22. A polyhydric alc.-polybasic acid resin or phenol- $\text{CH}_3\text{O}$  resin is dissolved in a solvent distd. from petroleum

refined by a cracking process, b. about 60-200° and having an aniline point of from about -5° to about 60° and a dist. value of about 15 to 35. Such solns are suitable for coating furniture, etc.

Composition of rubber and alkyl resin. Herman L. Grube and Roy H. Kienle (to General Elec. Co.), U. S. 2,018,432, Oct. 22. See Can. 347,518 (C. A. 29, 3674).

Insulating coatings. I. G. Farland, A.-G. Fr. 784,770, July 22, 1935. Polyvinyl chloride having a Cl content of 62-5% is used for coating metal wires or other conductors.

Insulating oils. N. V. de Bataafsche Petroleum Maatschappij. Fr. 784,540, July 22, 1935. Oils for cables, condensers and transformers are made by adding to appropriate mineral oils unsatd. aliphatic hydrocarbons (10%), particularly those obtained by cracking or dehydrogenating mineral oils or products from mineral oils.

Producing insulation on conductors. Siemens & Halske A.-G. Brit. 432,477, July 25, 1935. Wires and similar elec. conductors are insulated by extruding a bundle of fine threads or bands of polystyrene, a cellulose deriv. or similar substance from a press, carrying the bundle and the conductor through a stranding mangle or analogous device and thence over a draw-off device to a winding appliance, and stranding the threads or bands together around the conductor by the relative rotation of the draw-off and winding devices with respect to the extrusion orifices.

Heat- and sound-insulating articles. Soc. Italiana Pirelli. Ger. 616,930, Aug. 8, 1935 (Cl. 80b, 9, 20). Addn. to 541,437 (C. A. 20, 1794). See Brit. 414,934 (C. A. 29, 6704).

Sound-absorbing and heat reflecting insulating material suitable for refrigerator cars, etc. Geo. A. Nicol, Jr. (to Geo. A. Nicol Corp.) U. S. 2,019,253, Oct. 29. A relatively thick layer of flexible, compressible, cellular sound-absorbent material such as hair felt is used with a layer of metal foil such as Al foil and with an intervening layer of adhesively secured material such as paper.

Insulating coverings for pipes, etc. Frederick W. King (to Cape Asbestos Co. Ltd.) U. S. 2,019,417, Oct. 29. Various mg. details are described for making insulation from a fibrous material such as asbestos and a binder such as Na silicate.

Insulating and cooling composition suitable for use in transformers, etc. Frank M. Clark (to General Elec. Co.) U. S. 2,019,239, Oct. 29. A mineral oil is used with about 0.6% of maleic, succinic, malonic or adipic acid, which serves to inhibit sludge formation.

Mineral wool heat insulation. Howard J. O'Brien (to Johns-Manville Corp.) U. S. 2,019,621, Oct. 29. A moisture-resistant material comprises loose mineral-wool fibers thinly coated with a mixt. of an oleaginous liquid such as fuel oil or paraffin oil and a normally solid water-repellant fatty acid compd. such as Zn stearate, etc.

Weatherproofing textile-insulated conductors. Leslie P. Lamplough and Curtis E. Flay (to Western Elec. Co.) U. S. 2,018,404, Oct. 22. In a continuous operation (in a described app.), the conductor is first impregnated with a heated aliphatic compd., then slightly cooled and treated with a coating of heated liquid wax, and then treated with "anti-sticking" material such as powdered mica.

Dielectric composition suitable for use in transformers, capacitors, switches, etc. Frank M. Clark (to General Elec. Co.) U. S. 2,019,238, Oct. 29. A chloroolefin such as a chloroethylene and a chloropolyphenyl such as pentachlorophenyl or the like are used together. Cl. C. A. 29, 4104.

Dielectric material suitable for use in capacitors, etc. Frank M. Clark (to General Elec. Co.) U. S. 2,019,237, Oct. 29. A semi-resinous nitrochlorophenyl having a dielectric const. of about 7 to 8 is obtained by subjecting a mixt. of isomers of halogenated polyphenyls to a nitrating mixt. of HNO<sub>3</sub> and H<sub>2</sub>SO<sub>4</sub> for 2 to 15 hrs. at a reaction temp. of about 100-110°.

Adhesive sheets. Minnesota Mining and Manufacturing Co. Brit. 431,560, July 10, 1935. Divided on 427,653 (C. A. 29, 6230a) and addn. to 405,247 (C. A.

28, 41919). An adhesive for use in prep. the adhesive transparent or translucent sheets or films described in 405,247 consists of a mixt. of a vinyl resin, e. g., the polymerization product of vinyl chloride and vinyl acetate, and a PhOH-ald-hyde resin. The resins are dissolved in, e. g., ethylene glycol or diacetone alc. and may be mixed with nitrocellulose soln. and a plasticizer, e. g., dibutyl phthalate. The coated surface is made adhesive by application of heat or of a solvent, e. g., gasoline, CCl<sub>4</sub>, CCl<sub>2</sub>, ethylene dichloride.

Transparent adhesive tape. Urlian Combault and Société Industrielle de la Cellulose (S. I. D. A. C.) Brit. 431,261, July 1, 1935. This corresponds to Belg. 332,738 (C. A. 21, 5493) but excludes the use of natural or synthetic resins contg. a plasticizer.

Casein products. The Casein Manufacturing Co. of America, Inc. Fr. 784,298, July 22, 1935. Casein is mixed with a small amt. of water or other appropriate plasticizing agent and an alkali or salt or one or more other plasticizing agents. The mass is mixed under a high pressure, with or without heat until a modification of the casein takes place. The mass is extruded, dried and ground to a powder which is easily sol. in water and may be used for making glue and other products.

Patterning artificial leather, oil cloth or the like. Karl Schuchardt (to Oetzel-Vaesch, Corp.), U. S. 2,017,853, Oct. 22. A light-sensitive emulsion such as one contg. AgBr and gelatin is dried, powdered and mixed with a varnish, the mixt. is applied in the surface to be patterned or decorated, exposed to light and then is photographically developed and fixed in the presence of a varnish solvent and then dried.

Condensation product. Soc. pour l'ind. chim. à Bâle. Swiss 174,963, Apr. 16, 1935 (Cl. 41). Addn. to 172,080 (C. A. 29, 65189). A low-mol. nitrogenous product sol. in low-boiling solvents is obtained by condensing polymethylphenol (obtained by condensing PhOH with ClPh) and PhNH<sub>2</sub>, about 1 mol. of PhNH<sub>2</sub> being used to each PhOH residue, and the condensation being stopped when a test shows that the product is no longer clearly sol. in alc. The product is freed from volatile constituents by a stream of inert gas at 70°. The product is a resin sol. in acetone or in an alc.-C<sub>6</sub>H<sub>6</sub> mixt.

Condensation products of urea or its derivatives and formaldehydes. Soc. pour l'ind. chim. à Bâle. Ger. 618,427, Sept. 7, 1935 (Cl. 12a, 17, 03). Processes in which urea or its derivs. and ClPhO are condensed in the presence of active C are improved by using forms of active C which are capable of adsorbing acid electrolytes. Wood charcoal activated with steam at 800-1000°, and certain varieties of bone black, are suitable. The C may alternatively be added to the solns. of the reagents and removed before the solns. are mixed. Cl. Brit. 223,034 (C. A. 21, 2539).

Urea derivatives. Imperial Chemical Industries Ltd. and Henry A. Piggott. Brit. 432,279, July 22, 1935. Urea is condensed with 2 or more (up to 55) mol. proportions of ethylene oxide (1) and the products are acylated with an acid derived from a natural fat or fatty oil. The products are useful as textile assistants particularly as leveling and emulsifying agents. Among examples, urea is heated with 30 times its wt. of 1 and the product is heated with stearic acid, the acylated product may be added to an indigo vat, whereby slightly greener dyes, much faster to rubbing, are obtained.

Synthetic materials. Kurt Albert G. m. b. H. Chemische Fabrik. Fr. 784,158, July 22, 1935. Condensation products of amides and aldehydes, cellulose derivs., proteinoplasts, amine-aldehyde condensation products, "novolacs," natural and synthetic resins, etc., or mixts. of aliphatic or aromatic amines and hardenable condensation products contg. phenols and carbonyl, are hardened by heat until a gel is formed which may be cut. The gel is cut into thin flakes or fragments which are fired together and molded with heat and pressure or simply heat.

Coloring polymerization products. I. G. Farbenind. A.-G. (Walther Lützendorf, Hans Fikentscher and Heinrich Hopff, inventors). Ger. 618,006, Aug. 30, 1935

(Cl. 39b, 4 02). The polymerization products of compds. contg. one double bond, e. g., vinyl esters, acrylic esters, or acrylic nitrile, are colored by treatment with aq. suspensions of water-insol. or sparingly sol. dyes known to be suitable for dyeing cellulose esters. Aminoanthraquinones, nitroaromatics and aminoazo compds. are among the classes of dyes specified. Products obtainable by polymerizing mixts. of the olefinic compds. with other compds., or the products obtainable by after-treating the polymerization products, e. g., by chlorination or reaction with aldehydes, may also be colored. The products may be treated in the form of films, filaments, sheets, tubes, etc. Sp. processes are described.

Emulsifying and other agents. *Chemische Fabrik vorm. Sandoz*. Swiss 175,860-870, July 1, 1935 (Cl. 36a). Adds to 171,359 (C. A. 29, 5548<sup>3</sup>) A cleaning, washing, emulsifying, dispersing or softening agent is made by treating olive oil with a mixt. of  $H_2SO_4$  and the glycerol ester of  $H_2SO_4$  (175,860). The olive oil may be replaced by coconut oil, (175,867), castor oil, (175,868), coconut oil fat acid, (175,869), or naphthene acid (175,870).

Emulsions *Reinhold O. Braike*. Brit. 431,642, July 8, 1935.  $H_2O$  is dispersed in oils, fats, resins, pitches, etc., by adding to the  $H_2O$ , prior to or during the mixing, about 0.01% of the principal substance of aq. alkali, e. g.,  $NaOH$ ,  $KOH$ ,  $NaOH$ , having dissolved therein aromatic hydrocarbon derivs. or their salts sol in alkali, e. g.,  $BzOH$ ,  $Na$  salicylate,  $o$ ,  $m$ - or  $p$ -resol. The products may have pigments or solid substances incorporated therewith for use as paints, color varnishes, printing inks and lubricants. Among examples, 350 g  $H_2O$  contg. 0.015 g.  $NaOH$  and 0.0015 g.  $BzONa$  are stirred at 30° into 1000 g. olive oil, the product may be used as salad oil. Cl. C. A. 28, 5153<sup>4</sup>

Wax emulsions *I. G. Farbenind. A.-G.* Fr. 784,614, July 22, 1935. Wax emulsions such as polishes and cleaning compds. are made stable as regards color and appearance by adding during or after their prepn a colorless substance liberating  $O$  easily, such as peroxides, persalts, alkali salts of nitrobenzoic, nitrophthalic or nitrobenzenesulfonic acids.

Compositions containing collagen products. *Wlfred G. Dewsbury and Arnold Davies*. Brit. 431,360, July 5, 1935. Glue or gelatin is treated with a mineral, animal or vegetable oil at 130° until a mass of fibers seps., the fibers are sepd and then dispersed in an aq. medium. The aq. dispersion may be mixed with glue as a size or to increase its setting time, with ice cream to control the formation of ice crystals, as a protective colloid with latex to check coagulation, e. g., on cones or on addn of asbestos fiber, as a stabilizer with emulsions, e. g., oil-in- $H_2O$  emulsions contg. pigments, with cream for whipping or with preserves, jams or meat exts., with the fillers or colloidal  $S$  in rubber, or with the  $H_2O$  used in wet-grinding, e. g., of graphite to be used in the impregnation of fibers to be used as elec. resistances, or of  $S$  for vulcanization.

Colloidal dispersions. *Richard Werner*. Ger. 618,269, Sept. 4, 1935 (Cl. 12e, 4 01). For the manuf. of colloidal dispersions of silicates, tungstates and other poor elec. conductors by the elec. dispersion method, use is made of electrodes in which one or more metal cores are surrounded by the poor conductor, which is itself enclosed in an outer metallic sheath.

Reversible gels. *Soc. pour l'ind. chim. à Bâle*. Swiss 177,270, Aug. 1, 1935 (Cl. 41). Carbamides and  $CH_3O$  are condensed, the condensation not being allowed to proceed beyond the hydrophile stage, in a neutral medium in the presence of a solvent at temps. in the region of 100°. The resulting soln. is dried to give a water-sol. powder capable of forming a reversible gel. In the example, urea is condensed with  $CH_3O$  in the presence of active C and water.

Jelly-forming materials such as carob-kernel flour, gum acacia, etc. *Rudolf G. Schulz (to Illeke) & Co.* G. M. b. H. U. S. 2,019,303, Oct. 29. To prevent jelly-forming org. substances of various kinds from forming lumps when swelling or dissolving, the finely pulverized material is heated to about 141-180° in the presence of

about 3% of moisture for a sufficient time to form coarser, porous aggregates, without effecting any substantial gelation and without forming a soln. Boiling xylene may be used as a heating medium.

Cleaning composition. *Paul Antenen and Arnold Brunner*. Swiss 175,610, May 10, 1935 (Cl. 15c). Oil of turpentine, sulfonate, cyclohexanol,  $NH_4OH$ ,  $AcOAm$ ,  $MgO$  and water are mixed together.

Use and cleaning of dry-cleaning liquids. *Wm. H. Alton (to R. T. Vanderbilt Co.)*. U. S. 2,018,507, Oct. 22. Dirty dry-cleaning liquid is mixed with a filtering material such as pyrophyllite of graded sizes and the resulting mixt. is passed to a filter where the larger sizes of the graded material build up a filtering foundation supporting the finer particles to insure a fine straining action on the passing liquid.

Detergents. *Robert D. Grant*. Brit. 432,140, July 22, 1935. A cleaning prepn is composed of soft soap, a gritty or abrasive substance, e. g., sawdust, ground wood or cork, an animal or vegetable fatty oil, a perfume and  $H_2O$  to form a paste.

Washing composition *Gottfried Held, Chemische Fabrik*. Swiss 176,622, July 1, 1935 (Cl. 21d). A compn. as above contg. a ferment contains at least one protective colloid which does not arrest the action of the ferment, and in such quantity that it exerts an emulsifying and washing action. In an example, the compn. consists of  $Na$  launurate,  $NaCl$ , calcium soda and pancreatin.

Washing and other agents. *Chemische Fabrik vorm. Sandoz*. Swiss 174,511 to 174,514, Apr. 1, 1935 (Cl. 36a). Adds to 171,359 (C. A. 29, 5548<sup>3</sup>) A cleaning, emulsifying, dispersing and softening agent is obtained by treating sperm oil with a mixt. of  $H_2SO_4$  and glycerol- $H_2SO_4$  (174,511). The sperm oil may be replaced by spermaceti (174,512). Spermaceti may be treated with fuming  $H_2SO_4$  in the presence of a mixt. of monoxylglycerol ether isomers (174,513). Finally, bees wax may be treated with a mixt. of  $H_2SO_4$  and glycerol- $H_2SO_4$  (174,514).

Coating compositions. *Colloidal Colours Ltd. and Reginald Graham Durrant*. Brit. 431,280, July 4, 1935. Colored materials for coating surfaces, e. g., of slates, tiles, glass, porcelain, concrete, brickwork, are made by prep. sols from hydroxide of Fe and (or) hydroxide of Cr and incorporating therewith inorg. powders serving as coloring matters without acting as electrolytes or having any adverse effect upon the sols. The powders, e. g.,  $Fe_2O_3$ , green oxide of Cr, black oxide of Mn, ochre, small, may be incorporated with the liquid sol and the mixt., if desired, dried or they may be mixed with the already dried sol. For application, the mixt. is stirred with  $H_2O$  and, after application, the sol may be gelled by applying an electrolyte, e. g.,  $Na$  silicate soln. Cl. C. A. 29, 5249<sup>7</sup>.

Coating articles with cellulose acetate. *Charles J. Nurse*. Brit. 431,616, July 11, 1935. In molding coverings on knitting pins, dress buckles, etc., the cellulose acetate is placed around the article which is then heated in an oven until the cellulose acetate becomes plastic, the heated aggregate being then transferred to and pressed between dies at a lower temp. than that of the oven so that the cellulose acetate at its inner faces, which are to be joined, is more plastic than at the faces in contact with the dies. App. is described.

Coating metals. *The British Thomson-Houston Co. Ltd.* Brit. 431,816, July 10, 1935. A metal, e. g., steel plate, core, foundation or reinforcement, is united with a covering layer composed of textile fibers united by an artificial resin, e. g., a phenolic condensation product, by applying and baking onto the metal a coating of enamel such as used in enameling wire, applying the textile material and uncured artificial resin and curing the resin. The textile fibers may be loose or batted or in the form of threads or woven or felted fabric. A steel wire enameled by applying and baking on several coatings consisting mainly of linseed oil, china-wood oil, coal-tar oil and a solvent such as kerosene is passed through a soln. of uncured artificial resin and wound with cotton thread, which may be impregnated with uncured artificial resin. Further layers of resin and thread may be applied, and the wire

baked to cure or to cure partly the resin. Wire thus coated can be used as a reinforcement in the construction of a spinning pot for rayon from fibrous textile material and artificial resin.

Transparent or translucent sheet material. See also Crystall. 1r 784,213, July 22, 1935. Textile fibers are impregnated with a 40% soln of polystyrene, and, after evapn of the solvent, are treated in a 2nd hot bath contg 90% of pure polystyrene resin. The product is dried and compressed while heated under 25-40 kg per cm<sup>2</sup> to form smooth sheets.

Rust-preventing composition. I. Berhard Wurbs. Swiss 176,041, June 17, 1935 (Cl. 37g). The compn consists of an alk. reagent, Fe powder and at least one other powdered metal of the same electromotive series as Fe. The alkalinity of the compn is about equiv. to a 0.25 to 0.005 N acid soln. A varnish may be added to the compn. In an example, the compn. consists of Pb powder, 1e powder, 3 Ag<sub>2</sub>CO<sub>3</sub>, white lead and varnish.

Plywood. Geo. R. Meyercord and Charles E. Rozema (to Reconstruction Finance Corp.). U. S. 2,018,733, Oct. 29. A layer of thermosetting resinous material such as a phenolaldehyde product and a layer of non-resinous adhesive material such as dried blood is placed between each ply and the next inner ply, the proportion of resinous material to the non resinous material decreasing from the outer faces of the assembly toward the center, and the materials are subjected to heat and pressure.

Wood ply. George H. Osgood and Russell G. Peterson. U. S. 2,019,050, Oct. 29. Wood plies are united by a vegetable hemucellulose-contg. adhesive which contains a sufficient excess of caustic alkali and CS<sub>2</sub> to soften the wood fibers along the glue line so that the natural acids of the wood react on the cellulosic materials to form a waterproof bond.

Gluing panels of wood veneer or the like under pressure. Charles B. Norris (to Reconstruction Finance Corp.). U. S. 2,018,736, Oct. 29. A pressure equalizing pad for use in a hot press is formed of a casing such as thin sheet steel and filled with metal of low m. p. such as an alloy of Pb and Bi.

Fiber container with metallic ends suitable for holding oils, greases, etc. Pierris Heydrickx. U. S. 2,019,412, Oct. 29. An oil-resisting coating such as casein hardened with formal is used on the inner walls and ends.

Shoe counter material. Fred L. Ayers (to Brown Co.). U. S. 2,018,245, Oct. 22. A partially shaped counter is formed essentially of a felted fibrous base impregnated with rubber (various mfg. details being described).

Foamed slag. Dorman, Long & Co. Ltd. and John S. Lewis. Brit. 431,647, July 9, 1935. H<sub>2</sub>O, in the form of a jet or the like, is delivered into contact with the under surface of molten slag falling through space to a collecting device. App. is described.

Composite mica tubes suitable for resisting high temperatures. Willis A. Boughton and Wm. R. Mansfield (to New England Mica Co.). U. S. 2,017,943, Oct. 22. A sheet of flexible mica and a binder such as Na metaphosphate soln is rolled into a cylinder, the cylinder is provided with interior and exterior coatings of carboniz-

able material such as kraft paper and with a plant non-combustible outer covering such as Cu foil and is heated on a noncombustible core such as a steel rod to carbonize the carbonizable material and render the tube readily separable from the core and from the outer covering.

Stencil sheets. Wm. G. D. Orr (to A. B. Dick Co.). U. S. 2,018,501, Oct. 22. A backing sheet is used with a type-impressible sheet impregnated with a colored material such as one which is dark blue and a homogeneous sheet of elastic material such as cellophane having a waxy color-bearing coating on each side, the coating on one side being colored to yield offset copies of applied impressions and the coating on the other side being colored to give contrast between the stenciled impression and the undisturbed portions of the type impressible sheet.

Fricition-testing apparatus suitable for testing brake linings, etc. Sydney G. Tilden (to Raybestos-Manhattan, Inc.). U. S. 2,018,688-9, Oct. 29. Mech. features.

Photomechanical printing processes. Bekk & Kaulen chem. Fab. G. m. b. H. Ger. 615,773, July 12, 1935 (Cl. 57d, 2 03). Addn. to 605,296 (C. A. 29, 1181). A chromate or dichromate of a nonvolatile alkali, e. g., Na or K, is used as the sensitizing agent in the process of Ger. 605,296.

Sterilizing and proofing bristles. The Pro-phy-lac-tic Brush Co. Brit. 431,780, July 5, 1935. Toothbrushes, etc., or the bristles from which they are made, are rendered self-sterilizing and mold-proof by impregnation with a soln of a phenylmercuric salt, e. g., the nitrate or chloride, in H<sub>2</sub>O or other solvent, e. g., dioxane, AcOAm, EtOH, Me<sub>2</sub>CO or AcOEt. Before impregnation, the bristles may be treated with an oxidizing agent, e. g., H<sub>2</sub>O<sub>2</sub>, and, after impregnation, they may be treated with a stabilizing agent, NaCl or NaI. Alternatively, the bristles may be immersed in a bath contg. 2 or all 3 of the treating agents. The bristles may also be treated with a waterproofing agent, e. g., paraffin, ceresin, carnauba wax or an ester or other of cellulose.

Lamp shades, etc. Deutsche Gasgluhlicht-Auer-Gesellschaft m. b. H. (to Decca A.-G. (Auergesellschaft)). Brit. 432,145, July 22, 1935. A lamp screen, shade or reflector is provided with a coating contg. a Nd compd. or is made of a transparent or translucent material, other than glass, contg. a Nd compd. Among several methods described, a translucent paper, cardboard or fibrous material is soaked in Nd NH<sub>4</sub> nitrate and then coated on both sides with lacquer, or the soaking soln. may be mixed with the binder, e. g., wheat starch, turkey gum or gelatin, and the Nd salt then deposited in solid form by evapn.

Preserving cut flowers. I. Garbenund A.-G. Fr. 784,356, July 22, 1935. A soln is used contg. a food for the flowers, such as cane sugar, and a substance preventing putrefaction such as org. compds. of N contg. at least one aliphatic radical of high mol. wt. attached to N or substitution products thereof, e. g., dodecylamine-HCl, dimethylbenzyl-dodecylammonium chloride and dimethyl-dodecylbenzylchlorobenzyllammonium chloride.

Fireproofing paints or glues. Marcel Fimaux and Paul Kuhler. Fr. 784,849, July 22, 1935. These are made fireproof by the addn. of Wassy cements.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Mineral waters of Castrocara. Maria Bacchini. *Scienza farm.* [2], 3, 107-18(1935).—Analyses of waters from the different mineral springs of the Castrocara region are given.

City of Manchester Rivers Department. Ann. Rept. for year ending March 31, 1935. S. P. Dawson. 44 pp., 1935.—The sewage-purification works have functioned satisfactorily. The extensions at the Davyburne Works have been completed and the new activated sludge units are now in full commission.

Edward Bartow  
Travertine-depositing waters near Lexington, Virginia. Edward Steidtmann. *Science* 82, 333-4(1935).—The

waters are supersatd. with Ca(HCO<sub>3</sub>)<sub>2</sub> throughout the year, the excess ranging from about 68 to 76 parts CaCO<sub>3</sub> per million. Adjustment resulting in deposition of calcite is hastened by rise in temp., aeration and the presence of calcite. Excess of deposition of CaCO<sub>3</sub> over CO<sub>2</sub> suggests that much of the CaCO<sub>3</sub> which appeared to be in soln. was really in a cryst. colloidal state.

P. S. Roffler  
The water supplies of German large and middle-sized cities. E. O. Stern. *Gesundh.-Ing.* 58, 600-602(1935). Cf. C. A. 28, 7385.—Data, mostly of economic significance, for 27 cities are reported in tabular form and discussed.

M. G. Moore

Regime of salts in waters of the Alexandretta sandjak. Vladimir Frolow. *Comp. rend.* 201, 613-15(1935); (C. A. 27, 2308).—The elec. resistance of the waters of 21 springs or streams in the sandjak of Alexandretta (Syria) has been detd. at various times during 1933-4. The results show close connection with the rainfall and the nature of surrounding rocks. C. A. Suberog.

Acid mine drainage control on upper Ohio River tributaries. E. S. Trindle and E. W. Lyon. *J. Am. Water Works Assoc.* 27, 1180-88(1935).—Recently a mine-sealing program went into effect (C. A. 29, 1900) and after 9 months is considered successful. Two hundred and fifteen mines were closed and after 9 months 75% of the acid has been removed from their drainage. D. K. French.

Chemical hazards in water-works plants. M. C. Smith, et al. *J. Am. Water Works Assoc.* 27, 1225-48(1935).—The handling and utilization of Cl and adverbial first and only is considered. Care in handling is stressed. Containers should be stored standing vertically and prevented from falling over. First aid and treatment for irritant gas poisoning, etc., is discussed. Twelve precautionary recommendations in regard to Cl handling are given. D. K. French.

The relation of activated carbon to water purification. C. H. Billings. *Sanitation Water Works J.* 17, No. 4, 11-13 (1935).—Tests are given on 6 activated carbons. The best C for water treatment should remain longest in suspension and have a high phenol removal. Detailed methods of testing are given. O. M. Smith.

Methods for determining traces of heavy metals in mineral waters. K. Heller, K. Kubla and F. Machek. *Mikrochemie* 18, 193-222(1935).—According to Mikolok, C. A. 23, 2457, 3133, 3214, the heavy metal content of a mineral water serves to identify the probable source of the spring. A scheme of analysis is outlined for detg. as little as 0.01 mg. of Cu, Bi, Pb, Cd or Zn per l. These ions were concd. by shaking with  $\text{CCl}_4$  + dithione (cf. Fischer and Leopoldi, C. A. 23, 2233) and the final detg. were made by the polarographic method (cf. Heyrovsky, C. A. 27, 6270) with a dropping Hg electrode. W. T. H.

Determination of traces of lead in drinking water. J. F. Reith and J. de Beus. *Z. anal. Chem.* 103, 13-27 (1935).—See C. A. 29, 3204. W. T. H.

The use of sodium pyrophosphate combined with metaphosphate in the determination of lead in drinking water. P. Karsten. *Chem. Weekblad* 32, 391-3(1935).—To avoid difficulties in Fe pptn. by pyrophosphate, metaphosphate is added to give the correct pH condition for Pb detn.; per 80 cc. water contg. less than 20 mg. Ca, 10 cc. 10% Na metaphosphate is added, then 1 g. Na pyrophosphate, 10 cc. ammoniacal  $\text{NH}_4\text{Cl}$  soln., lastly 2 drops of Na<sub>2</sub>S soln. Cu is eliminated if necessary by adding 4 drops of 10% KCN soln. to the above. This procedure allows simple colorimetric detn. of Pb even in very hard water and in the presence of up to 20 mg. Fe per l. B. J. C. van der Hoeven.

Step-photometric determination of manganese in drinking water and in service water. R. Baril. *Mikrochemie* 18, 230-35(1935).—Schmidt's method (C. A. 22, 1202) which depends upon the formation of a reddish violet compd. when quadrivalent Mn is treated with dimethyl-p-phenylenediamine is suitable for photometric measurement. The color, to be sure, is not sp. for Mn but it is easy to avoid interference by other oxidizing agents likely to be present in water. Full directions are given for carrying out the test with 100 cc. of water. W. T. H.

Step-photometric determination of free chlorine in chlorinated water. L. Goldenberg. *Mikrochemie* 18, 235-49(1935).—The colorimetric method of Ellis and Hauser (C. A. 8, 880, 2900) with an acid soln. of o-toluidine as reagent was studied with the photometer. A table was prepd. showing the Cl corresponding to each 0.1 in the drum readings ( $\text{Cl} = 0.54 - 0.077 \text{ mg. per l.}$ ) and possible interference studied. W. T. H.

Colorimetric method for the determination of dissolved oxygen. F. Wellington Gilcrease. *J. Am. Water Works Assoc.* 27, 1160-77(1935).—A colorimetric method is

described; amidol which is considered a valuable addn. to methods of water and sewage analysis is used. Only 2 reagents and a limited amt. of equipment are necessary. Certain oxidizing and reducing substances interfere, and the test while relatively accurate will probably never be as accurate as the standard Winkler method. D. K. F.

Results of algal activity, some familiar, others obscure. W. C. Purdy. *J. Am. Water Works Assoc.* 27, 1120-33 (1935).—Pure dissolved O is the result of algae growth.

This is produced only in sunlight, and is sufficient to support bacterial growth. In the absence of algae, bacteria soon exhaust the dissolved O, but in mixts. O production always exceeded depletion. Oxygen so produced has a vapor pressure about 5 times that of atm. O. D. K. French.

Determining the bacteriological quality of drinking water. J. K. Hoskins and C. T. Butterfield. *J. Am. Water Works Assoc.* 27, 1101-9(1935).—The use of larger portions than 10 cc is considered desirable. The need for a more dependable method than the dil. plate method seems reasonable. D. K. French.

Limiting standards of bacterial quality for sources of purified water supplies. H. W. Streeter. *J. Am. Water Works Assoc.* 27, 1110-19(1935).—Where waters require filtration the average *Es. coli* index should in no case exceed 5000 per 100 cc. and should not exceed 20,000 per 100 cc. during more than 5% of the period, as for instance a year. Where waters are simply chlorinated the av. *Es. coli* index should not exceed 50 per 100 cc. and should not exceed 400 per 100 cc. more than 5% of the time. D. K. F.

Preparation of fine anthracite coal for use in filter plants. F. L. Butler. *J. Am. Water Works Assoc.* 27, 1101-3 (1935).—Heavy refuse is first dropped out by water and then by shakers. There is also some ash removal. Signg follows. D. K. French.

Corrosion control with a marble filter. Henry Ryan. *Water Works and Sewerage* 82, 360-01(1935).—Filtration through coarse crushed marble (90%  $\text{CaCO}_3$ ) will raise the pH of a soft water, high in  $\text{CO}_2$  and materially reduce "red water" difficulties. G. H. Young.

Progress report of committee on tentative methods for testing teetles. Charles P. Hoover, et al. *J. Am. Water Works Assoc.* 27, 1178-83(1935).—Methods are advanced for the detn. of grain size and percentage of fines, weight per cu. ft. as received, resistance to mech. wear, rates of  $\text{Al}_2\text{O}_3$  to  $\text{SiO}_2$  and exchange value. D. K. French.

Assistants for working with hard water. Fritz Ohl. *Speyer u. Water* 53, No. 33, 8-11(1935).—For industrial purposes water is softened either in special installations or by the use of washing softeners. The 2nd method is less expensive and hence more suitable for the textile industry. These water softeners are (1) soda, (2) alkali bases, (3) mixts. contg. soda, water glass or other siliceous compds., (4) the same plus soap; (5) the same plus borax,  $\text{Na}_2\text{PO}_4$ , etc., with and without soap, (6) Na phosphates or alkali salts of silicic or phosphoric acids. The use of all of these softening agents is discussed. The following com. powders of German manuf. used as water softeners have these compns.: *Berol*-Ubersoda is soap, soda and a mixt. of cyclic alcs. *Herby* is soda (free from Cl) and water glass. *Sapo* is soap, soda, borax and water glass. *Triwalspa* washing soda is soap, soda and water glass. *Tetra* is soda and water glass (it consists of ammoniacal soda,  $\text{Na}_2\text{PO}_4$  and water glass). Various phases of water softening are discussed. Leopold Scheffan.

Water softening on steamships. An interesting plant for the "Queen Mary." *Am. Water and Water Eng.* 37, 537-8(1935).—A combined lime and base-exchange plant is used. W. A. Moore.

Diesel-engine exhaust used in water softening. Paul Stegeman. *Water Works Eng.* 88, 1182-4(1935).—The exhaust, corr. approx. 9%  $\text{CO}_2$ , is used for recarbonation. By this means a pH of 8.2 can be maintained in the treated water. No objectionable odors or tastes are imparted to the water nor is it necessary to scrub the gas before use. W. A. Moore.

Routine analysis of boiler feedwater sources. S. H. Coleman. *Power Plant Eng.* 39, 577(1935).—Routine

analyses should be made not only of the water in the boiler but of the water in various parts of a system and raw water sources. Such analyses may show variations in the raw water or leaks in a circulation system that, when found, can be corrected. Edward Bartow

Mottled enamel Crawford A. McMurray. *Southeast Water Works J.* 17, No. 4, 18-19 (1935).—Ninety-eight of 400 children between the ages of 6 and 13 years developed mottled enamel by using water exclusively that contained 4.4 p.p.m. of F. O. M. Smith

Chemical sewage treatment in America. Imhoff. *Gesundh.-Ing.* 58, 599-600 (1935); cf. C. A. 29, 5208.

M. G. Moore

Features of the new northside sewage-treatment works of Durham, N. C. Wm. M. Platt. *Water Works and Sewerage* 82, 337-43 (1935). G. H. Young

Experiments in chemical sewage treatment at Liberty, N. Y. W. A. Hardenbergh. *Public Works* 66, No. 10, 31-2 (1935).—Original expts. with chem. application 1 1/2 miles upstream to effect mixing and coagulation were unsatisfactory, an air mix tank installed at the plant site gave satisfactory results with chem. treatment, as follows:

(1) "Ferrisul" and chlorinated coppers gave satisfactory effluents but necessitated lime and Cl application at the upstream dosing point, (2) "Blackalum" gave satisfactory results without lime-Cl dosage upstream, and the final Cl dosage could be materially reduced, (3) application of activated C direct to the sludge digestors (a) increased digestive activity, (b) gas production, (c) removed sludge odors and (d) gave a faster drying sludge. A combination of 2 and 3 became standard practice. G. H. Young

The new sewage treatment plant of Walden, N. Y. Newell L. Nussbaumer. *Water Works and Sewerage* 82, 355-8 (1935). G. H. Young

State Hospital sewage-disposal works. Henry Ryan. *Public Works* 66, No. 10, 33 (1935).—Operating statistics from the Poughkeepsie (N. Y.) State Hospital plant. G. H. Young

The problem of sewage treatment at Brunn. Friedrich Frodl. *Techn. Gemeindeblatt* 38, 222-4 (1935).—The need for treatment in view of the very low dilution at times afforded by receiving streams and proposed types of treatment are discussed. *Ibid.* 245-82.—Graphical and tabular data important in the planning of a sewage-treatment plant are discussed, including the amt. of sewage flow, the phys. and chem. character of the sewage, the variation of these factors with the time of day and year, industrial wastes (which here are not of a troublesome nature) and the possible utilization of sewage sludge, etc. M. G. Moore

Chemical mechanical treatment of sewage. IV. (a) Mechanical filtration, (b) sludge treatment. Philip B. Streadner and Michael J. Blew. *Public Works* 66, No. 10, 15-16 (1935), cf. C. A. 29, 7540. —Under (a) the authors discuss (1) advantages of filtration, (2) filter types, (3) filtration rates and influencing factors, under (b) they discuss treatment and disposal, with factors influencing (1) sludge vol. and (2) concn. G. H. Y.

Sewage dangers. Marcel Bertharion. *Techn. sanit. munic.* 30, 228-34 (1935).—The very toxic nature of H<sub>2</sub>S gas in sewers and its frequent occurrence are noted. A subacute intoxication is possible at exposures of several hrs. at concns. of 5-20 p.p.m.; or 5-10 min. at concns. of 50-60 p.p.m. The irritation first is noticed in the eyes and mucous membranes and in severe cases results in pulmonary edema. Anaerobic putrefactive fermentations in sewers form large quantities of the gas CO<sub>2</sub> and CH<sub>4</sub>, are also found in sewers but are less important in a public health sense than H<sub>2</sub>S. Measures of security are outlined. C. R. Fellers

Experience with chlorination of activated sludge. L. F. Smith. *Water Works and Sewerage* 82, 362-4 (1935).—Soln. feed chlorination effectively controlled bulking difficulties at the Lima (Ohio) activated sludge plant, in addn. reduction of compressed air requirements as a result of chlorination were such that an estd. annual saving of \$320-\$1500 can be realized. G. H. Young

The biological treatment in water of settled sewage.

T. E. Giesecke and P. J. A. Zellar. *Southeast Water Works J.* 17, No. 6, 11 (1935).—An exptl. lake of about 14 acres was constructed at College Station, Texas, to handle 300,000 gals. daily of settled sewage with a biochem. O demand of 475 p.p.m. The lake effluent had a biochem. O demand of 80 p.p.m., thus supplying 75 lb. of O per acre per day. O. M. Smith

The manufacturing, testing and use of diffuser media. Frank C. Roe. *Southeast Water Works J.* 17, No. 4, 14-15 (1935).—See C. A. 29, 6670. O. M. Smith

Stream pollution and textile wastes. C. D. Blackwelder. *Mech. Eng.* 57, 631-2 (1935).—See C. A. 29, 4114. E. H.

Bacteriological examinations of oysters and water from Narragansett Bay during the winter and spring of 1927-28. L. M. Fisher and J. L. Acker. *U. S. Pub. Health Repts.* 50, 1449-75 (1935).—The quality of the water is better in winter and early spring than it is in the late fall. The quality of the oysters also tends to improve at these times. This tendency on the part of the oysters is perhaps more marked but results are likely to be more erratic. There is a general tendency in northern oyster-growing areas during the marketing season for oyster scores to increase as water scores increase, and vice versa, when viewed broadly. In individual comparisons, differences may be extreme. A marked improvement in the quality of oysters occurs within about 1° of the f.p. This improvement was much more consistent at these lower ranges of temps. than at other cold-weather ranges. Also in *Sewage Works J.* 7, 727-41 (1935). J. A. Kennedy

The efficacy of various insecticidal sprays in the destruction of adult mosquitoes. J. A. Sinton and R. C. Watts. *Records Malaya Survey India* 5, 275-306 (1935).—Adult mosquitoes in houses were effectively controlled by spraying the atm. with a mist of 1 part of Pyrethroid 20 (a proprietary concd. ext. of pyrethrum) and 19 parts of kerosene with the addn. of either oil of citronella 5, oil of sassafras 0.5-1.0 or oil of pine 4-5%. The efficacy of the spray seemed to increase with a rise in temp. and to decrease with a rise in relative humidity. The spray seemed to be less effective against certain culicines than against certain anophelines. At a concn. of 1 cc./225 cu. ft., the spray was highly toxic to mosquitoes in 30 min. When the spray was used at a concn. of 1 cc./100-150 cu. ft., persons in a closed room experienced to about 5 min. a distinctly oppressive feeling which developed into a mild headache with occasionally a slight irritation of the nasal mucosa. In concns. of approx. 1 cc./200 cu. ft., except for a slight oppressive feeling, the symptoms were slight, while in concns. of approx. 1 cc./350-400 cu. ft., very little unpleasant effect was noted in a closed room up to 30 min. K. D. Jacob

Larvicides and a method for temporary protection from adult mosquitoes in limited areas. Joseph M. Ginsburg. *New Jersey Mosquito Extermination Assoc., Proc. 22nd Ann. Meeting* 1935, 147-51; cf. C. A. 29, 3080. —A larvicide suitable for use on hard and salt waters is prepd. by mixing 6 lb. Gardinol W. A. Concentrated with 50 gal. water and then thoroughly agitating with 100 gal. kerosene contg. 2-3 lb. wool grease and enough pyrethrum ext. to equal 100 lb. flowers (contg. at least 0.9% pyrethrins). For spraying, the stock soln. is dild. with 10 parts water. The spray is effective against mosquito pupae and gives temporary control of adult mosquitoes when it is applied to grass, shrubs, etc. K. D. Jacob

Mosquito suppression work in Canada in 1934. Arthur Gibson. *New Jersey Mosquito Extermination Assoc., Proc. 22nd Ann. Meeting* 1935, 77-81.—Tray tests were carried out with the larvae and pupae of common species of *Aedes*. With oils applied at the rate of 1.5 gal./acre the kills of larvae in 18 hrs. were for kerosene 70, stove oil 63, luel oil 48, crude petroleum 33 and used crankcase oil 9%. The prepn. of satisfactory oil emulsions was facilitated by the addn. of 0.25-6.00% of pine oil but the killing efficiency of the mineral oils was not improved thereby. When it was used at the rate of 1.5 gal./acre, an emulsion prepd. by emulsifying equal parts of fuel oil and 5% soap soln. and dild. with 20 parts of water killed

an av. of 82% of the larvae. The larvicidal value of fuel oil-soap emulsions, with or without the addn. of pine oil, was materially increased by the addn. of derris powder (0.25 lb./gal.). The larvicidal value of oil emulsions was also increased by the addn. of pyrethrum powder (1 lb./gal.). The oil emulsions were completely effective against mosquito pupae. Sulfite liquor (1 part/240 parts water) was ineffective against larvae and pupae, and lime S (1.100 and 1-200) was not harmful to larvae in 20 hrs. A 1:8000 soln. of 40% nicotine sulfate gave 100% kill of larvae in 17 hrs. but had no effect on pupae. A soln. of laundry soap 1 in water 1600 parts gave 100% kill of larvae and 17% kill of pupae in 17 hrs. Dusts prep'd by mixing powd. derris (5% rotenone) 1 and infusorial earth 100 parts and applied at the rate of 1 lb. derris per acre gave complete control of larvae and pupae in 60 hrs. Infusorial earth impregnated with oil gave excellent results in destroying larvae and pupae when used in dosages per acre as little as 3-4 gal. oil. The use of oil exts. of pyrethrum instead of oil alone in prep'g the dusts gave markedly better results. Mosquito repellents for application to the clothing and skin are described. K. D. Jacob

Hygiene in lumpy rooms. A study of working conditions. W. Vaje and H. H. Weber. *Schriften Gesamtheit Gewerbeschule No. 44*, 1-48 (1935), *Abh. Reichsgesundh.* 68, 247-62 (1935).—A special portable app. for det'n. of Pb in air is described. The min. dangerous concn. (presumably 1 mg. per 4000 l.) was not found in any parts of the rooms. However, precautions are advised

in connection with collected dust on floors, etc. The CO<sub>2</sub> content did not exceed 0.5% and was considered without influence. The highest CO content recorded was 0.013%, which was considered insufficient to cause acute symptoms. R. P. Walton

Paints and preservatives for engineering structures [water or sewage-treatment plants] (Dodd) 26.

2 Base-exchange agents. Soc. anon. dite "Mutosel" Soc. Holding Luxembourg. Swiss 175,664-5, May 16, 1935 (Cl. 36g). A method of causing deposition of salts in soln. in water consists in having at least two base exchangers each with a different cation sep'd. diagonally in a container. Thus, in prep'g (AcO)<sub>2</sub>Pb, zeolite is said with Pb(NO<sub>3</sub>)<sub>2</sub> and a 2nd quantity of zeolite is said with (AcO)<sub>2</sub>Ca. The exchange of bases yields (AcO)<sub>2</sub>Pb.

3 Filter. Heinz Diekmann. Swiss 176,637, July 1, 1935 (Cl. 43). Details of a filter tower for sewage water are given.

Cleaning sewage water. Heinz Diekmann. Swiss 176,638, July 1, 1935 (Cl. 43). Sewage sludge is dried, pow'd. and used as an adsorption filter for cleaning sewage water. The dried sludge may be mixed with peat or lignite. Cl. C. A. 29, 59431.

4 Automatic tide gate and sewage regulator for sewage systems. Edwin R. Schofield. U. S. 2,018,383, Oct. 22. Various structural, mech. and operative details.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

Ceylon soils. V. Soils associated with limestone. A. W. R. Joachim and S. Kandiah. *Trop. Agr. (Ceylon)* 83, 67-77 (1935), cf. C. A. 29, 81493.—Chem. and phys. data relative to the classification of these soils are given. VI. Some forest soils of the wet low-country. A. W. R. Joachim and D. G. Panditt-e-kere. *Ibid.* 146-56.—Profile characteristics and analytical data on 7 forest areas are given. John O. Hardesty

The soils of Tadzhikistan. M. A. Pankov. *All-Union Sci. Research Cotton Inst.* (Tashkent, U. S. S. R.) 1935, 1-128.—A series of chem. analyses on the chernozem-like soils, dark and light gray soils, chestnut soils, alluvial and solonchak complexes. J. S. Joffe

A soil survey in the valley of the Great Stour, Kent. W. O. Sharp. *J. South-Eastern Agr. Coll. Wye, Kent* No. 36, 143-4 (1935).

Relationships of roots, soil profile and irrigation in the Sudan. F. E. Kenchington. *J. South-Eastern Agr. Coll. Wye, Kent* No. 36, 135-82 (1935).—The chem. and phys. properties of Sudan soils are discussed with particular reference to the occurrence, origin, nature and effects of soil salts and org. matter. K. D. Jacob

[Report on] biochemistry. N. Craig. Mauritius Dept. Agr., *Sil. Ann. Rept. Sugarcane Research Sta.* 1934, 21-39; cf. C. A. 29, 22711.—Base-exchange capacity of soils.—The base-exchange capacity of the inorg. absorbing complex varied greatly in different types of soils. In the mature soils the clay from the most highly laterized samples had an extremely low capacity for base exchange, the capacity increased as the degree of laterization decreased. The exchange capacity of the org. absorbing complex remained practically the same in all the mature soils. In the highly laterized mature soils the clay exerted a very minor influence on the base-exchange properties of the whole soil, the predominating influence being that of the org. matter, which, wt. for wt., absorbed approx. 20 times more bases than did the clay. With mature soils of low degree of laterization the exchange capacity of the clay was more than twice that of the clay in the highly laterized zones; in these soils the morg. fraction was as important as the org. fraction in exchange relationships. The base-exchange capacity of the org. fraction of the mature soils, the immature soils and the gray soils was

fairly const., around 2.50 milliequiv. % org. matter. In the mature soils, passing from the wet to the dry regions, the base-exchange capacity of the clay fraction increased from about 13 to 25 milliequiv. % clay and in the immature soils from about 21 to 70 milliequiv. %, while for the Médine gray soil it amounted to 90 milliequiv. %. Phosphate status of Mauritius soils.—When the org. complex in immature highly leached soils was destroyed by heating the sample at 550° for 8 hrs. the P ext'd by Truog's reagent was approx. the same as that ext'd. by 1% citric acid from the untreated soils; Truog's reagent ext'd. less P from the untreated soils than did 1% citric acid. The evidence indicates that Truog's reagent exts. only inorg. easily available P whereas 1% citric acid exts. also, org. soil P. There was evidence that in the more acid soils, where exchangeable bases are not very plentiful, there is a tendency for P to be fixed in the org. form, but in the more neutral soils, where exchangeable bases are plentiful, the P tends to be associated, with these bases. Data are given on the relation between moisture and the phys. properties of Mauritius soils and on the nitrifying power of Mauritius soils. Admixt. of 10% of subsoil with the surface soil had no deleterious effect upon the soil microorganisms and the nitrification process was not suppressed in mixts. contg. 50% of subsoil. Mauritius subsoils are not toxic to soil microorganisms, but merely sterile, and the depression of the nitrification process is due to diln. of the active surface soil with the sterile subsoil. K. D. Jacob

Soil reaction and plant growth. James Hendrick and Walter Moore. *Trans. Highland & Agr. Soc. Scotland* 47, 34-49 (1935).—Under conditions in the north of Scotland the optimum pH ranges for the growth of ordinary crops are: sugar beets and peas 6.0-7.5, barley 5.8-7.5, red clover 5.5-7.5, wild white clover 5.5-7.1, wheat 5.5-7.0, turnips 5.2-6.5, oats 4.5-6.2, potatoes 5.0-6.2 and swedes 4.8-6.0. The soils of the northeast of Scotland usually have pH values of 5.5-7.0. The results of plant-growth tests on soils of different pH values are given.

K. D. Jacob  
Chemical nature of organic matter or humus in soils, peat bogs and composts. Selman A. Waksman, *J. Chem. Education* 12, 511-19 (1935).—H<sub>2</sub>O-sol. carbohydrates, starches and simple N compounds are the first

plant constituents to decompose in soils or composts, followed by free proteins, pentosans and cellulose. The lignins contain hemicelluloses, notably polyuronides and resins. These are resistant and tend to accumulate. Fresh wood products such as oak leaves, pine needles and cypress wood are high in lignin and polysaccharides but are low in N. Cereal straw and corn stalks are high in carbohydrates, and low in N. Leguminous plants are high in N and low in lignin. Humus constituents of decomposed plant remains consist of a varying proportion of lignin or lignin derivs and protein accompanied by a less stable group of resistant carbohydrates, fatty and waxy substances. Low moor peat contains nearly 70% of the ligno protein group compared with 36% in the original plant material. Corresponding values for high moor peat are 36 and 13%, resp. The humus in chernozem soils is characterized by its content of Ca and Mg. In arid soils the humus is high in protein and has a narrow C/N ratio. Acid humus is considered to differ primarily from mild humus in the nature and extent of base satn. of the exchange complexes. The function of humus in plant nutrition is discussed.

Irvin C. Feustel

The organic matter content and the carbon nitrogen ratio of South African soils of the winter rainfall area. W. I. Isaac. *Trans. Roy. Soc. S. Africa* 23, 205-30 (1932).—Soil N was detd. by the Kjeldahl method, soil org. C by the  $\text{SO}_2$  reduction method of Robinson, and org. matter by C X 1.724. The estn. of soil org. matter by the formula  $\text{N} \times 20$  was shown to be entirely unsuitable for the soils investigated. Five soil groups were studied: Somerset West, Dwaarsrivier, Hock, Elin District, Kuisenbosch and Bredasdorp District. The C/N ratios of these soils ranged from 11.2 to 22.9 with an av. for the 12 soils of 16.6, and only 2 soils had ratios of the order 10-12. A C/N ratio of 15.1 is regarded as typical of the winter rainfall region soils (cultivated) of the South-west Cape. In passing from a soil to subsoil, with one exception (Krom River Farm of the Elin District) there was found a marked decrease of org. C and N, and this was accompanied by a narrowing of the C/N ratio. The av. of the 6 subsoils studied was 14.7. On the whole, the org. matter content and the C/N ratio of the cultivated soils are lower than those of the virgin soils. No correlation was found between the av. org. matter content and the C/N ratios of the soil groups and the av. annual rainfall.

K. C. Beeson

The organic matter content and the carbon nitrogen ratios of some semiarid soils of the Cape Province. W. I. Isaac and B. Gershl. *Trans. Roy. Soc. S. Africa* 23, 245-54 (1935).—Three soil groups, Whitehill, Karroo Poort and Ouberg Pass, were studied. An av. C/N ratio of 11.7 was found on 6 soils. By eliminating a soil from the Whitehill group that receives more moisture than normal for the region the av. is reduced to 10.6. The av. percentage of org. matter in the soil was lower than that of the winter rainfall soil series. The org. matter varied from 0.55 to 1.51% and averaged 0.96%, while the C/N ratios varied from 5.0 to 13.5. The soils were neutral to slightly alk. in reaction. Investigation of a Whitehill soil showed that a reduction in org. matter from 0.75% to 0.94% occurred in the subsoil. This was accompanied by a decreasing C/N ratio.

K. C. Beeson

Research at Rothamsted of importance in horticulture. Mary D. Glynn. *Sci. Horticulture* 3, 215-221 (1935).—The N value of dried poultry manure was somewhat inferior in the equiv. of  $(\text{NH}_4)_2\text{SO}_4$  in the first year of the exp. In exps. with green manures, neither tares nor mustard ploughed in was able to maintain N fertility for the following wheat crop. A fertilizer trial on peas showed a definite yield increase from application of 224 lb. Nitrochalk per acre while  $\text{K}_2\text{SO}_4$  gave a small depression on gravel soil. Potash produced a striking improvement in Brussels sprouts on a heavy medium soil. Expts. with kale demonstrated the capability of leafy crops to utilize large doses of quick acting N up to 672 lb. Nitrochalk per acre. A no. of tests on root crops showed that intensive cultivation when a crop is growing has a somewhat depressing action after the land has been freed from weeds.

Investigations on the decompos. of plant materials showed that the fungus tissue itself is a readily available source of N. Inoculation of plants with certain mild viruses appears to protect the plant from effects of more virulent strains. A mixt. of some mild viruses with certain other viruses produces a disease more severe than either component. Incorporation of antioxidants with talc pyrethrum and kieselguhr-pyrethrum dusts retards loss of activity as a poison due to light and air exposure. Tannic acid, pyrocatechol, resorcinol, hydroquinone and pyrogallol offer some protection.

I. C. Eustel

Organic soils and epinastic response. W. Neilson Jones. *Nature* 136, 554 (1935).—From certain infertile org. soils a gas may be exd. (by aeration, centrifuging or heating) which produces on tomato plants epinastic curvatures of the petioles similar to those brought about by ethylene. Exts. from such soils when added to water culture soils produce similar epinastic curvatures on cuttings and influence the rooting of the cuttings and the manner of root growth of cuttings and seedlings. The intensity of the effects may be seasonal.

Philip D. Adams

The apple-growing soils of Tasmania. J. A. general investigation of the soils. C. G. Stephens. *Australia Council Sci. Ind. Research Bull.* 92, 7-31 (1935).—The 10 soil types in all the main apple growing areas of Southern Tasmania are classified and described. With the exception of the alluvial and Woodbridge soils, all are of a podzolic nature. The mech. analyses and reaction of these soils are given in an appendix. These soils can be divided roughly into 3 groups, the first having a mean  $\text{pH}$  value between 5.7 and 5.9 for surface soils, the second  $\text{pH}$  4.8 and the third  $\text{pH}$  6.3 to 6.5. Except for a few of the more acid and heavier samples it appears that these soils readily respond to moderate dressings of  $\text{CaO}$ . An examn. of 5 profiles shows that the replaceable base content for the surface soils is reasonably good. In some cases there is a relatively high proportion of Na. K is generally low but apparently sufficient for tree requirements. Relatively high proportions of Ca in the alluvial soil emphasize its superiority. In general, there is a very fair amt. of N and better tree growth is usually characterized by higher N values.  $\text{P}_2\text{O}_5$  is generally low although in sufficient quantity or of little significance in the trees' requirements. The  $\text{K}_2\text{O}$  figures show a definite correlation between  $\text{K}_2\text{O}$  content and condition of the trees. The soil problems and tree growth are discussed briefly. II. A soil survey of part of the Huonville District. J. K. Taylor and C. G. Stephens. *Ibid.* 32-55.—A brief discussion and location of the Huonville District, the appendix contg. mech. analyses and reaction data (see above) and a soil survey map.

J. R. Adams

Iodine contents in the soils in Japan. II. Influence of natural conditions and fertilizing on the iodine contents. Arai Itano and Yasuhiko Tsuji. *Ber. Ohara Inst. Landw. Forsch. Japan* 7, 103-141 (1935). *cf.* C. A. 29, 1592.—Virgin soils from the Takahashi River basin near the sea contained 20 times more I than those from the locality of the upper stream. With arable soils the difference was not so marked. There was no definite relation between Cl and I contents, but the influence of sea  $\text{H}_2\text{O}$  was similar in both cases. There was no marked variation in the I contents of soil samples taken at various elevations on a hillside up to 100 m. With regard to surface soils and subsoils, there was more I in the surface soil of the dry-farm and virgin fields, while in the paddy field the opposite was true. The I content was increased by the application of org. fertilizers. The same was true to a greater extent with org. fertilizers, and those from the animal source were more effective than those from the plant source. Of the total I content of the soil 1.6 to 16.4% was  $\text{H}_2\text{O}$ -sol. There was no definite relationship between the  $\text{H}_2\text{O}$ -sol. I and the nature of the soil.

John O. Hardesty

Determination of manganese and magnesium in soils and silicate rocks. L. A. Dean and E. Truog. *Ind. Eng. Chem., Anal. Ed.* 7, 333-5 (1935).—A method for Mn and Mg was developed in which both are pptd. as the phosphate and weighed or titrated together after which the Mn present is detd. by the bismuthate method and the

Mg is obtained by difference. The procedure was tested on a known soil contg. only Mn and Mg and on another soil. contg. also Fe, Al and Ca and on a soil. Results for Mn and Mg on both known soils were correct to within a few hundredths of a mg. Pptn. of Mn with Br or persulfate gave high results by the bismuthate method. The new procedure gave 0.48 mg. of Mn on a sample of pyroene while the direct detn. of Mn gave 0.61 mg. These results agree within exptl. error. C. W. Whittaker

**Determination of nitrogen in soils by oxidative digestion** C. R. Hariharan Iyer and R. Rajagopalan *J. Soc. Chem. Ind.* 54, 341-2T (1935).—A crit. survey of the problem of hastening digestion and avoiding acid fumes in the detn. of N in soils was undertaken. Continuous heating of the soil with dichromate or  $\text{CrO}_3$ ,  $\text{H}_2\text{SO}_4$  and  $\text{H}_2\text{O}$  gave lower results than the Kjeldahl method. Minute amts. of  $\text{NH}_4$  dichromate are formed if the oxidizing agent is added to the cold or moderately warm mixt. of soil and acid. On heating, part of the dichromate decomposes with loss of elemental N. This is avoided by adding the oxidizing agent to the boiling mixt. of soil and acid. Traces of  $\text{HNO}_3$  formed may be completely retained by use of an air- or water-cooled condenser. The following procedure is recommended: Weigh 10 g. of soil into a suitable flask, add 2 g.  $\text{H}_2\text{O}$  or  $\text{H}_2\text{SO}_4$  and 15-20 cc. of water and shake thoroughly. Add with shaking 30-40 cc. concd.  $\text{H}_2\text{SO}_4$ , connect a condenser to the flask and boil 5 min. Remove flame, add 5 g. dichromate to the hot mixt. and immediately resume heating. Heat for 30 min., allow to cool for 5 min., dil. to 300 cc. and treat with pure powdered  $\text{Na}_2\text{SO}_3$  (about 7 g.) until the dichromate is all reduced (this is indicated by color change and by color of  $\text{SO}_2$  when the sulfate is in excess). Heat to boiling, add 2 g. pure Zn powder and continue boiling until most or all of the Zn dissolves. Cool and distill with excess alkali in the usual way. Results obtained on 6 soils were uniformly higher than those by the official Kjeldahl method but agreed nearly perfectly with the wet digestion procedure of Greenivasan and Subrahmanyan (cf. C. A. 28, 5531).

**Determination of nitrate in soils** R. E. Stephenson *Chemist Analyst* 24, No. 4, 16 (1935).—Shake 4 g. of soil and a little pure  $\text{CaSO}_4$  with 20 cc. of water. Allow the solid to settle. With a pipet, transfer 1 drop of the liquid to a spot plate and add 4 drops of diphenylamine soln. (0.05 g. solid reagent in 25 cc. of concd.  $\text{H}_2\text{SO}_4$ ). After a few min. compare the color with that obtained from definite vols. of standard  $\text{KNO}_3$  soln. W. T. H.

**Influence of temperature on the carbon nitrogen ratio of soils** N. R. Dhar and S. K. Mukherji *J. Indian Chem. Soc.* 12, 436-40 (1935); cf. C. A. 29, 6695.—Detns. of the C/N ratio of soils have been made by estg. the C and N content according to the method of Robinson, McLean and Williams (C. A. 23, 5531). Results obtained from soils collected in Bengal, Behar, the United Provinces of Agra and Oudh, and the Punjab show ratios of 9.13, 9.17, 11.3 and 14.37 against ratios for England, the Sudan and the Transvaal of 10, 12.6 and 14.4, resp. These results show that the ratio in temp. climates is lower than in tropical. The proteins present in the soil of a warm country are oxidized more readily than those exposed to a temperate climate. It appears that soil oxidations take place in accordance with the same laws as those prevailing in animal metabolism and that the C/N ratio in soils is not altogether dependent on the microbial activity as has been hitherto believed.

**Rapid determination of amount of water in soil** Fernand Obaton. *Compt. rend.* 201, 845-6 (1935).—The sample is placed in an ebullite tube 2 1/2 cm. X 2 sq. cm., one end of which consists of a fixed C plate, the other also of C is attached to a piston whereby the contained soil is subjected to a pressure of 40 kg. The resistance of this cylinder of soil is then detd. by a c. (800 cycles). A curve relating resistance to percentage of  $\text{H}_2\text{O}$  is given.

**Determination of organic carbon in soil** G. Pichard. *Bull. soc. chim.* [5], 2, 1504-4 (1935).—Heating the sample

in a current of  $\text{O}_2$  by the method of Demstedt is satisfactory for the detn. of org. C and if the temp. is not allowed to rise above  $440^\circ$  any  $\text{CaCO}_3$  present is not decomposed. W. T. H.

**Potash in Massachusetts soils and its availability for crops** Fred W. Morse. *Mass. Agr. Expt. Sta. Bull.* 324, 2-16 (1935).—Mass. soils are derived from glacial drift which consists principally of material from K-bearing rocks. The lighter plain soils required K but heavier soils showed less response. The percentage of K in Mass. soils is influenced largely by the texture of the soil. The finer the soil, the more K is dissolved by the acid used in its detn. Characteristic samples of important soil series were sept into sands and silt-clay. The av. percentage of K (by fusion) in sands was 2.07 and in the silt-clay 2.13. The lowest percentage of K was 1.27 in the sands overlying a diorite ledge. The soil particles yield an important part of the K required by crops. Clay presents more surface to the soil than sand and also holds more water. Therefore, clay soils supply more available K than sandy soils of similar origin. C. R. Fellers

**Further work with the Cunninghamella plaque method of measuring available phosphorus in soil** A. Mehlich, E. B. Fred and L. Truong *J. Am. Soc. Agron.* 27, 820-32 (1935), cf. C. A. 29, 2277.—A description is given of a special clay culture dish for conducting the *Cunninghamella* test for available P of soils. The results obtained with this new dish and slight modifications of the method (smaller quantities of soil and nutrient soln.) agree quite satisfactorily with crop yields in the field and with the results of the Neubauer and chem. methods. *C. blakesleeana* showed better growth on calcareous soils than *C. elegans* and can be successfully employed in testing calcareous soils without pre-treatment with acid. P need is indicated when the diam. of growth is less than 16 mm. This will vary somewhat with the plant grown. J. R. Adams

**The biological effect of available phosphorus in Hawaiian soils** A. Floyd Heck. *J. Am. Soc. Agron.* 27, 847-51 (1935).—In the presence of available energy material, biol. activity in Hawaiian laterites is greatly stimulated by the presence of available P, when measured by assimilation of nitrate N by microorganisms. In the combination with energy material, P helps prevent leaching of mineral N and also helps build up a larger biol. balance in the soil, which increases the amt. of P and the N held in the org. form, thus increasing the availability of the P.

**The effect of dilution on the solubility of soil phosphorus** Hugh Dukes. *J. Am. Soc. Agron.* 27, 760-3 (1935).—Concn. of P in aq. exts. of a no. of soil types increased with diln. up to a certain point for each soil, and upon further diln. decreased. P reaches its max. concn. at the point where Ca first disappears from the leachates. J. R. Adams

**A study of the effects upon growth and development of an upland rice of varying the moisture content of soil in pots** Guillermo O. Palis. *Philippine Agr.* 24, 393-412 (1935).—Best results were obtained with soil contg. 80% of satn. with moisture. At 20% of satn. the crop was a total failure. A. L. Mehring

**Comparative nutritional experiments on some difficult soils** Herbert Schorstein *J. Landw.* 83, 219-22 (1935).—Seven soils were examd. for P and K according to the König-Hasenbäumer (C. A. 24, 4574), Neubauer (C. A. 26, 3320) and *Aspergillus* methods. The values obtained by the micromethod of Sekera are included in a qual. comparison of the results. There was considerable variation among the values obtained by different methods on the same soil. John O. Hardesty

**The clay ratio as a criterion of susceptibility of soils to erosion** Geo. J. Bouyoucos. *J. Am. Soc. Agron.* 27, 728-41 (1935).—The ratio of  $\frac{\text{sand and silt}}{\text{clay}}$ , clay ratio, is suggested as a criterion of the erosiveness of soils.

The general agreement between this ratio and the ratio proposed by Middleton, cf. C. A. 26, 5364, indicates the value of this clay ratio for judging the relative susceptibilities of soils to erosion. J. R. Adams

The improvement of glasshouse soils. W. Corbett. *Sci. Horticulture* 3, 148-52 (1935).—Yield of tomatoes and other crops grown continuously on the same soil gradually diminishes. Decrease is common to both fertilized and unfertilized plots. Examin showed that root decay starts earlier each successive year. When 5 crops had been grown the av. crop wt. from fertilized plots showed a decrease of 10.5 tons per acre over the initial crop. The corresponding decrease on the unfertilized plots was 12.7 tons per acre. The decrease is ascribed to loss of green residue and fiber which stimulate bacterial activity and provide proper soil aeration. Beneficial effects were secured from straw placed almost vertically in the soil.

Irvin C. Frustel

The temporary injurious effect of excessive liming of acid soils and its relation to the phosphate nutrition of plants. W. H. Pierre and G. M. Browning. *J. Am. Soc. Agron.* 27, 742-59 (1935).—With one exception, all soils gave considerably lower yields of alfalfa when limed to  $pH$  values slightly above 7.0 than where limed to lower  $pH$  values, the av. decrease in yield being 46%. This was considerably more pronounced for the first than the second and third cuttings and, with 5 of the 9 soils, overliming injury to alfalfa disappeared after the first year. Addition of  $MnSO_4$ ,  $Al_2SO_4$ ,  $FeSO_4$ , iron humate or large amounts of KCl had no effect in reducing liming injury to corn grown on acid Dekalb loam which had been limed to  $pH$  values of approx. 6.5 and 7.5. Large amounts of  $CaH_2(PO_4)_2$ ,  $KH_2PO_4$ , or silica gel overcame the injury. The substitution of increasing amounts of  $MgCO_3$  for  $CaCO_3$ , up to 75%, improved growth and produced normal leaf color where the largest amt. was added. Materials that overcame liming injury materially increased  $H_2O$  sol.  $P_2O_5$  in the soil and est. In a comparison of 4 liming materials added in sufficient amounts to bring an acid Dekalb loam to  $pH$  7.0, corn and rape made better growth with dolomitic limestone or  $CaSiO_3$  than with  $Ca$  limestone or  $CaCO_3$ . In the latter cases the plants showed symptoms of  $P_2O_5$  deficiency. When used in amounts to bring the soil to  $pH$  5.8, no liming injury was obtained. Corn plants from the soil limed to 7.0 had a higher ash content and a lower percentage of  $Mg$  and  $P$  on the ash basis than plants grown at  $pH$  5.8. With 1 exception, some evidence was obtained of a relationship between injury from excessive liming and the  $Ca/P$  ratio of plants. The temporary overliming injury obtained in these expts. is due to a disturbed  $P_2O_5$  nutrition.

J. R. Adams

The waste products of horticulture and their utilization as humus. Sir Albert Howard. *Sci. Horticulture* 3, 213-14 (1935).—The Indore process is described as used for increasing the humus supply in coffee, sugar, rubber and other plantations in India and Ceylon. A mixt. of vegetable wastes (C/N ratio of about 30/1) is transformed into humus (C/N ratio of 10/1) by means of fungi and bacteria, combined N in the form of manure and urine, phosphate and potash and a base such as wood ashes or lime. Considerable fixation of N accompanies the later stages of decomposition. Weed seeds, eggs of noxious insects and harmful spores of fungi are destroyed. Irvin C. Frustel

Use of sugar-beet petioles as indicators of soil fertility needs. Robert Gardner and D. W. Robertson. *Colo. Agr. Expt. Sta., Tech. Bull.* 14, 3-16 (1935).—A comparison of sugar-beet petiole analysis with the  $K_2CO_3$  soil test in a sugar beet plot expt. showed the petiole test to be much more efficient in detecting the differences in available P due to the fertilizer treatments than the  $K_2CO_3$  soil test. The petiole test was sufficiently accurate to give a reliable indication of the P needs of the soil. Treble superphosphate and fertilizer were compared as to their effects on the compn. of plant cuts. Fertilizer was considerably more efficient in increasing the available P. The petiole test is also applicable to the detn. of the nitrate and K needs of plants. C. R. Fellers

Immediate effects of fertilization upon soil reaction. C. B. Clevenger and L. G. Willis. *J. Am. Soc. Agron.* 27, 833-40 (1935).—Detns. were made on 4 soils of the early neutralizing effect of org. ammoniates such as cottonseed meal and urea, in comparison to that of dolomitic limestone

used at rates calcd. to produce a non-acid-forming fertilizer. On mixing the fertilizers with the soil, a drop in the  $pH$  of the soil ranging from 0.6 to over 1.0 took place immediately. This is due to salt effect. The reaction trends of the various fertilizers for the soils used are very similar except for the Coxville soil where the magnitude of change is smaller because of a high content of org. buffering material. In the unlimed soils without dolomitic supplements, the reaction trends for fertilizers contg.  $(NH_4)_2SO_4$  and  $NaNO_3$  show a slight rise in  $pH$  following the initial decrease. Fertilizers contg. cottonseed meal and urea showed significant rises in  $pH$  which were proportional to the amounts of these materials in the fertilizers. With dolomitic limestone supplements (unlimed soil), the  $(NH_4)_2SO_4$  fertilizers gave a greater  $pH$  rise than that of  $NaNO_3$  or cottonseed meal fertilizers and this was exceeded only by the  $pH$  rise for fertilizers contg. the larger increments of urea. Relative to the  $pH$  values of unfertilized soil, none of the fertilizers gave evidence of as great a neutralizing effect in the limed soil as in the corresponding soil unlimed, nor was the range in  $pH$  values produced by org. ammoniates without dolomite as great as in unlimed soils. The max.  $pH$  values reached by the fertilizer in which all the N was in the form of cottonseed meal without dolomite was approx. the same as that found in the corresponding treatment where urea was the source of half the N. For a period after application of fertilizers the org. ammoniates can serve as neutralizing agents almost as extensively as a dolomite supplement.

J. R. Adams

The microorganisms in profiles of certain virgin soils in Manitoba. M. I. Timonin. *Can. J. Research* 13, C, 32-46 (1935).—Twelve profiles of 5 different kinds of virgin soils of Manitoba were sampled, described and critically examd. for soil organisms, H-ion concn. and the moisture and org. matter present. Usually the A horizon showed the highest count of each group of microorganisms and the C horizon the lowest, although the greatest no. of bacteria were present in the B horizon of 1 soil in the month of May. The proportion of anaerobic bacteria and fungi to total nos. increased with the depth of the horizon. Moisture content of the soil was not found to exert any consistent effect upon the nos. of microorganisms present. Fungi were most abundant in the wooded and peat soils, bacteria more so in soils of the meadow-prairie phase. In the wooded soils the microbiol. horizons appeared to coincide with the morphological horizons.

J. W. Shipley

Microbiological studies of Appalachian upland podsol soils. I. Effects of physical and chemical treatments. P. H. H. Gray and H. J. Atkinson. *Can. J. Research* 13, C, 115-26 (1935).—A study has been made of the effects of fertilizers and limestone, of fallowing, and of deep ploughing, upon certain aspects of microbial activity in representative Appalachian podsol soils at 3 farms in the Lesters Townships region of Quebec Province. The results show that the evolution of  $CO_2$  and nos. of bacteria and actinomycetes were not altered by any simple fertilizer applied annually for 2 years. Limestone, at the rate of 6 tons per acre, increased the nos. of microorganisms during the 2 years of the expt. Deep ploughing reduced both  $CO_2$  and bacterial nos. in soils ordinarily ploughed to a normal depth. Studies have also been made to det. the effects of some other chem. treatments upon the soil microflora.  $CO_2$ , bacterial nos. and nitrification of soil N were increased in field plots after treatment with  $CaO$ ,  $Na_2CO_3$  and  $NaOH$ , alone or in combination; the effects lasted through 2 seasons. J. W. Shipley

Decomposition and movement of herbicides in soils, and effects on soil microbiological activity and subsequent crop growth. II. J. D. Newton and A. D. Paul. *Can. J. Research* 13, C, 101-14 (1935); cf. C. A. 27, 1707.—Further expts. at Edmonton to det. the effects on soils and on subsequent crop growth of  $CuSO_4$ ,  $NaClO_2$  and  $NH_4CNS$  are reported, together with new expts. with  $Na_2Cr_2O_7$ . The field plot expts. were limited to Edmonton black soil, but 3 typical Alberta soils, including Edmonton soil, were used in the lab. expts.  $CuSO_4$  applied to a series

of fallow plots in 1931 did not affect the yields of wheat on these plots significantly in 1932, or the yields of wheat, oats, rye and flax on these plots in 1933. The soil was not appreciably injured, even temporarily, by the  $\text{CuSO}_4$ .  $\text{NaClO}_2$  was applied to one series of fallow plots in 1930, and to another series in 1931. The effect of the heaviest applications (1300 lb. per acre) lasted for 3 years in one series, but serious injury to crops from such heavy applications did not last for more than 2 years in either series.  $\text{Na}_2\text{Cr}_2\text{O}_7$  was applied to a series of fallow plots and a series of wheat plots in 1932. It reduced the wheat yields very much in 1932, but did not reduce crop yields the following year in either series, as it decomposed and lost its toxicity in the soil rather quickly.  $\text{NH}_4\text{CNS}$  was applied to a series of fallow plots and a series of wheat plots in 1932, and it reduced the wheat yields even more than  $\text{Na}_2\text{Cr}_2\text{O}_7$  in 1932. It retarded nitrification and did not decompose and lose its toxicity completely during the season of application, but even in the cases of the heavier applications (650 and 1300 lb. per acre) the toxic effect disappeared early in the following season. The total and straw yields of crops sown on these plots were generally increased by the lighter applications (160 and 325 lb. per acre) in 1933, but the grain yields were generally reduced by the heavier applications (650 and 1300 lb. per acre). Growth of certain annual weeds was considerably stimulated by this nitrogenous weed-killer in 1933 and 1934, in the plots to which the heavier applications had been made. Lab. expts. showed that the thiocyanate may be leached out of a soil with water, that it decomposes fairly rapidly in soils under favorable conditions of moisture and temp. and more rapidly in fertile soil rich in org. matter than in poorer soil, and that nitrification in soils is depressed for a time by the  $\text{NH}_4\text{CNS}$ . J. W. Shipley

The response to fertilizers and the change observed in the nutrient economy of the soil during wet and dry years. K. Opitz. *Ernähr. Pflanze* 31, 341-9 (1935).—Field expts. on the utilization of nutrients by various crops showed that the natural fertility of the soil and the intensity of fertilizing influenced the nutrient reserves in the soil to a greater extent than did the rainfall. J. O. R.

Effect of plant nutrients, soil reaction and light on gardenias. Harold E. White. *Mass. Agr. Expt. Sta. Bull.* 315 (Ann. Rept. 1934), 58-9 (1935).—N and P greatly increased vegetative growth in gardenias; K had no effect. Low N caused a uniform chlorosis of the foliage and dwarfing of the plants. Interveinal chlorosis was severe on plants fed with  $\text{Ca}(\text{NO}_3)_2$  as a source of N, such plants became green after spraying with  $\text{FeSO}_4$  solu. N in the form of  $\text{NH}_4$  salts produced less chlorosis than  $\text{Ca}(\text{NO}_3)_2$ . Soil reaction alone is not a safe basis on which to judge the possibility of interveinal chlorosis in gardenia plants, since expt. chlorosis occurred from pH 5.0 to 6.1. Gardenias are very sensitive to Fe deficiencies and require more Fe than the av. ornamental plant. C. R. F.

Efficiency of ammoniated superphosphates for cotton. J. T. Williamson. *J. Am. Soc. Agron.* 27, 724-8 (1935).—Increases in yield due to P were greatest on the Highland Rim and the Appalachian Plateau soil groups and least on the Greenville soil group of the Coastal Plain. With superphosphate as a basis, the relative increases due to different sources of P were: superphosphate, 100; ammoniated superphosphate (2% N), 100; ammoniated superphosphate (4% N), 90; and pptd.  $\text{Ca}_3(\text{PO}_4)_2$ , 85. Ground  $\text{CaCO}_3$  used with the complete fertilizer contg. superphosphate produced an av. increase of seed cotton per acre over 3 times that obtained when used with the complete fertilizer contg. 4% ammoniated superphosphate. J. R. Adams

Phosphate fertilizer investigations in sand cultures. E. A. Mitscherlich. *Phosphorsäure* 5, 517-26 (1935).—Increased applications of N or K without the application of P caused a reduction in the  $\text{P}_2\text{O}_5$  content of the plant. Application of 0.060 g. of  $\text{P}_2\text{O}_5$  with from 0.000 to 5.000 g. of N caused an increase in the amt. of  $\text{P}_2\text{O}_5$  taken up from 15.3 to 57.9% of the total added. A similar K-P series caused an increase in the  $\text{P}_2\text{O}_5$  taken up of from 45.2 to 57.2% of the total. K. C. Beeson

Decomposition of phosphate fertilizers. P. Kötgen. *Phosphorsäure* 5, 551-7 (1935).—Five hundred-g. quantities of soil were treated with Thomas meal or superphosphate at the rate of 60 kg. per ha. Total acids and total bases were detd. at the end of 1 and 7 days by the electro-ultrafiltration method. The acid and base values at the end of one day were higher when superphosphate had been added than when Thomas meal had been added, but at the end of 7 days, the soly. of the acids and bases in the superphosphate-treated soil had decreased, and the soly. of the acids dropped below that in the soil treated with Thomas meal. In the soil treated with Thomas meal, the soly. of the acids increased after 7 days, but the soly. of the bases decreased to equal that in the superphosphate-treated soil. K. C. Beeson

The most suitable nutritive ratio in Nitrophoska (containing lime). E. Blanck and W. Heukeshoven. *J. Landw. Bm.* 203-18 (1935), cf. C. A. 28, 6451.—The grain and straw of oats from 2 different soils which had received similar fertilizer treatments were examd. for the utilization of N, P and K. Favorable nutrition of the plant is not only dependent on the applied fertilizer but is also influenced by the phys. and chem. characteristics of the soil. John O. Hardesty

[Effect of liming on the phosphate status of soil.] F. Hardy. *Proc. Sugarcane Investigation Committee (Trinidad)* 4, 336-7 (1934).—Addn. of ground limestone to bolca in soils increased the available P (Truog method) 39-67%. The limestone, supplied by quarries in Trinidad, contained 0.023-0.031%  $\text{P}_2\text{O}_5$  and 2.99-6.29%  $\text{MgCO}_3$ . The increase in the available P content of the soils was not due solely to the P content of the added limestone. K. D. Jacob

Some effects of lime on ryegrass. Alex. F. R. Nisbet. *Scottish J. Agr.* 13, 349-53 (1935).—The no. of surviving seedlings of ryegrass is usually increased by adding lime to the soil. The ordinary hay type of perennial ryegrass, while developing 70-80 seedlings per 100 viable seeds on light acid sandy soil (pH 4.98 and lime requirement 3 tons/acre), may give over 90 seedlings when the soil receives its lime requirement and almost every viable seed may develop a plant when heavy liming is given. The indigenous "Kemish" perennial ryegrass develops 50-80 seedlings per 100 viable seeds on light acid soil and 80-90 at the lime requirement rate, but the nos. are not increased with very heavy liming. Both types on light acid soils tend to tiller earlier and produce a greater no. of tillers when heavy liming is given. Both types produce more total growth on neutral clay loam than on acid peaty soil (original pH 4.27 and lime requirement 10 tons/acre) receiving its lime requirement, but less growth with fewer tillers than on acid sandy soil similarly treated. K. D. Jacob

Effect of fertilizers on the longevity of mowings. A. B. Beaumont, R. W. Donaldson and M. E. Snell. *Mass. Agr. Expt. Sta. Bull.* 322, 2-8 (1935).—The quality and yield of grass on Merrimack fine sandy loam were greatly improved by fertilizer mixts. high in N and K. Little or no benefit was derived from superphosphate. A fertilizer having a ratio of N,  $\text{P}_2\text{O}_5$  and  $\text{K}_2\text{O}$  of about 3:1:2 is recommended for old mowings on soils of this type. Mowings deteriorate after 6-8 years regardless of fertilization, and should be reseeded.  $\text{NaNO}_3$ ,  $(\text{NH}_4)_2\text{SO}_4$ ,  $\text{CaCN}_2$  and urea were compared as top dressings at the 50 lb. per acre level (calcd. to N). The crop increase was slightly over 100%. No significant advantage for any source of N was obtained. Chem. analyses showed that total N of grass decreased as maturity advanced. In the earliest stage of growth the N fertilizers increased the N content of grass from 25 to 50%. In the last stages there was little effect on compn. as a result of fertilization. C. R. F.

Pasture fertilization. F. D. Gardner, S. I. Bechdel, P. S. Williams, C. F. Noll, J. W. White, E. S. Erb, E. B. Coffman, C. C. Fuller and C. R. Enlow. *Pa. Agr. Expt. Sta. Bull.* 323, 3-24 (1935).—This is a preliminary report after 5 years of a projected 10-year expt. designed to show the effect of different fertilizer treatments on the botanical compn. of the turf, yield of clippings and hay, and yield

of digestible nutrients, as determined by chemical analyses and by grazing cattle. The use of grazing animals to measure the carrying capacity of fertilized pasture plots necessitates a long term investigation to eliminate experimental error. To date, the results indicate that dairy cattle can be satisfactorily used to measure the carrying capacity of pastures under different systems of fertilization. Conclusions are withheld until the termination of the experiment. C. R. F.

The influence of potash fertilization on the value and efficiency of fodder. F. König. *Landw. Jahrb.* 81, 829-83 (1931).—The fluctuations in the nutritional value of both hay and beets from year to year were greater than any difference noted due to fertilization. Thus, the N-free extract of the beets varied from 5.88% in 1931 to over 9% in 1934, but those beets fertilized with 200 kg./ha. of K<sub>2</sub>O had 1.06% of N-free extract while those not fertilized showed 0.7%. Fertilization with potash increased the ash, K and Cl contents of hay markedly. Smaller increases were found in the P content. In general no larger increases were obtained with 200 kg./ha. of K<sub>2</sub>O than with half that quantity. Na and Mg showed a tendency to decrease with increased potash fertilization while Ca decreased materially except in the fourth year of fertilization when a slight increase was noted with the application of 20 kg./ha. of K<sub>2</sub>O. A study of the mineral balance in animals showed that there was a greater retention of Ca and P from potash fertilized fodder than from the unfertilized material. Calorimetric data showed no clear differences between the energy content of unfertilized and fertilized fodder. A calorimetric nutritional balance showed for both fertilized and unfertilized fodders an efficiency of about 55%. K. C. Beeson.

The effect of the addition of nutrient salts on the root secretions of various plants. Paul Solberg. *Landw. Jahrb.* 81, 891-917 (1931). Cf. C. A. 29, 8196.—In unfertilized plots and secretions were found from the roots of beans, corn and lupine. With beans and corn the difference between the root zone and outer zone in each case was about 0.5 pH unit, while the difference with the lupine was about 1 pH unit. The addition of a physiologically acid salt mixt. where the N was supplied from (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> decreased the pH about the root zone of beans from 5.23 to 4.60, corn 5.05 to 4.69 and lupine 4.90 to 4.79. When NaNO<sub>3</sub> was substituted as the source of N to give a physiologically alk. mixt., the increase in acidity was very small, and the difference in the zone was less in some cases than when no fertilizer had been added. K. C. B.

Comparative fertilizer investigations with Thomas meal and Alger phosphate on a high-moor sand-mixture culture eighty years old. Brune. *Phosphorsäure* 5, 357-50 (1935).—No significant difference was noted in the yields obtained with Thomas meal and Alger phosphate. Application of either of the phosphates in increased quantities caused equal increases in the P and Ca contents of the plants. K. C. Beeson.

How to introduce mineral fertilizers for cotton during the vegetation period. D. V. Khar'kov. *Boz'ka za Khlopok* 1935, No. 5-6, 51-9.—Kh. presents data and discusses the problem of fertilizer placement for cotton under conditions of irrigation. J. S. Joffe.

Progress report of fertilizer studies with Jonathan apples upon Ephrata fine sandy loam. F. L. Overlier and F. L. Overholser. *Wash. Agr. Expt. Sta., Bull.* 319, 14 pp. (1935).—See C. A. 29, 4877.

Fertilizer treatments for sweet corn. W. A. Hudson and M. C. Gillis. *Ill. Agr. Expt. Sta., Bull.* 417, 353-455 (1935).—As a result of 6 years' field work, treatments of single fertilizer salts were usually ineffective. Mixts. of 2 sal. s. contg. N and P or P and K gave good results when the proper ratios were used. When N was omitted, 40 lb. of a 0-16-3 fertilizer gave best results. Mineral fertilizers applied without N should not contain more than 17% K<sub>2</sub>O. Of all the 63 treatments investigated, an application of 40 lb. of 0-16-12 fertilizer supplemented by 50 lb. of side-dressed NaNO<sub>3</sub> per acre gave best yields. NaNO<sub>3</sub> should be applied 3-40 days after the corn is planted. In every case fertilizer treatments hastened maturity of the sweet corn. P had the greatest effect in

advancing maturity. K used either alone or in combination with P retarded maturity. C. R. Fellner.

Fertilizing of bulbs. Gordon W. Gibson. *Nrs. Herb. Culture* 3, 174-85 (1935).—Most of the important bulb-growing areas are observed as centering on soil having a low clay fraction and a high fine sand content. Fertilizer is generally applied to preceding crops; thus bulbs are allowed to benefit from residues. Lime, basic slag and bone meal are helpful to tulips. Deep cultivation and a suitable rotation are highly important for narcissus but soil may be acid or slightly alk. Recommended fertilizers contain approx. 1% N, 10% water-sol. P<sub>2</sub>O<sub>5</sub>, 10% mol. P<sub>2</sub>O<sub>5</sub>, and 7.5% potash. A compost of seaweed, weeds, manure, etc., is beneficial to bulbs either as a top dressing or when planting. Presence of Fe and abundance of K assist in giving good color to flowers. Irvin C. Feustel.

Nitrification of ammoniated peat and other nitrogen carriers. R. O. E. Davis, R. R. Miller and Walter Scholl. *J. Agr. Soc. Amer.* 27, 723-37 (1935). Nitrification of ammoniated peat prep'd at 180° and 300° showed approx. the same max. value of conversion to nitrates, 24%, in 1 series of tests, while in another series the 180° sample showed 31% conversion and the 300° sample gave only 13.4%. The nitrification of the 300° material was longer in starting and the rate was slower than with the 180° material. The H<sub>2</sub>O-sol. N compounds in both the 180° and 300° material were quite easily nitrified. It appears that the extent of nitrification of this portion is about the same as with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. The soil portion from ammoniated dextrose gave a max. conversion of 40% after 18 weeks. The leached residues from ammoniated peat gave results varying from 6 to 17% conversion to nitrate. Ammoniated lignin and its leached residue gave nitrification values corresponding closely to those of ammoniated peat. Whole ammoniated starch gave about the same value as raw peat and somewhat less than the H<sub>2</sub>O-leached residues from ammoniated peat. The H<sub>2</sub>O-leached residue from ammoniated dextrose gave 8.2% of the total N as nitrate after 8 weeks. Ammoniated peat and dextrose residues from exhaustive extractions with several solvents were nitrified somewhat more in each case than raw peat. Ammoniated peat H<sub>2</sub>O-insol. residue with NaNO<sub>3</sub> added gave a nitrification value of 13.4% after 6 weeks as contrasted with 17% for a similar residue alone. Three ammoniated peat H<sub>2</sub>O-insol. residues, with active N of 50, 80 and 87%, all gave low conversion to nitrate, approx. 12, 10 and 11%, resp. Mg NH<sub>4</sub> phosphate nitrified at about the same rate as (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>. After 12 weeks guanidine carbonate had a conversion value of only 6%. The insol. N of ammoniated peat becomes available as nitrate at about the rate of the N in the natural occurring soil org. matter. J. R. Adams.

Influence of certain sulfate-hydrated lime mixtures on transpiration. J. D. Wilson and H. A. Rummels. *Ohio Agr. Expt. Sta., Bi-monthly Bull.* 175, 143-61 (1935).—CuSO<sub>4</sub> in combination with hydrated lime and water (Bordeaux mixt.) was not alone effective in increasing the transpiration rate of plants since NiSO<sub>4</sub>, MnSO<sub>4</sub>, and FeSO<sub>4</sub> caused nearly as great an increase when applied to *Cobaea* as did Bordeaux mixt. Mixts. contg. ZnSO<sub>4</sub>, (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, and K<sub>2</sub>SO<sub>4</sub> were considerably less effective. The ppts. of these various mixts. settled in the reverse order of their effectiveness in increasing the transpiration rate, e. g., the mixt. contg. CuSO<sub>4</sub> increased the water loss most, but its ppt. settled most slowly, whereas that of the one contg. K<sub>2</sub>SO<sub>4</sub> settled most rapidly, and the mixt. caused the smallest transpirational increase. C. R. Fellner.

Composts and fertilizers in relation to greenkeeping. VI. Basic slag. T. W. Evans. *J. Board Greenkeeping Research* 4, 41-2 (1935). Cf. C. A. 29, 3095. K. D. J.

Salinity of irrigation water and injury to crop plants. Frank M. Eaton. *Calif. Citregraph* 20, 392, 322, 24-29, 334, 362-5 (1935).—Under conditions in the irrigated districts of Calif., the concns. of B. Ca, Mg, Na, Cl, carbonate and sulfate are usually several times higher in the displaced soil salts than in the irrigation waters. In irrigation practice the ratio of milliequiv. of Na to

milliequiv. of total bases is usually of more importance than is the content of total sol. salts in the water, except when the sol. salt content is excessively high, when the ratio is 0.5 or higher the water is definitely unsuited for irrigation purposes. In nutrient solns, the root growth and water uptake of corn and tomatoes are depressed by the presence of 10 milliequiv. of NaCl and the effect increases with increasing concns. of NaCl; Na<sub>2</sub>SO<sub>4</sub> has a similar effect. Salt injury to plants is not accompanied by characteristic symptoms other than reduced growth. There seems to be no three-fold concn. below which chloride-sensitive crops are unharmed by NaCl. With concns. of Na<sub>2</sub>SO<sub>4</sub> above those supplying the amt. of S necessary for plant growth, each successive increment of sulfate causes a depression in plant growth. K. D. Job

Onions in the Connecticut Valley. A. B. Brannucci, M. E. Spill, W. L. Deran and A. J. Reeder. Mass. Agr. Expt. Sta., Bul. 318, 3-31(1935).—From 1 to 2 tons of lime every 2-3 years is recommended for onions. Greatest fertilizer response was obtained with P through K and N were also important in the production of max. yields. The optimum  $\text{pH}$  of the soil for the growth of onions is 6.0-6.5. A 4-12-0 fertilizer mix carrying 1% of its N in org. form gave better results with onions grown from seed than did another of the same grade but containing N only. KCl was fair as satisfactory as  $\text{K}_2\text{SO}_4$  as a carrier of K. High analysis fertilizer mixes gave as satisfactory results as dil. ones. Deferring application of 1/2 of the N until the tops were 1/2 developed gave beneficial results with seed onions only. A maximum-wap spray proved satisfactory over a period of years for the control of onion thrips. Since remounting of plants is very rare, frequent follow-up sprays are necessary. C R F

**Dates growing in Arizona.** D. W. Affert and R. H. Hilleman, Ariz. Ag. Expt. Sta. *Bull.* 149, 231-81 (19-35).—The date palm has a relatively high tolerance for alkali soils and does better in the light dry soil than in the heavy clay type. Cultural methods are detailed. The use of org. matter, N and P, is advantageous in most Arizona soils. It is essential that the fruit have a high percentage of sugar accumulated before they are picked from the palm if a high-quality product is to result from artificial ripening. Thus the Khadrawi variety when green contained 20% total sugar, when 35-40% translucent, 30%; and when fully translucent, 42%. When examined the sugar content of ripe dates reaches 75-80%. Rain damage is serious as it causes swelling and breaking of the outside, the absorption of water by the fruit, and finally rotting or spoilage. The fruit should be fumigated with HCN, or ethylene oxide- $\text{CO}_2$  before it is packed in a wholesale or retail package as insect infestation may be serious. For good keeping quality, Arizona dates should have their moisture content reduced to about 25%. Soft dates must be dehydrated or sunning will occur. In dehydration chambers the temp. is kept at approx. 55-60° while in the sun-drying chamber the temp. is 35-50° and the relative humidity 60-80%. Dates may be successfully held in cold storage at temps. of 0-2° at relative humidities of 65-70%. A description of the principal varieties is given. C. R. Evers.

The way to independence by a strong economy in agriculture. A. J. Varanen. *Somex Kemilähti & Co.*  
Nations by legitimate plans & control. A. I. Stage. An important place in economic policy as well as being a valuable food. E. E. Jalala.

Some fundamental questions of nutrition of horticultural crops. H. HILL. *Sci. Agr.* 16, 21-4 (1935).—With strawberries grown in sand culture, the withdrawal of K resulted in a marked reduction in total carbohydrate; this reduction appeared in reducing sugars, sucrose and starch. The omission of K also resulted in increased N accumulation. In K-starved plants, nitrate is not reduced and is protein formed. The importance of a balanced N:K ratio cannot be over-emphasized. Ash analyses indicate a definite antagonistic relation between K and Ca; as one falls the other tends to increase. In plants, low K symptoms were obtained with excess Ca treatment. A poor correlation was found between P and K. Deficient K

tended to increase P accumulation and deficient P resulted in a tendency toward an increase in K.

C. R. Fellers

Some responses of Yellow Transparent apple trees in Delaware to various nitrogen treatments. F. S. LARSEN, Del. Agr. Expt. Sta., *Bull.* 195, 3-4, (1933).—A 5-yr study showed that applications of N increased the circumference and terminal growth of trees but had no significant influence on yield. The use of N did not change the biennial bearing characteristic of the trees to annual bearing, nor did it affect firmness of the fruit or its keeping quality. A treatment of Yellow Transparent apple trees did not greatly affect the moisture content of the fruit or seeds, but such treatment did significantly increase the percentage of N in the flesh of the fruits. The percentage of N in the seeds was not increased. C. R. FIELDS

Tree injection—discussed by the injection of fertilizers. Progress report. W. A. Rouse. East Malling Research Sta., 2nd Rep. 1934, 1935-6, cf. C. A. 29, 2647.—Cox's Orange Pippin apple trees in a peach plantation were treated with a solid cone of  $\text{K}_2\text{HPO}_4$  0.2% and urea 0.25% at the rate of 0.003-0.1% in tree or 10-50 lb./acre. The amt. of shoot growth, as judged by the wt. and no. of prunings, was nearly doubled as a result of the injection. The increase was greater in the trees absorbing the larger amt. of fertilizer. Attack by apple leaf hopper and red spider was markedly less severe on the injected trees than on the controls. Just before and just after picking, the fruit from the trees absorbing the larger amt. of fertilizer was inferior in color and taste to that of the control trees. Although the fertilizer was applied in a single hole (0.25 in. in diam.) drilled diametrically through the main stem, all branches of the tree were uniformly affected. The diagnosis and cure of chlorosis in a peach tree. Progress report. 1st 1934-5.—Lime-induced chlorosis in a peach tree was diagnosed and cured by the injection of a 0.03% soln. of  $\text{FeCl}_3$  through 0.125-in. holes bored diametrically through the 2 main stems. The treatment had no effect on the tree and within 2 weeks the leaves had become a healthy green color. Injection of a 0.1% soln. of  $\text{FeCl}_3$  cured about 50% of the leaves to fall but the remainder rapidly recovered from the chlorosis. E. D. Jacob.

Maintenance of adequate nitrogen for citrus (trees).  
Wiliam G. Rabcock. *Calif. Citigraph* 25, 212, 216-22  
(1933)—In 23 well fertilized citrus groves the av. concn.  
of nitrate N in the 1st 6 m. of soil decreased from approx.  
550 p. p. m. in Oct. to less than 50 p. p. m. in Jan. and  
Feb., the concn. then gradually increased to 550 p. p. m.  
in the following Oct. In the next 20 m. of soil the av.  
concn. decreased from about 50 p. p. m. in Oct. to 150  
p. p. m. in Jan. and then gradually decreased to nearly  
zero in the following Sept. The highest concn. of nitrate  
N in the root zone occurred at the time of min. activity on  
the part of the trees. Nitrogenous fertilizers applied to  
citrus trees during the summer months should be readily  
sol. in water, and thus immediately available for use by the  
tree and capable of readily penetrating to the root zone.

Some aspects of citrus decline in Arizona. W. T. McGeorge. *Calif. Experiment.* 25, No. 214-17, (1933).—A discussion of the effects of alkali salts and high soil  $\text{pH}$  values on citrus trees.

Progress report on vegetable diseases. VI. 1. Opine, R. O. McAllister and P. W. Bruen. Univ. British Columbia, Research Sta., Ann. Rept. 1934, 173-90, of C. C. 23, 1917.—In a 3-yr. exp., a considerable reduction in the incidence of *potato leaf-roll disease* on *Brassica sprouts*, grown in a humus soil of p. 32, was obtained during the 3rd yr. by annual applications (in January) of either ground bent lime or hydrated lime at the rate of 3-4 tons acre. Annual applications (in April) of 3-4 cwt. of CaCN<sub>2</sub> reduced the disease only slightly. *Root-rot of lettuce* (caused by *Marasmius funicola*) was not controlled by treating the soil with Ca-bone dust (4 lb. acre) shortly before the plants were set out or by dipping the plants in Fendlen mix. prevent. to planting out. The treatments had a deleterious effect on the plants which occurred

bronzed and stunted in the spring following the treatment (about 4 months after planting). Good growth of most root (caused by *Parasitic root-knot*) on *Alnus incana* was obtained by watering the plants on January 5th with a 7.5% tar oil emulsion contg. 1%  $\text{CuSO}_4$ ; the treatment occasionally caused a substantial reduction in the no. of marketable shoots. It is not of course (caused by *Nectria caryophagella*) was not controlled by treating the seed with formalin (1 pint to 16 gal.) at the time they were drilled into the ground. K. D. Jacob

The effect of calcium cyanamide and of formalin on pea sickness. Progress report. C. L. Walton, L. Ogilvie and B. O. Mulligan. Univ. Bristol Agr. Hort. Research Sta., *New Rep.* 1934, 158-61—See C. A. 29, 5970

K. D. Jacob

Raan or borer deficiency in swedes. D. G. O'Brien and R. W. G. Dennis. *Scottish J. Agr.* 18, 326-34 (1935)—The symptoms of the Raan disease of swedes appear to be restricted to the older zones of the root portion of the bulb and do not extend to the stem portion. A cross section of a bulb severely affected with the disease shows a clearly defined zone mottled with brownish areas, arranged according to no definite pattern. In less severe cases the area involved may be merely a small patch or are of tissue having a water soaked appearance and usually situated halfway between the circumference and the center of the bulb. In a longitudinal section the brown areas are seen to be elongated, converging toward the base and maintaining a fairly constant zone of healthy tissue between themselves and the rind. In severe cases small cracks occur, marking the outer limits of the diseased zone. As compared with healthier bulbs, diseased bulbs of the same variety of swedes contained more fiber and less carbohydrate, the amt. of sugar in the juice being reduced as much as 12%. Application of Mn compds. to the soil had very little effect on the incidence of the disease, but the disease was completely controlled by application of borax at the rate of 20 lb./acre. In water culture soils, without B, turnip seedlings remained very small, had a pale yellowish green appearance and died after about 3 months; at this time they weighed only about 5% as much as plants grown in complete soil contg. 0.003 g. borax/l. In the absence of B fibrous root development did not occur.

K. D. Jacob

The boron status of fruit and leaves in relation to "internal cork" of apples in the Nelson district. Preliminary report. H. O. Adair. *New Zealand J. Sci. Res.* 17, No. 1, 388-91 (1935)—The B content of apples affected with "internal cork" was found to be 3-6 p. p. m. Unaffected apples contained 10-30 p. p. m. Leaves from affected trees contained 9-11 p. p. m. B, leaves of healthy trees contained 17-18 p. p. m. "Internal cork" of apples is attributed to a B deficiency of the soil.

W. Gordon Rose

"Potato sickness" on allotments at New Romney. S. G. Jary and S. J. Travers. *J. South-Eastern Agr. Soc. New. Acad. No.* 36, 100-2 (1935)—Attack of the clubroot (*Heterodera schachtii* Schmidt) on potatoes was reduced by digging drained creosote salts (0 cwt./acre) into the soil 3 weeks before planting the potatoes.

K. D. Jacob

Important diseases of pepper in Georgia. B. B. Higgins. *Ga. Agr. Expt. Sta., Bull.* 186, 20 pp (1934)—Semesan, a con. org. Hg prep., was the most effective seed disinfectant used for the sterilization of pepper seed. For the control of fungus diseases in the growing plants at least 2 sprayings with Bordeaux mixt. should be used. The concn. of the first spray should be 3-4-30 and the second, 4-6-30. If plant lice are present, nicotine sulfate should be added to the Bordeaux mixt. C. R. F.

Boron superphosphate and Bor-Am-Sup Ag. against heart and dry rot of beets. K. Schumann. *Prakt. Landw. Pr.* 62, 171 (1935); *Rev. Agr. Med.* 14, 613—Heart and dry rot of beets required only 5 kg. of B per 0.34 hectare for control when a well-balanced fertilizer was used.

Oden E. Sheppard

Control of bacterial fruitrot of the pineapple in the Philippines. F. B. Serrano. *Philippine J. Sci.* 57,

29-32 (1935)—There are at least 4 factors favoring the malady: incomplete closing of the eyes, leanness of shoots, high temp. and low acidity of the fruit. Potash application in the form of  $\text{K}_2\text{SO}_4$  caused the greatest reductions in the total infection of the fruit. The  $\text{Ca}$  of fruit fertilized with  $\text{K}_2\text{SO}_4$  was 3.8 as compared with 3.9 when no potash was used and with 4.0 for the controls. Bordeaux mixt. of a concn. between 3-4-30 and 4-5-50 was superior as a spray for the control of fruitrot to lime sulfur,  $\text{CuSO}_4$ ,  $\text{HgCl}_2$  and Semesan. K. C. Becen

Dry application of chlorates. H. W. Hulbert and L. V. Benjamin. Idaho Agr. Expt. Sta., *Circ.* 74, 3-8 (1935)— $\text{NaClO}_3$  gave excellent control of quack grass (*Alopecurus repens*), wild morning glory (*Coriaria coccinea*), leaf spurge (*Euphorbia* spp.), and Canada thistle (*Cirsium arvense*) when applied in the dry state in the autumn. The rate of application was 3-5 lb. per sq. rod. The dust was as effective as the liquid spray. Two sprayings or dustings, spaced several weeks apart, are recommended for max. results in destroying weeds. Both cost and fire hazards are reduced by the use of  $\text{NaClO}_3$  in dry form.

C. R. Fellers

The tung-oil tree. Wilmon Newell, Harold Morrow, R. M. Barnett, A. F. Camp and R. D. Dickey. Fla. Agr. Expt. Sta., *Bull.* 280, 3-67 (1935)—The tung-oil tree, *Alseodaphne fordii*, thrives in Fla. on well-drained soils of acid reaction. Excesses of lime and phosphate in the soil are detrimental to growth. The use of  $\text{ZnSO}_4$  to prevent bronzing is recommended. Complete fertilizers contg. N,  $\text{P}_2\text{O}_5$  and  $\text{K}_2\text{O}$  in the ratios of 5:5:4 give the best results in tree growth and yield of nuts. C. R. F.

Final summary of the research into the origin of superphosphate. Max Speter. *Superphosphate* 8, 141-51, 161-8, 181-90 (1935); cf. C. A. 29, 5587

History of guano. W. J. Copenhagen. *Farming Sci. Africa* 10, 221, 226 (1935)—A brief discussion is given of the history of the guano industry in Peru and in the Ichnae Island on the southwest coast of Africa.

K. D. Jacob

An apparatus for determining purity of marls. L. M. Turk. Mich. Agr. Expt. Sta., *Quarterly Bull.* 18, 29-32 (1935)—A known wt. of marl is treated with 1.5 N  $\text{HCl}$  and the resulting vol. of  $\text{CO}_2$  is detd. by means of a gas buret. The rapid method requires only 3-5 min. and is accurate to 3%. on a 3-g. sample. The value of a marl as a soil neutralizer depends on its content of  $\text{CaCO}_3$ .

C. R. Fellers

Agricultural value of blast furnace slag. J. W. White. Pa. Agr. Expt. Sta., *Bull.* 320 (4th Ann. Rep.), 13 (1935)—From 5 to 10 million tons of basic slag is produced in Pa. annually. It possesses 40% the value of ground limestone for correcting soil acidity. When compared on the basis of equal units of  $\text{Ca}$  oxide, of the same degree of fineness, slag gives results superior to limestone.

C. R. Fellers

Bagasse and paper mulches. O. C. Magistad, C. A. Farden and W. A. Baldwin. *J. Am. Soc. Agron.* 27, 513-25 (1935)—Bagasse mulch was distinctly better than paper which was in turn better than plain soil mulch in conserving moisture. The first 6 in. of soil contained less moisture but more nitrate than soil at greater depths. Paper mulch treatment maintained a higher nitrate content in the soil than either the bagasse or soil treatment.

J. R. Adams

Ultraviolet light as an aid on the farm, with special reference to fertilizers and feeding stuffs. Julius Grant. *Fertilizer, Feeding Stuffs & Farm Supplies* 1, 20, 67-43 (1935)—Under ultraviolet light bone meal has a bright blue color and superphosphate is colored a dull violet. Basic slag does not fluoresce but raw phosphate rock usually appears brown or yellow. The method will detect 10% of phosphate rock in a mixt. and its sensitivity is increased if a 10%  $\text{HCl}$  ext. is examd. instead of the solid material. The method can be used to det. the thoroughness of distribution of fertilizers in soil. As little as 0.5% of  $\text{ZnO}$ , which gives a yellow color, can be detected in flour and cattle foods.

K. D. Jacob

Diseases and insect pests of rhododendron and azalea

Richard P. White and C. C. Hamilton. N. J. Agr. Expt. Sta., *Circ.* 350, 3-23(1935).—These plants require acid soils. The use of 1 lb. of  $\text{Al}_2(\text{SO}_4)_3$  1810 per 18 sq. ft. in ordinary garden soils will furnish adequate acidity. Chlorosis can be effectively controlled by spraying with a soln. of 0.25%  $\text{FeSO}_4$ . Spider mites, *Tetranychus telarius*, are serious pests and are best controlled by the repeated applications of either fine S dust or pyrethrin-soap emulsion. The emulsion should contain at least 0.005% pyrethrins and 0.5% soap. The control of *Cercospora* leaf spot caused by *Cercospora rhododendri* is attained by spraying at 2-week intervals with a 2-2-50 soln. of Bordeaux mixt. Black vine weevils, *Brachyrhinus sulcatus* Fah., can be poisoned in June by an attractant bait consisting of 5 lb. of wheat bran, 1 oz. of Ca arsenate, 1 pint of molasses and 2 quarts of water. Another useful attractant and poison consists of apple pulp impregnated with 3.5%  $\text{Na}_2\text{SiF}_6$ . C. R. F.

The control of the insect pests of basket willows, with special reference to the use of combined insecticidal and fungicidal washes and to methods of application. H. G. H. Kearns. Univ. Bristol Agr. Hort. Research Sta., *Ann. Rept.* 1934, 120-16.—A discussion of the properties and use of nicotine, derris, pyrethrum and Cu dusts and sprays and Pb arsenate sprays in relation to the control of insect and fungus pests of basket willows. K. D. J.

The control of the brassy willow beetle (*Phyllocolpa vitellinae* L.) with special reference to the use of dusts. H. P. Hutchinson and H. G. H. Kearns. Univ. Bristol Agr. Hort. Research Sta., *Ann. Rept.* 1934, 147-9.—The beetle was controlled by dusting the willow stools either with a proprietary derris prepn. contg. 0.18% rotenone or with a dust of the same rotenone content in which kalin was used as a diluent. Under dry weather conditions the dust retained sufficient effective toxicity to kill or repel wandering beetles for at least 3 days after it was applied to the stools. For efficient control the dust should be applied just after the time of bud burst and before the shoots have attained a length of 18 in. K. D. Jacob.

The control of *Phylloperthia horicicola* L. in grassland. C. L. Walton. Univ. Bristol Agr. Hort. Research Sta., *Ann. Rept.* 1934, 150-7.—See C. A. 29, 6777.

K. D. Jacob. Control of dothiorella rot on avocado fruits. W. T. Horne and D. P. Palmer. Calif. Agr. Expt. Sta., *Bull.* 594, 10 pp.(1935).—The most effective spray for the control of dothiorella rot consists of 10 lb. of 4-4-50 Bordeaux mixt., 6 lb. of wettable S, 6 oz. of blood albumin spreader, and 100 gals. of water. This spray is best used when the fruits attain a size of 1.5 in. in diam., with a second application 6-8 weeks later. S applied alone as a liquid with spreader is also a very effective fungicide against this disease. Liquid fungicides are more effective than dry dusts.  $\text{CuSO}_4$  is somewhat more efficient than  $\text{ZnSO}_4$ . The addn. of S to a Cu fungicide greatly increases its effectiveness. Fumigation of the fruits with  $\text{NCl}_3$ , with or without vacuum, was of little value in controlling the rot. C. R. Fellers.

Control of tobacco wildfire. W. S. Betch. Pa. Agr. Expt. Sta., *Bull.* 322, 3-29(1935).—Leaf-spot damage to tobacco is caused mostly by wildfire, *Phytophthora tabaci*. The importance of making early application of fungicides in seed beds, especially Bordeaux mixt. and Cu-lime dust, is emphasized. A spray of milk powder with water is as effective as Bordeaux mixt. in the prevention of wildfire in seed beds.  $\text{HgCl}_2$  causes some stunting of tobacco seedlings, or a delay in the maturity of the crop, by preventing the development of secondary roots near the soil surface. C. R. Fellers.

Experiments in the control of tobacco wildfire with chemical preparations. K. Böning. *Prakt. Bl. Pflanzenb.* 13, 60-77(1935). *Rev. Applied Mycol.* 14, 659.—In the seed bed and field beneficial effects of regular applications of Bordeaux mixt. (1 or 2%) against tobacco wildfire (*Phytophthora tabaci*) are apparent. In the seed bed satisfactory results were also obtained by various other Cu-contg. mixts. including the dusts Cusua and Cupulvit.

Cusua and Nospelit were also generally effective in the field tests in which, however, the outcome of the different treatments varied according to the year. Lime sulfur was not found to be altogether reliable. O. R. S.

Effects of modifications of the potato-spray program. E. O. Mader and F. M. Mudgett. N. Y. (Cornell) Agr. Expt. Sta., *Bull.* 621, 31 pp.(1935). *cf.* C. A. 29, 7667.—A summary of expts. carried on for 5 years shows that spraying and dusting are profitable practices even when late blight, caused by *Phytophthora infestans*, does not occur. Leaf beetles, leaf hoppers and early blight, caused by *Alternaria solani*, were well controlled by either Cu-lime dusts or by Bordeaux mixt. Cu has a distinct stimulative influence on potato foliage growth. The kind of lime used in prep. these dusts and sprays was of little significance, though slightly better results were obtained with high-Mg limes. In general, more Cu must be added per acre in the form of dust than as spray. Heavy applications of Cu spray or dusts late in the season resulted in tubers of uneven size and shape and a lower yield of No. 1 potatoes. C. R. Fellers.

Potato blight—a new method of control by chemical spraying. R. K. MacDowall. *Scottish J. Agr.* 18, 213-9(1935).—The infection of potatoes with blight about the time of harvesting caused by the presence of the fungus, *Phytophthora infestans*, on the hedges, was reduced by destroying the diseased green parts with a spray contg. about 16%  $\text{H}_2\text{SO}_4$  (15 gal. brown oil of vitrol per 100 gal. of spray). The treatment killed chickweed, charlock and other weeds and facilitated the mech. digging of the crop, it had no detrimental effect on the tubers themselves. K. D. Jacob.

A contribution to the knowledge of the chemical constitution of wart-infested potato soils. A. Nienke. *Phyto. path.* 2, 8, 301-5(1935). *Rev. Applied Mycol.* 14, 659.—Chem. analyses of some potato soils infested by wart disease (*Synchytrium endobioticum*) at northern Czechoslovakia indicated a general abundance of humus and an excess of  $\text{H}_2\text{PO}_4$  and more or less markedly an reaction exchangeable Ca and Mg was low. Similar conditions prevailed in other localities except for a deficiency of  $\text{H}_2\text{PO}_4$ . The results do not permit one to draw conclusions as to the effect of soil constitution on the distribution of the disease but it is thought that the excessive use of stable manure may possibly be a contributory factor to its spread. Oden R. Sheppard.

Scale control by fumigation. G. Peters. *Indag.* 8, 209-10(1935).—A review of the properties of  $\text{Ca}(\text{CN})_2$  and its use in the fumigation of citrus trees. K. D. J.

Studies on *Dytiscus tomentosus* Fabr. V. Experiments on the control of the raspberry and loganberry beetle, 1934. W. Steer. East Malling Research Sta., 2nd *Ann. Rept.* 1934, 191-3. *cf.* C. A. 29, 2619.—A single application of a dust contg. 5-10% derris, applied in May to control the adult stage of the beetle, failed to give satisfactory results on raspberries, even when the rate of dusting was about 3 cwt./acre and the crude rotenone content of the dust as high as 0.36%. On loganberries derris gave as good results in controlling the larval stage of the beetle when it was incorporated in a spray of lime S and sulfite lye or of "colloidal Cu" and sulfite lye as when used with soft soap. The combined sprays gave an appreciable control of the loganberry cane spot disease caused by *Flumoe veneta*. Satisfactory control of the beetle on blackberries was obtained by a single application of a soap-derris spray. K. D. Jacob.

Mexican bean beetle and its control. Ray Hinton. *Mech. Agr. Expt. Sta., Quarterly Bull.* 18, 7-9(1935).—The Mexican bean beetle, *Eupilachna corripula*, is well controlled early in the season by a spray of 2 lb. of Mg arsenate in 100 gal. of water. From 25 to 30 lb. of infested plants also gave good control. Pyrethrum dusts were slightly less effective than derris. C. R. Fellers.

Further investigations on the control of wireworms by applications of potassium salts. Werner Sinklev. *J. natl. Pflanzen 31*, 381-3(1935); *cf.* C. A. 28, 6917.—*Agriotes obscurus* L. from peat soils were more resistant to 0.2%

KCl soln. than those found in loamy sand soils. The differences in physical constitution of the larvae do not appear to be hereditary, but depend on the type and compn. of the soil in which the larvae occur. John O. Hardesty.

Earthworm control without the aid of water. R. B. Dawson and R. B. Ferro. *J. Food Greenhouse Research* 4, 55-72 (1935).—Solid Pb arsenate, applied at the rate of 1.5-2.0 oz./sq. yd. or 4.00-5.25 cwt./acre, gave very effective control of earthworms in medium and medium-heavy soils. Pb arsenate, at the rate of 1.5 oz./sq. yd., did not give satisfactory results in a soil that was covered by a peaty mat. Under favorable conditions a marked reduction in worm activity was obtained in 11-24 days after application of Pb arsenate, but full results as regards worm control and improvement in quality of turf were not apparent until after a growing season. Pb arsenate was effective on medium soils for at least 4 years and possibly longer. It had no detrimental effect on the grass even at such heavy rates as 16 cwt. on the surface and 32 cwt./acre under the turf. K. D. Jacob.

Life history and control of the gladiolus thrips, *Taeniothrips gladioli* M. and S., in California. Howard L. McKenzie. *Calif. Agr. Expt. Sta., Circ.* 337, 1-16 (1935).—Treatment of infected bulbs by a 1:1000 HgCl<sub>2</sub> soln. for 17 hrs. is effective. Fumigation with Ca(CN)<sub>2</sub> with 2 oz. of the chemical per 100 cu. ft. with an exposure of 4 hrs. is effective. Approx. 1 lb. of naphthalene flakes per lb. of bulbs gives satisfactory control. An overdose of the naphthalene causes no injury. Weekly or biweekly sprays with a mist consisting of Mn arsenate 0.25 lb., brown sugar 4.12 lb. and water 6.25 gal. is recommended for control of the insects on the growing plants. C. R. Fellers.

Helminthosporium diseases of barley and their control. M. Mitra and R. D. Bose. *Indian J. Agr. Sci.* 5, 419-44 (1935).—The diseases were best controlled by treating the seed for 10 min. with 0.01 soln. of HgCl<sub>2</sub>. Treatment with either S, formalin, Uspulun or Ceresan was less effective. Nona of the treatments gave complete control of the diseases. K. D. Jacob.

A mealy bug new to Egypt (*Pseudococcus brevipennis* Chitt.) on roots of Phoenix sp. and its control by the application of chemicals to the soil. M. Homs and M. Shafiq. *Ministry Agr. Egypt, Tech. Sci. Service Bull.* 159, 8 pp. (1935).—The insect was controlled by treating the soil around the plant with either *p*-dichlorobenzene (2-10 g.), *o*-dichlorobenzene (2-10 cc.), naphthalene (2-10 g.) or HgCl<sub>2</sub> (0.5 oz./gal. H<sub>2</sub>O). HgCl<sub>2</sub> had no deleterious effect on the plants and its action on the insects was more rapid than that of the other compounds. K. D. Jacob.

The spittle insect or froghopper. Byrles F. Dingers and B. B. Pepper. *N. J. Agr. Expt. Sta., Bull.* 593, 1-4 (1935).—Of the 5 species of froghoppers, *Philaenus spumarius* Linn. is most abundant in N. J. Spraying experiments showed that nicotine sulfate and soap, used as a spray, and pyrethrum dust were ineffective in controlling the insect. Derris dusts carrying 0.75% rotenone gave satisfactory control of the nymphs on strawberries and sweet clover. C. R. Fellers.

The caterpillar of *Agrohis segetum* Schiff. and its extermination. Josef Paxler. *Lesly Cuckoo* 54, 1-6 (1935).—Baits prep'd from 25 lb. dry wheat middlings mixed with 0.5 lb. Swainson green were moistened with dil. molasses and placed as baits between the rows of beets. Other toxic agents used were NaF and Na fluosilicate in 0.5 g. quantities. Sprays or powder prep'd applied to the beet greens were effective only during the early life of the caterpillars. For the moths, shallow trays on posts 1 m. high spread over the fields contg. molasses with 0.5-1.0% Na arsenate were effective instruments of extermination. Frank Marech.

Combined washes—progress report. H. C. H. Kearns, R. W. Marsh and H. Martin. *Univ. Bristol Agr. Hort. Research Sta., Ann. Rept.* 1934, 109-25, cf. C. A. 28, 2481.—No significant differences were observed in the degree of apple sawfly control obtained with sprays contg. nicot-

ine, lime S and sprayer in which the sprayers (Agrisol, Ipreon, Leithalite Weiting Ipreon and Sulfonated Loxol) were used at the rate of 5 oz./100 gal., the results were practically the same as when sulfite ly (60° Tw) at 6 pints/100 gal. was used as sprayer. Crude Ca polysulfonate at 24 oz./100 gal. also proved to be an effective sprayer. Refined petroleum oil (1%) and lime-S (1%) combinations were applied post-blossom to a no. of coal varieties of apple without causing spray damage. Addition of 5 lb. cryst. FeSO<sub>4</sub> per gal. of lime-S concentrate reduced the formation of soot. As in combination sprays of lime S and Pb arsenate, obviated sludge production, rendered the spray deposit more clearly visible and increased its adherence. Combinations of refined petroleum oil (4.25%) and lime S were successfully applied to black currants at the pre-blossom stage for the simultaneous control of big bud and caped bug. Excellent control of caped bug on black currants was obtained by the application of combinations of either semirefined or half-white petroleum oil (4.25%) and strained anthracene oil (4.25%) as dormant sprays. The substitution of oleic acid for Agral W. B. as emulsifier increased slightly the efficiency of the spray. K. D. Jacob.

Studies on the ocidial action of winter washes—1934 trials. M. D. Austin, S. G. Jary and H. Martin. *J. South-Eastern Agr. Coll. N.Y., Kent No.* 36, 80-94 (1935), cf. C. A. 28, 6915.—Emulsions of asphaltic, paraffinic and naphthene base oils were prep'd. at 2 and 4% concns. by the 2-soln. oleic acid method with 0.6% oleic acid and 0.1% NaOH as emulsifier. In lab. expts., oils falling within the following limits appeared to be equally efficient as emulsifiers (when used at 4% concns.) against *L. psyllaeus* on red currants: (a) viscosity between 120° and 800° Redwood 1 at 70°F. and (b) unsaponifiable residue 60-100% by vol. In general, the oils were not effective at 2% concns. Emulsions contg. 2-6% of either dibutyl phthalate, methylcyclohexanyl stearate or dilauryl tartrate were deficient in ocidial properties as compared with petroleum oils of similar boiling range. Under field conditions an emulsion contg. strained anthracene oil 4 gal., semirefined petroleum oil 8 gal., oleic acid 1 gal. and NaOH 1.5 lb. per 100 gal. of spray was an effective emulsion against *L. psyllaeus* on red and black currant bushes; the spray retarded foliage development on the Tay's Prolific variety of red currant. K. D. Jacob.

Bordeaux mixture-nicotine combinations against aphids and apple scab. M. D. Austin, S. G. Jary and H. Martin. *J. South-Eastern Agr. Coll. N.Y., Kent No.* 36, 85-94 (1935).—The sprays used were (1) ordinary Bordeaux mixt. (8.12:100) plus 6 oz. nicotine per 100 gal.; (2) Bordeaux-sulfite ly prep'd by dilg. 6 pints sulfite ly (60° Tw) with water, adding to a suspension of 12 lb. hydrated lime in 80 gal. water, then adding 8 gal. 10% CuSO<sub>4</sub>, 5H<sub>2</sub>O soln. and 6 oz. nicotine and dilg. to 100 gal. and (3) cottonseed oil-Bordeaux mixt. prep'd by adding 6 pints cottonseed oil and 5 gal. 10% CuSO<sub>4</sub>, 5H<sub>2</sub>O soln. to a suspension of 6 lb. hydrated lime in 90 gal. water and then adding 4 oz. nicotine, followed by vigorous stirring and dilg. to 100 gal. The modified sprays showed a fungicidal efficiency equal to that of ordinary Bordeaux mixt. The sprays contg. sulfite ly and cottonseed oil gave better control of aphids (*Anuraphis rosae*) than did the straight Bordeaux-nicotine spray but the results were inferior to those normally obtained with tar distillate sprays. The cottonseed oil Bordeaux spray caused less foliage damage and fruit (apple) russeting than did ordinary Bordeaux mixt. or the Bordeaux-sulfite ly spray. Similar amts. of Cu were deposited on the leaves by the 3 sprays. K. D. Jacob.

The control of apple scab. Allington Phipps and Newton Winder. 1934. W. Goodwin, N. H. Pizer, E. S. Salmon and W. M. Ware. *J. South-Eastern Agr. Coll. N.Y., Kent No.* 36, 55-61 (1935), cf. C. A. 28, 6915.—Equally effective control of the scab was obtained by spraying the trees with either ordinary Bordeaux mixt. (CuSO<sub>4</sub>, 5H<sub>2</sub>O 8, hydrated lime 12 lb., water 100 gal.) or an emulsion of cottonseed oil and Bordeaux mixt. (6 pints of cottonseed oil and 4 gal. of 10% CuSO<sub>4</sub>, 5H<sub>2</sub>O soln. added simultane-

only to 95 gal. water contg. 6 lb. hydrated lime).

**Special sulfur dust versus lime sulfur for apple-seah control.** John W. Hall *Scottish J. Agr.* 18, 251-4 (1935).—S dusts and lime-S sprays were equally effective in controlling apple seah. The leaves were not injured by lime-S spray (1:20) in the pre-blossom stage but were very susceptible to injury with a spray of this strength in the post-blossom stage.

**Preliminary experiments on the control of apple surface-eating tortricid [*Cacoccia podana* Scop.] larvae.** F. J. D. Thomas, Last Malling Research Sta., *22nd Ann. Rept.* 1934, 205-7.—A 50% reduction of the damage caused by the insect was obtained by spraying with derris 2 and soft soap 5 lb./100 gal. approx. 9 weeks after petal fall; the spray contained 0.0075% of crude rotenone. A spray contg. BaSiF<sub>6</sub> 4 and Agral N 1 lb./100 gal. was somewhat less effective.

**Observations on woolly aphid (*Eriosoma lanigerum* Hansm.) in 1934.** R. M. Greenslade, Last Malling Research Sta., *22nd Ann. Rept.* 1934, 236-8; cf. C. A. 29, 2906.—Attack of the aphids on cankers and pruning wounds of apple trees was prevented by painting the parts with a prep. composed of raster machine oil (a heavy machine oil with a proportion of special soap) 1, water 3 quarts, nicotine (95-98%) 1 fluid oz. and flour 0.5 lb. The flour and water were boiled to a paste and the nicotine was added. The oil was stirred in and the whole shaken in a closed container to a smooth creamy emulsion.

**Field spraying and dusting trials on the control of apple blossom weevil [*Anthonomus pomorum* L.] and of apple sawfly [*Hoplocampa testudinea* Kug.] in 1934.** W. Ster and J. D. Thomas, East Malling Research Sta., *22nd Ann. Rept.* 1934, 194-204; cf. C. A. 29, 2948.—Blossom rapping, due to apple blossom weevil, was reduced approx. 50% by a derris dust (finely ground derris 10 and china clay 90%) contg. 0.36% rotenone applied in prevent oviposition. A BaSiF<sub>6</sub> dust (BaSiF<sub>6</sub> 72, NaAlF<sub>6</sub> 8 and inert material 20%) was ineffective. The eggs were not affected by nicotine sprays. The eggs of the apple sawfly were very susceptible to nicotine; addn. of nicotine to the petal-fall, lime-S seah spray gave good control. Sawfly damage was also considerably reduced by the addn. of derris to the lime-S spray. Derris dusts gave good control of the migratory larvae. Addn. of a wetting agent in a petal-fall spray of lime-S and nicotine was not necessary if the trees were heavily sprayed. As a petal-fall spray, Pb arsenate, either alone or in combination with lime S, was less effective than lime S plus derris and a wetting agent.

**Apple blossom weevil experiments in 1934.** Impregnation of tree banding materials. R. M. Greenslade, A. M. Massee and F. J. D. Thomas, Last Malling Research Sta., *22nd Ann. Rept.* 1934, 180-4.—The best catches of weevils (*Anthonomus pomorum* (L.) Curt.) were obtained with corrugated cardboard bands treated with a 3% soln. of "Seckay." Wax A XIII in trichloroethylene. There were indications that the treatment attracted weevils to the bands. Promising results were also obtained with bands treated with a 7% soln. of tetrachlorobenzene in trichloroethylene and with a 3% soln. of "Seckay." Wax A 123 in trichloroethylene, resp. None of these treatments raised any mortality of the weevils collected in the bands and they were not injurious to the bark of the trees. The weevils seemed to be repelled by bands treated with either 30% soln. of "Seckay." Wax A 68 or A 93 in trichloroethylene, 10% soln. of "Seckay." Wax A 68 in o-dichlorobenzene, soln. contg. 10% "Seckay." Wax A 68 and 30% p-dichlorobenzene in trichloroethylene or 20% of "Seckay." Wax in creosote oil. The "Seckay." waxes are a series of chlorinated naphthalenes prep'd. by Imperial Chemical Industries.

**Resistance of the apple to fungal invasion.** A. S. Horne and P. Webb, *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 165-76 (1934).—Tests were carried out at East Malling (1933) and in Northern Ireland (1932) on the relationship between resistance to fungal

invasion and chem. compn. of fruit from trees subjected to various fertilizer treatments. The results at the 2 stations were quite different, and in some cases diametrically opposite, indicating the complexity of the problem.

**Lime-sulfur sprays for the combined control of purple scale and rust mites.** W. L. Thompson, Fla. Agr. Expt. Sta., *Bull.* 282, 4-38 (1935).—Three lime-S applications made at intervals of 6 weeks or longer reduced purple-scale infestations and controlled rust mites for a period of 7-10 months. Two lime-S applications at an interval of 2 weeks gave results comparable with 1 emulsion application in the control of purple scale when applied after Bordeaux mixt. The effectiveness of liquid lime-S and dry lime-S against purple scale and rust mite was increased by the addn. of either wettable S or bentonite S.

**Removal of arsenic and lead residues from apples.** O. C. Roberts and J. K. Shaw, Mass Agr. Expt. Sta., *Bull.* 315 (*Ann. Rept.* 1934), 73 (1935).—Apples which had been sprayed with Pb arsenate were washed 3-5 min. in a specially designed washer contg. 1.3% HCl at 13-15° and were practically freed from As or Pb residues without apparent injury to the fruit.

**Field inspection work (on arsenic and lead on sprayed citrus fruits).** Gray Singleton, Fla. Quart. *Bull.* 42, No. 2, 11-20 (1933).—The Gutzeit test as simplified for use in field tests is described. Marked differences were found in the acidity of sprayed as compared with unsprayed citrus fruits. The acidity was always decreased in some cases where As was applied as dust it could not be detected on the foliage after 3-4 weeks but could be found on the rind of the fruit. Where As was applied as a spray with lime S it could be found on the leaves for several months. If there was Bordeaux mixt. spray residue on the trees when the As was applied, the As persisted as long as the leaves remained on the tree. If Bordeaux was applied after the As spray, and while the As was still on the leaves, the As became fixed. The effect of As, both on the fruit and on the tree, is stopped by the application of Bordeaux mixt. or other Cu spray or dust. That is, CuSO<sub>4</sub> prevents damage to the trees and fruits from As sprays.

**Relative amounts of arsenic found on the surface and in the tissues of celery plants which had been sprayed with lead arsenate or other arsenical poisons.** L. Longfield-Smith, Fla. Quart. *Bull.* 42, No. 2, 48-52 (1933).—In the analysis of 508 samples of celery and cabbage for As residues, a concn. of 5% H<sub>2</sub>SO<sub>4</sub> by vol. was preferable to 3% boiling HCl for the extrn. of As from the plant material. The heat of soln. aids the extrn. Boiling acid makes the tissues very soft and causes considerable org. matter to go into soln. This org. matter makes the evolution of AsH<sub>3</sub> much slower and results in a smaller amt. of As being obtained. It is desirable to wait for at least 3 hrs. before reading the strip. When the vegetable residue after extrn. the As 2-3 times with 5% H<sub>2</sub>SO<sub>4</sub> was digested with H<sub>2</sub>SO<sub>4</sub> and HNO<sub>3</sub> to destroy all trace of org. matter, and the remaining As det'd., a large quantity, frequently 50-60% of that extrd. by plain acid wash, was obtained. When the amt. of As det'd. by acid wash was added to that obtained by subsequent digestion, the total As was invariably greater in amt. than the quantity which could be obtained by 1 digestion. This difference may be as much as 60%. Numerous data are given showing that large amts. of As are found on celery and cabbage which have been sprayed with As sprays.

**Enforcement of the arsenical spray law.** Report of the Chemist. L. Longfield-Smith, Fla. Quart. *Bull.* 42, No. 2, 27-33 (1933); cf. C. A. 28, 555-5.—Over 2000 samples of fertilizers, soils, citrus fruits, twigs and miscellaneous vegetables were exam'd. for As content. Fla. phosphate rock varied from a trace to 0.004% As<sub>2</sub>O<sub>3</sub>. Nitrophosphate averaged 0.076% As<sub>2</sub>O<sub>3</sub>. Tankage, raw bone meal, castor pomace, cottonseed meal, German kainite, KNO<sub>3</sub> and NaNO<sub>3</sub> (Chilean) contained only traces of As. Synthetic NaNO<sub>3</sub> contained 0.031% of As<sub>2</sub>O<sub>3</sub>. Twelve colored figures showing As standards by the Gutzeit test

are given. A detailed description of the improved Gutzert method is presented. C. R. Fellers

Influence of various sulfur-containing fungicides on transpiration. J. D. Wilson and H. A. Runnels. Ohio Agr. Expt. Sta., *Bimonthly Bull.* 175, 146-8 (1935); cf. C. A. 29, 6353<sup>2</sup>.—Eighteen S-contg. spray materials were applied to *Coleus* plants to det. their transpiration rates. Liquid lime-S plus Ca(OH)<sub>2</sub> and Kofolog, which contains a high percentage of bentonite, were the only materials tested which caused an increase in transpiration comparable with that of Bordeaux mixt. The transpiration increases were approx.  $\frac{1}{2}$  to  $\frac{1}{3}$  as great as those caused by Bordeaux. Dry lime-S and liquid lime-S caused an increase in transpiration over the untreated checks of more than 50% during the night period. Any injury resulting from the application of S-contg. materials to plant tissue cannot be due to excessive increase in transpiration. C. R. Fellers

Action at a distance of metals on some species of fungi. E. Corneli. *Rev. Pat. reg.* 24, 397-406 (1934), *Rev. Appl. Mycol.* 14, 646.—When spore suspensions of *Penicillium glaucum* in hanging-drop cultures were exposed to a lead disk in hermetically sealed glass containers only a small percentage of the spores germinated, the figure being highest when the Pb was farthest away (3.5 mm.) and lowest when it was nearest (1 mm.). When the spores were removed to normal conditions in the absence of the metal, growth was resumed, and was more rapid than in controls. The radiation effect was less marked on spore masses than on single spores, and when open containers or Cu and Ag disks in closed ones were used no appreciable effect of the radiation resulted. The distance of the metal from the fungus was less important than the area of the disk and the vol. of the container, the effect of a disk of given size at a given distance increasing as the vol. of the container decreased. *Aschyta psi* and *Tricothecium roseum* were less susceptible to the radiation than was *P. glaucum*, the uredospores of *Uromyces betae* remained unaffected. C. believes that germination was reduced only in sealed containers because of the fact that in these there was a constantly increasing accumulation of secondary radiation or a progressively more complete ionization of the atm. Oden E. Sheppard

Contact insecticides from fatty alcohols. E. W. Bousquet, P. L. Salzberg and H. F. Dietz. *Ind. Eng. Chem.* 27, 1342-4 (1935).—The higher fatty acids were found to be effective against aphids and do not react with hard water. Numerous long-chained alkyl derivs. were synthesized and tested. The rhodanates were found to be particularly effective and satisfactory (cf. C. A. 29, 2656<sup>1</sup>). A max. insecticidal effect was found for rhodanates contg. 12 C atoms. The normal, primary compds. were used, as branch-chain rhodanates were not promising. No one phys. property was correlated with this peak in toxic action, and it is probably the resultant of several properties. The 12-C homolog is sale on many kinds of plants, in the proper dispersion medium. E. R. Rushton

Insect and allied pests of cultivated mushrooms. V. Control of flies and mites. M. D. Austin and S. G. Jary. *J. South-Eastern Agr. Coll. Wye, Kent* No. 36, 107-10 (1935).—Sprays contg. nicotine (98%) at a diln. of 1:1600 were ineffective in killing eggs of *Scatara fenestrata* in lab. expts. The addn. of Sulfonated Loral (1:4000) did not increase the efficiency of the spray. Under the most favorable exptl. conditions a 60% mortality of the larvae of *S. fenestrata* was obtained with nicotine sprays. Good control of the adult flies was obtained by spraying the mushroom beds with nicotine (98%) at the rate of 1 oz./10 gal. water or by fumigating the cellars with nicotine (0.75-1.00 cc. per 1000 cu. ft. of space). The larvae were not affected by spraying with 1:1600 solns. of NaCl. The wetting agents, Sulfonated Loral and Na  $\gamma$ -sulfonate, were harmless to growing mushrooms when they were applied as sprays at 1:2000 diln. A proprietary oil emulsion, when carefully mixed and lightly sprayed on growing mushrooms, checked the injury caused by *Tyroglyphid* mites; a light application, when the temp. of the mushroom

was 104°F., produced no injury to mushrooms. Warm water, applied at a temp. of 110°F., also caused no injury to mushrooms. K. D. Jacob

The effect of antioxidants on highly concentrated pyrethrum extracts. C. B. Gnadinger, C. S. Corland and C. A. Clark. *Soap (Sanitary Products Sect.)* 11, No. 10, 85, 97, 99 (1935).—Kerosene (K) exts. of low pyrethrum content (2.5%) were quite stable over periods of 4-9 months but concd. exts. (10-15%) were unstable during prolonged storage. In order to prevent concd. pyrethrum exts. which would not have the antioxidant (A) present in K or other mineral oils, decabhydronaphthalene (D) was used as a solvent. Neither D nor K interfered with the Cu reduction method for analyzing total pyrethrum content (cf. C. A. 23, 5548). Before proceeding with the analysis the exts. are first dild. with petr. ether, chilled overnight and filtered to eliminate altered or oxidized pyrethrins. At 35° concd. pyrethrum ext. in D or K contg. no A lost 12-26% pyrethrum content in 2-4 months. Of 19 A tried on concd. D-pyrethrum ext. held at 35°, one proprietary material at 0.1% prevented any loss for 60 days but the loss was 9.2% after 81 days, and  $\alpha$ -naphthylamine (0.5%) and thymol (0.5%) had similar effect. Conc'd. K exts. contg. the same proprietary A were quite stable at 6° for 94 days but lost up to 10.4% at 35° storage. Henry H. Richardson

Fused needle of species of *Pinus*—progress report. H. E. Young. *Queenland Agr. J.* 44, 286-98 (1935).—The condition is manifested by a resinosis of the terminal buds and a twisting and adhesion of each needle in the fascicle. There was no relation between the chem. compn. of the soil and the occurrence of the disease. Treatment of individual trees with the essential elements and also with B, Zn, Ca and Al gave neg. results. Chem. analyses of material collected from diseased and healthy trees showed no great dissimilarities. K. D. Jacob

A new method for precision testing in the laboratory of the toxicity of lime sulfur and of Bordeaux mixture as protective fungicides. Progress report. H. B. S. Montgomery and M. H. Moore. East Malling Research Sta., *22nd Ann. Rept.* 1934, 217, 22.—Mark individual glass slides with a ring 15 mm. in diam. cut into the glass with a diamond by means of a lathe. Clean the slides very carefully by successive treatment with warm dil. HNO<sub>3</sub>, CrO<sub>3</sub> cleaning soln. and ether, with intervening washing with water. Store the slides in ahs. alc. and flame and cool just before using. Transfer 0.015 cc. of the spray fluid to the marked-off area of the slide from a graduated fine-glass tube. Spread the spray fluid to the edge of the groove with a finely pointed glass rod, dry the deposit in the lab. and store the slide for 1 day in an unheated water oven at approx. 15-18°. Support the slide over a pool of distd. water for several hrs. before application of the spore suspension. Apply 0.05 cc. of the spore suspension (spores of *Venturia inaequalis* Aderh. were used by the authors) and spread it in the groove. Incubate the slide in an individual moist chamber for 24 hrs. and det. the degree of germination by counting under the high power field of the microscope. At least 10 test slides and 10 control slides are recommended for each spray diln. Under these conditions germination of the spores was almost completely inhibited by lime S at a concn. of 1:50 and free germination was entirely prevented by Bordeaux mixt. contg. 0.025% CuSO<sub>4</sub> in which hydrated lime was used at the rate of 3 parts to 2 parts CuSO<sub>4</sub>. Methods of raising large supplies of viable spores of *V. inaequalis* in pure culture are discussed. K. D. Jacob

Preliminary laboratory tests of bactericides on the plum bacterial canker organism [*Pseudomonas mors prunorum*]. H. Wormald. East Malling Research Sta., *22nd Ann. Rept.* 1934, 151, 5, cf. C. A. 29, 2651<sup>1</sup>.—Growth of the organism was completely prevented by either phenol 0.1, EtOH 0.80, CH<sub>3</sub>O 0.01, quinosol 0.005, CuSO<sub>4</sub> 0.2, CuCl<sub>2</sub> 0.01, ZnSO<sub>4</sub> 0.005 or HgCl<sub>2</sub> 0.0005%. In culture media that reacted only slightly with CuSO<sub>4</sub>, the organism was killed by contact for 10 min. with a 0.01% soln. of CuSO<sub>4</sub>. Under these conditions the bactericidal action of CuSO<sub>4</sub> was much more rapid than that of ZnSO<sub>4</sub>.

Tar oil at 1% concn killed the organism in 10 min., though at 0.1% it did not kill in 1 hr. K D Jacob

Laboratory trials of wetters against woolly aphis, *Eriosoma lanigerum* (Hausm.). R. M. Grunshaw. Last Mailing Research Sta., 22nd Ann Rept 1934, 185-90.—Ol a no. of wetting agents tested with 0.025% nicotine soln., Agral II was the only one that showed any promise of increasing the effectiveness of the nicotine. At 0.5% concn., with nicotine it gave results as good as those obtained with nicotine plus 1% of soft soap, but at this concn Agral II may cause damage to the fruit (apples). At 1% concn Agral II completely wetted tufts of woolly aphis "wool" in 40 min., while none of the other wetting agents showed signs of wetting before 1 hr. Soft soap at 0.5% concn was a much better wetting agent than Agral II at 0.1% concn. None of the preps had any apparent solvent action on the wax threads of the "wool." The strawberry tarsonemid mite was not controlled by spraying the strawberry plants with either 3% lime S plus 1% of a no. of different wetting agents, lime S alone (1 1/4%), petroleum emulsion (2-5%), paraffin emulsion (2-50%) or a spray composed of liver of S 30 oz and soft soap 10 20 lb per 100 gal. K D Jacob

Effect of molds and other seed-borne fungi on germination. F A McLaughlin. Mass Agr Expt Sta., Control Bull 77, 59-60 (1935).—Thirty-five lots of fungus-infected sweet-corn seeds were divided into 3 lots and 1 lot was dusted with Et Hg phosphate, 1 was treated with 1 1000 HgCl<sub>2</sub> for 10 min., and the last lot was left untreated. The seeds were germinated and the seedlings noted for fungus diseases. The org Hg prep and the HgCl<sub>2</sub> were equally effective in destroying fungi on the seeds. *Penicillium* and *Rhizopus*, 2 of the most abundant seedling fungi, are well controlled by seed treatment.

C R Tellers

A field spraying trial of combined fungicide-contact insecticide sprays in 1934. Progress report. M H Moore and H B S Montgomery. East Mailing Research Sta., 22nd Ann Rept 1934, 208 10, cl C A 29, 1202.—Fairly good control of apple scab (*Leptaria maculosa* Aderh.) on Cox's Orange Pippin was obtained by 1 pre-blossom (pink-bud) followed by 2 post-blossom applications of lime S (1-30 pre-blossom and 1 100 post-blossom) to which, at petal fall, nicotine was added, with either Sulfonated Loral, "Lethalate" Wetting Prep or sulfite lye as spreader. Very good control of sawfly (*Hoplocampa testudinea* Klug) and red spider (*Oligonychus ulmi* Koch) was obtained with all spray treatments. There was some evidence that "Lethalate" Wetting Prep was the most efficient of the wetting agents tested.

K D Jacob

Tolerance of cabbage seedlings to insecticide dips for the control of aphids and cabbage worms. Harry G Walker and Lauren D. Anderson. Va Truck Expt Sta., Bull. 86, 1203-10 (1935).—Expts. showed that the dipping of cabbage plants infected with aphids and cabbage worms in 1-400 concns. of pyrethrum or derris for 30 sec. destroyed these insects and caused only slight reduction in plant survival. If only aphids were present, dipping in a soln. of 0.7 lb. of nicotine sulfate or Black Leaf 40 in 50 gal. of water was also effective. Pyrethrum and derris lost their activity rapidly in aq. solns. and only enough soln. should be made up to last 1 day. C R F

Fish-poisoning vines, a native insecticide in Kwangsi Chin-Pi Chen. Science (China) 19, 1405-30 (1935).—*Millettia parhycarpa* Benth., commonly known as "fish-poisoning vines" in China, is widely distributed in the mountains of Kwangsi province, China. C. finds this plant contains a large amt. of saponin (C<sub>24</sub>H<sub>40</sub>O<sub>10</sub>) and possibly also considerable rotenone. Mixts of this plant with soap or tea oil serve not only as good insecticides, but also as contact poison and stomach poison, the efficiency for the latter purposes being not inferior to derris, though far cheaper. C. L. Tseng

Some plants with insecticidal properties. A. Barcellos Fagundes. Bol. ministerio agr. e com. (Brazil) 24, Numers 1-3, 60-75 (1935).—A list of 89 toxic or insecticidal

plants with their uses and bibliography of 24 references. C. W. Whittaker

The applicability of hydrogen peroxide as a seed disinfectant. F. Pichler. Phytopath. Z. 8, 245-51 (1935). Ret. Applied Mycol. 14, 619-20.—Lab. and field expts using up to 3% H<sub>2</sub>O<sub>2</sub> for wheat and barley and 4-5% for oats failed to give control of wheat bunt (*Tilletia caries*), covered smut of barley (*Ustilago hordei*) and loose smut of oats (*U. avenae*). These results are contrary to those of Kresser and Porthem (C A 29, 1571). O. L. S.

Investigations on machinery used in spraying II. Nozzles. Cornelius Davies and G R B Smyth-Horne. J. South Eastern Agr. Coll. 11, 32, Kent No 36, 123 (1935).—The surface area of trus covered by spray fluid was detd. by a method previously described (C A 28, 60214). The results obtained in the field under com. conditions showed an av. cover of about 78%. An analysis of the uniformity and degree of atomization of the spray deposit on the trees used was also made and the "spray cover efficiency" (based on area covered, atomization and uniformity) averaged 62%. In field expts under various pump and nozzle conditions the cover ranged from 60 to nearly 92%. K D Jacob

Crab grass control on lawns. Howard B Sprague. N J Agr Expt Sta., Circ 354, 1-4 (1935).—The use of 5-10-5 fertilizers at the rate of 15-25 lb per 1000 sq ft encourages desirable grasses which will overgrow the crab grass, *Digitaria sanguinalis*. The use of such org. fertilizers as bone meal and tankage alone benefits crab grass more than desirable lawn grasses. Highly acid soils should be rendered only slightly acid by the use of Ca(OH)<sub>2</sub>. C R Tellers

Plant fish poisons as insecticides. Roland M Whittaker and Arthur L Whittaker. Poultry Sci 14, 351-4 (1935).—Body lice on badly infected chickens were completely killed in 18 hrs by dusting the birds, by the pinch method, with small amts of powd. derris contg 1% rotenone. In expts on the toxicity of rotenone and derris to chickens, no visible effects were obtained by the oral administration of either 0.2 g. of derris dust or 0.02 g. of pure rotenone in gelatin capsules fed twice in 12 hrs to cockerels 4 weeks old; a single dose of 0.1 g. of rotenone had no effect. The egg-laying ability of hens was not affected by the ingestion of rotenone. K D Jacob

A homemade cattle spray. C B Dibble. Mich. Agr. Expt. Sta., Quarterly Bull 18, 5-7 (1935).—A good easily prep'd cattle spray is made by mixing 0.5 lb. of ground pyrethrum flowers with 1 gal. of either oil or mineral spirits. Shake occasionally for 48 hrs., strain out the residue and use the clear liquid as a spray. Specifications for oil: flash 104°, sp. gr. 47.6, color 26; no S., initial b. p. 305°; 20% distils at 330°, 50% at 346° and 90% at 380° with the end point at 423°. C R Tellers

Weed killers. R. M. Woodman. The Horticultural Education Assoc. Yearbook 2, 77-83 (1933).—A report on the observation of various investigators indicates that an application of approx. 200 lb. per acre of NaClO<sub>2</sub> broadcasted in autumn cleared very weedy land of couch and creeping bent grasses, crowfoot and shallow-rooted perennial weeds, but did not seriously affect deep-rooted weeds. Five and 15% solns. with a spreader gave excellent control of most weeds. NaClO<sub>2</sub> was not efficient against aquatic weeds. Two to 5% solns. of NaAsO<sub>2</sub> are excellent for clearing land in autumn. Four applications each of a mixt. contg. 150 lb. of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, 50 lb. calcined FeSO<sub>4</sub>, and 1/2 ton of soil per acre of old lawn turf completely eradicated white clover, daisy, mouse-ear, chickweed, moss, pearlwort, etc. The NH<sub>4</sub><sup>+</sup> ion appears to have a selective toxic action on weeds. An application of 800 lb. of cyanamide per acre immediately prior to active growth of lawn is said to destroy most weeds. A soln. of 1 lb. of As<sub>2</sub>O<sub>3</sub> in 8 gals. of H<sub>2</sub>O applied at 240 gal. per acre controlled all weeds except yarrow, dandelion, dock and sorrel, as effectively as the same vol. of 2.5% NaClO<sub>2</sub>. Wheat has been safely sown without ill effects after spraying soil with 1% NaClO<sub>2</sub> but with more concd solns. sowing should be left until the following season.

KCl soln than those found in loamy sand soils. The differences in physiol. constitution of the larvae do not appear to be hereditary, but depend on the type and compn. of the soil in which the larvae occur. John O. Hardesty.

Earthworm control without the aid of water. R. B. Dawson and R. B. Ferro. *J. Board Greenkeeping Research* 4, 58-72(1935).—Solid Pb arsenate, applied at the rate of 1.5-2.0 oz./sq. yd. or 4.00-5.25 cwt./acre, gave very effective control of earthworms in medium and medium heavy soils. Pb arsenate, at the rate of 1.5 oz./sq. yd., did not give satisfactory results in a soil that was covered by a peaty mat. Under favorable conditions a marked reduction in worm activity was obtained in 11-28 days after application of Pb arsenate, but full results as regards worm control and improvement in quality of turf were not apparent until after a growing season. Pb arsenate was effective on medium soils for at least 4 years and possibly longer. It had no detrimental effect on the grass even at such heavy rates as 16 cwt. on the surface and 32 cwt./acre under the turf. K. D. Jacob.

Life history and control of the gladiolus thrips, *Taeniothrips gladioli* M. and S., in California. Howard L. McKenzie. *Calif. Agr. Expt. Sta., Circ.* 337, 1-16 (1935).—Treatment of infected bulbs by a 1:1000 HgCl<sub>2</sub> soln for 17 hrs is effective. Fumigation with Ca(CN)<sub>2</sub> with 2 oz. of the chemical per 100 cu. ft. with an exposure of 4 hrs is effective. Approx. 1 lb. of naphthalene flakes per lb. of bulbs gives satisfactory control. An overdose of the naphthalene causes no injury. Weekly or biweekly sprayings with a mixt. consisting of Mn arsenate 0.25 lb., brown sugar 4.12 lb. and water 6.25 gal. is recommended for control of the insects on the growing plants.

C. R. Fellers

Helminthosporium diseases of barley and their control. M. Mitra and R. D. Bose. *Indian J. Agr. Sci.* 5, 449-54 (1935).—The diseases were best controlled by treating the seed for 10 min. with 0.01 soln. of HgCl<sub>2</sub>. Treatment with either S. formalin, Uspulan or Ceresan was less effective. None of the treatments gave complete control of the diseases. K. D. Jacob.

A mealy bug new to Egypt (*Pseudococcus brevipes* Kell.) on roots of Phoenix sp. and its control by the application of chemicals to the soil. M. Hosni and M. Shafik. *Ministry Agr. Egypt, Tech. Ser. Service Bull.* 159, 8 pp (1935).—The insect was controlled by treating the soil around the plant with either p-dichlorobenzene (2-10 g.), o-dichlorobenzene (2-10 cc.), naphthalene (2-10 g.) or HgCl<sub>2</sub> (0.5 oz./gal. H<sub>2</sub>O). HgCl<sub>2</sub> had no deleterious effect on the plants and its action on the insects was more rapid than that of the other compounds.

K. D. Jacob

The spittle insect or froghopper. Byrley F. Driggers and B. B. Pepper. *N. J. Agr. Expt. Sta., Bull.* 593, 1-14(1935).—Of the 5 species of froghoppers, *Philaenus spumarius* Linn. is most abundant in N. J. Spraying expts. showed that nicotine sulfate and soap, used as a spray, and pyrethrum dust were ineffective in controlling the insect. Derris dusts carrying 0.75% rotenone gave satisfactory control of the nymphs on strawberries and sweet clover.

C. R. Fellers

The caterpillar of *Agrotis segetum* Schuff and its extermination. Josef Pazler. *Listy Cukrov. 54*, 1-6 (1935).—Baits prepd. from 25 kg. dry wheat middlings mixed with 0.5 kg. Swmubrod green were mowned with dil. molasses and placed as balls between the rows of beets. Other toxic agents used were NaF and Na fluosilicate in 0.5 kg. quantities. Sprays or powd. prepn. applied to the beet greens were effective only during the early life of the caterpillars. For the moths, shallow trays on posts 1 m. high spread over the fields cont. molasses with 0.5-1.0% Na arsenate were effective instruments of elimination. Frank Marech.

Combined washes—progress report. H. G. H. Kearns, R. W. Marsh and H. Martin. *Univ. Bristol Agr. Hort. Research Sta., Ann. Rept.* 1934, 109-25, cf. C. A. 28, 2487.—No significant differences were observed in the degree of apple sawfly control obtained with sprays contg. micro-

time, lime S and spreader in which the spreaders (Agrisal, Igepon, Lethalite Wetting Prepn. and Sulfonated Loxol) were used at the rate of 8 oz./100 gal.; the results were practically the same as when sulfite lye (60° Tw) at 6 pints/100 gal. was used as spreader. Crude Ca γ-sulfonate at 24 oz./100 gal. also proved to be an effective spreader. Refined petroleum oil (1%) and lime-S (1%) combinations were applied post-blossom to a no. of com. varieties of apple without causing spray damage. Addition of 5 lb. cryst. FeSO<sub>4</sub> per gal. of lime-S concentrate reduced the formation of soot. As in combination sprays of lime S and Pb arsenate, obviated sludge production, rendered the spray deposit more clearly visible and increased its adherence. Combinations of refined petroleum oil (4.25%) and lime S were successfully applied to black currants at the pre-blossom stage for the simultaneous control of bag bud and capsid bug. Excellent control of capsid bug on black currants was obtained by the application of combinations of either semirefined or half-white petroleum oil (4.25%) and strained anthracene oil (4.25%) as dormant sprays. The substitution of oleic acid for Agral W. B. as emulsifier increased slightly the efficiency of the spray. K. D. Jacob.

Studies on the ovicidal action of winter washes—1934 trials. M. D. Austin, S. G. Jary and H. Martin. *J. South-Eastern Agr. Coll. Wye, Kent No.* 36, 80-94(1935); cf. C. A. 28, 6422.—Emulsions of asphaltic, paraffinic and naphthenic base oils were prepd. at 2 and 4% concns by the 2-soln. oleic acid method with 0.6% oleic acid and 0.1% NaOH as emulsifier. In lab. expts., oils falling within the following limits appeared to be equally efficient as ovicides (when used at 4% concns) against *L. pabulinus* on red currants: (a) viscosity between 120° and 800° Redwood I at 70°F and (b) unsulfonated residue 60-100% by vol. In general, the oils were not effective at 2% concns. Emulsions contg. 2-6% of either dilutyl phthalate, methylcyclohexanyl stearate or dimyl tartrate were deficient in ovicidal properties as compared with petroleum oils of similar boiling range. Under field conditions an emulsion contg. strained anthracene oil 4 gal., semirefined petroleum oil 6 gal., oleic acid 1 gal. and NaOH 1.5 lb. per 100 gal. of spray was an effective ovicide against *L. pabulinus* on red and black currant bushes; the spray retarded foliage development on the Fay's Prolific variety of red currant. K. D. Jacob.

Bordeaux mixture-nicotine combinations against aphids and apple scab. M. D. Austin, S. G. Jary and H. Martin. *J. South-Eastern Agr. Coll. Wye, Kent No.* 36, 95-9 (1935).—The sprays used were: (1) ordinary Bordeaux mixt. (8.12/100) plus 6 oz. nicotine per 100 gal.; (2) Bordeaux-sulfite lye prepd. by dilg. 6 pints sulfite lye (60° Tw.) with water, adding to a suspension of 12 lb. hydrated lime in 80 gal. water, then adding 8 gal. 10% CuSO<sub>4</sub>, 5H<sub>2</sub>O soln. and 6 oz. nicotine and dilg. to 100 gal.; and (3) cottonseed oil-Bordeaux mixt. prepd. by adding 6 pints cottonseed oil and 5 gal. 10% CuSO<sub>4</sub>, 5H<sub>2</sub>O soln. to a suspension of 6 lb. hydrated lime in 90 gal. water and then adding 4 oz. nicotine, followed by vigorous stirring and dilg. to 100 gal. The modified sprays showed a fungicidal efficiency equal to that of ordinary Bordeaux mixt. The sprays contg. sulfite lye and cottonseed oil gave better control of aphids (*Anuraphis rosae*) than did the straight Bordeaux-nicotine spray but the results were inferior to those normally obtained with tar distillate sprays. The cottonseed oil-Bordeaux spray caused less foliage damage and fruit (apple) russeting than did ordinary Bordeaux mixt. or the Bordeaux-sulfite lye spray. Similar amts. of Cu were deposited on the leaves by the 3 sprays.

K. D. Jacob

The control of apple scab. Allington Pippin and Newton Wonder, 1934. W. Goodwin, N. H. Pizer, E. S. Salmon and W. M. Ware. *J. South-Eastern Agr. Coll. Wye, Kent No.* 36, 55-61(1935); cf. C. A. 28, 6918.—Equally effective control of the scab was obtained by spraying the trees with either ordinary Bordeaux mixt. (CuSO<sub>4</sub>, 5H<sub>2</sub>O, 8 hydrated lime 12 lb., water 100 gal.) or an emulsion of cottonseed oil and Bordeaux mixt. (6 pints of cottonseed oil and 4 gal. of 10% CuSO<sub>4</sub>, 5H<sub>2</sub>O soln. added simultane-

ously to 0.5 gal. water contg. 6 lb. hydrated lime)

K. D. Jacob  
Special sulfur dust versus lime sulfur for apple-scale control. John W. Hall. *Scottish J. Agr.* 18, 234 (1935).—S dusts and lime-S sprays were equally effective in controlling apple scale. The leaves were not injured by lime-S spray (1:20) in the pre-blossom stage but were very susceptible to injury with a spray of this strength in the post-blossom stage.

K. D. Jacob  
Preliminary experiments on the control of apple surface-eating tortricid [*Cacoecia padana* Seep.] larvae. J. D. Thomas. East Malling Research Sta., 22nd Ann. Rept. 1934, 205-7.—A 50% reduction of the damage caused by the insect was obtained by spraying with derris 2 and soft soap 5 lb./100 gal. approx. 2 weeks after petal fall; the spray contained 0.10% of erude rotenone. A spray contg. 1 lb. S, 4 and Agral N 1 lb./100 gal. was somewhat less effective.

K. D. Jacob  
Observations on woolly aphid (*Eriosoma lanigerum* Hauw.) in 1934. R. M. Greenslade, East Malling Research Sta., 22nd Ann. Rept. 1934, 230-8, cf. C. A. 29, 2994.—Attack of the aphids on cankers and pruning wounds of apple trees was prevented by painting the parts with a prep. composed of castor machine oil (a heavy machine oil with a proportion of special soap) 1, water 1 quart, nicotine (85-94%) 1 fluid oz. and flour 0.5 lb. The flour and water were boiled to a paste and the nicotine was added. The oil was stirred in and the whole shaken in a closed container to a smooth creamy emulsion.

K. D. Jacob  
Field spraying and dusting trials on the control of apple blossom weevil (*Anthonomus pomorum* L.) and of apple sawfly [*Hoplocampa testudinea* Klug.] in 1934. W. Steer and J. J. Thomas. East Malling Research Sta., 22nd Ann. Rept. 1934, 191-204; cf. C. A. 29, 2944.—Blossom capping, due to apple blossom weevil, was reduced approx. 50% by a derris dust (finely ground derris 10 and china clay 90%) contg. 0.20% rotenone applied to prevent oviposition. A Dettol dust (Dettol 72, NaAlH<sub>2</sub> 8 and inert material 20%) was ineffective. The eggs were not affected by nicotine sprays. The eggs of the apple sawfly were very susceptible to nicotine; a 10% nicotine to the petal-fall, lime-S scab spray gave good control. Sawfly damage was also considerably reduced by the addition of derris to the lime-S spray. Derris dusts gave good control of the migratory larvae. Adlin, of a wetting agent in a petal-fall spray of lime-S and nicotine was not necessary if the trees were heavily sprayed. As a petal-fall spray, Ph osenate, either alone or in combination with lime S, was less effective than lime S plus derris and a wetting agent.

K. D. Jacob  
Apple blossom weevil experiments in 1934. Impregnation of tree banding materials. R. M. Greenslade, A. M. Massee and J. J. Thomas. East Malling Research Sta., 22nd Ann. Rept. 1934, 180-4.—The best catches of weevils (*Anthonomus pomorum* (L.) Curt.) were obtained with corrugated cardboard bands treated with a 23% soln. of "Seckay." Wax A 111 in trichloroethylene. There were indications that the treatment attracted weevils to the bands. Promising results were also obtained with bands treated with a 7% soln. of tetrachlorobenzene in trichloroethylene and with a 33% soln. of "Seckay." Wax A 123 in trichloroethylene, resp. None of these treatments caused any mortality of the weevils collected in the bands and they were not injurious to the bark of the trees. The weevils seemed to be repelled by bands treated with either 50% solns. of "Seckay." Wax A 68 or A 63 in trichloroethylene, 10% soln. of "Seckay." Wax A 68 in o-dichlorobenzene, soln. contg. 10% "Seckay." Wax A 68 and 20% p-dichlorobenzene in trichloroethylene or 20% of "Seckay." Wax in creosote oil. The "Seckay" waxes are a series of chlorinated naphthalenes prep. by Imperial Chemical Industries.

K. D. Jacob  
Resistance of the apple to fungal invasion. A. S. Horne and P. Welch. Dept. Sci. Ind. Research, Rept. Food Irrigation Board 1934, 165-76 (1934).—Tests were carried out at East Malling (1933) and in Northern Ireland (1932) on the relationship between resistance to fungal

invasion and chem. compn. of fruit from trees subjected to various fertilizing treatments. The results at the 2 stations were quite different, and in some cases diametrically opposite, indicating the complexity of the problem.

A. Papineau-Contin  
Lime-sulfur sprays for the combined control of purple scale and rust mites. W. L. Thompson. 11th Agr. Expt. Sta., Bull. 282, 1 38 (1935).—Three lime-S applications made at intervals of 6 weeks or longer reduced purple-scale infestations and controlled rust mites for a period of 7 to 10 months. Two lime-S applications at an interval of 2 weeks gave results comparable with 1 emulsion application in the control of purple scale when applied after Bordeaux mixt. The effectiveness of liquid lime-S and dry lime-S against purple scale and rust mite was increased by the addition of either wettable S or limestone S.

C. R. Fellers  
Removal of araeic and lead residues from apples. O. C. Roberts and J. K. Shaw. Mass. Agr. Expt. Sta., Bull. 315 (Ann. Rept. 1931), 77 (1935).—Apples which had been sprayed with Pb arsenate were washed 3 to 5 min. in a specially designed washer contg. 1 3/4% HCl at 17-18° and were practically freed from As or Pb residues without apparent injury to the fruit.

C. R. Fellers  
Field inspection work (on araeic and lead on sprayed citrus fruits). Gray Sington. Fla. Quart. Bull. 42, No. 2, 11 26 (1933). The Cutzel test as simplified for use in field tests is described. Marked differences were found in the acidity of sprayed as compared with unsprayed citrus fruits. The acidity was always decreased in some cases where As was applied as dust it could not be detected on the foliage after 3 to 4 weeks but could be found on the skin of the fruit. Where As was applied as a spray with lime S it could be found on the leaves for several months. If there was Bordeaux mixt spray residue on the trees when the As was applied, the As persisted as long as the leaves remained on the tree. If Bordeaux was applied after the As spray, and while the As was still on the leaves, the As became fixed. The effect of As, both on the fruit and on the tree, is stopped by the application of Bordeaux mixt or other Cu spray or dust. That is, CuSO<sub>4</sub> prevents damage to the trees and fruits from As sprays.

C. R. Fellers  
Relative amounts of araeic found on the surface and in the tissues of celery plants which had been sprayed with lead arsenate or other araeical poisons. L. Longfield-Smith. Fla. Quart. Bull. 42, No. 2, 45 42 (1933).—In the analysis of 894 samples of celery and cabbage for As residues, a concn. of 5% H<sub>2</sub>SO<sub>4</sub> by vol. was preferable to 3% boiling HCl for the extn. of As from the plant material. The heat of soln. aids the extn. Boiling and makes the tissues very soft and causes considerable org. matter to go into soln. This org. matter makes the evolution of AsH<sub>3</sub> much slower and results in a smaller amt. of As being obtained. It is desirable to wait for at least 4 hrs. before reading the strip. When the vegetable residue after extn. the As 2-3 times with 5% H<sub>2</sub>SO<sub>4</sub> was digested with H<sub>2</sub>O<sub>2</sub> and HNO<sub>3</sub> to destroy all trace of org. matter, and the remaining As detd. a large quantity, frequently 50-60% of that extd. by plain acid wash, was obtained. When the amt. of As detd. by acid wash was added to that obtained by subsequent digestion, the total As was invariably greater in amt. than the quantity which could be obtained by 1 digestion. This difference may be as much as 60%. Numerous data are given showing that large amts. of As are found on celery and cabbage which have been sprayed with As sprays.

C. R. Fellers  
Enforcement of the araeical spray law. Report of the Chemist. L. Longfield-Smith. Fla. Quart. Bull. 42, No. 2, 27-33 (1931); cf. C. A. 25, 5585.—Over 2000 samples of fertilizers, soils, citrus fruits, twigs and miscellaneous vegetables were examd. for As content. Fla. phosphate rock varied from a trace to 0.001% As<sub>2</sub>O<sub>3</sub>. Nitrophoska averaged 0.076% As<sub>2</sub>O<sub>3</sub>. Tankage, raw bone meal, castor pomace, cottonseed meal, German kainite, KNO<sub>3</sub> and NaNO<sub>3</sub> (Chilean) contained only traces of As. Synthetic NaNO<sub>3</sub> contained 0.031% of As<sub>2</sub>O<sub>3</sub>. Twelve colored figures showing As standards by the Cutzel test

are given. A detailed description of the improved Gutzert<sup>1</sup> method is presented. C. R. Fellers

Influence of various sulfur-containing fungicides on transpiration. J. D. Wilson and H. A. Runnells. Ohio Agr. Expt. Sta., *Bimonthly Bull.* 175, 146-8 (1935); cf. *C. A.* 29, 6353<sup>1</sup>.—Eighteen S-contg. spray materials were applied to *Coleus* plants to det. their transpiration rates. Liquid lime-S plus Ca(OH)<sub>2</sub> and Kolofog, which contains a high percentage of bentonite, were the only materials tested which caused an increase in transpiration comparable with that of Bordeaux mixt. The transpiration increases were approx. 1/5 to 1/4 as great as those caused by Bordeaux. Dry lime-S and liquid lime-S caused an increase in transpiration over the untreated checks of more than 50% during the night period. Any injury resulting from the application of S-contg. materials to plant tissue cannot be due to excessive increase in transpiration. C. R. Fellers

Action at a distance of metals on some species of fungi. E. Corneli. *Riv. Pat. veg.* 24, 397-406 (1934). *Rev. Applied Mycol.* 14, 646.—When spore suspensions of *Penicillium glaucum* in hanging-droplet cultures were exposed to a lead disk in hermetically sealed glass containers only a small percentage of the spores germinated, the figure being highest when the Pb was farthest away (3.5 mm.) and lowest when it was nearest (1 mm.). When the spores were removed to normal conditions in the absence of the metal, growth was resumed, and was more rapid than in controls. The radiation effect was less marked on spore masses than on single spores, and when open containers or Cu and Ag disks in closed ones were used no appreciable effect of the radiation resulted. The distance of the metal from the fungus was less important than the area of the disk and the vol. of the container, the effect of a disk of given size at a given distance increasing as the vol. of the container decreased. *Ascochyta pisi* and *Tricostema roseum* were less susceptible to the radiation than was *P. glaucum*, the urospores of *Uromyces betae* remained unaffected. C. believes that germination was reduced only in sealed containers because of the fact that in these there was a constantly increasing accumulation of secondary radiation or a progressively more complete ionization of the atm. Oden E. Sheppard

Contact insecticides from fatty alcohols. E. W. Bousquet, P. L. Salzberg and H. F. Dietz, *Ind. Eng. Chem.* 27, 1342-4 (1935).—The higher fatty alcs. were found to be effective against aphids and do not react with hard water. Numerous long-chained alkyl derivs. were synthesized and tested. The rhodanates were found to be particularly effective and satisfactory (cf. *C. A.* 29, 2656<sup>2</sup>). A max. insecticidal effect was found for rhodanates contg. 12 C atoms. The normal, primary compds. were used, as branch-chain rhodanates were not promising. No one phys. property was correlated with this peak in toxic action, and it is probably the resultant of several properties. The 12-C homolog is safe on many kinds of plants, in the proper dispersion medium. E. R. Rushton

Insect and allied pests of cultivated mushrooms. V. Control of flies and mites. M. D. Austin and S. G. Jary. *J. South-Eastern Agr. Coll. Wye, Kent* No. 36, 107-10 (1935).—Sprays contg. nicotine (98%) at a diln. of 1:1600 were ineffective in killing eggs of *Sciara fenestralis* in lab. expts. The addn. of Sulfonated Lorol (1:4000) did not increase the efficiency of the spray. Under the most favorable exptl. conditions a 60% mortality of the larvae of *S. fenestralis* was obtained with nicotine sprays. Good control of the adult flies was obtained by spraying the mushroom beds with nicotine (98%) at the rate of 1 oz./10 gal. water or by fumigating the cellars with nicotine (0.75-1.00 oz. per 1000 cu. ft. of space). The larvae were not affected by spraying with 1:160 solns. of NaCl. The wetting agents, Sulfonated Lorol and Na  $\gamma$ -sulfonate, were harmless to growing mushrooms when they were applied as sprays at 1:2000 diln. A proprietary oil emulsion, when carefully mixed and lightly sprayed on growing mushrooms, checked the injury caused by *Tyroglyphid* mites; a light application, when the temp. of the liquid

was 104°F., produced no injury to mushrooms. Warm water, applied at a temp. of 110°F., also caused no injury to mushrooms. K. D. Jacob

The effect of antioxidants on highly concentrated pyrethrum extracts. C. B. Gnadinger, C. S. Corland and C. A. Clark. *Soap* (Sanitary Products Sect.) 11, No. 10, 93, 97, 99 (1935).—Kerosene (K) exts. of low pyrethrin content (2-5%) were quite stable over periods of 4-9 months but concd exts. (10-15%) were unstable during prolonged storage. In order to prep. concd. pyrethrum exts. which would not have the antioxidant (A) present in K or other mineral oils, decahydronaphthalene (D) was used as a solvent. Neither D nor K interfered with the Cu reduction method for analyzing total pyrethrin content (cf. *C. A.* 23, 5546<sup>1</sup>). Before proceeding with the analysis the exts. are first dild. with petr. ether, chilled overnight and filtered to eliminate altered or oxidized pyrethrins. At 35° concd. pyrethrum ext. in D or K contg. no A lost 12-26% pyrethrin content in 2-4 months. Of 19 A tried on concd. D-pyrethrum ext. held at 35°, one proprietary material at 0.1% prevented any loss for 60 days but the loss was 9.2% after 81 days, and  $\alpha$ -naphthylamine (0.5%) and thymol (0.5%) had similar effect. Conc'd. K exts. contg. the same proprietary A were quite stable at 6° for 94 days but lost up to 10.4% at 35° storage. Henry H. Richardson

Fused needle of species of *Pinus*—progress report. H. C. Young, *Queensland Agr. J.* 44, 286-98 (1935).—The condition is manifested by a resinosis of the terminal buds and a twisting and adhesion of each needle in the fascicle. There was no relation between the chem. compn. of the soil and the occurrence of the disease. Treatment of individual trees with the essential elements and also with B, Zn, Cu and Al gave neg. results. Chem. analyses of material collected from diseased and healthy trees showed no great dissimilarities. K. D. Jacob

A new method for precision testing in the laboratory of the toxicity of luna sulfur and of Bordeaux mixture as protective fungicides. Progress report. H. B. S. Montgomery and M. H. Moore. East Malling Research Sta., *22nd Ann. Rept.* 1934, 217-22.—Mark individual glass slides with a ring 15 mm. in diam. cut into the glass with a diamond by means of a lathe. Clean the slides very carefully by successive treatment with warm dil. HNO<sub>3</sub>, CrO<sub>3</sub> cleaning soln. and ether, with intervening washing with water. Store the slides in abs. alc. and flame and cool just before using. Transfer 0.015 cc. of the spray fluid to the marked-off area of the slide from a graduated fine-glass tube. Spread the spray fluid to the edge of the groove with a finely pointed glass rod, dry the deposit in the lab. and store the slide for 1 day in an unheated water oven at approx. 15-18°. Support the slide over a pool of distd. water for several hrs. before application of the spore suspension. Apply 0.05 cc. of the spore suspension (spores of *Venturia inaequalis* Aderb. were used by the authors) and spread it in the groove. Incubate the slide in an individual moist chamber for 24 hrs. and det. the degree of germination by counting under the high-power field of the microscope. At least 10 test slides and 10 control slides are recommended for each spray diln. Under these conditions germination of the spores was almost completely inhibited by lime S at a concn. of 1:50 and free germination was entirely prevented by Bordeaux mixt. contg. 0.025% CuSO<sub>4</sub>, in which hydrated lime was used at the rate of 3 parts to 2 parts CuSO<sub>4</sub>. Methods of raising large supplies of viable spores of *V. inaequalis* in pure culture are discussed. K. D. Jacob

Preliminary laboratory tests of bactericides on the plum bacterial canker organism [*Pseudomonas mors-prunorum*]. H. Wormald. East Malling Research Sta., *22nd Ann. Rept.* 1934, 151-5; cf. *C. A.* 29, 2651<sup>1</sup>.—Growth of the organism was completely prevented by either phenol 0.1, EtOH 0.1, CH<sub>3</sub>O 0.01, quinosol 0.005, CuSO<sub>4</sub> 0.2, CuCl<sub>2</sub> 0.01, ZnSO<sub>4</sub> 0.005 or HgCl<sub>2</sub> 0.0005%. In culture media that reacted only slightly with CuSO<sub>4</sub>, the organism was killed by contact for 10 min. with a 0.01% soln. of CuSO<sub>4</sub>. Under these conditions the bactericidal action of CuSO<sub>4</sub> was much more rapid than that of ZnSO<sub>4</sub>.

Tar oil at 1% concn. killed the organism in 10 min, though at 0.1% it did not kill in 1 hr K D Jacob

Laboratory trials of wetters against woolly aphid, *Eriosoma lanigerum* (Hausm.). R M Greenslade East Malling Research Sta, 22nd Ann Rept 1934, 185-90.—Of a no. of wetting agents tested with 0.25% nicotine soln, Agral II was the only one that showed any promise of increasing the effectiveness of the nicotine. At 0.5% concn with nicotine it gave results as good as those obtained with nicotine plus 1% of soft soap, but at this concn Agral II may cause damage to the fruit (apples). At 1% concn Agral II completely wetted tufts of woolly aphid "wool" in 40 min, while none of the other wetting agents showed signs of wetting before 1 hr. Soft soap at 0.5% concn was a much better wetting agent than Agral II at 0.1% concn. None of the preps had any apparent solvent action on the wax threads of the "wool". The strawberry tarsonemid mite was not controlled by spraying the strawberry plants with either 3% lime S plus 1% of a no. of different wetting agents, lime S alone (1-14%), petroleum emulsion (2-5%), paraffin emulsion (2-50%) or a spray composed of liver of S 30 oz and soft soap 10-20 lb per 100 gal K D Jacob

Effect of molds and other seed-borne fungi on germination. F. A. McLaughlin Mass Agr Expt Sta, Control Bull 77, 58-60 (1935).—Thirty-five lots of fungus-infected sweet-corn seeds were divided into 3 lots and 1 lot was dusted with Et Hg phosphate, 1 was treated with 1 1000 HgCl<sub>2</sub> for 10 min, and the last lot was left untreated. The seeds were germinated and the seedlings noted for fungus diseases. The org. Hg prep. and the HgCl<sub>2</sub> were equally effective in destroying fungi on the seeds. *Penicillium* and *Rhizopus*, 2 of the most abundant seedling fungi, are well controlled by seed treatment C R Fellers

A field spraying trial of combined fungicide-contact insecticide sprays in 1934. Progress report. M H Moore and H. B. S. Montgomery East Malling Research Sta, 22nd Ann. Rept 1934, 208-16, of C A. 29, 1202.—Fairly good control of apple scab (*Venturia inaequalis* Aderh.) on Cox's Orange Pippin was obtained by 1 pre-blossom (pink-bud) followed by 2 post-blossom applications of lime S (1-30 pre-blossom and 1 100 post-blossom) to which, at petal-fall, nicotine was added, with either Sulfonated Loral, "Lethalate" Wetting Prep. or sulfate lye as spreader. Very good control of sawfly (*Hoplocampa testudinea* Klug.) and red spider (*Oligonychus ulmi* Koch.) was obtained with all spray treatments. There was some evidence that "Lethalate" Wetting Prep. was the most efficient of the wetting agents tested K D Jacob

Tolerance of cabbage seedlings to insecticide dips for the control of aphids and cabbage worms. Harry G. Walker and Lauren D. Anderson Va Truck Expt Sta, Bull. 86, 1205-10 (1935).—Expts showed that the dipping of cabbage plants infected with aphids and cabbage worms in 1 400 concns. of pyrethrum or derris for 30 sec destroyed these insects and caused only slight reduction in plant survival. If only aphids were present, dipping in a soln. of 0.7 lb. of nicotine sulfate or Black Leaf 40 in 50 gal. of water was also effective. Pyrethrum and derris lost their activity rapidly in aq. solns and only enough soln. should be made up to last 1 day C R F

Fish-poisoning vines, a native insecticide in Kwangsi Chin-Pi Chen. Science (China) 19, 1405-30 (1935).—*Millettia pachycarpa* Benth., commonly known as "fish-poisoning vines" in China, is widely distributed in the mountains of Kwangsi province, China. C finds this plant contains a large amt. of saponin (C<sub>25</sub>H<sub>40</sub>O<sub>10</sub>) and possibly also considerable rotenone. Mixts of this plant with soap or tea oil serve not only as good insecticides, but also as contact poison and stomach poison, the efficiency for the latter purposes being not inferior to derris, though far cheaper. C. L. Tseng

Some plants with insecticidal properties. A. Barcellos Fagundes. Bol. ministeria agr. e com. (Brazil) 24, Numbers 1-3, 69-75 (1935).—A list of 89 toxic or insecticidal

plants with their uses and bibliography of 24 references C W. Whittaker

The applicability of hydrogen peroxide as a seed disinfectant. F. Pichler. Phytopath Z 8, 245-51 (1935), Rev. Applied Mycol 14, 619-20.—Lab. and field expts using up to 3% H<sub>2</sub>O<sub>2</sub> for wheat and barley and 4-5% for oats failed to give control of wheat bunt (*Tilletia caries*), covered smut of barley (*Ustilago hordei*) and loose smut of oats (*U. avenae*). These results are contrary to those of Kisser and Portheim (C A. 29, 1571) O E S

Investigations on machinery used in spraying. H. Nozzles. Cornelius Davies and G. R. B. Smyth-Home-wood J. South Eastern Agr. Coll. Wye, Kent No 36, (2-8) (1935).—The surface area of trees covered by spray fluid was detd. by a method previously described (C A. 28, 6021). The results obtained in the field under com. conditions showed an av. cover of about 78%. An analysis of the uniformity and degree of atomization of the spray deposit on the trees used was also made and the "spray cover efficiency" (based on area covered, atomization and uniformity) averaged 62%. In field expts under various pump and nozzle conditions the cover ranged from 60 to nearly 92% K D Jacob

Crab grass control on lawns. Howard B. Sprague. N J Agr Expt Sta, Circ 354, 1-4 (1935).—The use of 5-10-5 fertilizers at the rate of 15-25 lb per 1000 sq ft encourages desirable grasses which will overgrow the crab grass, *Digitaria sanguinalis*. The use of such org. fertilizers as bone meal and tankage alone benefits crab grass more than desirable lawn grasses. Highly acid soils should be rendered only slightly acid by the use of Ca(OH)<sub>2</sub> C R Fellers

Plant fish poisons as insecticides. Roland M. Whittaker and Arthur L. Whittaker Poultry Sci 14, 351-4 (1935).—Body lice on badly infected chickens were completely killed in 18 hrs by dusting the birds, by the pinch method, with small mnts of powd. derris contg 1% rotenone. In expts on the toxicity of rotenone and derris to chickens, no visible effects were obtained by the oral administration of either 0.2 g of derris dust or 0.02 g of pure rotenone in gelatin capsules fed twice in 12 hrs to cockerels 4 weeks old; a single dose of 0.1 g. of rotenone had no effect. The egg-laying ability of hens was not affected by the ingestion of rotenone K D Jacob

A homemade cattle spray. C B Dibble Mich. Agr. Expt Sta, Quarterly Bull 18, 5-7 (1935).—A good easily prep. cattle spray is made by mixing 0.5 lb. of ground pyrethrum flowers with 1 gal. of either oleum or mineral spirits. Shake occasionally for 48 hrs, strain out the residue and use the clear liquid as a spray. Specifications for oleum spirits are: Bash 104°, sp gr 47.6, color 20; no S, initial b. p. 305°; 20% distils at 330°, 50% at 346° and 90% at 386° with the end point at 423° C R Fellers

Weed killers. R. M. Woodman The Horticultural Education Assn. Yearbook 2, 77-83 (1933).—A report on the observation of various investigators indicates that an application of approx 200 lb per acre of NaClO<sub>2</sub> broadcasted in autumn cleared very weedy land of couch and creeping bent grasses, crowfoot and shallow-rooted perennial weeds, but did not seriously affect deep-rooted weeds. Five and 15% solns with a spreader gave excellent control of most weeds. NaClO<sub>2</sub> was not efficient against aquatic weeds. Two to 5% solns of NaAsO<sub>2</sub> are excellent for clearing land in autumn. Four applications each of a mixt contg 150 lb of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, 50 lb calcined FeSO<sub>4</sub>, and 1/4 ton of soil per acre of old lawn turf completely eradicated white clover, daisy, mouse-ear, chickweed, moss, pearlwort, etc. The NH<sub>4</sub><sup>+</sup> ion appears to have a selective toxic action on weeds. An application of 800 lb. of cyanamide per acre immediately prior to active growth of lawn is said to destroy most weeds. A soln of 1 lb. of As<sub>2</sub>O<sub>3</sub> in 8 gals. of H<sub>2</sub>O applied at 240 gal per acre controlled all weeds except yarrow, dandelion, dock and sorrel, as effectively as the same vol of 2.5% NaClO<sub>2</sub>. Wheat has been safely sown without ill effects after spraying soil with 1% NaClO<sub>2</sub> but with more concd solns, sowing should be left until the following season

depending on the nature of the soil, climatic conditions, etc. For doses up to 12 lb. per acre it is stated no injury to germination occurs. **Irvin C Feustel**

Use of a wetter in weed spraying. **1 L. Ingledand and R. M. Woodman. J. Ministry Agr. (Engl.) 42, 663-6 (1935).**—A spray soln. composed of 2 lb. of  $\text{NH}_4$  sulfate, 1 lb. of soft soap and 2 gal. of water readily killed young seedlings of *Polygonum aviculare* (pig weed) and of *Trifolium stratum*, but did not kill grass. Without the soap this spray failed to adhere to the waxy coating of the cotyledons and seedling leaves. Coned soap and  $\text{NH}_4$  sulfate solns. should be made separately and mixed with each other and the necessary water just before using.

**C. W. Whittaker**  
The extermination of weeds along railway tracks and in courtyards with sodium chlorate. **F. Neuwirth. Listy Cukrovar 53, 477-80 (1935).**—Travex (contg. 97.8%  $\text{NaClO}_3$ ) in a 2% concn. and in doses of 2.1 per sq. m. sprayed on controlled plots along railroads and in yards about sugar factories was considered satisfactory in its action, although the results were not abs. Most of the vegetation on the plots was exterminated, and only a few growths occurred after a single treatment. An equivalent quantity of dry, powdered  $\text{NaClO}_3$  sprayed on plots was not as effective as the wet spray. Iron sheets dipped in Travex and exposed to the atm. gained 0.8% in weight, those dipped in dist.  $\text{H}_2\text{O}$  under the same conditions gained 0.4% in weight. Clothes, wood, etc., impregnated with Travex become highly inflammable. **Frank Mareš**

The extermination of weeds on railroad tracks and in factory yards by means of sodium chlorate. **Otakar Král. Listy Cukrovar 53, 490 (1935).**—Instead of Travex (cf. preceding abstr.) K. has been using a 2%  $\text{NaClO}_3$  soln. (2.1 per sq. m.) during a 3-yr. period. Since  $\text{NaClO}_3$  is half as expensive as Travex, the  $\text{NaClO}_3$  sprays can compete with manual procedures for removing weeds. Although the effects of  $\text{NaClO}_3$  are not absolute, they remain satisfactory for an entire summer, they appear on the day after the spray, and they are particularly effective in crevasses between stones, ties, etc., where manual efforts are useless. The corrosive action of the  $\text{NaClO}_3$  under actual conditions of application is negligible and can be ignored. **Frank Mareš**

Detn. of nitrates [application in soils]. (**Bennett, Hartwood.**) **7** Drying malt sirups, other sirups, vegetable juices, molasses residues, etc., for use in feeds or fertilizers, etc. (**U. S. pat. 2,018,797.**) **12** Transforming hydrocarbons [product as a fertilizer]. (**Brit. pat. 432,368.**) **22** Polynuclear phenols and nitration and sulfonation products [as insecticides]. (**Brit. pat. 431,945.**) **10**

Fertilizer. **Chemische Fabrik Uetikon vorm. Gebrüder Schinorli.** **Swiss 172,740, Apr. 1, 1935 (Cl. 42).** A rich fertilizer contg. N and P is obtained by treating crude phosphate with a mixt. of  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$  without sep. the gypsum formed. The excess of acid may be neutralized after disintegration of the crude phosphate. The  $\text{N}_2\text{O}$  gases evolved may be led back into the fertilizer mass.

Fertilizer. **Fischer-Wysa Maschinenfabrik A.-G., Swiss 177,273, Aug. 1, 1935 (Cl. 42).** Vegetable waste matter such as waste grain, fruit, parings, flowers, etc., are worked up to form a fertilizer by pulping while hot, and evap. the pulp to dryness.

Fertilizers. **1 G. Garbenmund A.-G. 1: 784,196, July 22, 1935.** A mixt. of crude phosphate and carbonaceous materials such as lignite or peat is treated with oxides of N, Cl or  $\text{SO}_2$  or a mixt. of more than one of these, water or ag. liquid being supplied to the treated material during the decompos. in amt. sufficient to replace that consumed.

Insecticides. **Frank J. De Rewal (to Atmospheric Nitrogen Corp.) U. S. 2,019,121, Oct. 29.** Comps. of metals such as Cr, Pb and Cu with  $(\text{CH}_3)_4\text{N}_4$  are used in insecticides suitable for treating plants.

Insecticides and fungicides. **John F. Littooy and Frank F. Lindstaedt (to Hercules Glue Co.) U. S. 2,018,681, Oct. 29.** A dry mixt. is formed comprising a toxic substance such as Pb arsenate, together with a smaller proportion of a nonmetallic oleaginous material such as mineral oil which is present in an amt. (suitably about 0.25-10% of the wt. of the toxic substance) insufficient materially to augment or modify the insecticidal effect of the toxic material but which serves to improve the compn. for use as a spray on fruits, etc.

Sulfur mixture for use as an insecticide. **Ludwig J. Christmann and David W. Jayne, Jr. (to American Cyanamid Co.) U. S. 2,019,443, Oct. 29.** Powder S is used in admixt. with pine oil and liquorice root.

Protecting vegetable matter such as plants against injurious animal life such as insects. **Philip T. Sharples (to Sharples Solvents (Corp.) U. S. 2,019,275, Oct. 29.** Triamylamine is used (suitably in an oil emulsion).

Apparatus for drying or wiping fruits to remove spray residues. **Douglas C. Morris and Leonard O. Cockrill (to Fruit Packers Supply and Equipment Co.) U. S. 2,019,687, Oct. 29.** Structural, mech. and operative details.

Seed disinfectants. **Schering-Kahlbaum A.-G. Brit. 431,172, July 2, 1935.** See Fr. 760,840 (C. A. 29, 5429).

Disinfectants containing mercury. **1 G. Garbenmund A.-G. Fr. 784,320, July 22, 1935.** Insol. disinfectants, particularly for treating seeds, are made by causing sol. organometallic compds. of Hg to react with compds. of S capable of reaction. Thus, compds. are prepd. from ethylmercuric nitrate and Na orthosulfate, methoxyethylmercuric acetate and sol. glass, ethoxyethylmercuric acetate and sol. glass, o-hydroxyphenylmercuric chloride and sol. glass, dimethylaniline-mercuric acetate and sol. glass, etc.

Plant-rust preventives. **1 G. Farbenindustrie A.-G. Brit. 431,331, July 1, 1935.** Preps. to be applied to the soil or to plants to prevent or treat rust diseases consist of an amide of an aromatic sulfonic acid, e. g., p-toluene sulfamide or its Na salt, o-toluene sulfamide, benzene sulfamide, xylene sulfamide, dichlorobenzene sulfamide, together with an inert solid diluent and (or) a fertilizer, e. g., tale, prepd. chalk, Thomas slag,  $\text{NaNO}_3$ , K salts.

## 16—THE FERMENTATION INDUSTRIES

### C. N. PREY

Material economy in the alcohol industry. **L. Kowalczyk. Przemysł Chem. 19, 158-60 (1935).**—This industry presents a closed cycle. There are no by-products. From the viewpoint of consuming all the materials it is nearly perfect. **A. C. Z.**

Butyl and acetone fermentation. **1 Intermediates products in the butanol-acetone fermentation.** **Konrad Bernhauer and Karl Kurschner. Biochem. Z. 280, 379-87 (1935).**—The explt. evidence points to butyric acid as the mother substance from which butanol is formed, with butyraldehyde probably as an intermediate product in the reduction. The butyric acid is not formed from either acetaldo. or  $\beta$ -hydroxybutyric acid but probably from

crotonic acid. Since the transformation of acetaldehyde  $\rightarrow$  butanol takes place over acetaldo., although the latter is not actually utilizable, it is concluded that acetaldo. changes to butyric acid only when it is in the nascent state. The acetone fermentation proceeds by way of AcOH  $\rightarrow$  acetoacetic acid. **S. Morgulis.**

Cider-making trials for the season 1933-34. **P. T. H. Peckford. Univ. Bristol Agr. Hort. Research Sta., Ann. Rept. 1934, 191-208, cl. C. A. 28, 6929.**—Analyses are given of numerous samples of cider prepd. from a wide variety of apples. **K. D. Jacob.**

The role of pectin in cider-making processes. **1 Introduction and historical.** **Vernon L. S. Charley**

Univ. Bristol Agr. Hart. Research Sta., *Ann. Rept.* 1934, 217-22.—A review with 13 references. II. Pectin changes associated with maceration and fermentation and the effects of the addition of pectin solutions to dry ciders *Ibid.* 227-45.—Apple juices macerated with once-pressed pomace dissolved considerable quantities of sol pectin. The favorable flavor changes in ciders made by this process could not be correlated directly with pectin data, as the fermented products contained no sol pectin, this having been removed during fermentation. Ciders fermenting in each lost most of their pectin (as given by Ca pectate) before fermentation ceased. In a few cases of filtered juices which had been 6 months in bottle, the Ca pectate figure was extremely small, but most of the ciders gave no ppt. at all. The alc ppt. method gave very much higher results for pectin than were obtained by pptn. as Ca pectate. Samples of sterile pasteurized apple juices fermented separately with 10 different pure yeasts showed no loss of pectin over a 60-day period. In a similar series, not subjected to pasteurization, approx. 60% of the pectin was removed. The amt. of decomposition varied with the yeast used. Complete removal of the pectin in 1 case was correlated with the occurrence of mold growth in the flask. A dry cider to which pectin was added in the form of cold and hot water pomace exs. and no citrus pectin was found to contain no pectin after a few weeks in bottle.

K. D. Jacob.

The biochemical characteristics of the barleys of the Soviet Union. N. N. Ivanov. *Bull. Applied Botany, Genetics, Plant Breeding (U. S. S. R.) Ser. III, No. 7*, 1-174, in *English* 176-88 (1935). Data on the chem. characteristics of barley from the Soviet Union are presented from the standpoint of its beer-brewing qualities. It is pointed out that the high-protein barleys may also be just as good as the low-protein for beer brewing. It was found that the quality of the starch of the high-protein barley is, in some respects, superior to that of low-protein barley. The starches are more sol. and more easily converted into sugars by diastase. These also contain a more active amylase.

J. S. Joffe.

"Cats' tails," a new variety of hop. L. S. Salmon. *J. South-Eastern Agr. Coll. Wye, Kent No. 36*, 41-7 (1935). The new variety (OZ70) was obtained by the natural crossing of the wild hop of America (*Humulus americanus* var. *neo-mexicanus*) with an English male hop (*H. lupulus*). Analyses of the new variety, English com. varieties and the richest samples of American hops obtainable on the London market, during the period 1930-31, showed a acid 5.80-8.85, 6.07-7.81, 0.23-0.26;  $\beta$ -lactone 7.71-12.90, 7.23-9.47, 7.00-13.36, estd. antiseptic substances 8.41-12.14, 7.60-10.22, 10.52-12.55%, resp. OZ70 is considerably richer in preservative properties than any of the English com. varieties and occupies a position intermediate between the best English com. varieties and the richest American hops.

K. D. Jacob.

Colloid chemistry of the brewing industry in the last ten years. K. S. Silbereisen. *Kolloid-Z.* 73, 104-11 (1935).—Conclusion of the review (cf. *C. A.* 29, 82237). Filly references.

Oscar T. Quimby.

Fermentation of wort in the presence of malt diastase. M. Hamburg and S. Pieckholz. *Brau. Malzind.* 35, 63-6 (1935).—Addn. to sterile wort of a pasteurized or unpasteurized aq. ext. of diastatic malt had no influence on the biol. condition of the resulting beers; pasteurization, however, reduced the diastatic power of the solution by 6 and 30% when kept for  $\frac{1}{2}$  hr. at 55° and 60°, resp. Addn. of unpasteurized diastase soln. to wort in pitch-lined glass fermentation vessels had no effect on the acidity, total and formal N of the fermented product. With increasing amts. of added diastase, the nonfermentable ext. decreased, the maltose content remained approx. const., while the attenuation increased from 71.6 to 82.7-81.7% and the alc. content from 3.55 to 3.92-4.07%. Similar fermentations in Al vessels were less pronounced with regard to increase in attenuation and alc. content.

S. Lauer.

Substances which can stop alcoholic fermentation. L. Genevois. *Ann. fermentations* 1, 80-100 (1935).—A re-

view of the properties and action toward yeast of the 3 classes of substances which can stop alc. fermentation. (1) "narcotics," which arrest fermentation by, and respiration and growth of yeast, but which exert no action that is strictly reversible provided it does not act for too long a period, (2) antiseptics, which kill the cells; (3) specific fermentation inhibitors which, under certain conditions, stop cellular fermentation without affecting respiration or even growth.

A. Papirer and Conture.

Experimental work on cucumber fermentation. VIII. Genuine dill pickles. A biochemical and bacteriological study of the curing process. F. W. Palmer and L. J. Wickham. *Mich. Agr. Expt. Sta., Tech. Bull.* 146, 1-20 (1935). *cf. C. A.* 29, 5534.—There is a definite sequence of bacterial population in dill pickle fermentation. At first, Gram-pos. cocci predominate, followed by short acid-producing rods which are Gram-pos. Finally, the latter give place to long, non-producing, Gram-pos. rods which are responsible for the marked rise in acid production after 8-10 days. The addn. of 2 lb. of sugar per bbl. of pickles greatly increases the no. of bacteria and insures a more rapid production of acid. Hard water did not significantly delay fermentation. Addn. of 2 lb. of mustard per bbl. did not appreciably retard the fermentation. Washing the cucumbers in Cl soln. before packing in brine had no influence on the course of the fermentation.

Normal mnts. of soil or dirt adhering to cucumbers had no harmful influence on the fermentation. The addn. of sufficient acid such as AcOH to dill pickle brine to produce an initial pH of 4.5 is desirable.

C. R. Teller.

Vinification in California wineries. H. M. Brown and Victor Del Henriquez. *Ind. Eng. Chem.* 27, 1215-19 (1935).

G. G.

Metals in wineries. Charles S. Ash. *Ind. Eng. Chem.* 27, 1213-4 (1935).—Ni, Cr steel and Durrone are very resistant to the corrosive action of fruit juices and wines. Cu, iron, brass and ironzies corrode more or less but are usually satisfactory for use in wineries. Al and Al alloys put and corrode rapidly. Pb, Sn and Zn are rapidly dissolved by grape juice and wine. Cast Fe gives variable results. In some cases the corrosion rate increases with time. Wrought Fe and steel are suitable for use in places where they become coated with insol. Fe tannate provided the coating is not removed by mech. action as it is with moving parts.

L. F. Gilson.

Pasteurization of New York State wines. Carl S. Pederson, Harry L. Goreslue and L. A. Hovens. *Ind. Eng. Chem.* 27, 1257-61 (1935).—Various types of wines of low TiO<sub>2</sub> content can be effectively stabilized by pasteurizing at 130°F. for 20 min., and this pasteurization can be carried out, under controlled conditions, in bulk, in closed bottles or in open bottles. The microorganisms which occasionally survive the heating at this temp. are not of the spoilage type and apparently have little significance. The addn. of small quantities of SO<sub>2</sub> to the wine (25-50 p. p. m.) had an appreciable effect in lowering the temp. (approx. 5°F.) or shortening the time necessary. Method and app. are described.

L. F. Gilson.

Effect of filter aids and filter materials on wine composition. L. G. Saywell. *Ind. Eng. Chem.* 27, 1215-50 (1935); *cf. C. A.* 29, 82221.—The use of cellulose and asbestos filter pads did not cause any significant increase in Fe or Ca. Diatomaceous earth and porous silica candles gave excellent results. Certain (California) wines become cloudy and deposited a sediment as a result of the presence and growth of certain microorganisms. After filtration through diatomaceous earth the wine was free from such microorganisms and remained brilliant for long periods. App. and methods are described.

L. F. G.

Volatile acids of wine. Mark M. Morris. *Ind. Eng. Chem.* 27, 1250-2 (1935).—Many volatile acids reported by earlier workers were not found in the various types of Calif. wines examined. Young wines contained practically no volatile acids except AcOH. Sound old wines contained AcOH and traces of TiCO<sub>2</sub>H. Disposed wines contained AcOH, traces of TiCO<sub>2</sub>H and little or no lactic acid. Twenty-eight references.

L. F. Gilson.

Estimation of citric acid in wine. A. Helduschka and H.

Sommer *Pharm Zentralhalle* 76, 593-5(1935).—After commenting on the errors inherent in the methods heretofore employed, recourse to the following procedure is suggested. The citric acid is first pptd as Ba salt which is thereupon treated with coned  $H_2SO_4$ , whereby the citric acid is made to yield acetonedicarboxylic acid or AcMe. The latter is distd off and then treated with  $KMnO_4$ , the resulting AcH being estd iodometrically via Messinger.

W O E

Turbidity due to reduction in bottled white wines Jules Flamand *Bull assoc elevs inst sup. fermentations Gaud* 36, 209-16, 227-32(1935).—A review of the causes and remedies of this defect, and of the detn of the liability of a wine to suffer from it.

A Papineau-Couture

Effect of temperature on the precipitation rate of cream of tartar from wine G L Marsh and M. A. Joslyn *Ind Eng Chem* 27, 1252-7(1935).—The pptn of cream of tartar from new wines (California) is hastened by cold storage. The pptn is more rapid during freezing storage.

L E Gilson

Selected yeasts in wine making L Moreau and F Vinet *Ann fermentations* 1, 101-7(1935).—Attention is drawn to the complexity of the problem of using selected yeast cultures in wine making, which renders their use for this purpose much more difficult and the results obtained less certain than in the brewing industry.

A P C

Pure yeast for fruit and berry wine production F Wrede *Suddeut Apoth Ztg* 75, 734-5(1935).—The necessity for employing pure yeast in fruit wine production is emphasized, in connection with suggestions for suitable manipulation of the must and containers therefor and the finished products.

W O E

Errors in the production of fruit and berry wines F Wrede *Suddeut Apoth Ztg* 75, 742-3(1935).—Supplementary to the foregoing article, W. points out anew certain precautions to be observed in the treatment, bottling and aging of the finished products.

W O E

Composition of brandy G L Marsh *Fruit Products J* 15, 42-3(1935).—A review.

E H

Manufacture of champagne and sparkling burgundy F M Champlin, H F Goresline and D K Tressler *Ind Eng Chem* 27, 1240-3(1935).

Beer quality improved by newer methods for hops removal Geo Defren *Food Ind* 7, 578-9(1935).—Rapid and continuous straining of the hot wort direct from the brew kettle through an enclosed unit with relatively small filtering area reduces the time of contact of wort with hops, and prevents loss of volatile hop aromatics. The process also avoids contact of hot wort with the  $O_2$  of the air, increases the yield of wort per 100 lb of hops, and reduces the quantity of hops necessary to give the desired flavor and aroma. The moisture content of the spent hops is reduced by approx 85%.

C R F

The determination of glutathione in beer G Weller *Ann fermentations* 1, 108-14(1935).—A review of the literature on the detection and detn of glutathione, more particularly in yeast, with 28 references. The method of Binet and Weller (*C A* 28, 4095<sup>3</sup>; 29, 1117<sup>4</sup>) is briefly described.

A. Papineau-Couture

Effect of the degree of oxido reduction of beer on pasteurization Jacques Segard *Bull assoc elevs inst sup. fermentations Gaud* 36, 243-51(1935).—A study of  $r_n$  of beer pasteurized under various conditions indicated that optimum results as regards taste and stability are obtained when pasteurization is carried out at an  $r_n$  value of about 10. This result can possibly best be obtained by a combination of as complete elimination of air as possible and the use of small amts of Na hyposulfite.

A P C

The storage of beer J Raux *Brasserie & Malterie* 25, 225-32, 241-8(1935).—A Papineau-Couture.

Stabilization of beer by means of "Astra" short period plate heater H. Schnegg and H. Kippbau *Z ges Brauw* 58, 41-6(1935); cf Richter and Damm, *C A* 27, 5887. Further expts were carried out on pasteurization of beer with this app. Loss of  $CO_2$  at pressures above 5 atm was found to be due to bending of some plates and to rapid deterioration of rubber washers caused by steam sterilization of the app. before use. These defects were

remedied by strengthening the plates with ribs, and by using water at 80° for sterilization according to a procedure which is described. Twenty-four tests were carried out over a period of 9 months with normal beers which have been in an artificial manner heavily infected with various organisms, such as culture and wild yeast, sarcina, lactic and acetic acid bacteria. The pasteurizing temps employed varied from 55° to 75°. The treated samples were incubated at 25° for 4 weeks and observed for growth development. A pasteurization temp of 65° was found sufficient in all cases, while for moderately infected beers even a lower temp of 62° gave satisfactory results. Pasteurization below 70° had no detrimental effect on flavor and other properties such as head formation and protein haze development on prolonged storage at 25°, as compared with normal unpasteurized beers.

S Laufer

Investigations of the yeast assimilable nitrogen content of beer wort Niels Nielsen *Compt rend trav lab Carlsberg* 21, 113-38(1935).—The yeast-assimilable N and total N of Pilsner, Lager and Porter worts from the Carlsberg breweries were detd. In making these detns the worts were dild with a N-free sugar and salt-contg nutrient soln, inoculated with a small quantity of pure yeast, and resulting yeast crops were harvested daily over an incubation period of a no of days. The weight of the yeast crops and the N content of the yeast gave a measure of the amt of N assimilated. Nielsen concludes that of the total N content of beer worts 40 to 50% is assimilable by yeast although in brewery practice only about 30% is assimilated. The temp at which the yeast is cultivated (10-20°) has no influence on its ability to assimilate the N compts of wort. Microorganisms vary in their N-assimilating ability. *Rhizopus sinensis*, e g, can assimilate about 60-70% of the N of the wort, whereas *Klosteria apiculata* can assimilate only 40%. The greater portion of the assimilable N is assimilated very easily whereas a lesser portion is assimilated more slowly and with greater difficulty.

Yeast Ivan A Ffront and Adalbert Popper. Fr. 784,127, July 22, 1935. Only a part of the liquid in the fermenting vat is submitted to strong aeration and this

part may be caused to rise in an open cylinder in the vat and flow over and down again or may be caused to flow to a 2nd vat in which the same action takes place to a 3rd vat and so on.

Yeast. Wirtschaftliche Vereinigung der Deutschen Heleindustrie. Ger. 618,021, Sept. 2, 1935 (Cl. 6)

## 17—PHARMACEUTICALS, COSMETICS AND PERFUMES

W. O. EMERY

Chemical examination of the roots of *Aristolochia indica*, Linn. f. P. R. Krishnamay, B. L. Manjunath and S. Venkata Rao. *J. Indian Chem. Soc.* 12, 470-SS (1935).—*Aristolochia indica* is a twining perennial, native to the tropical portions and known locally as *isarcera* *terre* whose roots taste very bitter and have a characteristic aromatic odor. Though supposedly valuable against snake and insect bites it has recently been shown that the plant has no antitumor or therapeutic effect against cobra venom. Percolation of 75 kg. of crushed roots with alc. and distn. and steam distn. of the concd. ext. gave 150 g. of pale yellow oil which had the characteristic odor of the roots. The aq. layer was decanted from the semi-solid residue which yielded, on extr. and recrystn. from alc., 0.4 g. of white cryst. material (I), m. 285-90° (Ac der. m. 162-5°), hydrolyzed by HCl in AmOH to a phytosterol, m. 146°, and a reducing sugar. I is probably a glucoside of the type of ipuranol. The aq. layer was freed from resins by the addn. of 5%  $\text{Na}_2\text{CO}_3$  and the filtered liquid was extr. with  $\text{CHCl}_3$ . The dried  $\text{CHCl}_3$  ext. was extr. with 1% HCl. On concn., this HCl ext. yielded a HCl salt, m. 208° (decompn.), which liberated a well-defined individual alkaloid termed *aristolochine*, m. 215°, mol. compd. with toluene, m. 180° (decompn.). The aq. layer was treated successively with  $\text{Ph(OAc)}$  and  $\text{Ph(OH)OAc}$ . After removal of the minute ppts. and excess  $\text{Ph}$  by passing in  $\text{H}_2\text{S}$ , the filtered liquid was evapd. and extr. with AmOH. The concd. ext. gave a reddish syrup possessing reducing properties. The aq. soln. was concd. to a thick syrup contg. glucose and hydrolyzable sugars. A MeOH soln. of the syrup yielded a crop of large prismatic crystals of allantoin, m. 232° (decompn.). The alc. ext. from the original roots, after sepn. from the phytosterol, was concd. and taken down to dryness with 2 kg. of crushed root. This material was then exhaustively extr. with petr. ether, ether,  $\text{CHCl}_3$ , AcOEt and finally EtOH. The petr. ether ext. yielded 0.2 g. of I and 1.25 kg. of a dark brown oil, consisting of the glycerides of palmitic, stearic, lignoceric, cerotic, oleic and linoleic acids. A considerable amt. of cholesterol, a small quantity of the glucoside of phytosterol, m. 146°, and someeryl alc. were isolated from the unsaponifiable matter. As the extra. with EtO proceeded the extra. from the solvent a microcryst. yellow solid (II),  $\text{C}_{27}\text{H}_{48}\text{NO}_2$ , m. 275°. This butter principle is similar to and isomeric with *aristolochic acid* isolated by various workers from different species of *Aristolochia*, and has been named *isovarilochic acid*. II has no MeO, OCH<sub>3</sub> or enolic groups but contains 1 active H atom. Attempts at acetylation were unsuccessful and II does not react with  $\text{H}_2\text{NOH}$ ,  $\text{H}_2\text{NNHPh}$  or  $\text{H}_2\text{NCONH}_2$ , and does not react with Mel. Benzoylation gave *benzoyl-aristolochic acid*,  $\text{C}_{27}\text{H}_{48}\text{NO}_4$ , m. 170-1°. *Me isovarilochic acid*,  $\text{C}_{27}\text{H}_{48}\text{NO}_4$ , m. 207° (decompn.), is tasteless and unaffected by refluxing with N KOH in MeOH for 4 hrs., proving it to be an ether and demonstrating the lack of a COH group in II. Oxidation of II with alk.  $\text{H}_2\text{O}_2$  produced an acid,  $\text{C}_{27}\text{H}_{48}\text{NO}_6$ , m. 164.5°. Though Hesse (*Arch. Pharm.* 233, 684 (1935)) isolated 3 acids from the roots of *A. argentea*, no other acids similar to II could be obtained from the roots of *A. indica*. II The essential oil. C. S. Krishna Rao, B. L. Manjunath and K. N. Menon. *Ibid.* 494-8. The essential oil distillate (163 g.) was dried over anhyd.  $\text{MgSO}_4$  and gave a pale yellow oil, d<sub>4</sub> 0.9225, n<sub>D</sub> 1.5023, [α]<sub>D</sub> -33.11°, acid value 2.0, ester value 7.5 (after acetylation 22.5). The oil contains 3% carbonyl compds. but no substances

17.32). A continuous yeast-production process is described in which the fermenting liquid flows through a series of vertical tubes at a steadily increasing velocity sufficient to prevent the deposition of sediment in the tubes. Nutrient soln. is fed to each tube, and air is passed into all or some of the tubes.

possessing the phenolic or the lower alkoxy groups. A small amt. of an oil with the odor of isovanillin was isolated. Sapon and a sepn. of Twitchell's method showed the presence of palmitic and oleic acids. The remaining oil (150 g.) was fractionally distd. under diminished pressure into a 1st fraction contg. a cryst. substance m. 116° with the odor of camphor and 2 main fractions A (75 g.), b<sub>1</sub> 104-5°, and B (15 g.), b<sub>1</sub> 128-30°. Di<sub>10</sub>n. of the colorless fraction A over Na gave a mobile colorless liquid sesquiterpene, *isovarilene* (I),  $\text{C}_{27}\text{H}_{48}$ , b<sub>1</sub> 104-5°, d<sub>4</sub> 0.9227, n<sub>D</sub> 1.5035, [α]<sub>D</sub> -42.37°, liquid mono-HCl deriv. b<sub>1</sub> 128-30°, d<sub>4</sub> 1.0230, n<sub>D</sub> 1.5107. I reacted attempts to dehydrogenate it by heating it with Se for 48 hrs. at 240-70°. The highly viscous pale green oil constituting fraction B gave indications of ketonic structure. A soln. of 60 g. of B in excess 95% alc. was refluxed with excess  $\text{H}_2\text{NCONHNH}_2$ , HCl and AcONa for 2 hrs. and yielded 50 g. of a semicarbazone,  $\text{C}_{27}\text{H}_{48}\text{N}_2\text{O}$ , m. 240°, which, on decompn., formed a colorless sesquiterpene ketone, *isovarilone* (II),  $\text{C}_{27}\text{H}_{46}\text{O}$ , b<sub>1</sub> 118-20°, d<sub>4</sub> 0.9290, n<sub>D</sub> 1.5122, [α]<sub>D</sub> -46.47°, *p*-nitrophenylhydrazone, m. 184.5°, 2,4-dinitrophenylhydrazone, m. 167.5°, *isovarilone*, m. 133°. The residues from fraction B (30 g.) after removal of II were distd. and the distillate was fractionated. Residn. of the middle fraction gave a pale yellow viscous *sesquiterpene alcohol*, *isovarol*,  $\text{C}_{27}\text{H}_{48}\text{O}$ , b<sub>1</sub> 126-8°, d<sub>4</sub> 0.9926, n<sub>D</sub> 1.5098, [α]<sub>D</sub> -7.29° which did not react with PhNCO but was partially acetylated on boiling with AcONa and AcO for 5 hrs. C. R. Addams.

Sodium (propylmethylcarbamyl)allylbarbiturate, a short-acting hypnoic. Edward E. Swanson. *Proc. Soc. Exptl. Biol. Med.* 32, 1503-5 (1935). C. V. Bailey

Canadian vs. American fine-cured tobacco—comparison of chemical constituents and primary prices. John W. Symons. *Can. Chem. Met.* 19, 1239-61 (1935).—If everything is taken into consideration the Canadian tobacco is chemically equiv. to the American tobacco which sells at twice the price. The percentage compns. of 5 Canadian and 4 American tobaccos are tabulated.

W. H. Boynton  
7 Chemistry of the new antimalarials. Konrad Funke. *Pharm. Monatsh.* 16, 129-31 (1935).—A review.

H. M. Berlage  
Galenical studies. I. Creosote pills. Berta Suiko. *Pharm. Monatsh.* 16, 131-3 (1935).—The disintegration of pills and disintegrating agents are discussed. Eleven formulas are offered and comments made on the same.

H. M. Berlage  
8 Detection of alkaloids in ergot and ergot extracts. Dragutin Barbovic. *Pharm. Monatsh.* 16, 154-5 (1935).—*Drug.*—Treat 0.2 g. of the powder in a test tube or a small flask with 20 cc. Et<sub>2</sub>O contg.  $\text{CH}_3\text{CHO}$  (2-3 drops per 10 cc.) (I), 1 cc.  $\text{H}_2\text{O}$  and 1-2 drops of ammonia (II) or Na<sub>2</sub>CO<sub>3</sub> soln. (III) (III) Shake the mixt. vigorously for 10 min. and allow the Et<sub>2</sub>O layer to sep. completely. Draw off carefully 10 cc. of the clear Et<sub>2</sub>O layer (= 0.1 g. of drug) and shake strongly for 1/2 min. with 2 cc. AcOH (50%). After clearing sep. the acid alkaloid soln. and underlay carefully with 3-3.5 cc. H<sub>2</sub>SO<sub>4</sub> (80%). After a short time a blue-violet ring should appear at the zone of contact. If alkaloids are absent this zone is colorless or not more than pale yellow. Mix the layers and in a few min. if alkaloids are present a dark to pale blue-violet color appears; if no alkaloids are present the mixt. is colorless or not more than pale yellow. *Final test.*—Add to 0.4 g. 10 cc. H<sub>2</sub>O and 20 cc. of (I) and make alk.

with 1 2 drops of (II) or (III). Shake the mixt for some min vigorously and allow the  $\text{Et}_2\text{O}$  to sep. completely, draw off 10 cc of the clear  $\text{Et}_2\text{O}$  (= 0.2 g fluidext.) and treat as above. **Extract**—Dissolve with titration 0.2 g of the extract, in 10 cc  $\text{H}_2\text{O}$ , add 20 cc (I) and make alk with 1 2 drops of (II) or (III). Shake vigorously for some min and treat the  $\text{Et}_2\text{O}$  layer as before. The test will detect 0.05% alkaloids in the drug and ext. and 0.025% in the fluidextract. **H. M. Burlage**

**Suncucho** The magic drink causing oblivion. **Victor A. Reko** *Pharm. Monatsh.* 16, 155-7 (1935).—This Mexican drink is identified with 3 distinct plants: (1) *Hernia salicifolia* (var. *mer.*, Link.), the leaves of which contain chlorophyll, fats, tannins, dyestuffs, gums, glucose, starch, traces of a volatile oil and the usual salts but apparently no ingredients which give the characteristic reactions (these ingredients seem to be formed after fermentation), (2) the kidney-shaped seeds of *Rhynchospora praeacornia* D. C., (3) the root-bark of *Piscidia erythrina*, L. When 1 3 g is taken as a tea it serves as a good diaphoretic, larger amts produce a deep sleep. The seeds contain benzoic resins, fats and a glucoside, an insol substance, piscidin, which is not an alkaloid and is responsible for the action of the drug. **H. M. Burlage**

**Ultraviolet capillary analysis of pharmaceutical drugs** **Paul Ernst and Alfred Stueber** *Pharm. Monatsh.* 16, 171-6 (1935).— $\text{Me}_2\text{CO}$  exts. of the drugs of the Austrian Pharm are prep'd as follows. Ext. 0.2 g of the drug with 25 cc pure  $\text{Me}_2\text{CO}$  (sp. gr. 0.79 at room temp.) 2 hrs with occasional shaking. To 7 cc of the liquid obtained by decantation add 1 4 cc  $\text{N.NH}_4\text{OH}$ ; to a 2nd portion add 1 4 cc  $\text{H}_2\text{O}$ , to a 3rd portion add 1 4 cc  $\text{N.NH}_4\text{OH}$  and place in cylindrical tubes with diams of 2 cm a sufficient amt of these mixts to occupy heights of 3 2 cm. Dip in the liquids strips of filter paper (1/4,  $\times$  28 cm) to a depth of 2 cm and allow to stand for 1 hr., remove, dry and exam under the lamp. In a table the capillary pictures of the 3 types of solns for 141 drugs are described which might serve as a means of detg. the identity and purity of these drugs. **H. M. Burlage**

**The evaluation of the medicinally used tannin bearing drugs** **O. Dalfert and M. Fleischer** *Pharm. Monatsh.* 16, 185-90 (1935).—A review of the methods proposed for the qual. and quant. exam. of these drugs. One hundred and one references. **H. M. Burlage**

**Pharmaceutical action of aromatics and volatile oils** **Josef Augustin** *Ruechstoff-Ind.* 10, 157-8 (1935).—The action and use of fenchone, benzyl alc., fenchyl alc., amyl alc.,  $\text{C}_6\text{H}_5\text{O}_2$ , amyl oil, anethole, menthol, mustard oil, angelica root oil, apiole, amber, anthracic acid and its derivatives, Atlas cedar oil and Am isovalerianate in pharmaceuticals are discussed. **H. M. Burlage**

**New procedures in the chemistry of aromatics** **A. Lewinson** *Ruechstoff-Ind.* 10, 160-3 (1935), cf. *C. A.* 29, 8228<sup>1</sup>.—A review dealing with aldehydes. **H. M. Burlage**

**History of cosmetics in recent times** **A. Hauenstein** *Ruechstoff-Ind.* 10, 171-2 (1935); cf. *C. A.* 29, 8228<sup>2</sup>.

**Chemical and physiological investigation of the alkaloids of Aconitum napellus L.** **W. A. van Bronhorst** *Pharm. Weekblad* 72, 1056-68 (1935).—Physiol. standardization of *A. congitae* does not check with the chem. detn. of total alkaloid, since aconitine is more active than aconine. A chem. method is proposed which is based on detn. of  $\text{BrOH}$  liberated from the aconitine by sapon. of the mixed alkaloids. Deterioration of aconite, however, cannot be detd. by this method since the spontaneous decomp. does not proceed beyond the benzoylamine stage. Tinctures of aconite are more stable if the alc. is first acidified with  $\text{HCl}$  so that the final peroxide has a  $\text{pH}$  of 5.2. **A. W. Dor**

**Our Dutch Pharmacopoeias** **W. F. Daems** *Pharm. Weekblad* 72, 1078-1101 (1935).—Historical A chronological list is given of national Pharmacopoeias from the Danish of 1772 to the Jugoslav. of 1935, and of the local Dutch Pharmacopoeias from that of Amsterdam in 1626 to that of Groningen in 1729 and their subsequent editions. Some obsolete recipes are quoted from the old Amsterdam

Pharm., and the naive dedicatory verses of the Leiden Pharm. are given. **A. W. Dor**

**Communications from the laboratory of the Dutch Society for the Advancement of Pharmacy.** No. 52. **Camphoras hexamethylenetetrammi.** **H. J. van Giffen** *Pharm. Weekblad* 72, 1153-8 (1935); cf. *C. A.* 29, 2639<sup>1</sup>.—"Amphotropin" is shown to be the 1 2 and not the 1 1 salt of camphoric acid and  $(\text{CH}_3)_6\text{N}_4$ . Directions are given for prep'g solns. for ampoules. **A. W. Dor**

**Oleum citrenellae** **P. A. Rowaan** *Pharm. Weekblad* 72, 1158 (1935), cf. *C. A.* 29, 6350<sup>1</sup>.—Of 14 samples of Ceylon citronella oil purchased in retail drug stores 7 failed to meet the "Schimmel test" of complete soly. in 80%  $\text{EtOH}$ . This supports R.'s contention (*C. A.* 29, 6350<sup>2</sup>) that Ceylon oil is inferior to Java oil. **A. W. Dor**

**Spectrographic investigation of cinchona alkaloids** **C. G. van Arkel and P. van der Wielen** *Pharm. Weekblad* 72, 1194-1208 (1935).—Curves of absorption spectra in the ultraviolet are given for total alkaloids of cinchona bark, for the tartrates of quinine, cinchonidine, quinidine and cinchonine, and for various mixts of quinine and cinchonidine. The curves are so similar that a detn. of quinine in the presence of one or more of the other alkaloids is not feasible spectrographically. Total alkaloids from the leaves, however, give a different curve from those of the bark. **A. W. Dor**

**Phenobarbital injections** **C. J. Blok** *Pharm. Weekblad* 72, 1221-5 (1935).—Phenobarbital-Na in aq. soln. decamps spontaneously with sepn. of cryst.  $\text{PhEt(CHClO)}_2\text{NHCONH}$ . A stable soln. suitable for ampoules can be prep'd by dissolving 10 g phenobarbital and 2 75 g  $\text{Et}_3\text{NH}$  in a mixed solvent contg. 26 g  $\text{EtOH}$  and 31 g glycerol add. to 100 cc. This soln. can be heated to 60-65° without decomp. **A. W. Dor**

**Preparation of infusions, decoctions and macerations in accordance with the D. A. B. VI, by the aid of the "Simtrax" apparatus of Schott & Gen., Jena** **Annüller** *Apoth. Ztg.* 50, 1264-5 (1935).—An illustrated article showing the use of this app. when working condurango, iperac, cinchona, etc. **W. O. E.**

Evaluation of the adsorptive capacity of medicinal charcoal. Emil Starkenstein and Helwig Langerker. *Scientia Pharm.* 6, 91-93 (1935).—The use and importance of this product as applied during the past century and at present in various countries are discussed in connection with expl. data obtained in the evaluation of different com. brands of medicinal charcoal.

W. O. P.  
Evaluation of rhubarb. L. Rosenthaler. *Scientia Pharm.* 6, 93 (1935).—It is shown that the official Swiss method of evaluation is completely worthless.

W. O. P.  
New stabilized antidote applicable in intoxications with heavy metals. Casimir Stryzowski. *Scientia Pharm.* 6, 94-7 (1935).—"Anthiotum metallicum" is prep. as follows: Sol 2.1. of dist. H<sub>2</sub>O 1 min. To 1/2 the liquid add immediately 2 g. pure NaOH (free from Fe and Ca), and mix with H<sub>2</sub>S previously bubbled through a suspension of CaCO<sub>3</sub> in H<sub>2</sub>O. In the other 1/2 of H<sub>2</sub>O dissolve at 50° 2 g. of the pure MgCl<sub>2</sub> and 2 g. NaHCO<sub>3</sub>. After cooling add the 2nd soln. to the 1st and finally mix the solns. thus mixed with H<sub>2</sub>S at a temp. of -2° to -3°. The antidote thus prep. is stored at approx. this temp. in colorless, sterilized bottles of 125 cc. capacity, closed with reil, previously washed rubber stoppers, securely tied and paraffined. The primarily colorless soln. should finally acquire a lemon yellow color, indicative of the desired quality. The strength of this soln. is such that 100 cc. thereof is capable of converting 1 g. of aluminum into its inactive H<sub>2</sub>S. Control data are presented.

W. O. P.  
Biochemistry of amygdalin (bitter, cyanogenic princ-

ple from bitter almonds). Anna Verhoever and Harry Mack. *Am. J. Pharm.* 107, 337-45 (1935). Conn. amygdalin was found to contain 2 mols. of water of crystal—in contrast to 3 mols., as reported in the literature. The hydrolytic conversion of amygdalin has been confirmed. Enzyme (emulsin) and dist. acid convert it to HCN, H<sub>2</sub>H and glucose. Alkalies cause its decomposition into amygdallic acid and NH<sub>3</sub>. Conc. HCl forming amygdallic acid and NH<sub>3</sub> as intermediary products hydrolyzes amygdalin finally to l-mandelic acid, NH<sub>3</sub>, and glucose. The purity and quantity of the amygdallic acid produced during the alk. hydrolysis may be indirectly measured by the amt. of NH<sub>3</sub> liberated. Amygdallic acid may be isolated by decomg. its Na salt with an excess of H<sub>2</sub>SO<sub>4</sub>, neutralizing with basic lead carbonate, and then decomg. the sol. Pb amygdalinate to free the amygdallic acid. Amygdalin exerts its action obviously only in the extent, in amt. and speed, of its hydrolysis to HCN and H<sub>2</sub>H. This effect, previously observed in higher animals (vertebrates) and particularly in plant exerts, has now been demonstrated also for the crustacean daphnia. In 2% and 4% solns. of amygdalin in culture, water death was only observed, as a rule, after 16 to 24 hrs., this was due, no doubt, to the slow hydrolytic action by digestive enzymes. The fixative, cramp, myocle and fatal action of HCN on daphnia was readily observed in a 2% culture H<sub>2</sub>O soln. of amygdalin, hydrolyzed by the addition of emulsin. 10-15% emulsin was added, death occurred in all (14) animals in 60 to 70 min., 11 normal daphnia then placed into the very same soln. died within 30 to 50 seconds, this was due, no doubt, to the presence of accumulated HCN. 1% emulsin was added in the 2% amygdalin soln. in culture water, the animals (14) died within 5 to 7 min., showing the marked symptoms characteristic of poisoning of HCN. H<sub>2</sub>H appears only comparatively harmless, as reported in some references of the literature, when quickly oxidized in the body to benzoic acid. Otherwise, slowly through partial soln. of cell lipids, it will cause toxic effects of necrosis, sprime and depressed breathing and death of rats upon oral administration of 3.5 cc. per kg. and subcutaneous (peritoneal) injection of 3 cc. per kg. of body wt. In a 0.01% soln. in culture water, after like symptoms, daphnia died within 1 to 2 hrs., although the animals invariably recovered from initial paralysis or cramps when the soln. was exposed to air and oxidation in a very thin layer. In concn. of 0.4% to approx. 0.8% H<sub>2</sub>H culture-H<sub>2</sub>O solns. the animals were completely paralyzed within 5 to 20 seconds, depending upon the concn. Amygdallic acid, showing no marked toxicity to daphnia submerged in a 0.3% soln. for several hrs., caused paralysis and death in 2% concn. within 30 to 60 min. Ammonia, in amt. of the fatal oral dose reported for rats (0.25 gm. per kg.), also proved fatal in a rat, with the progressive symptoms of (1) increased secretion of saliva, (2) tetanic spasms or convulsions, followed by (3) coma and (4) death within one-half hr. Added in concn. of 0.1 cc. (28%) to 10 cc. culture water, NH<sub>3</sub> caused instantaneous death, in one quarter that concn., cramps, asphyxia and death within 5 to 10 seconds. l-Mandelic acid, while causing only temporary narcosis, depression of the respiration and whitening of the body of rats, upon subcutaneous (peritoneal) administration of 1 g. per kg. showed definite pyridic effects in somewhat higher concns. upon daphnia, placed in such solns. Partial paralysis of the digestive, respiratory and circulatory systems may be observed within a few min., death within less than an hr. In freshly made solns. of 0.21 to 0.27%. In a day-old soln. the characteristic symptoms and death are delayed, in higher concns. (0.3 to 0.67%) death occurred within a few to 17 min. according to the concn. of the fresh soln.

W. G. Gieseler  
Separation of atrycholine from cinchona alkaloids. G. P. Mattery and Peter Valzer, Jr. *Am. J. Pharm.* 107, 349-51 (1935).—The combined alk. solts are obtained and precipitated in the usual manner by extn. from alk. soln., then by acid and in turn again from alk. soln. This purified residue is obtained in final form in a 300-cc. Pyrex beaker and brought to dryness on the steam bath. To the residue

add 3 cc of distd  $H_2O$ , heat over a small hole in the steam bath with const stirring with a glass rod for at least 10 min, replacing with a small amt of addnl. water that which was evapd. This heating will solten the alkaloidal residue and allow the water to take up the strychnine and just so much of the cinchona alkaloids. In this manner the ratio of strychnine to cinchona alkaloids is boosted to nearly equality of each. Cool and filter through a very small paper filter placed in a 1-in. glass funnel, having the filter paper when folded cut down to a length of not over one half in. Insert in a funnel, wet with water and pour through this the alkaloidal soln., allowing it to go into a 7/16 cc Pyrex beaker. Wash the filter paper with 2 cc of distd. water and evap the soln. to dryness in the steam bath by inserting into a hole of the bath by means of beaker tongs. After evapn the residue will usually be pure white and cryst. If any strychnine is present a small amt of this cryst. material will readily show up by any of the principal color tests for strychnine. The following is an example of a digestion and extn. of strychnine from colloidal protein material into 100 cc. of horse saliva which was of a very thick gelatinous consistency were incorporated by heating with alc and then driving off the alc before digestion, the following drugs: one 1/16 grain strychnine sulfate hypodermic tablet, 0.0017 g morphine alkaloid, 0.3 gram of caffeine alkaloid, 0.2 gram of quinine sulfate. The entire amt was digested for 6 hrs. with 15% by wt. of  $H_2SO_4$  by strong vigorous refluxing. The strychnine, caffeine and quinine were recovered by the usual extn. processes for these drugs, the caffeine and quinine being extd. completely, as put in the soln.

**Determination of the carbonyl group in camphor, menthones, pulegones, etral and furalur with 2,4-dinitrophenylhydrazine** L. Socas Vinals *Anal. anal. nac. farm. (Madrid)* 1935, 1, *Anal. farm. biogum.*, Supl. 6, 84 (1935).—The hydrazones form readily and are very insol. in water-alc mixts. The reagent is especially suitable for the quant. analysis of perfumes and similar preps.

**Pharmaceutical and commercial chaulmoogra oils** A. Chalmers and C. Chalmers *Pharm. mod.* 44, 63 (1935); *Anal. farm. biogum.*, Supl. 6, 75 (1935).—Pharmaceutical descriptions should include Dymock's reaction for identification and  $n_D^{20} = 1.4842-1.4858$ . The upper limit for [α] and the lower limit for free acid should be removed.

**Chaulmoogra oil and its antileprosy products** Andrea Gandini *Scienza farm.* [2], 3, 64-71, 97-106, et seq. (1935).—Practically all the known compds. and derivs. of the chaulmoogra oil acids are described.

**Pharmaceutical preparations of equisetum** Cristoforo Manno *Scienza farm.* [2], 3, 72-81 (1935).—Fluids, of equisetum contain little or no Si. The expressed juice and infusions of the fresh plant contain sol. Si compds., probably mon.

**Bismuth compounds in therapy** Tomaso Cessa *Scienza farm.* [2], 3, 78-90 (1935).—A review, with 89 references.

**Colloidal chemistry in pharmacy** Giuseppe Corazza *Scienza farm.* [2], 3, 119-32, et seq. (1935).—The properties of various types of colloidal solns. are discussed.

**Analysis of turpentine** J. F. Gilson *Anal. Anal.* 60, 685 (1935).—In distn. with steam for the purpose of removing turpentine and camphor, frothing is likely to cause trouble but can be overcome by adding 0.5 ml. of surphy  $H_2O_2$ , per 50 g. of limment.

**Analysis of iodine ointments** F. W. Edwards, E. B. Parkes and H. R. Nanji *Anal. Anal.* 60, 747-8 (1935).—Weigh out 2 g. of the well mixed ointment into an open capsule which can be prep'd by cutting off the bottom of a test tube. Add a little pumice powder and introduce the capsule and its contents into 100 ml. of strong  $H_2SO_4$  in a 400-ml. distg. flask which is connected with an air condenser fitted with a bulb-tube dipping under 50 ml. of water in a tall cylinder. Heat and distil slowly. At first  $HI$  and  $SO_2$  come off chiefly. Gently boil for 3-4 hrs.

which will cause all of the  $I$  to pass into the distillate. Rinse the condenser tube and filter the distillate and the washings to remove fatty acids. Make acid with  $H_2O_2$  and ppt. with  $AgNO_3$ .

**Examination of rubbed spearmint** W. A. N. Markwell and A. I. Cross *Anal. Anal.* 60, 747-8 (1935).—Spearmint, which has been dried and rolled to pass through a sieve, is sold in packet form for culinary use. The adulteration with *Atlantus glandulosa* has been mentioned but it is shown here that the appearance of some portions of dried spearmint under the microscope is very similar to that of the striated epidermis of *Atlantus*. The analyst, therefore, as a result of microscopic tests, is likely to report adulteration when the sample is really pure.

**Analysis of essence of cumun** S. Sakai and L. Palfray *Ann. chim. anal. chim. appl.* 17, 289 (1935); *cf. C. A.* 27, 5144.—The method previously described is unchanged. The reaction, however, does not take place directly. Cumaldehyde first reacts with benzyl alc. to form benzaldehyde and cumic alc., and it is the benzaldehyde, rather than cumaldehyde, which reacts with the KOH used in the analysis.

**Critical solution temperature in alcohol of castor oil** Doris Anderson *Soc. Chem. Ind. Victoria, Proc.* 34, 914-16 (1935).—In the standard British methods for testing the purity of castor oil, the soly. in alc. is required. The test is a delicate one and the so-called critical soln. temp. varies greatly with slight variations in the d. of the alc. used. As a result of this, some pure samples of castor oil will not pass this requirement of the British Pharm.

**Fatty alcohol sulfonates in cosmetics** Josef Augustin *Am. Perfumer* 31, 70-81 (1935).

**Recent investigations of digitals glucosides** A. Stoll *Chem.-Ztg.* 59, 773-6 (1935); *cf. C. A.* 29, 7584.

**Manufacture of ammoniacal smelling salts** A. G. Arend *Perfumery Essent. Oil Record* 26, 331-3 (1935).

**Anethole** V. A. Vuichenski *Bull. Applied Botany, Genet. Plant Breeding (U.S.S.R.)*, Ser. A, No 14, 173-6 (1934).—*Heracleum ichmannianum* Bge. was analyzed and the etheral oils were found to contain 80% anethole. A hectare of this plant gives 10-30 tons of green material, contg. 25-100 kg. of oil per hectare or 20-80 kg. of anethole. The plant residues may be used for silage for animal feed.

**The chemistry of the cardiac glucosides** Robert C. Elderfield *Chem. Rev.* 17, 187-249 (1935).—A review.

**Sternutators** Kirby P. Jackson *Chem. Rev.* 17, 251-92 (1935).—A review.

**Oderous principle of lignum aloe** Kinzo Kafuku and Nobutoku Ichikawa *J. Chem. Soc. Japan* 56, 1155-63 (1935).—Powd. lignum aloe obtained from *Agalarcha gallocha* Roxb. is extd. with alc.; the yield is 48%. Sapon of the ext. and steam distn. gave benzylacetone (I) and a monoketone (II),  $C_{15}H_{12}O_2$ , whose semicarbazone m.p. 160-2°. From the residue of sapon of the alc. ext. the presence of hydrocinnamic acid and a cryst. acid,  $C_{15}H_{12}O_4$ , m.p. 103°, was confirmed. A sesquiterpene alc. which gives the odor of lignum aloe is sepd. I and II are probably formed during the sapon.

**Essential oil of Lantana camara** L. II and III. Kinzo Kafuku, Tessaku Ikeda and Chuta Iata *J. Chem. Soc. Japan* 56, 1184-91 (1935); *cf. C. A.* 28, 4175.—The earlier report indicated that sesquiterpene fraction of the oil contained a caryophyllene type (I) and a cadinene type (II); the substance isolated from I is camerenene (III) and from that of II is isocamerenene (IV). It turns to IV, as it is unstable. The other substance isolated from cadinene type is isocamerenene (V). Oxidation of III with  $O_3$  gives  $HClHO$  and acetone, indicating that III contains  $CH_3$  and  $Me_2C$  groups. The nonvolatile residue contains succinic acid. Oxidation of IV gives only  $HClHO$  but no acetone, this may be the change of the  $Me_2C$  group in III to  $Me(CH_2)$  group in order to give an isomer IV in.

order named are: 263°, 253°; 121-2°, 110-11°; 0.9056, 0.8942; 1.500, 1.4925; 66.25, 66.41; +6.74°, -11.2°. V has no conjugated double bond as it is not reduced by Na and AmOH. Oxidation with O<sub>2</sub> gives small amt. of RC-HO and acetone. Nonvolatile residue gives Ag salt, C<sub>14</sub>H<sub>12</sub>O<sub>4</sub>Ag. Oxidation with KMnO<sub>4</sub> gives hexahydro-melophanic acid, m. 179-181.5°. These facts give a clue that the structure of V must be either VI or VII.

(VI)

(VII)

V b<sub>1</sub> 126-8°, d<sub>4</sub><sup>20</sup> 0.9155, n<sub>D</sub><sup>20</sup> 1.5050, M R 66.09, V-HCl m. 103.5-6.5°, V-HBr m. 123-4°, V-HI m. 114-15°, V-NOCl m. 94-6° K. Katsura

Newer information on local anesthetics Guy H. Ellingham. *Brit. Dental J.* 59, 198-205 (1935).—No anesthetic is of more general use than ethocaine (procaine). The synergizing effect of K sulfate and methylene blue should be investigated further. Anesthetic soths, are usually acid and alkalization to a degree approximating that of living serum has been shown to be very desirable. A naturally alk. salt should be used whenever possible.

Frances Krasnow  
The constituents of Chinese drug, bsi-hsin, Asarum Sieboldi, Muq T. Q. Chou and J. H. Chu. *Chinese J. Physiol.* 9, 261-6 (1935).—The essential oil of this drug contains the following constituents: a small amt. of org. acid not identified, pinene, a phenol, m. 110°, forming an acetate, m. 129-130° and a benzoate, m. 124°, a ketone whose semicarbazone m. 182°, and methyl eugenol. From the nonvolatile resinous matter obtained by extra there has been isolated a well-cryst. neutral principle, having a mol. formula C<sub>14</sub>H<sub>16</sub>O<sub>2</sub>, m. 124° and with a specific rotation -130°. It contains no methoxyl groups and does not react with Ac<sub>2</sub>O and phenylhydrazine.

L. A. Maynard  
Emetine camphosulfonate. Carlos A. Grau. *Bull. soc. pharmol.* 42, 452-6 (1935).—The prep. of camphosulfonate acid is described. Emetine base should be prep. from the pure HCl salt. Most com. salts contain up to 3% cephaeline which is about 3 times as toxic as emetine. The camphosulfonate is prep. by mixing a soln. of 14.123 g. emetine with 13.67 g. camphosulfonic acid in EtOH and evap. The thick sirup is dild. to 1 l. and filled aseptically into ampoules. The effect in anaesthesia is quite satisfactory; the toxicity is 1/3 of that of the HCl salt causing a far better tolerance.

A. E. Meyer  
The question of assaying ergotocine, the new ergot principle. Edward E. Swanson, Chester C. Hargreaves and K. K. Chen. *J. Am. Pharm. Assoc.* 24, 835-9 (1935).—Thirty-five lots of ergotocine were compared by 6 methods of testing: the isolated rabbit uterus, the U. S. P. cock's comb, the polarimetric, the colorimetric, the postpartum dog's uterus and the postpartum human uterus methods. With a few exceptions the results by the different procedures appear to confirm one another. Ergotocine may be assayed by the isolated rabbit uterus method, supplemented by the clinical method. Polarimetric and colorimetric tests may furnish preliminary information concerning the purity of the product, but should always be confirmed by physiol. and clinical expts. In the light of our present knowledge the U. S. P. cock's comb method is not sp. enough for the assay of ergotocine, and the Broom-Clark method is entirely useless for this purpose.

A. Papineau-Couture  
Drug extraction. V. The extraction of belladonna root with glyceric menstrua. Wm. J. Huss and Louis Magd. *J. Am. Pharm. Assoc.* 24, 839-40 (1935); cf. C. A. 29, 7582°.—Percolation expts. with glyceric menstrua indicated that glycerol retards the extrn. of alkaloids from belladonna root. The retardation is greater with increasing concn. of glycerol and with decreasing concn. of alc.

A. Papineau-Couture

1 Assay for phenol in official preparations. Glenn L. Jenkins and Melvin F. W. Dunker. *J. Am. Pharm. Assoc.* 24, 840-2 (1935).—The following method was studied: introduce a sample contg. about 0.04 g. PhOH into a glass-stoppered flask, dil., add 30 cc. of 0.1 N Koppe-schaar's soln., rinse down the neck of the flask, quickly introduce 5 cc. HCl, shake vigorously at intervals during 5-10 min., add 5 cc. 20% KCl soln., taking care to avoid loss of Br vapors, shake vigorously for 3-5 min., add 1 cc. CHCl<sub>3</sub> and titrate with 0.1 N Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. Glycerite of phenol and phenolated soln. of I can be assayed directly by this method after diln. without sepg. the PhOH. Camphorated phenol, phenolated oil and ointment of PhOH can be assayed satisfactorily after extrn. of the PhOH with H<sub>2</sub>O. The method of assay for ointment of PhOH proposed for inclusion in the U. S. P. XI is subject to variations due to the volatility of the constituents of the ointment base.

A. Papineau-Couture  
A chemical study of sulfur ointment. Lewis C. Britt. *J. Am. Pharm. Assoc.* 24, 854-6 (1935).—The following method has been devised and found workable: gently boil 1 g. of the ointment with 50 cc. of 10% KOH till the lard is saponified and the S converted in K<sub>2</sub>S (about 30 min.), add 50 cc. of H<sub>2</sub>O soln., digest 30 min. slightly below boiling, acidify slightly with SO<sub>2</sub>-free HCl, heat to boiling, cool, filter, wash and det. S in the filtrate by pptn. with BaCl<sub>2</sub>.

4 Exam. of a no. of com. samples of S ointment indicated a tendency on the part of retail pharmacists to substitute petroleum for benzoinated lard. A. Papineau-Couture  
Report on (the assay of) drugs Arthur E. Paul. *J. Assoc. Official Agr. Chem.* 18, 549-15 (1935), cf. C. A. 28, 6527°.—A brief discussion of the reports of the associate referees.

A. P.-C.  
Report on (the determination of) tetrachloroethylene. G. M. Johnson. *J. Assoc. Official Agr. Chem.* 18, 519-20 (1935), cf. C. A. 28, 6528°.—The previously described method was studied collaboratively on a sample contg. 51.24% C<sub>2</sub>Cl<sub>4</sub> and approx. 25% each of liquid petrolatum and oleoresin aspidium. The results were in excellent agreement with the amt. actually present, and adoption of the method as tentative is recommended.

A. P.-C.  
Report on (the analysis of) mercurials. Wm. C. Cavett. *J. Assoc. Official Agr. Chem.* 18, 520-1 (1935); cf. Deal, C. A. 28, 6527°.—The ointment base interferes with the detn. of Hg in mild mercurial ointment according to U. S. P. directions. The following method, which was studied collaboratively, gave satisfactory results, and its adoption as tentative is recommended: mix the ointment thoroughly with a glass rod avoiding contact with metals, to 1 g. weighed into an Erlenmeyer flask add 20 cc. H<sub>2</sub>O and 20 cc. HNO<sub>3</sub>, heat gently over a small flame till red fumes cease to evolve, cool, decant the aq. soln. from the ointment base into a separator, wash the ointment base repeatedly with 50-cc. portions of H<sub>2</sub>O till all the Hg is removed, decanting the washings into the separator, shake with 50 cc. Et<sub>2</sub>O, transfer the aq. soln. to an Erlenmeyer flask, wash the Et<sub>2</sub>O with 3 X 10 cc. H<sub>2</sub>O till the Hg is removed, add the washings to the flask, add 3 cc. of ferric NH<sub>4</sub> sulfate indicator soln., and titrate with 0.1 N NH<sub>4</sub>CNS.

A. Papineau-Couture  
Report on microchemical methods for (the identification of) alkaloids. C. K. Glycart. *J. Assoc. Official Agr. Chem.* 18, 521-3 (1935); cf. C. A. 28, 6527°.—A 5% AuCl<sub>3</sub> aq. soln. is a suitable microchem. reagent for the identification of homatropine, hyoscyamine and scopolamine, the test being carried out by adding 2 drops of reagent to 1 drop of approx. 1% soln. of the alkaloid, exam. microscopically and comparing with the crystals produced by known alkaloids. Atropine forms no cryst. ppt. with AuCl<sub>3</sub>.

A. Papineau-Couture  
Report on microchemical methods for (the identification of) synthetics. Irwin S. Shupe. *J. Assoc. Official Agr. Chem.* 18, 523-5 (1935), cf. C. A. 28, 6527°.—In preliminary work on acetanilide and acetophenetidine several reagents were found that produced crystals with PhNH<sub>2</sub>, sulfate and phenetidine sulfate, their products of hydrolysis, but the crystals showed considerable resemblance and did not serve to differentiate PhNH<sub>2</sub> from acetophenetidine.

4.5%  $\text{HgCl}_2$  aq. soln. gives fairly characteristic crystals with  $\alpha$ -naphthyl, but they are rather similar to those given by antipyrine; Marine's reaction (3 g.  $\text{C}_6\text{H}_5$  in 15 cc.  $\text{H}_2\text{O}$  contg. 6 g.  $\text{KI}$ ) produces more characteristic crystals with antipyrine in acid soln., but is not so sensitive as  $\text{HgCl}_2$  soln. The general murexide reaction produces no ppt. with 2.4-dinitrophenylhydrazine on treating an alk. soln. of the compd. with  $\text{HCl}$  to liberate the free nitrophenol 4-branched compd. plates are formed. The limit of sensitivity is a concn. of about 1.5%  $\text{C}_6\text{H}_5\text{OH}(\text{Na})$ , at which single rectangular plates are formed, but the best results are obtained at a concn. of 1.100 and with a 1%  $\text{HCl}$  soln. In every case comparison should be made with a control of the pure substance treated in the same way.

#### A. Papineau-Conture

Report on the determination of hypophosphites (in pharmaceutical preparations). Henry R. Bond, *J. Assoc. Official Agr. Chem.* 18, 521-6 (1935); cf. *C. A.* 28, 632<sup>2</sup>.—Further study of the determination of hypophosphites by reduction of  $\text{HgCl}_2$  to  $\text{Hg}_2\text{Cl}_2$  showed that the method is unsatisfactory, the highest results obtained being only 97% of theoretical. Oxidation with standard  $\text{I}_2$  soln. and titration of the excess  $\text{I}_2$  with standard  $\text{Na}_2\text{S}_2\text{O}_3$  gave inconsistent results. Collaborative study of the oxidation of hypophosphite to phosphate by boiling with  $\text{HNO}_3$ , with subsequent ppm of the phosphate, supplemented by the detn. of  $\text{Ca}$  in  $\text{Ca}$  hypophosphite, gave satisfactory results, recoveries ranging from 99.42 to 102.26% (av. 100.87%) for  $\text{P}_2\text{O}_5$  pptn., and from 99.26 to 101.20% (av. 100.17%) for  $\text{Ca}$  detn.

#### A. Papineau-Conture

Report on the determination of santonin. Harry J. Fisher, *J. Assoc. Official Agr. Chem.* 18, 520-22 (1935).—The method of Fernandez and Socas (*C. A.* 26, 4414, 1933) gives satisfactory results on pure santonin, for the detn. of santonin in chocolate mixt. it gives high results, that are not due to the presence of excess reagent remaining in the ppt. Correct results can be obtained by washing out the fat with petr. ether acid with santonin and then extg. the santonin with  $\text{CH}_2\text{Cl}_2$ , evap. the solvent, taking up the residue in alc., and treating with dimethylphenylhydrazine; the present tentative A. O. C. method gives slightly high results on chocolate mixt., but it is doubtful whether the increased accuracy obtainable by the modified Fernandez and Socas method is great enough to recommend its adoption in place of the present method which is much less time-consuming. The following method was developed for the detn. of santonin in chocolates: shake 6 g. of ground sample for 5 hrs. with 100 cc.  $\text{CH}_2\text{Cl}_2$ , filter, shake the filtrate vigorously for 5 min. with 35 cc. of 5%  $\text{Na}_2\text{CO}_3$  soln., discard the aq. layer, centrifuge the  $\text{CH}_2\text{Cl}_2$  soln., filter, evap. 50 cc. to dryness, take up in 60 cc. satd.  $\text{Ba}(\text{OH})_2$ , heat to boil and then for 10 min. on a steam bath, filter, cool, add 6 cc. dil.  $\text{HCl}$  (2 + 1), ext. with 25, 15, 10, 10 and 5 cc. of  $\text{CHCl}_3$ , filtering each portion through a pledget of cotton, evap. to dryness, dissolve in 25 cc. warm alc., add 50 cc. of 1% 2,4-dinitrophenylhydrazine in 10%  $\text{H}_2\text{SO}_4$  (by vol.), let stand 4 hrs. in a dark place, filter on a tared Gooch crucible, wash with 150 cc. of dil. (1 + 2) alc., dry 1 hr. at 100°, cool and weigh. Collaborative study of the method on chocolates and on a santonin-mugwort mixt. of known santonin content showed that, while check detns. were satisfactorily close and the av. value for all collaborators was very near the true value, there was too wide a variation between the results of the collaborators with the santonin sample. The method, however, appears promising and should be studied further.

Report on the determination of ether. W. F. Kunkle, *J. Assoc. Official Agr. Chem.* 18, 522-5 (1935); cf. *C. A.* 28, 632<sup>2</sup>.—The effect of essential oils (oil of eucalyptus, turpentine, Me. sylvate) on the detn. of  $\text{Et}_2\text{O}$  in aq. alc. soln. was studied with a view to finding some selective absorption liquid that will retain the vapor of volatile substances and permit the  $\text{Et}_2\text{O}$  vapor to pass through. Of all the liquids tried, only the combination of a satd. soln. of  $\text{KOH}$  in alc. (mixed with the sample) and  $\text{H}_2\text{SO}_4$  and alc. (1 - 1 by vol.) in 2 chambers quantitatively retains the volatile substances; this combination, however, al-

most completely retains  $\text{Et}_2\text{O}$ .  $\text{H}_2\text{SO}_4$ - $\text{H}_2\text{O}$ -alc. (1 - 1 + 2 by vol.) also retains  $\text{Et}_2\text{O}$  vapor. The results show that some progress was made in the search for the proper selective absorption liquid, but they do not justify recommendation of a method for  $\text{Et}_2\text{O}$  in a sample contg. an unknown amt. of essential oil or other volatile substance. When it is definitely known that the sample contains only a small quantity of a volatile substance when compared with the quantity of  $\text{Et}_2\text{O}$  present, the present tentative A. O. C. method for  $\text{Et}_2\text{O}$  gives fairly good results.

Report on the determination of benzyl compounds (in pharmaceutical preparations). Joseph Callaway, Jr. *J. Assoc. Official Agr. Chem.* 18, 523-9 (1935); cf. *C. A.* 28, 632<sup>2</sup>.—When attempts were made to apply the previously devised method to benzyl benzoate, it was found that aq. alkali does not completely hydrolyze the compd., even after prolonged boiling. In alc. soln. it was found to be quickly hydrolyzed. The following formulae were worked out for calg. amts. of both benzyl and  $\text{Et}$  alcs. in the same way based on the d. and immersion refractometer readings:  $3.18V - 7.91C = 743.04 - 775.63$ ,  $3.18V + 1.624 = 5 - 11.55$ , in which  $V = \text{g. per 100 cc. of benzyl alc.}$ ,  $C = \text{g. per 100 cc. of } \text{Et-OH}$ ,  $A = \text{d.}$ ; the next,  $B = \text{immersion refractometer reading at } 20^\circ$ . The method is described in detail and shown to give fairly accurate results for benzyl alc.

Report on the determination of nitrates in tablets. Frank C. Simon, *J. Assoc. Official Agr. Chem.* 18, 544-6 (1935); cf. *C. A.* 28, 632<sup>2</sup>.—A collaborative study of the  $\text{KClO}_4$  method on tablets composed of dried fluidx of *Crataegus* fr., starch,  $\text{NaHCO}_3$  and  $\text{NaNO}_3$  gave very satisfactory results, the max. calcd. deviation being 1.9% from theoretical.

#### A. Papineau-Conture

Report on the analysis of ointments. W. F. Kunkle, *J. Assoc. Official Agr. Chem.* 18, 546 (1935); cf. *C. A.* 18, 600<sup>2</sup>.—The 2 methods studied previously for the detn. of free  $\text{I}$  and  $\text{KI}$ , though they appeared to be promising when used on relatively fresh ointments, were later found to be unsuitable, because of the following changes which occur after the ointment has stood 6-8 months: (1) a trace (about 0.1-0.2%) of the  $\text{I}$  is absorbed by the fat, (2) there is a slow decrease in the  $\text{I}$  content accompanied by a corresponding increase in solids; the cause of which has not been ascertained. A method was developed (and is described in detail) for the detn. of total  $\text{I}$ , which is essentially as follows: 1 g. of ointment is carbonized at not over dull red heat in a Ni crucible in presence of 4 g.  $\text{K}_2\text{CO}_3$ ; the res. line is taken up with 10 ml.  $\text{H}_2\text{O}$  and treated with 2%  $\text{KMnO}_4$  to a permanent pink; the color is discharged with alc.; the soln. is made to definite vol., and a suitable aliquot is acidified with  $\text{H}_2\text{SO}_4$ , treated with 1%  $\text{KI}$  soln. and titrated with 0.1  $\text{N}$   $\text{Na}_2\text{S}_2\text{O}_3$  of which 1 cc. = 0.002115 g.  $\text{I}$ .

#### A. Papineau-Conture

Report on the determination of acetophenone, acetylacetic acid and caffeine. L. F. Warren, *J. Assoc. Official Agr. Chem.* 18, 547-51 (1935); cf. *C. A.* 28, 632<sup>2</sup>.—A method for the sepn. of the 3 drugs is described. It is based on the removal of the medicinal ingredients from the mixt. in slightly acid soln. by means of  $\text{CHCl}_3$ .

before attempting to sep. the individual constituents Acetylcholine and is extd. from the  $\text{CHCl}_3$  soln. by means of  $\text{Na}_2\text{CO}_3$  soln. and detd. gravimetrically as tetralodophenylenequinone. Caffeine is sep'd. from acetophenetidine by evap. the  $\text{CHCl}_3$  in the presence of  $\text{H}_2\text{SO}_4$ , dilz. to not over 20 cc. with  $\text{H}_2\text{O}$ , extg. with 3 X 50 cc.  $\text{CHCl}_3$ , distg. off the bulk of the solvent, evap. the last portions at room temp. and allowing to stand in the open to const. wt. Acetophenetidine is detd. by neutralizing the soln. from which caffeine was extd. by means of an excess of solid  $\text{NaHCO}_3$ , adding 5 drops  $\text{Ac}_2\text{O}$ , extg. with  $\text{CHCl}_3$ , evap. the solvent, removing any considerable excess  $\text{Ac}_2\text{O}$  by repeated additions and evap. of 1 cc.  $\text{CHCl}_3$  and a drop of alc., and allowing to stand in the open or over  $\text{CaO}$  in a vacuum desiccator till the final wt. differs from the preceding by not over 0.5 mg. A collaborative study of the method gave results that were far from uniform, the most consistent errors being the caffeine gain. The results were so far from theoretical that further work on the subject is considered to be unwarranted.

#### A. Papineau-Couture

Report on (the determination of) pyridium C. L. Clav. *J. Assoc. Offic. Agr. Chem.* 18, 531-2 (1935).—Pyridium base can be detd. in pyridium soln. by extg. a 0.1% soln. with  $\text{CHCl}_3$  in the presence of  $\text{NH}_4\text{OH}$ , evap. the solvent on the water bath and drying at  $100^\circ$  for 1 hr. Purify of the residue can be ascertained by detg. the m.p. which should be  $137-9^\circ$ , and by testing with 5%  $\text{KCNS}$  soln. in the presence of very dil.  $\text{HCl}$  which gives characteristic reddish brown crystals. The technique is described. The results tend to be slightly high. Prolonged heating of the residue at  $100^\circ$  produces a considerable loss.

#### A. Papineau-Couture

Report on (the determination of) gums (in drugs). J. H. Cannon. *J. Assoc. Offic. Agr. Chem.* 18, 532-4 (1935); cf. C. A. 28, 6339.—Collaborative tests were carried out on the seps. of Irish moss and agar (individually) from interfering substances in drugs and their identification, by use of the tests previously described and carrying them out successively in the order named. The results, while not entirely satisfactory, were encouraging, and the methods are considered capable of yielding satisfactory results.

#### A. Papineau-Couture

Report on (the assay of) resins and oleoresins-polyphthym. L. E. Warren. *J. Assoc. Offic. Agr. Chem.* 18, 533-7 (1935); cf. C. A. 27, 5148.—A collaborative study of the previously described method (slightly modified) (described in detail in *J. Assoc. Offic. Agr. Chem.* 18, 83 (1935)) yielded results that showed that close duplication cannot always be obtained, even when the procedure is carried out with rapid attention to details. The method is somewhat empirical and requires that the technique be followed in meticulous detail.

#### A. P.-C.

Report on (the testing of) psyllium. Henry M. Berlage. *J. Assoc. Offic. Agr. Chem.* 18, 535-69 (1935).—Clemenger (*Drug Markets* 29, 267 (1931)) has proposed to det. the swelling factor of the seeds as follows (Method A): introduce 1 g. of seeds in a 10-cc. graduated cylinder (use a 50-cc. cylinder for *Lithospermum erythrorhizon*), fill with water, shake frequently to facilitate the swelling of the mucilage, after 30 min. allow the seeds to settle and note the total vol. occupied by the swollen seeds. Younker has suggested that the following modification (Method B) permits the formation of more mucilage and therefore serves as a better index of the mucilage-forming capacity: place 1 g. of seeds in a 50-cc. graduated cylinder and add tap water to the 20-cc. mark (to the 50-cc. mark for *Lithospermum erythrorhizon*), shake at intervals during a period of 24 hrs., allow to settle and note the total vol. occupied by the seeds. Collaborative study indicated that Method B gives considerably higher swelling factors than Method A because of longer period of exposure, and the use of a larger cylinder prevents packing and ensures more thorough agitation. Results obtained by both methods showed considerable variation and indicated that temp. plays a part in the detn. and that fermentation must be prevented if possible.

The germicidal properties of solutions containing potassium permanganate and oxyacetic acid. Ferenc Varza. *Magyar Orvosi Archiv.* 35, 237-45 (1935).—The presence of oxyacetic acid of  $\text{H}_2$ , boric acid and 0.01 N or 0.02 N  $\text{H}_2\text{SO}_4$  increases the germicidal property of potassium permanganate greatly.

#### Henry Tamber

Detn. of moisture in small quantities of substance (Erdős). 1. Naphthalen deriv. [as a drug] (Swiss pat. 173,306). 2.  $\alpha$ -Diphenylmethane and  $\alpha$ -naphthylmethane sulfone acid [as intermediate for pharmaceutical products] (U. S. pat. 2,015,515) 25

Medicines. *Chemische Fabrik vorm. Sandoz*. Swiss 173,192, July 16, 1935 (Cl. 1164). The monomethanamine salt of 3,5-dinitro- $p$ -aminobenzoic acid is obtained by treating the latter with monomethanamine. The compd. is used in therapy.

Therapeutic preparation. Georg Penz. Ger. 616,566, July 31, 1935 (Cl. 124, 15,10). Addn. to 613,222 (C. A. 29, 5072). A substance which counteracts the effects of histamine is recovered from exts. of the accessory thyroid gland or from placental exts. by a modification of the process of Ger. 613,222. The  $\text{M}^+\text{OH}^-$  salt contg. the substance which reduces the Ca content of the blood serum, obtained in the last stage of the process of Ger. 613,222, is treated with about twice its vol. of  $\text{E}^+\text{OH}^-$ . The Ca-reducing substance is thus precip., while the antihistamine substance remains in soln.

Sedative therapeutic compounds. Abbott Laboratories. Brit. 452,267, July 24, 1935. Compds. having the formula  $\text{RR}'\text{XCCONR}''\text{R}'''$ , where R is a satd. aliph. group, R' is a secondary aliph. group contg. 4 or 5 C atoms,

X is H or a halogen, R' is H or an aliphatic hydrocarbon group and R'' is H, an aliphatic hydrocarbon group, CONH<sub>2</sub> or CONHCOR, are prep'd. by treating a comp'd of formula R.R'XCOCl, where R, R' and X are the same as above, with NH<sub>3</sub> or a primary or secondary aliphatic amine to form an amide, or condensing such comp'd with urea to form an acetylurea comp'd. Among examples, (1) ethyl-1-methylbutylacetic acid is converted into the corresponding acid chloride by SOCl<sub>2</sub> and slowly dropped into cold conc'd. NH<sub>4</sub>OH to form ethyl-1-methylbutylacetamide, (2) ethyl-1-methylbutylacetyl chloride is stirred with urea at 130° to form ethyl-1-methylbutylacetylurea Cf. C. A. 28, 6250<sup>7</sup>.

**Antineoplastic preparations** Wm. S. McEllroy and Wm. F. Herson Brit. 431,196, June 27, 1935. The preps. are obtained by the autolysis of animal tissue, especially liver and other granular tissue, the autolysis being continued for 10-14 days in an aq. antiseptic acid soln. until substantial satn. of the soln. with amino acids. CHCl<sub>3</sub> is conveniently used as antiseptic and may be removed by concn. of the autolyzed product. Any solid matter is filtered off and a preservative, e.g., alc., is added to the concentrate.

**Outments.** Fabrik chem.-pharm. Präparate Johann Trimmel and Hugo Weil Ger. 615,655, July 9, 1935 (Cl. 304,904). Addn. to 587,142 (C. A. 28, 859<sup>9</sup>). Outment bases are prep'd. by treating alkali silicate solns. with the NH<sub>4</sub> salts of aliphatic or hydroaromatic acids contg. more than 9 C atoms. Examples are given.

**Laxatives** James Henry Gates Brit. 430,900, June 27, 1935. A laxative confection is made by soaking agar (I) in cold H<sub>2</sub>O, sepg. the I and dissolving it in boiling dist'd H<sub>2</sub>O, adding sugar and heating to about 220°F., allowing to stand 2-5 hrs. and mixing with phenolphthalein. Soln. of the I is effected in a Cu steam-jacketed kettle with agitation. After addn. of the sugar, carup may be added and the temp. raised to 238°F.

**Glucosides.** Chemische Fabrik vorm. Sandoz Swiss 176,255-7, June 17, 1935 (Cl. 116<sup>8</sup>). Addns. to 171,174 (C. A. 29, 5601<sup>9</sup>). A new active glucoside is prep'd. by treating the C glucoside of *Digitalis lanata* with Ca(OH)<sub>2</sub> in the presence of water. The product is acetylated *D. lanata* glucoside C of formula C<sub>20</sub>H<sub>32</sub>O<sub>11</sub> and can be hydrolyzed to give digoxigenin, digitoxose and glucose (176,256). Similarly, acetyldigitoxin is treated with NaOH to give a glucoside identical with digitoxin (176,256). Also, a mixt. of *Digitalis lanata* glucosides A, B and C is treated with Ca(OH)<sub>2</sub> in the presence of water to give the acetylated glucosides A, B and C which, on hydrolysis give 40-41% of aglucon, 31% digitoxose and 32-33% of the cryst. disaccharide C<sub>12</sub>H<sub>22</sub>O<sub>11</sub>. The compds. have a strong cardiac action and are used in therapy. Cf. C. A. 29, 5602<sup>9</sup>.

**Quinine salt of 2-phenylquinoline-4-carboxylic acid** R. & O. Wel, chem.-pharmazeutische Fabrik. Ger. 618,023, Aug. 30, 1935 (Cl. 12p, 12). Addn. to 563,457 (C. A. 28, 4540<sup>9</sup>). The CHCl<sub>3</sub> used as solvent in the process of Ger. 563,457 is replaced by another org. liquid in which the reagents are sol. at 60-70°, e.g., benzene or a mixt. of alc. and ether.

**Preparations containing volatile constituents of plants** Madans & Co. Fr. 784,616, July 22, 1935. Plants or parts of plants contg. volatile constituents are ground up with noncrystallizable or difficultly crystallizable sugars and dried. Dextrose, invert sugar or a mixt. of glucose and lactose may be used.

**Diamino alcohols** Chemische Fabriken Jochem Wiernik & Co. A.-G. Brit. 431,848, July 12, 1935. Divided on and addn. to 431,788 (C. A. 29, 8000<sup>9</sup>). Diamino alcs. of formula RCH(OH)CH(CH<sub>3</sub>)NHR', in which R is an aromatic radical of the C<sub>6</sub>H<sub>5</sub> series and R' is a dialkylaminoalkyl group, are prep'd. from diketones of formula RCOCOR', or keto alcs. of formula RCH(OH)COCH<sub>3</sub>, by condensing these with aliphatic diamines contg. a primary amino and a dialkylamino group to form azomethine derivs. of formula RCOC(CH<sub>3</sub>)NR' or RCH(OH)C(CH<sub>3</sub>)NR', and subjecting these, simultaneously or subsequently, to reduction. In the examples, (1) 1-phenyl-

propane-1,2-dione and 1-amino-2-diethylaminoethane (I) are condensed in the presence of H<sub>2</sub>SO<sub>4</sub> and Zn dust to yield directly 1-phenyl-2-diethylaminoethylamino-1-propanol (II), which may be purified by way of its oxalate and then converted into its dihydrosulfide, (2) 1-phenyl-1-hydroxy-2-propanone and I yield an azomethine deriv. which is reduced, without isolation, by treatment with H in the presence of Pd catalyst; II is obtained. The products are of therapeutic value in the treatment of asthma Cf. C. A. 29, 6856<sup>9</sup>.

**Cyclic amides.** Soc. pour l'ind. chim. à Bâle. Swiss 176,830-1, July 16, 1935 (Cl. 116<sup>8</sup>). Addns. to 172,853 (C. A. 29, 5603<sup>9</sup>). Cycloheptadecanone thioisoxime is treated with a reducing agent to give heptadecamethyl-

amine (CH<sub>3</sub>)<sub>17</sub>NH, m. 64-6° (176,830). Similarly, cyclooctanone thioisoxime is reduced to give octamethylamine (CH<sub>3</sub>)<sub>8</sub>NH, m. 148-9° (176,831). The cyclic amines are used in therapy.

**Hydantoin** Soc. pour l'ind. chim. à Bâle. Swiss 174,461, Apr. 1, 1935 (Cl. 116<sup>8</sup>). Hydantoin contg. a furan ring is prep'd. by heating ethyl furyl ketone with a cyanide and (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub> in the presence of water and CO<sub>2</sub> under pressure. Thus, ethyl furyl ketone, (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>, KCN, water and EtOH are heated in a closed vessel with a CO<sub>2</sub> pressure of 10-15 atm. The product is 5,5-ethyl-furylhydantoin which has therapeutic uses. The structural formula is given.

**Hydantoin derivative.** Chemische Fabrik vorm. Sandoz Swiss 176,827, July 16, 1935 (Cl. 116<sup>8</sup>). Addn. to 166,004 (C. A. 28, 2830<sup>9</sup>). The deriv. 3-methyl-3-phenylmethylhydantoin is prep'd. by treating 5,5-phenylmethylhydantoin with Me<sub>2</sub>SO. The comp'd m. 188-190° and is used in therapy. Its structural formula is given Cf. C. A. 29, 7343<sup>1</sup>.

**Gulonate acid derivative** Tadeus Reichstein, Swiss 176,347, May 1, 1935 (Cl. 36<sup>6</sup>). The methyl ester of 2-keto-4-gulonate acid is prep'd. by treating the acid with MeOH. The ester m. 158-6° and is used in the prep'n of vitamin C.

**Nucleotide derivative.** Soc. pour l'ind. chim. à Bâle. Swiss 174,914-15, Apr. 16, 1935 (Cl. 116<sup>8</sup>). Addns. to 171,871 (C. A. 29, 5604<sup>9</sup>). An acetylating agent is caused to react on muscle adenylic acid (174,914). Alternatively, a deriv. may be obtained by the action of an acetylating agent on guanylic acid (174,915). The derivs. are used in therapy. Examples are given. Cf. C. A. 29, 6248<sup>7</sup>.

**Nucleotide derivative.** Soc. pour l'ind. chim. à Bâle. Swiss 176,258-9, June 17, 1935 (Cl. 116<sup>8</sup>). Addns. to 171,871 (C. A. 29, 5604<sup>9</sup>). Yeast adenylic acid is subjected to the action of a benzoylating agent to give the nucleotide deriv. benzoyladenylic acid (176,258). Also cytidylic acid is subjected to the action of an acetylating agent to give acetylcytidylic acid (176,259). The derivs. are used in therapy.

**Colloidal calcium malate.** The Drug Products Co., Inc. Brit. 431,375, July 5, 1935. An aq. dispersion of colloidal Ca malate for medical use by intravenous or intramuscular injection is prep'd. by pptg. Ca(OH)<sub>2</sub> and causing maleic acid to react therewith in the presence of a dispersing agent, e.g., Na gluconate. NaOH is preferably added to a soln. of CaCl<sub>2</sub> to ppt. the Ca(OH)<sub>2</sub>. Cf. C. A. 29, 4901<sup>1</sup>.

**Heterocyclic mercury compounds.** Soc. pour l'ind. chim. à Bâle. Swiss 176,757, July 16, 1935 (Cl. 116<sup>8</sup>). The above are prep'd. by the action of a mercuric salt on pyridine-3-carboxylic acid allylamide. Thus, the above mentioned pyridine deriv. is treated with (AcO)<sub>2</sub>Hg to give pyridine-3-carboxylic acid allylamide-(AcO)<sub>2</sub>Hg. This is treated with KOH and evap'd. to give pyridine-3-carboxylic acid allylamide-Hg(OH)<sub>2</sub>, which decomposes at 120°. It forms water-sol. salts which are used in therapy.

**Silver glycerophosphate preparation.** Karl Roth. Ger. 618,374, Sept. 6, 1935 (Cl. 12p, 15). Addn. to 617,151 (C. A. 29, 8239<sup>9</sup>). Freshly ppt'd. Ag<sub>2</sub>O is dissolved in an aq. soln. of glycerophosphoric acid and (CH<sub>3</sub>)<sub>2</sub>NH<sub>4</sub> and the

soln. is filtered and evapd. *in vacuo*. The product is identical with that described in Ger. 817,153.

Complex compounds of alkali metal and alkaline earth metal halides with hydroxy alkyl amines. Walter Kropp (to Winthrop Chemical Co.). U. S. 2,017,976, Oct. 22. Cryst. compds. of basic character and suitable for use in prepg. therapeutic media are obtained by treating a secondary or tertiary amine at least once substituted by a hydroxy alkyl group, such as triethanolamine, diethanolamine, or *N*-benzylolamine with a halide such as  $\text{CaBr}_2$ ,  $\text{NaI}$ ,  $\text{CaCl}_2$ ,  $\text{LiCl}$  or  $\text{KI}$ , in a solvent such as alc. or water, or by reaction of a hydrohalide of the amines with an alkali or alk. earth metal hydroxide. Several examples with details of procedure are given.

Primary phosphates of amino acid esters Schering-Kahlbaum A.-G. Brit. 432,155, July 22, 1935 See Ger. 609,997 (C. A. 29, 5224)

Vitamins. Tadeusz Reichstein Swiss 174,028, Apr. 1, 1935 (Cl. 116A) Vitamin-C (*l*-ascorbic acid), is obtained by enolizing 2-keto-4-gulonic acid ester by an alk. reagent and treating the product with coned. acid. Thus, 2-keto-4-gulonic acid methyl ester is dissolved in hot anhyd. MeOH. The air is driven out by N and Na added. Pure HCl free from Fe is then added to give ascorbic acid.

Fat-soluble vitamins Sophie Botchinsky (one-fifth to Solomon Testelbaum) U. S. 2,017,942, Oct. 22. A food material contg. these vitamins such as liver, kidney fat, egg yolk or vegetable material is minced and subjected to plasmolysis; any remaining whole cells are caused to burst by the addn. of a suitable quantity of deaerated hot water of such temp. that the resulting mixt. does not exceed 75°, the material is filtered under pressure, the residue is dried at a relatively low temp. under subatm. pressure and is coned. and crushed, extd. with a solvent for the fat-sol. vitamins of low b. p. such as "petr. ether" or 95% alc. and the ext. is filtered and the solvent is distd. off (all the steps being carried on in an inert atm.), to obtain a vitamin concentrate.

Vitamins A. Soc. pour l'ind. chim. à Bâle. Swiss 174,869, Apr. 16, 1935 (Cl. 36a). Addn. to 168,135 (C. A. 29, 5529). Monocyclic unsatd. primary diterpene alc. of the vitamin A type are obtained by condensing  $\text{C}_{15}\text{H}_{22}$  with  $\alpha$ -dihydronone, reducing the resulting acetylene carbinol to the corresponding vinyl carbinol, treating this with an inorg. acid halide and condensing the resulting primary halide with acetoacetic ester. The product is saponid. by alkali and the resulting ketone condensed with  $\text{C}_{15}\text{H}_{22}$ . The resulting acetylene carbinol is reduced to the corresponding vinyl carbinol which is heated with an org. acid anhydride to form the ester. This is saponid. to give the free primary diterpene alc. which has 136-8°. The product is used in prepg. physiologically active compds. Examples and the structural formulas of the compds. arising at each stage of the prepn. are given.

Hormones C. F. Boehringer & Soehne G. m. b. H. (Fritz Johannessohn and Erich Rabald, inventors). Ger. 618,165, Sept. 3, 1935 (Cl. 12b 17.10). As an adsorbent for recovering ovarian hormones from liquids contg. them in free or combined form, use is made of an  $\text{Al}(\text{OH})_3$  gel prepd. by treating a soln. of an Al salt with a coned. soln. of  $\text{NH}_3$ , and gradually heating the ppt. The gel A described by Willstätter and Kraut (C. A. 17, 3513) is suitable. The hormones are recovered from the gel by extn. with an org. solvent.

Follicle hormones. Schering-Kahlbaum A.-G. Brit. 432,435, July 25, 1935. Urine of pregnant individuals, or prepn. obtained from urine, are subjected to steam distn. to remove volatile phenols, the residue is treated with an alk. agent, e. g., alkali hydride or pyridine, the soln. is then caused to react with an acylating agent, e. g., *p*-toluenesulfonic acid chloride dissolved in  $\text{Me}_2\text{CO}$  or  $\text{BzCl}$ , and the acylation product is isolated and saponid. to yield the hormones. When urine is used, the boiling with alkali is continued until all  $\text{NH}_3$  is expelled. Kieselguhr may be added to facilitate removal of the acylation product by filtration, or it may be extd. by means of  $\text{Et}_2\text{O}$ .

Sex hormones Schering-Kahlbaum A.-G. Brit. 432,474, July 26, 1935. Divided on and addn. to 432,435 (preceding abstr.) The process of 432,435 is applied to other starting materials than urine, such as placenta ext., prepn. from ovaries and other organs, and exts. from vegetable matter prepd. in accordance with Brit. 271,492 (C. A. 22, 1654), 277,302 (C. A. 22, 2440) and 234,650 (C. A. 23, 1996).

Elastic woven bandages Ludwig Flemmich, Wilhelm Flemmich and Otto Flemmich (trading as A. Flemmich's Sohne) Brit. 431,663, July 12, 1935. A hinder or bandage for medical purposes, etc., comprises a warp of rubber threads, fast to hoisting, interspersed with cotton, silk, wool or like elastase warp threads, the rubber threads and some or all the other threads being woven with spaced elastase weft threads. The rubber threads may be made by spraying rubber latex as described in Brit. 214,615 or may be "Laster" or "Laetron".

Germeicidal dressings. Deutsche Gold- und Silber-Scheideanstalt vormals Roessler. Brit. 431,656, July 12, 1935. See Fr. 780,917 (C. A. 29, 59389).

Dentifrice. Guy A. McDonald and Daniel Müller (to Victor Chemical Works). U. S. 2,018,410, Oct. 22. Commuted di-Ca phosphate is used with a small proportion (suitably about 1-4%) of a stabilizing agent such as a Mg phosphate, stearate or sulfate, etc.

Dentifrice. Rudolph A. Kuever (to Pepsodent Co.). U. S. 2,019,142, Oct. 20. Insol. Na metaphosphate is used in fine particles so as to act as a polishing and cleansing agent (suitably alone or with various other ingredients).

Cosmetics. Ernst Schnabel. Brit. 432,022, July 15, 1935. See Ger. 605,804 (C. A. 29, 10441).

Cosmetic creams. Bella Brsko (nee Margoline). Fr. 784,203, July 22, 1935. The cream contains saponid. spermaceti 10, soda lye 12, stearic acid 50, glycerol 200 kg. and water 1751.

Cleansing agent for the skin. Pierre P. Coustolle. Fr. 784,404, July 22, 1935. A cleansing agent comprises or contains a salt made by the combination with one or more mineral or org. acids, other than those forming soaps, of an amine derived from mono- or poly-hydric alcs., particularly triethanolamine. Examples of acids are  $\text{HCl}$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{HNO}_3$ , phosphoric acids, boric acids and glycerophosphoric acid.

Reducing the nicotine content of tobacco. Hall Tobacco Chemical Co. Brit. 431,596, July 11, 1935. See U. S. 1,962,145 (C. A. 28, 48429).

Denicotinizing tobacco Dietrich Brumund. Ger. 618,359, Sept. 6, 1935 (Cl. 79c. 1). See Fr. 764,754 (C. A. 28, 59349).

## 18—ACIDS, ALKALIES, SALTS AND OTHER HEAVY CHEMICALS

R. M. SYMMES

Theoretical considerations on the synthesis of ammonia by Fausen's method. L. Kowalczyk *Przemysł Chem.* 19, 89-104(1935).—Four different conditions of chem. reactions are recognized, in which the heat of reaction has different values, depending on the pressures under which the heat content of the reagents is calc'd., (a) the first 2 of an imaginary van't Hoff model I for reservoirs and 11 for reaction vessel, and (b) for tech. app. III,

perfect app. in which the reaction attains an equil. and IV actual app. in which the equil. is not completely reached. In tech. app. the heat of reaction is about 6% lower than for reservoirs of the van't Hoff model. Factors involved in app. design are considered and a material balance is set up.

The manufacture of hydrochloric acid from chlorine [and hydrogen]. Angel Juliá Sauri. *Quím. e ind.* 12,

A. C. Zachin

157-61 (1935).—Several types of com. app. are described. L. E. Gilson

**Analysis and commercial value of nitrates from Goiás.** Virgilio Lucas. *Bol. Assoc. bras. farm.* 16, 313-17 (1935).—The nitrates from the state of Goiás are made up almost exclusively of K (93.5 to 98.6% KNO<sub>3</sub>), while the Chilean nitrates contain no KNO<sub>3</sub>. E. S. G. B.

**Cooling of salt solution in a cooling tower.** O. Mertens. *Kunstf. 6*, 26-29 (1934).—In the process of KCl production in Solikamsk, the brine is cooled to crystallize out KCl. The cooling of the brine in cooling towers vs. the cooling in Fe tanks is discussed. The savings of labor, space and time is emphasized. The problem of the troublesome KCl incrustations forming inside the cooling tower, which later interfere with the operation of the centrifuges, is solved by the following scheme: the cold brine from the tower contg. KCl crystals and broken-off incrustations is passed through a revolving screen. The fine crystals pass through with the brine into a settling tank. Large pieces of incrustations left in the screen are removed by a screw conveyor to a roller mill, crushed and let fall into the settling tank. The uniformly fine crystals obtained in this manner pass to the centrifuges. Pumps, piping and other equipment suitable for this service are discussed. James Sorrell

**The reaction of sulfur dioxide with water under pressure.** L. L. Kurzman and V. P. Postnikov. *J. Chem. Ind. (Moscow)* 12, 571-80 (1935).—Thermodynamic calculations show that in the formation of H<sub>2</sub>SO<sub>3</sub> and S from SO<sub>2</sub> and H<sub>2</sub>O, pressures exceeding 300 atm. need not be used. Expts. show that increased temp. favors the reaction. In a sealed tube at 320° an approx. 10% soln. of SO<sub>2</sub> reacts completely in 12 hrs. A smaller vol. of gas space above the liquid is helpful. However, H<sub>2</sub> ions slow the reaction greatly, so that as H<sub>2</sub>SO<sub>3</sub> is formed the reaction rate falls sharply. This effect can be partially overcome by increasing the pressure of SO<sub>2</sub> in the soln., but even when liquid SO<sub>2</sub> is added to the tube the max. concn. of H<sub>2</sub>SO<sub>3</sub> which can be obtained is 25%. S and Se act as catalysts only at low temps., and (NH<sub>4</sub>)<sub>2</sub>S is little better. Thus, although the S which is formed is very pure, the reaction has com. limitations. A better method is to use a soln. of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and NH<sub>4</sub>HSO<sub>3</sub>. These react smoothly to form (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, S and H<sub>2</sub>O at relatively low temp. and in any concn. H. M. Leicester

**Sulfur from sulfur dioxide.** Arthur J. Caddick. *Mining Mag.* 53, 213-16 (1935).—H<sub>2</sub>S and elemental S are produced when SO<sub>2</sub> is reduced by incandescent carbonaceous matter, but investigations show that COS and CS<sub>2</sub> are also formed. Expts. were conducted to det. whether these last 2 could be made to deliver up their S in elemental form; this was found to be readily achieved if either gas were mixed with an excess of SO<sub>2</sub> and passed through a tube contg. red hot pumice. The secondary reactions and general exptl. data are discussed. Each vol. of CS<sub>2</sub> requires twice its vol. of SO<sub>2</sub>, and each vol. of COS half its own vol. for complete decompn. to yield elemental S. A. W. Furbank

**Is there a profit in chlorine and nitrate from salt?** F. W. de Jahn. *Chem. & Met. Eng.* 42, 537-8 (1935). E. H.

**Extraction of germanium and gallium from germanite.** I. Removal of germanium by the distillation of germanous sulfide. Warren C. Johnson, Laurence S. Foster and Charles A. Kraus. *J. Am. Chem. Soc.* 57, 1823-31 (1935).—A simplified process for the removal of at least 99% of Ge from germanite as germanous sulfide in the vapor phase is described. II. Acid extraction of gallium. Laurence S. Foster, Warren C. Johnson and Charles A. Kraus. *Ibid.* 1832-5.—Residues from the above removal of As and Ge from germanite are extd. with HCl. The ext. is treated with H<sub>2</sub>S to ppt. the heavy metal sulfides, Ga and Al are then sepd. from Fe and Zn by boiling the soln. with NH<sub>4</sub>HSO<sub>4</sub>, leaving the Fe and Zn in soln. Al is sepd. from the Ga as AlCl<sub>3</sub>·6H<sub>2</sub>O from a ether-water mixt. satd. with HCl, in which Ga and traces of Fe remain dissolved. The Fe is removed and the Ga pptd. as hy-

drated oxide. The latter is dissolved in slight excess of KOH and electrolyzed, giving the metal Ga. M. McMahon

**Columbium and tantalum.** Clarence W. Balke. *Ind. Eng. Chem.* 27, 1166-9 (1935).—The treatment of tantalite and columbite and the sepu. of Ta and Nb by recrystn. of their double K fluorides are described. These metals are finding extensive uses because of their corrosion-resistant properties, low work function and low cost. Ta carbide is used in the manuf. of hard carbide compns. for cutting tools, wire dies and abrasion-resisting surfaces. M. McMahon

**A feldspar producer in Colorado.** S. A. Ionides. *Eng. Mining J.* 136, 513-14 (1935).—The Western Feldspar Milling Co. has 20 or more deposits, with 7 working.

W. H. Boynton  
**Mechanism of hydration of langbeinite.** Tadeusz Pieschowicz. *Przemysł Chem.* 19, 105-110, 122-5 (1935).—The process of hydration of langbeinite consists of 2 stages involving soln. of langbeinite to yield a supersatd. soln., which later crystallizes. Covering of the surface by hydrated products can be avoided by agitating the soln. The supersatd. soln. can, when sufficiently stable, be sepd. from the raw material by filtration or decantation and yields pure cryst. products. K<sub>2</sub>SO<sub>4</sub> free from insol. impurities was obtained from schönite treated by this method. The rate of soln. of langbeinite in satd. solns. is a function of temp. and is represented by curves with a max. at 25° (equil. of schönite-MgSO<sub>4</sub>·7H<sub>2</sub>O) or at 60° (schönite-K<sub>2</sub>SO<sub>4</sub>). A math. theory of continuous soln. is given. A. C. Z.

**The activation of bleaching earths.** M. Kraynovné and E. Cerkovnikov. *Chem. Zitz* 59, 716-17 (1935).—Samples heated between 250° and 300° showed a max. adsorptive capacity. S. Bradford Stone

**Recovering solids from solns.** (Ger. pat. 618,107) 1.

**Anhydrous hydrogen fluoride.** Wm. S. Calcott and Lee C. Holt (to E. I. duPont de Nemours & Co.). U. S. 2,018,397, Oct. 22. For producing substantially anhyd. HF from a crude material contg. less water than the const.-boiling mixt., the material is fractionally distd. from a still the final temp. of which is brought to about the b. p. of the const.-boiling mixt., and through a fractionating device so controlled that the exit gas from it is at the temp. of the b. p. of anhyd. HF.

**Deaerating sulfuric acid.** Paul W. Bachman (to General Chemical Co.). U. S. 2,019,038, Oct. 29. Gaseous HCl, HF, Cl or F is continuously circulated in intimate contact with a dispersed stream of H<sub>2</sub>SO<sub>4</sub> at an elevated temp. (suitably about 60° or higher) so that an As halide is formed and passes off as vapor with the unreacted gas, the As halide is in large proportion condensed from the gas and sepd., and residual As halide is sepd. from the gas by the action of an adsorbent such as a carbon, silica gel or the like and the purified gas is then used for treating further portions of H<sub>2</sub>SO<sub>4</sub> to be purified. An arrangement of app. is described.

**Refining alkali and alkaline earth metals and their alloys.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Ger. 618,499, Sept. 9, 1935 (Cl. 40a 15.20). A filtering app. is described through which the fused metal or alloy is passed at a temp. at which the impurities remain solid. Means for removing the accumulated impurities is provided. The app. may be operated continuously or intermittently.

**Alkali metal cyanides.** Hermann T. J. König (to N.-V. Stukstofbondingsindustrie "Nederland"). U. S. 2,018,135, Oct. 22. For the production of high percentage alkali metal cyanide free from sulfide and chloride, an alk. earth metal cyanamide, such as that of Ca, is heated in the absence of chlorides at a reacting temp. above 500° with an alkali metal sulfide, such as that of Na, together with a C-yielding material, such as anthracite coal, and an excess of an alk. earth metal compd., such as CaCO<sub>3</sub>, capable of reacting at the temp. involved with the

alkali metal sulfide to form alk. earth metal sulfide; the resulting mass is extd. with a solvent for the alkali metal cyanide, such as with MeOH or EtOH, in which the alk. earth metal sulfide formed is insol.

**Alkali nitrates.** Paul Kubelka. Fr. 784,225, July 22, 1935.  $\text{HNO}_3$  is caused to react on an aq. soln. of an alkali chloride in which is suspended  $\text{Cu}_2\text{O}$  or  $\text{CuO}$  and Cu in amt. at least equiv. to the Cl present. The  $\text{CuCl}$  formed is sepd. and the soln. of alkali nitrate is evapd. The  $\text{Cu}_2\text{O}$  is regenerated.

**Easily soluble alkali metal metasilicate hydrate.** Ernest R. Boller (to Grasselli Chemical Co.). U. S. 2,018,632, Oct. 22. A molten alkali metal metasilicate hydrate is mixed with an easily decomposable peroxide, such as  $\text{Na}_2\text{O}_2$  or  $\text{H}_2\text{O}_2$ , and the mixt. is solidified.

**Gas reactions such as ammonia oxidation.** Nikodem Caro, Albert R. Frank, Rudolf Wendlandt and Thomas Fischer. U. S. 2,018,240, Oct. 22. For assisting in temp. and pressure control, steam or  $\text{CO}_2$  or other gases are added which are easily condensed, absorbed or otherwise sepd. from the reaction gases (as in the form of an aq. soln.) after they have passed through the reaction zone; or water vapor and  $\text{CO}_2$  may be formed from H and CO added to the reaction gases, and in some instances  $\text{SO}_2$  may be added. Various examples with details of procedure are given, and app. is described.

**Catalyst for ammonia oxidation.** Geo. M. Hickey (to J. Bishop & Co. Platinum Works) U. S. 2,018,760, Oct. 29. A catalytic gauze is formed of an alloy of Pt with Rh and Co in small proportions and is annealed and acid washed.

**Catalysts.** I. G. Farbenind. A.-G. Fr. 784,503, July 22, 1935. See Brit. 429,410 (C. A. 29, 70309).

**Purifying zinc salt solutions.** Leon R. Westbrook (to Grasselli Chemical Co.). U. S. 2,017,030, Oct. 22. A soln. of a Zn salt, such as one of  $\text{ZnSO}_4$ , contg. as an impurity an alkali or alk. earth metal compd., such as  $\text{Na}_2\text{SO}_4$ , is treated with Zn fluosilicate, and the resulting ppt. is sepd.

**Aluminum chloride.** Claude G. Miner and Dudley Baird. Fr. 784,178, July 22, 1935. Aluminous materials are caused to react with a chloride of Cu, Pb, Fe or Zn and a reducing agent to produce  $\text{AlCl}_3$  and a metal. Thus  $\text{Al}_2\text{O}_3$  is caused to react with  $\text{FeCl}_3$  and C at  $1200^\circ$ , with  $\text{CuCl}$  and C at  $1000^\circ$  or with  $\text{ZnCl}_2$  and C at  $1450^\circ$ . Cl. C. A. 29, 18934.

**Recovery of beryllium sulfate from its mixture with aluminum sulfate.** Charles B. Sawyer and Bengt Kjellgren (to Brush Beryllium Co.). U. S. 2,018,473, Oct. 22. The  $\text{Al}_2(\text{SO}_4)_3$  in the mixt. is converted, with an alkali sulfate, such as that of  $\text{NH}_4$ , to an alum, and the concn. of the soln., with respect to Be sulfate, is adjusted to or sufficiently close to satn. to prevent the soln. from holding in soln. more than any predctd. small amt. of alum at the final temp. at which the alum is sepd.

**Monocalcium phosphate.** Wm. H. Knox, Jr. (to Victor Chemical Works). U. S. 2,018,449, Oct. 22. Strong  $\text{H}_2\text{PO}_4$  is caused to react with a substantially dry lime base, such as hydrated lime, to produce mono-Ca phosphate and water, the reaction being effected under a substantial vacuum, so that evapn. of water maintains the temp. of the reaction below  $100^\circ$ .

**Calcium sulfate.** Winfield W. Hecker and Gordon D. Patterson (to Krebs Pigment & Color Corp.). U. S. 2,018,955, Oct. 29. A finely divided  $\text{CaSO}_4$  suitable for use with pigments is obtained (suitably by reaction of  $\text{H}_2\text{SO}_4$  with  $\text{CaCl}_2$ ) in an aq. medium in the presence of a compd. of Ce, Th, trivalent Ti or U, which serves to restrain crystal growth.

**Dehydrating copper sulfate.** Hector A. M. Toledo, Brit. 431,859, July 9, 1935.  $\text{CuSO}_4$  contaminated with org. matter, e. g., that resulting from the low-temp. dehydration of an org. liquid, e. g., alc., by means of anhyd.  $\text{CuSO}_4$  is sepd. by phys. means from adhering org. matter, preferably ground and then dehydrated at  $185\text{--}300^\circ$  with movement or agitation of the salt and removal of the liberated  $\text{H}_2\text{O}$  vapor.

**Magnesium chloride from dolomite.** Joseph S. Laird

(to Ford Motor Co.). U. S. 2,019,265, Oct. 29. Dolomite contg.  $\text{MgCO}_3$  and  $\text{CaCO}_3$  in proportions deviating substantially from equimol. proportions, is calcined and hydrated with water to form a slurry of  $\text{Ca}(\text{OH})_2$  and  $\text{Mg}(\text{OH})_2$ , and  $\text{HCl}$  is then added to this slurry in an amount not materially exceeding that corresponding to the  $\text{Mg}(\text{OH})_2$  present; the resulting slurry of mixed hydroxides and chlorides is then carbonated to ppt.  $\text{CaCO}_3$ , and the latter is sepd., leaving  $\text{MgCl}_2$  in soln. An arrangement of app. is described.

**Nickel carbonyl.** I. G. Farbenind. A.-G. (Leo Schlecht and Max Naumann, inventors) Ger. 618,108, Sept. 2, 1935 (Cl. 12n 4). Metallurgical or other products which contain Ni and S, and have been obtained by a process involving fusion, are treated with CO (or gases contg. it) at a raised temp. and pressure, e. g.,  $200\text{--}275^\circ$  and 200 atm., without preliminary roasting and reduction. Good yields of  $\text{Ni}(\text{CO})_4$  are obtained. The starting material may be pretreated to increase its surface, e. g., by pouring the fused material into water or by granulation. The pelleted starting materials contain, in addn. to Ni, other heavy metals capable of combining with S, e. g., Cu, Co or Fe. Sp. processes are described.

**Potassium sulfate.** Wintershall A.-G. Ger. 618,162, Sept. 3, 1935 (Cl. 12l 5). In the manuf. of  $\text{K}_2\text{SO}_4$  from kieserite by way of the double salt  $\text{K}_2\text{SO}_4 \cdot \text{MgSO}_4$ , undried kieserite is ground after it has been treated with KCl-contg. sulfate mother liquor obtained in the process. The double salt thus produced is worked up in known manner. Cl. Ger. 577,651 (C. A. 28, 8657).

**Sodium aluminate.** Russell E. Cushing and Clarence W. Burkhardt (to Pennsylvania Salt Mfg. Co.). U. S. 2,018,607, Oct. 22. See Brit. 427,459 (C. A. 29, 6376).

**Flaked sodium chloride suitable for use in household cleaning mixtures, etc.** Ernest R. Boller (to Grasselli Chemical Co.). U. S. 2,018,633, Oct. 22. A paste comprising  $\text{NaCl}$  particles and an org. adhesive such as gum arabic is spread into a film and the film is solidified and broken into flakes.

**Fusing materials such as sodium nitrate, etc.** Herman A. Beechhaus (to Atmospheric Nitrogen Corp.). U. S. 2,019,112, Oct. 29. For fusing a solid, fusible salt of an alkali metal and an oxy-acid of N, such as  $\text{NaN}_3\text{O}_4$ , a melt of the salt is brought directly into contact with a heating gas and the resulting heated melt then has the solid salt introduced into it. An app. for continuous operation is described.

**Zinc oxide.** Polenski & Zollner, Zweigniederlassung Berlin. Fr. 784,642, July 22, 1935.  $\text{ZnO}$  in ores is sepd. from other metal oxides, e. g.,  $\text{PbO}$ , by transforming the latter to sulfides or arsenides, e. g., by a neutral or reducing heating in admixt. with  $\text{FeS}$ . This may be followed by a flotation sepn.

**Sulfur dioxide.** Chemical Construction Corp. Fr. 784,147, July 22, 1935. Acid mists from the purification of hydrocarbons by  $\text{H}_2\text{SO}_4$  are decomposed by bringing them into contact with heated solid bodies, such as metal balls, pebbles, sand or coke. The  $\text{SO}_2$  is withdrawn from the heating zone.

**Cooling hot gases containing sulfur oxides.** Geo. A. Berry (to Calco Chemical Co.). U. S. 2,019,245, Oct. 29. The gases are cooled to temps. suitable for the production of  $\text{H}_2\text{SO}_4$  by the contact process by passing them in heat-exchange relation with liquid water maintained under a const. pressure such that its b. p. is below the temp. of the gases but above the dew point of the gases, so that heat is absorbed at const. temp. by the water and steam is evolved, and the gases are then passed in heat-exchange relation with the steam so generated, so that the steam is superheated and the temp. of the gases is lowered to the desired degree. App. is described.

**Lead recovery from chloride brine.** Niels C. Christensen. U. S. 2,018,438, Oct. 22. A relatively concd. chloride brine contg. Pb salts is treated with an amt. of  $\text{Ca}(\text{OH})_2$  substantially less than that chemically equiv. to the Pb in soln. in the brine, but more than three-fourths of such equiv. to form a ppt. which may be converted into basic Pb carbonate with  $\text{CO}_2$ .

Hydrogen Fritz Haussing (to American Magnesium Metals Corp.) U. S. reissue 19,733, Oct. 22. A reissue of original pat. No. 1,886,919 (C. A. 25, 1074).

Purifying hydrogen for the hydrogenation of carbonaceous materials. International Hydrogenation Patents Co. Ltd. Br. 431,970, July 18, 1935. For the hydrogenation of carbonaceous materials, H is scrubbed with liquefied hydrocarbons that are gaseous at ordinary temps. and is subsequently washed with oils to remove traces of said scrubbing agents. Liquefied  $\text{CH}_4$ ,  $\text{C}_2\text{H}_6$ ,  $\text{C}_3\text{H}_8$ ,  $\text{C}_4\text{H}_{10}$ ,  $\text{C}_5\text{H}_{12}$ , or a mixt. of these is suitable. The H is preferably preliminarily purified to remove the greater part of the impurities such as hydrocarbons,  $\text{CO}$ ,  $\text{NH}_3$ , etc.

Treating blow-off gas from hydrogen production by the iron water vapor reaction. Raymond Blondelle (to Societe des mines de Doirey) U. S. 2,018,118, Oct. 22. A cyclic process for obtaining a mixt. of H with CO and a small proportion of N and only traces of hydrocarbons involves first causing coke-oven gases to pass over Fe oxides at about 750° in H-producing app. of the "iron-water steam" type, then causing the resultant gases to pass continuously through a mass of coke, externally heated to about 1200° and collecting the gaseous mixt. passing from the mass of coke (the coke being of sufficiently small sized particles to offer high-contact surface without causing excessive loss of pressure in the app.). App. is described.

Nitrogen and hydrogen. Ammoniaque synthétique et derives. Fr. 754,355, July 22, 1935. A mixt. of N and H suitable for the production of  $\text{NH}_3$  is made by gasifying carbon under pressure by a mixt. of steam and air so as to obtain a gas formed principally of H, N and  $\text{CO}$ , which is afterwards treated to remove  $\text{CO}$  and traces of  $\text{CO}$ ,  $\text{CH}_4$  and other impurities. App. is described.

Complex metal compounds of tartaric, gluconic, mucic, lactic and citric acids, etc. Hans Schmidt (to Wintthrop Chemical Co.) U. S. 2,018,811, Oct. 23. New metallic complex compounds are prep'd by reaction of a peroxide, such as  $\text{H}_2\text{O}_2$  or  $\text{MgO}_2$  with a complex heavy metal comp'd of a sat'd. aliphatic hydroxy carboxylic acid contg. at least one hydroxy group in a position to a carboxylic acid group, said heavy metal being present in a lower stage of valency. By this oxidation process the complex bound heavy metal is transformed from its lower into its higher stage of valency. Such heavy metals are, for instance, Sb, Sn, Fe, Co, Mn, As, Cr and V. The starting materials suitable for the purpose are obtainable quite generally by heating an aq. suspension of an oxide or hydroxide of a metal of the character described and an aliphatic hydroxy carboxylic acid or a salt thereof of the character described until a clear soln. has been obtained and, if desired, neutralizing the reaction mixt. and pptg. the complex comp'd formed by pouring the reaction mixt. into an org. precipitant, such as alc. or by evap. to a dry state. Some complex compounds crystallize from their aq. solns., such as, for instance, antimonyl potassium tartrate. The starting complex comp'd is dissolved in water. To the soln. there is added at least the calcd. amount of a peroxide.

1 Preferably, a small excess is used. The reaction proceeds while self-heating and is complete after a short time. If the temp. increases too much, for instance, up to the b. p., cooling of the mixt. is advisable. Instead of using a substance yielding O, free O or gases containing O may be employed. After completion of the reaction, the soln. is neutralized by the addn. of an org. or inorg. base and evapd. to a dry state or pptd. by pouring the soln. into an org. precipitant, such as alc. or acetone.

2 Apparatus for activating carbonaceous materials in thin layers by gases. Albert A. Godel. Fr. 754,079, July 22, 1935.

3 Activating bleaching clays. Anton Wirmüller (to Bayerische A.-G. für chemische & landwirtschaftliche chemische Fabrikate). U. S. 2,018,887, Oct. 23. Clay material to be activated is suspended in an aq. soln. of a salt such as  $\text{AlCl}_3$  and there is added to the suspension a quantity of free acid of the salt such as  $\text{HCl}$  and the acidified suspension is boiled until the acid is completely used, so that the acid treatment is effected entirely in the presence of salts of the acid.

4 Active charcoal. Albert A. Godel. Fr. 754,115, July 22, 1935. A hard charcoal of high volumetric capacity is made by prolonged maceration of liginous substances in a soln. of  $\text{H}_2\text{SO}_4$  at appropriate concn. (25° Be.) and temp. (70°), drying and carbonizing at 100° or higher and then activating by gases or chem. agents at a high temp.

5 Active charcoal. Oswald Heller. Fr. 754,139, July 22, 1935. Grains, dust or molded pieces of a carbonaceous material are activated mechanically in a reaction chamber, a reaction taking place between the material to be activated and the activating substances ( $\text{CO}$  and steam) on the one hand and the reaction products ( $\text{CO}$  and H) and the means of reaction (O or air) on the other hand, so that by the latter reaction heat is liberated and activating gases are reformed.

6 Exchange and adsorptive material. N. V. Oetrooten Maatschappij "Activat." Fr. 754,348, July 22, 1935. A material having zeolitic and adsorptive properties is made by causing hygroscopic chem. substances capable of fixing water by chem. reaction to react on materials consisting of C. Thus, coal, anthracite, sawdust, peat, lignite, starch or molasses is treated with  $\text{SO}_2$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{ZnCl}_2$ ,  $\text{CaCl}_2$ ,  $\text{HCl}$  or  $\text{H}_3\text{PO}_4$  at 60-250°. The product is called active or activated humus.

7 Refining mineral products. Franziska Bleibtreu (see Stintzing), Helene Bleibtreu (see Graffenberg), Anna Labusch (see Bleibtreu), Max Bleibtreu, Adelheid Bleibtreu (see Schmidt) and Dorothea Bleibtreu. Ger. 618,022, Aug. 31, 1935 (Cl. 12g. 1.01). Kaolin, trachyte and like mineral products, contg. impurities sol. in hydrohalic acids, are powd. and mixed with (a) a halide of an alkali or alk. earth metal or Al and (b) a solid org. acid or an acid salt of an inorg. acid. All the components are taken in the air-dried state, but at least one of the components (a) or (b) must contain water of crystn. The mixt. is heated to about 300° and then lixiviated with water or dil. acid.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

C. E. BARTON AND C. H. KERR

Canada an important market for American glassware Charles H. Ducoite. *Ceram. Age* 26, 163 (1935).

Herbert S. Willson

Effect of viscosity of the slip on porosity of glass pots produced by casting. R. Moretti. *Ind. retro. ceram.* 7, 321-3 (1934); *Referatien Sikkiliteratur* No. 866 (1934). —It was found that lowering the viscosity effects a decrease in porosity, it is unimportant whether viscosity is obtained by surplus of liquefactors or water. M. V. Kondodov

The use of kyanite in crucibles for glass melting. S. R. Scholes. *Bull. Am. Ceram. Soc.* 14, 335-7 (1935). —Satisfactory crucibles for glass melting expts. have been developed. They are made from 65% calcined kyanite

(60-mesh) and 35% of a refractory ball clay (known in the trade as "XX Sagrer" clay). A slip is made with the addn. of 0.2% alkali by wt. (equal parts  $\text{Na}_2\text{CO}_3$  and  $\text{Na}$  silicate, brand "S"), and crucibles 2 1/2 x 7 in. high are cast. Firing is to cone 4. C. H. Kerr

Controlled luminous gas flame in glass melting. J. B. Nealey. *Ceram. Ind.* 24, 273-4 (1935). H. S. W.

The transparency of colorless glasses to various radiations of the spectrum. J. Escher-Desrivieres. *Ann. chim. phys.* 6, 354-6, 370-1, 381-3 (1935). —Several transmission curves are included with a general discussion. Herbert S. Willson

The question of the magnitude of powdered glass sur-

lances. E. Berger, W. Gelfand and K. Stösser. *Glastech. Ber.* 13, 301-25 (1935).—On the basis of theoretical considerations and exper. results, it is shown that the surfaces of powdered glass can be characterized by statistical values, which are readily reproducible if proper precautions are taken in the prepn. of the samples. They are, of course, not the abs. values and in general will vary with the method of measurement. Fatin with  $\text{HNO}_3$  and the absorption of iodococan were the methods used here. Twenty-three references. J. F. Hyde.

The development of optical glasses. In memory of Otto Schott. W. Wehl. *Angew. Chem.* 48, 677-8 (1935).—A historical sketch. Karl Kammermeyer. Glass in building. R. A. Miller. *Ind. Eng. Chem.* 27, 1291-3 (1935). G. G.

Hygienic glass for sanitariums. J. Polivka. *Tschekoslov. No. 1, No. 4-5, 83-6 (1934)*. *Referativnaia Shtatsbirokrat. No. 1327 (1935)*.—Glasses permeable to ultraviolet rays and those absorbing infrared rays are discussed and their properties pointed out. M. V. Kondodiy.

The determination of alkalis in substrates with special reference to high-alumina refractories. Edgar B. Read. *J. Am. Ceram. Soc.* 18, 341-6 (1935).—For precise analysis of high- $\text{Al}_2\text{O}_3$  materials the J. Lawrence Smith method (*Am. J. Sci.* [2], 50, 269 (1871), *Am. Chemist* 1, (1871)) is preferable to the HF method, provided the fusion temp. is high enough ( $1200^\circ$ ) to insure complete decomposition of the sample, and the top of the crucible is cooled sufficiently to prevent loss of alkalis by evapn. For routine analysis the results by the HF method are satisfactory, if it be remembered that the results are slightly low. If the sample can be decomposed completely by HF, that method is as good as the J. Lawrence Smith method and has the advantage of direct detn. of total alkalis. C. H. Kerr. Italian kaolins. Fausto Pizzi. *Centro studi ceram.* 1, 36 (1934).—The properties of Italian kaolins are given. M. V. Kondodiy.

Mining of kaolin and refractory clay in Italy. A. Lotti. *Ind. min. terram.* 7, 427-52 (1934). *Referativnaia Shtatsbirokrat. No. 1182 (1935)*.—Italian kaolins contain a high amt. of Fe compounds, and fine quartz particles. The mining and refining of kaolin and clays are described. M. V. Kondodiy.

Mechanical method for the measurement of the plasticity of clays and mixtures of clays. J. W. Whittemore. *J. Am. Ceram. Soc.* 18, 332-9 (1935).—The app. used measures the penetration of a constantly loaded (15 lb.) hemisphere (3 in. diam.) into the plastic clay mass during a definite time period. The data indicate that  $d = c/t^2$  expresses the relationship between depth of penetration,  $d$ , and the corresponding time,  $t$ ,  $c$  and  $P$  being consts. Undoubtedly  $c$  is related to the load used, the diam. of the hemisphere and some of the properties of the clay.  $P$  is the measure of the plastic properties of the clay. The amt. of recovery of penetration of the hemisphere after the load is removed is a measure of the air and gas content of the plastic mass. Further work is urged. C. H. Kerr.

Plasticized sulfur as a jointing material for clay products. W. C. Rueckel and W. W. Duecker. *Bull. Am. Ceram. Soc.* 14, 329-32 (1935).—Excellent results with plasticized S as a bonding agent for paving brick suggests its use as a jointing material for sewer pipe, sewer brick, etc. C. H. Kerr.

The effect of the solid-liquid ratio on grinding a ceramic nonplastic. Karl Schwartzwalder and Paul G. Herold. *J. Am. Ceram. Soc.* 18, 350-2 (1935).—A ceramic nonplastic (sp. gr. 3.04) was wet-ground with solid-liquid ratios of 2.7:1 and 1:15 for various lengths of time. Grain-size distribution and surface area, as detd. by the Wagner turbidimeter method, were compared. The material ground with the least water gave a lower percentage retained on a 325-mesh screen, fewer particles between 10 and 60 microns, and more between 10 and 80 microns. C. H. Kerr.

Specific gravity as an index for slip control. J. R. Beatty. *Bull. Am. Ceram. Soc.* 14, 333-5 (1935).—The sp. gr. of a casting body should be controlled to within

$\pm 0.003$ . The slip must be well blunged to release air, and the sample for testing must be evacuated before making the detn. C. H. Kerr.

The international standardization of colors. A. Maerz. *J. Am. Ceram. Soc.* 18, 361-6; *Bull. Am. Ceram. Soc.* 14, 349-55 (1935).—The classification and nomenclature of colors have been based upon arbitrary numerical systems. No such system has found wide practical use. Names of colors are usually preferred, even in the industries and sciences. There should be international standardization. C. H. Kerr.

Recent revisions of high temperatures. L. Donald Mooms and S. R. Scholes. *J. Am. Ceram. Soc.* 18, 359-60 (1935).—Data on recent detns. of certain fixed points for reference in pyrometry are collected here to be readily available to the ceramist. C. H. Kerr.

Screen analysis for plant control. Edgar W. Rugh. *J. Am. Ceram. Soc.* 18, 346-9 (1935). C. H. Kerr.

Pyrophyllite in San Diego County, Calif. (Richard) S. Coating compns. [for glass, porcelain and brickwork] (Brit. pat. 451,283) 13

Electric furnaces for melting glass. John Ferguson (to Fairmount Glass Works). U. S. 2,018,883-4, Oct. 29, 1935. Structural and operative details. U. S. 2,018,883-6 (no assignment noted) also relate to elec. furnaces suitable for melting glass.

Apparatus for molding glass articles such as bottles and jars. Victor E. Hoffmann (to Owens-Ill. Glass Co.). U. S. 2,018,821, Oct. 22, 1935. Mech. features.

Apparatus for forming glassware such as bottles and jars. Frank O'Neill and Clarence C. Kriker (to Owens-Ill. Glass Co.). U. S. 2,018,680, Oct. 22, 1935. Mech. features.

Apparatus for forming hollow glass articles such as bottles. Wm. H. Watkins and Clarence C. Kriker (to Owens-Ill. Glass Co.). U. S. 2,017,908, Oct. 22, 1935. Mech. features.

Apparatus for manufacture of hollow glass articles. Frederick A. Harrison (to United Glass Bottle Manufacturers Ltd.). U. S. 2,018,753, Oct. 29, 1935. Mech. features.

Variegated glass articles. Henry T. Hellmers and Robert H. Donald (to Akro Agate Co.). U. S. 2,019,048, Oct. 29, 1935. Various details of app. and operation are described, for combining molten glasses of different colors and forming articles such as cups, jars, etc.

Chromium-plated glass-working apparatus. Rowland D. Smith (to Corning Glass Works). U. S. 2,018,814, Oct. 29, 1935. Devices such as molds, planners, punches and blow fronts are formed of erodable metal such as steel or cast iron and coated with Cr.

Soft glass of high electrical resistance. Wm. C. Taylor (to Corning Glass Works). U. S. 2,018,816, Oct. 29, 1935. A glass contg. Pb oxide also contains boric oxide and F in a combined proportion of 1-6%, the boric oxide content being at least as great as the F content. U. S. 2,018,817 relates to glass such as may contain silica 55-60, Pb oxide 18-30, Na<sub>2</sub>O 2.5-3.5, K<sub>2</sub>O 8-10, Li<sub>2</sub>O 0.1-1.2 and Al<sub>2</sub>O<sub>3</sub> not more than 2%. C. H. Kerr.

Sheet glass. Wm. L. Monroe (to American Window Glass Co.). Brit. 451,668, July 12, 1935. In drawing a sheet upwards from a bath of molten glass contained in a drawing pit and moving the sheet continuously in a vertical direction until the glass has been annealed and cooled, the surrounding temp. of the glass is so controlled that the annealing zone lies at least partly inside the drawing pit. The invention may be applied to an app. of the Fourcault type in which a sheet is drawn from a mass of glass through a debiteuse which is situated in a drawing pit, the sheet being annealed and cooled in a keel situated above the pit. Coolers are situated as usual adjacent the meniscus of the sheet and a 2nd set of coolers is provided, adjacent to the sheet and above the main coolers, to reduce the temp. of the rising glass close to, and preferably within, the annealing range. Air is blown through the base of the keel transversely to the sheet by the means and in

the manner described in Brit. 431,669 (following abstracts).  
Cl. C. A. 29, 43287.

**Making sheet glass.** Frederic L. Bishop (to American Window Glass Co.). Brit. 431,669, July 12, 1935. In drawing a sheet continuously upward from a bath of molten glass, means is provided for causing the air or other gas that is in contact with the rising sheet, particularly with its lower portion, to circulate transversely to obtain more uniform annealing. A Fourcault type of app. is described, where the required circulation of the gas may be effected by means of blower nozzles which are placed at the sides of the drawing pit and direct air blasts transversely to the length of the glass sheet. The circulation of air may take place either in the pit or in the lower part of the hear above the pit so long as it takes place adjacent to the part of the glass where the temp. is within or above the annealing range.

**Apparatus for cutting sheet glass.** Joseph P. Crowley and Victor Mamberg (to Libbey-Owens-Ford Glass Co.). U. S. 2,019,175, Oct. 23. Structural and mech. features.

**Apparatus for automatically cutting predetermined lengths of a strip of glass.** Pilkington Brothers Ltd and Joseph Gaskell. Brit. 431,405, July 8, 1935.

**Apparatus for tempering sheet glass.** Pilkington Brothers Ltd. Ger. 618,253, Sept. 6, 1935 (Cl. 22a 39). See Brit. 444,548 (C. A. 28, 5199).

**Hardening glass.** Fritz Eckert. Brit. 431,565, July 1, 1935. In hardening glass articles, the temp. to which the glass should be heated is fixed, by observing the change of some phys. property of the glass which varies with temp., a sep. detm. being made for each article that is hardened. The desired temp. can be detd. by measuring the rapid decrease in the elec. resistance that takes place in the temp. approaches the softening point, or by observing the softening of a specimen of glass that is placed in such a pot well in the furnace that it is somewhat hotter than the sheet which is being heated.

**Optical glass.** Gehr. Fritzler Glasfabrikwerke G. m. b. H. Ger. 618,029, Aug. 31, 1935 (Cl. 235 6). An irregular opacity is produced by treating glass with an aq. H<sub>2</sub>HF bath of moderate concn., e. g., 10-50%, to which addnl. HF has been added in a proportion up to 1% by vol.

**Forming glass bulbs.** Yukioichi Sakakura. U. S. 2,018,422, Oct. 22. A glass bulb is filled with a soln. of NaHF<sub>2</sub> and is vertically dipped in a heating liquid such as water so that convection currents are created and the bulb is frosted in gradation on its inner side and a transparent portion is left at the top of the neck.

**Tools for polishing and grinding glass.** Frederic B. Waldron (to Pilkington Bros. Ltd.). U. S. 2,019,204-5, Oct. 23. Structural, mech. and operative details.

**Compound glass.** Schleicher-Speidelglas-Manufaktur, Carl Teich G. m. b. H. Brit. 431,234, July 3, 1935.

An inspection glass, e. g., for indicating liquid levels in pressure and vacuum containers for corrosive liquids, comprises several glass pieces sepd. by a layer or layers of a non-solubilizing material having approx. the same  $n$  as glass. The single glass pieces may be hardened and may differ in compn., e. g., the transparent piece may be a corrosion-resisting glass or have a low coeff. of expansion or may have a high Al<sub>2</sub>O<sub>3</sub> content. A suitable non-solubilizing material is a mixt. of polymerized vinyl acetate with a plasticizer, e. g., castor oil, oil of turpentine, and, if desired, nitrocellulose, and may be applied as a soln.

**Laminated glass ("safety glass").** Wallace H. Carothers, Gerard J. Berchet and Ralph A. Jacobson (to E. I. du Pont de Nemours & Co.). U. S. 2,019,118, Oct. 23.

Sheets of glass are united by a film orig. a polymer of a vinyl-ethyl methacrylate. Several examples are given.

**Porous ceramic tiles partially glazed and suitable for walls.** See Nelson P. Corne (to Mosier Tile Co.). U. S. 2,018,301, Oct. 22. Structural details.

**Finishing siliceous articles.** Gaston Delpech (to Societ  des manufactures des glaces et produits chimiques de Saint-Gobain, Chassy & Crey). U. S. 2,018,665, Oct. 22. The surfaces of a hot siliceous article are ground while at a temp. which is at least equal to the transforma-

tion point of cristobalite, the ground surfaces are heated while they are maintained at such temp. to glaze them, and the article is subjected to a reheating to at least 1000 . App. is described.

**Bricks for regenerator checkerwork.** Carl Otto. U. S. 2,018,223, Oct. 22. Structural details. U. S. 2,018,224 relates to regenerator chamber and checkerwork filler construction.

**Casting hollow articles or those with thin edges such as tubes or containers of zirconia, silica, etc.** Gaston Delpech (to Societ  des manufactures des glaces et produits chimiques de Saint-Gobain, Chassy & Crey). U. S. 2,019,045, Oct. 23. App. and various operative details are described.

**Porcelain resistant to passage of x-rays.** Leslie Brown (to Lenox Inc.). U. S. 2,018,699, Oct. 22. A reactive Pb compd. such as Pb oxide, an acidic oxide such as SiO<sub>2</sub>, and a relatively small amt. of a heat-decomposable alkali metal salt such as KNO<sub>3</sub>, are heated together to form a vitrified calcine of relatively high m. p.; this calcine is added to a porcelain mix and the mixt., in finely divided form, is pressed to the desired shape and fired to cause vitrification. Numerous examples are given.

**Refractory materials.** Victor M. Goldschmidt, Ger. 618,094, Sept. 4, 1935 (Cl. 55b, 8.08). Minerals containing mainly of Mg orthosilicate and contg. no more than 10% of Fe, called as FeO, are worked into mixts. comprising mineral powder assoc. with granules or pieces of the mineral, and the mixts are sintered without fusion in an oxidizing atm. and then, if desired, in a reducing atm. The mixts may be melted before they are sintered. Olivine is the preferred mineral.

**Refractory product suitable for resisting spalling.** Henry N. Baumann, Jr., and Charles McMullen (to Carborundum Co.). U. S. 2,019,278, Oct. 23. Fused cast refractory articles are formed of alumina together with about 2-15% of magnesia, the microstructure of the casting consisting principally of interlocking crystals of mullite, spinel and crystals of alumina.

**Cast refractory articles such as lamps for glass tanks.** Raymond C. Bender and Henry N. Baumann, Jr. (to Carborundum Co.). U. S. 2,019,279, Oct. 23. Cast articles are formed of Al<sub>2</sub>O<sub>3</sub> 85-95%, SiO<sub>2</sub> 2-14 and an alk. oxide such as Na<sub>2</sub>O or K<sub>2</sub>O 1-10%.

**Firing refractory blocks.** Hartford-Empire Co. Ger. 618,266, Sept. 4, 1935 (Cl. 80b, 12.16). See Brit. 276,903 (C. A. 22, 2419).

**Electric furnace for heat-testing refractory products.** Daniel Peitt. Fr. 784,105, July 22, 1935.

**Abrasive articles.** The Carborundum Co. Ltd. Brit. 431,662, July 1, 1935. In mfg. resin-bonded abrasive articles (by maintaining grains of abrasive material with a resin solvent and mixing with powder resin, the mixt. is heat-treated while the grains are maintained sufficiently sepd. to prevent agglomeration so that a coating or resin bond is formed around the individual abrasive grains. The article is subsequently formed by adding a small quantity of resin solvent, e. g., less than 1%, to the coated grains, pressing the mat. and curing by heating. As a result of the previous heat-treatment of the coated grains, the resin bond is partially hardened and does not tend to flow between the grains during the pressing and heat treatment of the article, which is thus open-pored and cut's freely.

**Recovering grain such as silicon carbide from ceramic bonded articles such as scrap abrasive material.** Alfred P. Thompson (to Carborundum Co.). U. S. 2,019,062, Oct. 23. Lumps of the material are subjected to disruptive forces such as by crushing and the disrupted masses are treated with chem. reagents such as NaOH soln. for further freeing the grain from the bond.

**Lead glazes, etc.** Dietrich Harkort. Fr. 784,647, July 22, 1935. Ores of Pb contg. S as well as residues of the Pb industry contg. S are converted directly to glazes or frits instead of obtaining the metal. The Pb ore is introduced into a firing furnace along with the constituents necessary to form the glaze and reducing agents and heated to fusion.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

A specification and test methods for cold-set cements. S. M. Phelps. *Am. Refractories Inst. Tech. Bull.* No. 60, 8 pp (1935).—The requirements are: (1) 95% must pass a 28-mesh standard Tyler sieve, (2) the  $H_2O$  retention period must not be less than 2 min., (3) the av strength of dry unfired joints must not be less than 100 lb per sq. in.; (4) the mortar must not flow out of the joint in the 1500° refractoness test. The procedure for tests is given. E. C. Petrie

The dependence of shrinkage of portland cement on physical and chemical influences. Hans Kuhl and Dzung-Hsien Lu. *Tonind-Zig* 59, 843-5, 844-6, 913-15, 1016-18, 1028-9 (1935).—The following conditions were studied: amt. of mixing water, humidity of air, compn of cement, gypsum and  $CaCl_2$  addn. Shrinkage increased with increase in  $Al_2O_3$  modulus but was a min when the molar content of  $Al_2O_3$  and  $Fe_2O_3$  was equal.  $SiO_2$  and  $CaO$  contents had little effect. Forty references.

P. S. Roller

Magnesite lining for cement kilns. Grigor'ev Zlatan-So Ser. 79, No. 61, *Referatnyi Sulkulaturat* No. 587 (1934).—Expts showed that the addn of calcined  $MgO$  to cement does not affect the vol stability of concrete, and is harmless when present in cement.  $MgO$  present in magnesite brick is dead-burned and therefore does not react with the constituents of the cement mix. Therefore magnesite brick is strongly recommended as lining for cement kilns. M. V. Kondoidy

The testing of cement plaster for water permeability. P. Mecke. *Tonind-Zig* 59, 991-2 (1935).—An app. is described in which the pressure required to force water through a mortar specimen is measured. P. S. R.

Determining colloids in soil for rammed earth construction. Ralph L. Patty. *Ag. Eng* 16, 275-6 (1935).—Data are given on the mech compn of soils in relation to their suitability for use in the construction of rammed earth walls. Soils contg 40% of colloids are of doubtful value for pise work. Soils contg more than 40% of colloids are definitely undesirable. Addn. of sand does not improve the wall if the soil naturally contains more than 42% of colloids. The Bouyoucos hydrometer method is suitable for detg colloids in soils for pise work. K. D. Jacob

Tightness and standing of concrete structures. H. Rahti. *Teknillinen Aikakauslehti* 25, 276-83 (1935).—Small sand particles give tight concrete, the larger particles increase strength. The grain of a suitable sand for water-tight concrete is above the Fuller curve  $y = 100\sqrt{d/D}$ . The newer special cements have not yet been thoroughly tested. Addns to plaster to increase tightness usually reduce its resistance to acids and its strength. These are chiefly org. substances. Inorg. addns increase acid resistance, but have no influence on strength or tightness. E. E. Juikola

A new method for impregnation of wood. Bror Hager. *Trattorindustrien* 20, 281-4 (1935).—The logs are treated for some hrs. with a soln. of Na arsenate at 92-4°. At this temp. most of the air and water enclosed in the log are removed. The soln. is cooled to about 75-80° and left for 12 hrs. The soln. partly penetrates the log. The warm soln. of Na arsenate is pumped off, and a cold soln. of  $ZnCl_2$  is poured in and left for 12 hrs. The  $ZnCl_2$  also penetrates the log and reacts with the Na arsenate to form  $Zn$  arsenate, which is insol. in water. In this form the As is poisonous to all wood-destructive organisms, but is not poisonous to the human body. J. W. Holst

Experiments on the preservation of mine timber.—Progress Report No. 1. J. Bryan and N. A. Richardson. *Dept. Sci. Ind. Research, Forest Products Research Records* No. 3, 10 pp (1935).—Props of *Pinus sylvestris*, of domestic and Scandinavian origin, in lots of 50 were treated by the open-tank hot- and cold-bath process, with Wolman salts ( $Tenolite$ ),  $NaF$ ,  $ZnCl_2$  and  $NaCl$  in 2 concns. each and with coal-tar creosote and placed in colliery pits in England

and Scotland. After exposure for 5 years, which is too short a time to arrive at definite conclusions, the following results are reported: untreated controls are practically all destroyed; creosote, Wolman salts and  $NaF$  are showing best protection;  $NaCl$  even in high concns. (10%) is the least effective. Nevertheless  $NaCl$  treatment will probably double the life of mine timbers. The lower concns. of Wolman salts and  $NaF$  (2%) are sufficient for satisfactory protection. Alfred L. Kammerer

The life of untreated and impregnated oak timbers. Willy Kienberg. *Lesly Cukrowar* 53, 483-4 (1935). *Z. Zuckerind. Cechoslovak Rep* 59, 471-2.—Untreated oak ties in Germany and France serve 8-12 yrs. In Czechoslovakia such ties began to decay after 2 yrs and had a useful life of 5-8 yrs. The necessity for using sapwood and inferior timber, the cracking at extremities and the collection of moisture in crevasses were responsible for the shorter life. Oak ties impregnated with a mixt. of  $ZnCl_2$  and a tar oil served 15 yrs and had to be removed because of mech. disintegration, on sections of the railroad where traffic was light, the life of the impregnated ties ranged from 20 to 25 yrs. Frank Maresh

Machines for moistening cement raw material with water (Brit. pat. 431,352) 1. Coating compns. [for concrete] (Brit. pat. 431,380) 13

Cement. Lennart Forsén. *Brit.* 430,781, June 25, 1935. See Fr. 776,747 (*C. A.* 29, 38039).

Cements. Aktiebolaget Vallevikens Cementfabrik (to Georg S. Lahm). *Brit.* 431,060, July 1, 1935. A cement having a rapid initial set, e. g., within 12 sec., and a sufficiently slow hardening speed to avoid the formation of cracks by the evolved heat comprises a mixt. of aluminous cement and portland cement or other  $Ca$  silicate cement free from gypsum or other retarding agent. The cement may be made by mixing 2 kinds of clinkers, e. g., in proportion from 1-3 to 3-1, and grinding.

Portland cements. Société des ciments français et des portland de Boulogne-sur-Mer et compagnie des portland de Desvres. *Brit.* 431,000, July 1, 1935. White cement clinker is obtained by removing the clinker directly from the hottest zone in the kiln and cooling it in the absence of any gas contg  $O$ . The cooling may be effected in an atm. of water gas, producer gas or  $H_2O$  vapor in a closed vessel or by quenching with  $H_2O$  or by allowing the clinker to cool in a heap in the air, the surface layer being removed in this case. App is described. *Cf. C. A.* 29, 12264.

Preparing raw materials for cement manufacture. Mikael Vogel-Jorgensen. *Brit.* 430,430, June 19, 1935. The raw materials are passed direct from 1 or more wash mills, without intermediate grinding, to 1 or more sieve machines which disintegrate the material and sep. the fine from the coarse particles. Each sieve machine comprises a sieve which surrounds the rotor carry log blades that project outward from the rotor and force the material against the sieve, the shape and inclination of the blades and speed of the rotor being so coordinated that the blades present advancing wall surfaces which receive all the material and distribute it substantially evenly in the axial direction of the sieve. The fine particles may be passed direct to a cement kiln or to a container for the finished slurry or may first be passed through 1 or more further sieve machines. The coarse particles, after being passed, if desired, through 1 or more further sieve machines, may be returned to the wash mill or mills or may be passed to a grinding mill and thence either back to the sieve machine or machines or direct to the container for the finished slurry.

Apparatus for cooling cement clinker. Harry Swadner Lee. *Ger.* 618,251, Sept. 6, 1935 (*C. I.* 80c. 14 20). This corresponds to *Brit.* 401,392 (*C. A.* 28, 2494).

Rotary kiln and associated apparatus suitable for cement, limestone or ore treatment. Johan S. Fasting

(to F. L. Smith & Co.). U. S. 2,019,179, Oct. 29  
Structural and operative details

Shaft furnace for burning cement, etc., fired with gaseous, liquid or pulverulent fuel. Ernst C. Loesche. Ger. 618,207, Sept. 5, 1935 (Cl. 80c 12)

Molding fibrous cement slabs in rolling-machines. Lina Schneider (nee Sturm). Brit. 431,103, July 1, 1935. Light fibrous cement slabs are produced by passing a band formed by stitching together wood fibers, straw, reeds, etc., through a slurry of magnesia or portland cement, cutting off lengths and placing them in molds to set. App. is described

Machines for coating tubes or similar articles internally with asphalt, varnishes, etc. Alfredo Vallini. Brit. 431,413, July 8, 1935

Coating surfaces. The British Mannesmann Tube Co. Ltd. and Arthur J. Hodgkiss. Brit. 431,562, July 11, 1935. An Fe or steel pipe or tube, while heated and containing a quantity of fluid bitumen in the bottom, is maintained substantially horizontal and rotated slowly, e. g., by rollers to lap or spread the bitumen in successive layers into a uniform coating, the speed of rotation being insufficient to subject the bitumen to any appreciable centrifugal force. A small quantity of filler, e. g., slate dust, kieselguhr, may be added.

Concrete and hydraulic cement. Dewey & Almy Ltd. Brit. 431,679, July 8, 1935. This corresponds to Fr. 763,952 (C. A. 28, 523)

Colored concrete. Dewey & Almy Ltd. Brit. 431,680, July 8, 1935. Addn. to 431,679 (preceding abstr.). See Fr. 44,218 (C. A. 29, 3131)

Light weight aggregate suitable for use in concrete. Carrell W. Bowyer. U. S. 2,017,889, Oct. 22. A lightweight aggregate is prepared by rapidly cooling molten slag, reheating it to near the m. p., and gradually recooling it.

Insertible vibrating device for use with concrete before setting. Enoch B. Jorgensen (to Vibro Co. Ltd.). U. S. 2,018,789, Oct. 29. Structural and mech. details

Apparatus and method for molding articles from concrete, etc. Eugene Frersumet. Brit. 431,484, July 9, 1935

Road materials. Société de recherches et de perfectionnements industriels. Brit. 431,781, July 8, 1935. See Fr. 762,692 (C. A. 28, 3204). Powder pitch may be used in place of the powder bitumen

Road materials. Soc. anon. des ciments portland de Rombas. Fr. 784,582, July 22, 1935. Blast-furnace slag, containing a high proportion of lime, which has been quickly cooled in air and finely ground is mixed with bituminous road materials

Road surfacing compositions. Société de recherches et de perfectionnements industriels. Brit. 431,474, July 8, 1935. A compn. that can be spread by app. usually used for spreading ordinary road tar comprises a tar bitumen or tar-pitch mixt. contg. 65-85% of bitumen or pitch, and a carbonaceous filler, preferably finely powdered coal, comprising 25-40% by vol. of the total compn. Cl. C. A. 29, 6599

Road surfacing and other compositions. Wm. F. Rees and Wm. F. Rees Ltd. Brit. 430,979, June 28, 1935. In material for surfacing roads, roofs, etc., of the type consisting of particles of aggregate coated with matrix and then mixed with aggregate of smaller particle size, the matrix is sufficiently soft to be the equiv. of bitumen having a penetration greater than 350. The matrix may be tar, resinous and asphaltic materials or petroleum or rosin distn. residues and the aggregate may be limestone, granite, slag or clinker. In an example,  $\frac{1}{4}$  m. to dust limestone is put through a 20 mesh sieve, the material retained on the screen is heated to 150°F., treated with asphaltic or erosote oil and mixed with 400-penetration bitumen at 210-50°F., i. e., flowable, the fines from the screen then being mixed in the cold. The quantity of fines added equals that of the coarse aggregate and the bitumen used amounts to 6% of the total aggregate

Molded artificial stone. Charles H. Hagopian. U. S. 2,018,355, Oct. 22. A soln. formed of water,  $MgSO_4$ ,

$H_2SO_4$ ,  $MgCl_2$ , chrome alum and  $MgF_2$  is used for prep. a mass of cream-like consistency with a mixt. formed from caston, talcum, calcined magnesite, borax and sand, and China wood oil is added just before pouring the final mixt. into a mold

Artificial marble. Ernesto Revelant. Brit. 430,948, June 27, 1935. See Fr. 768,166 (C. A. 29, 574)

Cementitious building tile, etc. August 11. Serton (to Superior Cement Corp.). U. S. 2,018,192, Oct. 22

A fluid mixt. of cementitious material of a cream like consistency is placed in a sheet metal mold having resilient side walls and the mold is vibrated to dispel air from the mixt. and to give it a hard smooth dense surface where it comes into contact with the surfaces of the mold after setting and hardening.

Building blocks. Heinrich Frank. Swiss 173,321, June 17, 1935 (Cl. 85). These are made by molding or pressing a mixt. of shavings,  $(AcO)_2Ca$ ,  $NaOH$  lye, cement and water

Sheet material suitable for various structural uses. Albert C. Fischer (to Philip Carey Mfg. Co.). U. S. 2,019,449, Oct. 29. Compressible and expandable strips are formed by mixing a mass of ductile waterproofing binder with vegetable reinforcing elements of relatively large surface areas such as corn husks and finely divided fibers and forming the material into a sheet between belts.

Constructional material suitable for partitions or panels. Philip B. Brill and Geo. H. Ellis (to Insulite Co.). U. S. 2,018,911, Oct. 29. Insulating material or the like is formed with a core of pulped hemicellulose material on the opposite sides of which are plates of metal united with the core by a casing cementing compn., kerfs extending along at least 2 edges of the composite material.

Preparing exfoliated Jeffersonite suitable for use in wall plasters, etc. James Keeth (to Universal Insulation Co.). U. S. 2,017,904, Oct. 22. Exfoliated Jeffersonite is finely comminuted in water to form a self-binding pulp and this pulp is mixed with a filling pulp formed by finely comminuting a vegetable fiber such as wood fiber in water, the resulting plastic compn. is dehydrated, and is then braked preparatory to use

Porous masses. Pietro Panzera and Carlo Pellegrini. Swiss 173,596, May 16, 1935 (Cl. 85). Porous masses for building or industrial purposes are made by soaking vegetable fiber in a soln. of  $CaCl_2$  and mixing with a cement with a Ca base

Hard masses. Géza Farkas. Swiss 174,661, Apr. 16, 1935 (Cl. 41). A solid vegetable filling material, alum, lithopone, etc., gypsum and a vegetable drying oil are mixed to form a hard mass for making wall or floor blocks or plates, etc.

Composition board suitable for use on walls and carrying an asphalt layer and differently colored grts. Robert S. Maclean (to Mastic Asphalt Corp.). U. S. 2,018,216, Oct. 22. Structural details

Synthetic lumber. Charles E. Hartford (to National Cornstalk Processes, Inc.). U. S. 2,019,452, Oct. 29. Pulp such as that of cornstalks is treated with chem. solns. such as a wax emulsion and fireproofing material and alum and a thick layer of the treated pulp is passed through a forming machine and press where excess of the solns. is removed (various operative details being described)

Wood. Hermann Gamber-Eggmann. Swiss 175,411, May 16, 1935 (Cl. 80a). Wood is toughened by impregnating it with a soap and size soln. and drying. The soln. may be applied while boiling. The wood may be pretreated with a boiling soln. of  $NaCl$

Ague wood. Jean Grusard and Félix Baptist. Fr. 784,378, July 22, 1935. Wood is artificially aged by heating it gradually and progressively to 160-220° at which it is maintained till the color is sufficiently deepened

Apparatus for drying wood, etc. Emil Raess. Swiss 176,698, July 1, 1935 (Cl. 80a).

Proofing wood against fungi. Imperial Chemical Industries Ltd., Thomas Callan and Stephen H. Oakshott. Brit. 431,344, July 1, 1935. Cut timber and wood products generally are protected against mildew or other fun-

gold growths by spraying or brushing with, or immersion in, a suspension or emulsion obtained by dispersing in  $H_2O$  a soln. of an arylamide of salicylic acid in an org. solvent and an admixed dispersing agent compatible with the org. solvent. In example, salicylamide is dissolved,

resp., in  $\beta$ -ethoxyethyl alc., MeOH and pine oil, the soln. being mixed with Turkey-red oil and dild. with  $H_2O$  for use. Other known compatible wood-preserving agents, e.g., cresotes, cresylic acids, may be added to the concd. mixts.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDIN H. EMERY

Fuel problems in central heating establishments  
V. W. Gianberg, *Tek. Foren. Finland* 35, 187-91 (1935).—Descriptions are given of various central heating plants which use garbage as fuel. An analysis of garbage is: moisture 40, ash 20, paper 10, coal and coke 0.2, wood shavings 2, food refuse 3, bone 4.8, glass 4.6, metals 2.4 and miscellaneous 2%. The performance on 3 municipal plants is 1 kg. steam per kg. garbage.

Liquid fuels I' O. Erkkö, *Suomen Kemistilehti* 8A, 103-5 (1935).—A survey of mfg. methods. R. H. J.

Hydrogenation of liquid fuels M. Stenart, *Industrie chimique* 22, 642-5 (1935).—A brief discussion of the problem from the tech. and economic standpoints.

A. Papineau Couture

Alcohol and alcohol gasoline blends as fuels for automobile engines III. Performance tests of alcohol, gasoline and alcohol gasoline mixtures as fuels for an eight-cylinder automobile engine A. L. Teodoro, *Philippine Agr.* 24, 352-87 (1935).—Up to 50% of 100° proof  $H_2O$  was miscible with gasoline at all temps. above 21°. 100° proof denatured alcohol was used for mixts. contg. more than 50%  $H_2O$ . Mixts. contg. as high as 20%  $H_2O$  were more economical than gasoline at full load.

A. L. Mehring

A new technic and apparatus for testing diesel fuels T. B. Hertz and P. H. Schweitzer, *Automotive Ind.* 73, 202-5 (1935).

A. L. Kaye

A new method for the rapid and exact determination of the hydrogen content of solid and liquid fuels. G. Lambiris, *Angew. Chem.* 43, 679-83 (1935).—The method consists of a combination of the calorimetric bomb combustion ( $O_2$ ) and the detn. of the formed  $H_2O$  by means of soly. data of the system alc.- $H_2O$ -petroleum hydrocarbons (phase sepn.). The total  $H_2O$  formed in the combustion is calcd. by the formula,  $x = (d - n) \times (11' - w) / (100 + 11') + d$ , where  $d$  is the wt. of (alc. +  $H_2O$  + ppt.) obtained by washing the bomb,  $n$  the amt. of  $CaCO_3$  added to the bomb (0.3-0.4 g. of  $CaCO_3$  for 0.5-1 g. of sample),  $11'$  the  $H_2O$  in the bomb detd. by the phase sepn. (exclusive of the 100 g. of original alc. used),  $w$  the  $H_2O$  which the alc. may have absorbed during storage, detd. by the phase sepn. like  $11'$ ,  $d$  the  $H_2O$  released as vapor when the bomb is brought to atm. pressure, calcd. as  $d = g \times 1' \times 10 / p_1$  ( $g$  = vapor density,  $1'$  = vol. of bomb,  $p_1$  = initial gas pressure). Detailed directions are given. Test results on chemically pure and technically pure substances and other pertinent data are presented. The variations of analytical results were 0.04-0.09% of  $H_2$  and 0.1-0.2% when alc. denatured with petroleum (100:1 by vol.) is used.

Karl Kanhammer

Microchemical analysis of solid fuels. W. R. Kliner, *Ind. Eng. Chem., Anal. Ed.* 7, 294-9 (1935); cf. C. A. 28, 631, 639-41. The adaptation of Pregl's microchemical methods to the analysis of solid fuels is discussed and modifications are suggested necessitated by the unique and chem. characteristics of solid fuels. The practicality of some of these modifications has been demonstrated in the Coal Research Lab., Pittsburgh, Pa.

J. W. Shupley

Comparative carbonizing tests with vertical retorts and vertical chamber ovens and the correlation of tests with Geipert apparatus with plant operation. H. Köhler, *Gas-u. Wasserfach* 78, 805-10 (1935).—Operating results secured with vertical retorts and vertical chamber ovens on the same coal are compared. In the latter, the mixed gas yield (coal gas plus water gas obtained on steaming retorts) is increased at the expense of the tar yield, and

a lower amt. of fuel is required for heating. The Geipert app. was used to det. the amt. of coke and gas compn. for various coals. The analysis of gas from the G. app. showed higher illuminant and  $H_2$  contents and less methane than gas from coin. carbonizing equipment, because of higher rate of carbonization in the G. app. The yield of coke could be correlated with practice by adding about 1.5% to the test results. The G. app. coke had a higher C content and lower volatile content than in plant practice.

R. W. Ryan

Microscopic and petrographic studies of certain American coals. Reinhardt Thiessen and C. C. Sprunk, *Bar. Mines, Tech. Paper No.* 564, 71 pp (1935).—The petrography and microscopy of the following 11 coals are described and illustrated by 42 figures, largely photomicrographs: Green River bed, Green River mine, Muhlenberg Co., Ky.; Upper Ireport bed, Wildwood mine, Allegheny Co., Pa.; Pittsburgh bed, Consolidation No. 63 mine, Marion Co., W. Va.; Pratt bed, Wylam No. 8 mine, Jefferson Co., Ala.; Sewell bed, Summetts mine, Lavette Co., W. Va.; and Sewell bed, Cranberry mine, Raleigh Co., W. Va.

Indiana coals—their classification and analysis. P. B. Place, *Combustion* 7, No. 4, 27-9 (1935); cf. C. A. 29, 60104.

Joseph H. Wells

Coal-sampling methods of the Detroit Edison Company. A. W. Thorson, *Combustion* 7, No. 4, 10-14 (1935).—Automatic devices for sampling coal from bucket and belt conveyors are described. A special design of rifle box has been developed to eliminate clogging with wet coal.

Joseph H. Wells

The economics of water treatment in the colliery industry. F. Hamer and S. Stevens, *Colliery Guardian* 151, 617-20 (1935).

B. H.

Carbonization of coal. Effects of variation of rate of heating during the carbonization of a typical coking coal. Wm. B. Warren, *Ind. Eng. Chem.* 27, 1530-4 (1935); cf. C. A. 29, 12209. Three series of carbonizations were made on Eilenborn coal to a max. temp. of 700° in which 2 rates of heating—1.4° and 21.5° per min.—were used in several combinations. The thermal history up to and after the plastic range is important since no direct correlation could be made between the effects found and the rate of heating through the plastic range alone. The vol. of gas is const. for the 2 rates of heating in the preplastic range but the  $H_2$  content is higher for the slower rate. Coke hardness is detd. largely by the rate of heating through the plastic range, being greater for the slower rate of heating.

Joseph H. Wells

Coal carbonization—the plastic stage. James H. Lum and Harry A. Curtis, *Ind. Eng. Chem., Anal. Ed.* 7, 327-33 (1935).—Correlation of the gas pressure-temp. curve of the Foxwell procedure with the condition of the coal during carbonization was made and data on plasticity were obtained by another method. Variables affecting the results were assumed to be rate of gas flow through the charge, packing of the coal in the fusion tube, length of the coal charge, screen analysis of the coal used and the rate of heating the charge. Gas flow of 6 cc. per min. per sq. cm. cross section of the fusion tube gave reproducible results. Irregularities due to packing the charge were readily obliterated and a length of 2.5 cm. of charge was found satisfactory. Wide variations in results were noticed depending on the screen analysis and these variations

were not removed by grinding, briquetting and regrounding fairly consistent values for the temps. of initial softening and max. gas pressure could be obtained by grinding to pass 10 mesh and keeping the amt. passing 80-mesh below 25%. A rate of 2° per min. in heating was found satisfactory. The max. gas pressure varied in successive runs and no significance was found to attach to the slope of the gas pressure-temp. curve as suggested by Layne (C.A. 19, 381, 21, 3117, 22, 859). No agreement was found between the height of the gas pressure-temp. curve as a measure of the degree of plasticity reached by a coal during carbonization and the degree of plasticity as indicated by the amt. of swelling observed when small briquets of the coal were carbonized. The rate at which coal in the plastic condition and under pressure passes through a small orifice was detd. and a correlation was found to exist between this rate, the temp. of initial softening, and the temp. of max. gas flow/pressure. J. W. Shipley

Hydrogenation of coal. V. Sihvonen. Suomen Kemistilehti 8A, 76-80 (1935).—Some of Germany's achievements in the utilization of lignite as a raw material in the chem. industries are described. The chem. reactions which appear in the manual of water gas are explained by the combustion theory of S. E. B. Jullola.

Note on the determination of nitrogen in coal. P. F. Hall. Chem. Abstr. Mining Sec. 3 Africa 3d, 28-31 (1935).—Beet's modifications (cf. C.A. 26, 6098, 29, 4154) of the Kjeldahl method for estn. of N in coal and cokes are reviewed and further modifications in reagents and procedures are suggested. The method is accurate, quick and money saving. Alcen H. Emery

Action of nitric acid on a bituminous coal. B. Juetner, R. C. Smith and H. C. Howard. J. Am. Chem. Soc. 57, 2322-26 (1935).—The action of  $NHNO_3$  in converting bituminous coal into sol. products has been shown to be chiefly an oxidation. The yield of humic acids reaches a max. in a few days, while that of the sol. acids increases slowly with time. If the reaction is carried out in air, only about 25% as much  $HNO_3$  is consumed as in its absence. The residue from the  $CaCl_2$  pressure extrn. of this coal oxidizes more rapidly than the original coal. Oxidation of the cokes obtained by thermal decompn. of the coal in vacuum shows no difference from the original coal with cokes up to about 440°. Cokes prepd. above this temp. show markedly greater resistance to oxidation. This temp. coincides with that at which gas evolution becomes rapid. Details of the ultimate compn. and functional groups on both types of acids formed in this oxidation show the regenerated humic acids contain markedly less HO than is reported for other humic acids, while the sol. acids contain negligible amts. In the humic acids only approx. half the O<sub>2</sub> detd. by ultimate analysis can be accounted for in functional groups, while in the sol. acids only small amts. of O<sub>2</sub> are thus unaccounted for. The presence in the sol. acids of  $C_6H_5(CO_2H)_2$  and  $C_6(CO_2H)_3$  was shown by isolation of their esters. Of the C of the coal which was oxidized to sol. acids, approx. 10% was recovered by decarboxylation as steam-volatile, aromatic hydrocarbons. The presence of acids more complex than the benzenic carboxylics is indicated. C. J. W.

Volatile matter of Pennsylvania anthracite. H. G. Turner and W. L. Keene. Ind. Eng. Chem. 27, 1373-6 (1935).—The compn. of the volatile matter of Pennsylvania anthracite was detd. on 38 samples considered to be representative of the area. The proximate and ultimate analyses of the coals are given. The samples were heated at temps. ranging from 21° to 1036° in a nichrome tube connected to 12-15 l. of space evacuated to less than 1 mm. pressure. With increase in the volatile matter from 3.8% in the low-volatile group to 7.6 in the high-volatile group, the gas yield increased from 5000 to 7200 cu. ft. per ton. The percentage of  $H_2$  is const. for all the coals, and averages 83%. No illuminants were detected. P. J. Wilson, Jr.

Control of forms of iron in the determination of fusion temperatures of coal ash. W. T. Reid. Ind. Eng. Chem., Anal. Ed. 7, 335-8 (1935), cf. C.A. 27, 178.—The effect of varying percentages of ferrous and ferric iron on

the viscosity of slags was detd. in a furnace operating in an atm. of N<sub>2</sub>. The standard of viscosity was chosen as 10 passes compared with castor oil and was detd. by estg. the fluidity by the ease of movement of a Pt rod inserted in the molten slag. The lowest temp. at which no resist. was felt to vertical movement of the rod, horizontal movement is but slightly impeded and the slag flows immediately into the trough left by the passing rod, is taken as the flow temp. of the slag. Flow temps. were found to rise with the percentage of ferric iron present. With the iron about 25% in the ferric condition the flow temp. was 1255°, while with about 64% ferric iron the flow temp. was 1400°. J. W. Shipley

Gasoline from coal. C. H. S. Tupholme. Ind. Eng. Chem., News Ed. 13, 414-15 (1935). E. J. C.

Humic acids. II. Walter Scheele, Werner Schulze and Hans Spandau. Kolloid-Z. 73, 84-90 (1935); cf. C.A. 29, 7949.—Humic acid was isolated from 2 lignites mined in central Germany. After successive 8-hr. extrns. with  $CaCl_2$  and  $Me_2CO$ , the humic acid was leached from the lignite by 14-day digestion with  $N NaOH$ ; the clear Na humate soln. was then acidified with  $HCl$  and the insol. humic acid sepd. by centrifuging; the ppt. was redissolved in aq.  $NaOH$ , the soln. filtered and the humic acid reprecip. with  $HCl$ ; the humic acid was washed thoroughly, first with  $HCl$  soln. and then with  $H_2O$ , and dried over  $P_2O_5$  in a vacuum oven at 80°. Both samples of humic acid were practically insol. in cold aq.  $KF$  soln., contained no more than traces of ale. sol. matter (humins, telomelic acid), and had an equiv. wt. of about 190. Boiling an aq. Na humate soln. contg. excess  $NaOH$  causes decompn. with the production of acidic substances sol. in aq. acidic solns. The decompn. is not an autoxidation because the same result is obtained whether  $N_2$  or  $O_2$  is bubbled through the soln. This decompn. also takes place at room temp., but requires a much larger excess of  $NaOH$ . Oscar T. Quimby

The structure of humic acid and its relation to lignin and coal. I. Sedletzki and B. Brunovskii. Kolloid-Z. 73, 90-1 (1935).—X-ray diagrams for lignin, humic acid, lignite, anthracite and graphite suggest a close structurally genetic relation between them. The d of these substances increases in the order given. Oscar T. Quimby

Practical solution to Salt Lake Valley smoke nuisance. S. Clark Jacobson and George W. Carter. Ind. Eng. Chem. 27, 1278-83 (1935); cf. C.A. 29, 4545.—The Salt Lake City area has a higher rate of soot fall than any other locality studied so far; it is due primarily to the use of bituminous coal in houses and small plants. Processing such coals by high-temp. distn. has not solved the problem, but when low-temp. distn. (300-750°) under pressure was used, secondary cracking of volatile products formed being used, the resulting C is not graphitic, but burns readily. Dust-free coals were treated in batch furnaces, at 538-740°, and surrounded by steam, in retorts as shown. Data on test runs, results obtained upon using such fuels in household heating devices and the marked improvements in smoke elimination are presented. W. C. Ebaugh

Manchester and District Junior Association. Presidential address. A. K. Collinge. Gas J. 212, 201-4 (1935).—Operating methods for reducing the costs in gas production are discussed. P. J. Wilson, Jr.

Natural gas in 1933. R. B. Harkness. Ann. Rept. Ontario Dept. Mines 43, Pt. 5, 1-51 (1935). A. H. E.

The use of gas for industrial purposes. F. L. Atkin. Gas World 103, No. 2672. Ind. Gas Suppl., 93-6 (1935). Gas J. 212, 259-62.—Small, gas-fired ovens are briefly described. Heated air is continuously recirculated at a rate 50 to 100 times that of natural convection. P. J. Wilson, Jr.

The chemist and works control. Arthur J. Doran. Gas World 103, 339-42 (1935); Gas J. 212, 205-7.—The gas-plant chemist's work is outlined. P. J. Wilson, Jr.

Fifty years of the Auer gas mantle, changes and developments. Karl Quasebaart. Gas u. Wasserfach 78, 765-9 (Oct. 12, 1935).—The discovery and development of the incandescent gas mantle are reviewed. R. W. Ryan

The flash system of carbureting [gas]. Thord

Nagel. *Gas J.* 211, 704 (1935); cf. C. A. 29, 6398, 7616.

Purification of manufactured gas with active carbon. Kurt Blume. *Gas-u. Wasserfach* 78, 785-9, 110-4 (1935).—The theory of the adsorption of vapors on active C is reviewed, with diagrams. Active C adsorbs little water as compared with silica gel and will take benzene out of a benzene-water mixt., while silica gel removes the water. For this reason, the heat of adsorption is greater with silica gel when removing vapors from gas containing water vapor. Adsorption isotherms are given for CCl<sub>4</sub>, benzene, acetone and ether, on active C. In absorbing vapors from manifold gas, the active C first becomes saturated with respect to CS<sub>2</sub> and unsat'd hydrocarbons, and these then escape. The benzene satn. point comes much later. Consequently to secure quant. removal of CS<sub>2</sub>, unsat'd hydrocarbons, etc., it is necessary to stop at about 1/3 of the benzene satn. point. The active C plant for recovering light oils at Bayreuth is described. Because of varying make, the rate of gas passage through the adsorbers varies widely, but uniformly good results are secured. The water condensate produced on steaming out the adsorbers has a very disagreeable odor due to cyanogen compds. Special valves on adsorber cooling and heating coils were required, because of very great temp. differentials. Steam requirements per gallon of light oil were approx. 34 lb., while cooling water requirements were about 23 lb. ft. of steam per lb., and labor requirements about 1/2 hr. for each steaming out period (the av. adsorption period was 3-4 hrs. for each adsorber). Based on the recovery of approx. 85 tons of light oil per year, operating costs were approx. \$18.70 per net ton (exchange at par). Capital charges, etc., increased this to approx. \$10.40 per net ton of light oil. When operating plant at 1/3 of the light oil satn. point so as to secure greater gas purification, costs were about 60% greater. The quality of the light oil recovered depends more on the type of carbonizing plant than the recovery system. However, the light oil must be redist'd. after admn. of Fe chloride soln. to remove low-boiling S compds.—thus removing yellow color and bad odor. Complete removal of naphthalene from gas by this process has caused a decrease in pressure drop in mains, but iron rust released on removal of naphthalene has collected at pockets or sharp turns in services, causing stoppages.

A new modification of the circular manifold type of gas-analysis apparatus. Minor C. K. Jones. *Am. Gas J.* 143, No. 4, 27-9, 110 (1935).—The app. has been improved by the incorporation of the Huff pumping pipet.

An electric gas generator. Ivar Høle. *Gas J.* 212, 271 (1935).—See C. A. 29, 6333.

Flow of natural gas through high-pressure transmission lines. T. W. Johnson and W. B. Bierwald. *Eur. Mines Monograph* No. 6, 120 pp (1935).—A fundamental study.

The latest form of flexible pipe main for gas. P. H. Wilson. *Gas J.* 212, 256-8 (1935); *Gas World* 103, 368-9. —The Stanton-Wilson self-adjusting joint for cast-iron pipe consists of 2 loose parts, a cast-iron locking ring and a joint ring of special rubber. The latter is special rubber, V-shaped in section, and provided with a Ph-sheath.

The locking ring is first placed on the spigot, the joint ring is put in front of it, and the end of the spigot inserted in the bell. By rotating the locking ring, lugs on it engage with lugs on the bell.

Benzene as natural gas. H. H. Schrenk, W. P. Vant and S. J. Pearce. *Bur. Mines, Rept. of Investigations* No. 3293, 2 pp (1935).—The dry natural gas supplied to the Pittsburgh station of the Bur. of Mines contained 2.91 and 2.98 p. p. m. by vol. of C<sub>6</sub>H<sub>6</sub>; a wet gas from a private well near Pittsburgh analyzed 17.5 and 17.9 p. p. m.

The age of the oil used in benzene recovery. G. C. Roco Avello. *Anales soc. esp. fis. quim.* 33, 714-20 (1935).—Wash oil, used for the recovery of C<sub>6</sub>H<sub>6</sub> from coke-oven gas, undergoes increase in viscosity with age,

which reduces markedly its absorptive properties. The reason for this is C<sub>6</sub>H<sub>6</sub> formation from the oil, a process insufficiently investigated. The effective, washed C<sub>6</sub>H<sub>6</sub> is always less than the recovered C<sub>6</sub>H<sub>6</sub>. P. M. Symmes.

Removal of nitric oxide from manufactured gas by dry purification material. K. Blume, H. Brückner and G. R. Haas. *Gas-u. Wasserfach* 78, 754-7 (1935).—In the course of dry purification a considerable decrease in the NO content of gas has been noted, and this has been attributed to formation of Rouson's salt (R. S.) or nitropotassium compds. The thick Rouson's salt, AlCl<sub>3</sub>(NO)<sub>2</sub>S<sub>2</sub>, is more stable than the red salt, and should be the one formed, but attempts to identify this salt by extg. spent purifying material with water, filtering, and extg. the filtrate with ether, failed to give the characteristic ether color. No nitropotassium could be found in the spent purifying material. By means of lab. expts. it was found that FeS<sub>2</sub> was necessary for the formation of R. S., and that FeS<sub>2</sub> would not yield R. S. In ordinary dry purifier operation, O is added to ensure continuous reactivation, and this prevents R. S. formation as insufficient FeS<sub>2</sub> is available. Under these conditions NO adsorbed to a slight extent may be evolved as NO<sub>2</sub>. In the absence of O, an NH<sub>3</sub> odor has been noted after NO adsorption. This is attributed to the following reactions: 2NO<sub>2</sub> + 6H<sub>2</sub>O + 21FeS = 2NH<sub>3</sub> + 2SO<sub>2</sub> + 21Fe(OH)<sub>2</sub>; and 3SO<sub>2</sub> + 4FeS + 6H<sub>2</sub>O = 7S + 4Fe(OH)<sub>2</sub>. In practice NO and NO<sub>2</sub> may be removed almost quantitatively by using a small box of sulfided purifying material before the usual box series, and admitting O after this box.

The recovery of sulfur from coal gas. O. W. Roskill. *Gas World* 103, 350 (1935).—The present S capacity of Thio process plants in Germany amounts to 1500 tons annually. Developments in S recovery from dry purification are discussed.

Benzene synthesis from carbon monoxide and hydrogen under ordinary pressure. XXVI. Gas contraction and benzene synthesis. Shunzo Tanioka and Yoshin Mura. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 23, 48-50 (1935); cf. C. A. 29, 4511<sup>14</sup>.—No relation appears to exist between the total gas contraction and yield of benzene.

Free carbon in coal tar. Erich Bierling. *Kolloid-Z.* 72, 92, 100 (1935).—A crude coal tar from Knurw was dist'd. in the range 180° to 412° and the tar fractions were tested for free C (Berl and Schildwächter, C. A. 22, 44(9)), viscosity and oil, tar and coke content. Viscosity increased with increase in free C. The latter existed in the coal tar in every state of subdivision from mol. dispersion through colloidal to coarse and fully insoluble. Heating the coal tar under pressure in the range 200° to 425° coagulated the C particles as shown by the viscosity curve and by no count. Plasticity of the pitch was decreased because of the coagulation. In distn. of coal tar a condensation of the dispersed C particles takes place along with a possible small cracking.

Coke Oven Manager's Association. Presidential address. T. Westphal. *Gas J.* 212, 316-18 (1935); *Gas World* 103, No. 2074 Coking Sect., 109-11.—Research problems in the coke and gas industries are outlined.

Process of formation of coke. M. Chorazy and J. Chmielewski. *Przemysł Chem.* 19, 113-22 (1935).—Permeability of semi-coke and cokes secured from coal at temp. from 450° to 1000° was investigated by a method worked out by the Coal Department of the Polish Chem. Research Inst. The app. is described briefly. Decidedly different permeabilities of cokes may be shown depending on the coal from which they are derived as well as the temp. at which they were obtained. The permeability of coke obtained at high temp. from coking coals rises to a max. value while that for cokes obtained at various temps. from gas-flaming caking coals possesses 2 distinct maxima corresponding with those of enhanced degassing of coal. Depending on the rate of heating not only different values of permeability of a given coal may be obtained but even the character of the permeability curve may be altered. The fundamental shape of the temp.-permeability curve

is not changed by varying the grain size of coke, but larger grains are likely to increase the permeability values at the given temps. The addn of bituminous substances leads to increased permeability of semicokes and cokes without changing the character of the curves, but the addn of debittuminized materials (semicoke, *put-head coal slack*, and hard coals) not only increase permeability generally but also shift the temp. of max. permeability. When mixed with *nitran*, *durain* produces an increase in permeability but *fusain* has no significant effect.

A. C. Zarbhn

Geological aspects of research on coal (Hickling) 8  
Purifying H for the hydrogenation of carbonaceous material (Brit pat 431,970) 18

Volatile combustible liquid Cruma soc anon Swiss 175,341, May 1, 1935 (Cl 366). The liquid, contg. ether, is obtained by first heating EtOH in the presence of a catalyst consisting of a metal oxide, and then heating the product with a catalyst consisting of a metal salt. Examples of the first catalyst are,  $Al_2O_3$ ,  $Fe_2O_3$  and  $Cr_2O_3$ , and of the second catalyst are,  $K_2S_2O_8$ ,  $(NH_4)_2SO_4$ ,  $MgCl_2$ ,  $CuCl$ ,  $CaSO_4$ , etc.

Elongated closed tank for containing liquefied gases such as liquefied propane for use as fuel. Paul S. Endacott (to Phillips Petroleum Co.). U. S. 2,019,094, Oct. 29. Various structural details.

Controlling furnace combustion of fuels such as fuel oil Ernest O. Scheerer. U. S. 2,018,925, Oct. 29. Various details of app and operation.

Distilling solid carbonaceous materials Hastings J. Holford Brit 431,397, July 5, 1935. Coal, peat, lignite, shale, *cannel coal*, etc., are carbonized in thin layers on shelves, the heating means comprising direct contact with superheated steam and a body of heated refractory material in proximity to the distn zone. App is described.

Distilling and gasifying solid carbonaceous materials Jean Lefevre Brit. 431,396, July 17, 1935. Coal, etc., is fed from a hopper into the space in a preheated container above incandescent coke, the layer of fuel being distd by heat radiated from the preheated walls of the container and from the coke. App is described.

Retorts Low Temperature Carbonisation Ltd and Whiston A. Bristol. Brit 431,772, July 16, 1935. Vertical or inclined retorts of narrow cross section are provided with top and bottom fittings whereby either containers enclosing the charge or the charge in a loose condition may be fed to and discharged from the retorts.

Retorts for the heat treatment of solid materials Samuel Moore Brit. 430,969, June 27, 1935. Coal, shale, peat, etc., or semisolid substances are fed by a screw conveyor into a retort between the upper and lower flights of a conveyor between the blades of which the material is propelled in sep. charges through the retort floor.

Destructive hydrogenation I. G. Farbenindustrie A.-G. (to International Hydrogenation Patents Co. Ltd) Brit. 431,435, July 8, 1935. See Fr 777,119 (C. A. 29, 3812).

Destructive hydrogenation I. G. Farbenindustrie A.-G. Brit 431,683, July 9, 1935. In obtaining low-boiling aromatic hydrocarbons from high-boiling hydrocarbon liquids consisting of or contg. aromatic hydrocarbons and derived from mineral coal, e. g., coal-tar fractions, heavy benzene obtained by destructive hydrogenation of mineral coal, the liquids are first refined by a heat-treatment in presence of H under conditions to remove S and O compds and to hydrogenate some of the double bonds without decomn into lower mol compds. The treatment is effected at above atm. pressure, e. g., 20 atm., and at 100-450° in presence of S-tinimane catalysts. The liquid may be heated to about 200°, passed into a separator from which polymerized compds. are removed, and the remaining product led with H over a heated catalyst, e. g., at 100-300° under pressures up to 500 atm over a hydrogenation catalyst consisting of oxides or sulfides of the 5th and 6th groups. The refined product is led with H under

100-500 atm and at 500-700° over catalysts such as compds of the metals of the 2nd to 8th groups.

Destructive hydrogenation. International Hydrogenation Patents Co. Ltd. Brit. 431,795, July 16, 1935. In a multi-stage process of destructive hydrogenation in which the carbonaceous materials are treated initially in the liquid phase and finally in the vapor phase, the products from the 1st stage are sep'd. in a catch-pot maintained under such conditions that no condensation takes place, i. e., at less than 20° below the temp. of the reaction vessel, and the vapors are passed, without condensation, to the vapor-phase stage. App is described.

Destructive hydrogenation of coals, tars, mineral oils etc. I. G. Farbenind. A.-G. (Mathias Pier and Eusto Anthes, inventors). Ger. 618,315, Sept. 12, 1935 (Cl. 12a. 1.05). Use is made of a circulatory system around which the hydrogenating gases, and vapors produced in the process, are caused to pass without any substantial reduction in temp. Vapors are withdrawn from a point in the cycle, continuously or periodically. As an alternative, the cycle may include means whereby the vapors are modified, e. g., a catalytic treatment zone assoc. with means for varying the temp. App is described.

Carbonizing processes Harold P. Stephenson. Brit 431,063, July 1, 1935. In the low-temp. carbonization of coal to yield a semi-coke and distillates, the powder coal is mixed with a heavy liquid hydrocarbon, e. g., tar, fuel oil and a catalyst and pre-heated under pressure before being passed by hydrostatic pressure through zones of increasing temp. A pressure of 750 lb per sq in. and a temp. of 300° is maintained in the preheater and 500-600° in the retort. App is described.

Carbonizing coal in an externally heated intermittent carbonizing retort chamber Wilhelm Fits and Joseph Daniels. U. S. 2,018,664, Oct. 29. Various details of app. and operation are described.

Apparatus for washing coal Simon-Carves Ltd and James Robson. Brit. 431,865, July 17, 1935. A discharge valve of a washer box is controlled by the upward and downward movement of a float which is completely submerged in the material being stratified, means independent of the discharge-valve operating mechanism being provided to prevent the float from emerging from the bed of materials.

Shaking sieve device for dewatering fine coal Fred Krupp Grusonwerk A.-G. Ger. 618,152, Sept. 2, 1935 (Cl. 1a. 17).

Air filter suitable for engine intakes Howard P. Weiss (to C. F. Burgess Laboratories, Inc.). U. S. 2,019,241, Oct. 29. Intertangled, elongated wood strands are bonded together by an adhesive such as a casein or other glue which forms a discontinuous coating on the strands.

Drier for steam G. Hochstrasser & Sohn Swiss 176,728, July 1, 1935 (Cl. 107d).

Fuel gas Metallgesellschaft A.-G. (Otto Hubmann, inventor). Ger. 616,595, Aug. 3, 1935 (Cl. 12a. 1.05). Addn to 592,223 (C. A. 28, 23817). The process of Ger. 592,223 is modified by causing the gas produced to exert a hydrogenating action on the heated solid fuel before the latter is subjected to the gas-producing reaction. An app is described.

Fuel gas Metallgesellschaft A.-G. Ger. 616,580, Aug. 3, 1935 (Cl. 2a. 2.05). Addn to 592,223 (C. A. 28, 23817). Pulverulent or finely granular fuel, kept in suspension by the gasifying agent, is used in the process of Ger. 592,223. App. is described.

Purifying gases Studien-und Verwertungs-G. m. H. Fr. 784,337, July 22, 1935. Compds of S are removed from gases contg. CO and H<sub>2</sub> by using alk. carbonates in amt. of at least 5% in intimate mixt. with oxides or hydrosides of Fe capable of reacting at temps. below that at which accessory reactions with CO would take place (230°).

Purifying gas such as a natural gas Thomas S. Bacon (to Lone Star Gas Co.). U. S. 2,019,468, Oct. 29. Gas contg. H<sub>2</sub>S as an impurity is brought into contact under superatm. pressure, in the presence of O, with alkali soln. contg. a complex of metal compds formed by

mixing a soln. of a mixt. of Zn and Fe salts or the like with 1 an aq. alkali soln. App. is described.

Gas-scrubbing processes. W. C. Holmes and Co. Ltd., Charles Cooper and Daniel M. Henshaw. Brit. 430,980, June 27, 1935. All the volatile hydrocarbons such as  $C_2H_4$  and a substantial proportion of  $CS_2$  are removed from combustible gases by scrubbing with a vol. of wash oil, unsatd. with respect to  $C_{11}H_{22}$ , of the order of 50 gallons per 1000 cu. ft., and a proportion of the hydrocarbons is afterward returned to the gases. The used wash oil may be only partly stripped and returned into contact with the gases while contg. a substantial proportion of the absorbed substances, or some of the  $C_2H_4$  recovered by a complete stripping is revaporized into the scrubbed gas App. is described.

Gas producers, gaseous mixtures. Metallgesellschaft A.-G. Brit. 431,030, June 28, 1935. Addn to 364,407 (C. A. 27, 2020).—In a process as described in 364,407 for obtaining a combustible gas rich in H and  $CH_4$ , and in which solid fuel is gasified under high pressure with O, or air admixed with O, and steam, air and steam are used and the CO and part of the N are removed from the resulting gas in a sep. plant. The air is compressed to 20–30 atm., but pressures up to 200 atm. may be used, the higher the pressure the lower the N content of the gas, and steam is mixed with the air (1/6), the mixt. being superheated to about 500°.  $CO_2$  and  $H_2S$  are removed by washing with  $H_2O$  under pressure and by treatment with NaOH and the CO and part of the N are removed by cooling,  $CH_4$  and other gaseous hydrocarbons together with H and N being left. The residual CO and N may be used for superheating the gasifying medium. The CO may be converted into  $CH_4$  or H catalytically prior to its sepn. from the mixed gases. The sep. CO may be converted into  $CH_4$ , and (or) H which is mixed with the gas before or after it is treated in the sep. plant.

Gas producers. I. G. Farbenindustrie A.-G. Brit. 431,480, July 9, 1935. A gas suitable for illuminating gas is obtained by supplying gases such as waste gases from low-temp. carbonization or oil-cracking plants, fuel-distn. gases, natural gas or gases from the destructive hydrogenation of coal tars or mineral oils, to a gas producer, such as described in Brit. 214,544 (C. A. 18, 2802), in which the incandescence fine-grained fuel is kept in movement similar to that of a boiling liquid. These gases may be mixed with steam or  $CO_2$ , and the gas, rich in O for maintaining combustion, may also have an addn of steam or  $CO_2$ . The resulting gas contains at least 12 and preferably 20–30%  $CH_4$ .

Gas producers. Hermann Kahlbötzer. Brit. 431,635 July 11, 1935. Fuel such as wood chips, sawdust or maize cobs is used in a producer having an outer shell enclosing an inner shell open at both ends and attached to the outer shell by a trough which receives liquid condensates from a domed top.

Spirally-guided gas holders. Geo. F. H. Beard, Jr. Brit. 431,086, July 1, 1935. Two carriers, which are pivoted to a carriage, each support 1 guide roller bearing on the upper surface and 1 guide roller bearing on the lower surface of the guide rail, the axle of 1 upper surface guide roller of each pair being connected by an approx. vertical link to the axle of the lower surface guide roller of the other pair.

Sealing strip for waterless gas holders. Friedrich Schürmann (to Stacey Bros. Gas Construction Co.). U. S. 2,019,273, Oct. 29. Structural details.

Ammonia recovery from hot distillation gases. Matthew J. Müller (to Smet-Solvay Engineering Corp.). U. S. 2,018,893, Oct. 29. Hot coal-distn. gases are partially cooled to obtain an aq. liquid contg. a portion of the  $NH_3$  originally present in the gases and a lesser portion of  $CO_2$  and  $H_2S$ , the liquid is subjected to a distn. treatment to remove the  $NH_3$ ,  $CO_2$  and  $H_2S$  as gases, the gases are washed with a quantity of water sufficient to remove substantially all the  $CO_2$  and  $H_2S$  but insufficient to dissolve all of the  $NH_3$ , the wash water is sep. from undissolved  $NH_3$ , heated to espel dissolved gases including  $NH_3$ , and the expelled gases are brought into contact with acid to fix the  $NH_3$ . App. is described.

Dehydrating and distilling tar. Stuart P. Müller (to Barrett Co.). U. S. 2,018,377, Oct. 22. Fresh hot coal-distn. gases are cooled to sep. tar from them; the cooled gases are reheated and are passed into direct contact with tar contg. water to heat the tar and vaporize the water, and resulting gases are admixed with fresh coal-distn. gases, and the admixed gases are then passed to a light-oil absorber for conjoint recovery of light oil from the coal-distn. gases and any light oil distd. from the tar during its dehydration. An arrangement of app. is described.

Coking processes. Société générale de fours à coke, systèmes Léocq, Soc. anon. Brit. 431,825, July 16, 1935. In the production of semi-coke, the coke oven is heated in 2 stages, in the 1st of which the charge is heated so as rapidly to attain a temp. of about 700° in the material adjacent to the walls of the coking chamber and in the 2nd the heating is reduced so that no substantial amt. of the material exceeds 600°. The oven walls are heated by convection and radiation during the 1st stage and by radiation only in the 2nd stage. App. is described.

Coking processes. Linsele, Koksofenbaugesellschaft m. b. H. Brit. 432,390, July 25, 1935. To improve the yield of by-products, e. g.,  $C_2H_4$ , from coke ovens, the distillates, during the 1st portion of the heating period, are led off by a relatively long path through the oven chamber and (or) through the hot brickwork and during the latter part of the heating period are removed by a shorter path to avoid overheating. App. is described.

Plant for quenching glowing coke. Buss A.-G. Swiss 175,289, July 1, 1935 (Cl. 12a).

Coke ovens. Clemens Delkeskamp. Brit. 431,490, July 9, 1935. In a retort bench for the distn. of fuel briquets comprising a no. of open-topped narrow retorts arranged in a ring and provided with a common discharging device, each of the retorts is substantially quadrilateral in cross section and has 2 of its sides externally heated by flues. In 431,490, the vertical-retort bench is provided with a distributor element rotated continuously about the vertical axis of the bench and delivering into an annular feed shaft, which is maintained substantially full of charge material so that the briquets slide gently thereto without free fall.

Coke ovens. Joseph Becker (to The Koppers Co. of Delaware). Brit. 432,348, July 25, 1935. In a vertically-flued coke oven, recirculation of a portion of the combustion products is effected by connecting a down-cast flue in 1 heating wall to an up-cast flue in an adjacent wall through a duct passing beneath the intervening oven.

Vertically-flued coke ovens of the cross-over type. The Koppers Co. of Delaware. Brit. 432,345, July 22, 1935, 432,361, July 25, 1935 and 432,413, July 22, 1935, divided on 432,345.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. YARAGHER

Petroleum in 1933. R. B. Harkness. Ann. Rept. Ontario Dept. Mines 43, Pt. 5, 52–6(1935). A. H. E. Efficiency of petroleum-fractionating columns. C. W. Cannon and R. L. Huntington. Refiner & Natural Gasoline Mfr. 14, 18–20, 60–2, 424–5, 490–3(1935).—The subject is discussed under the headings of (1) capacity and

efficiency of lab.-packed column; (2) efficiency of a com. bubble tower; (3) a study of lab. packed columns; and (4) efficiency of different sections of a com. bubble-plate column.

Critical solution temperature of mineral oils. E. Velinger and J. D. Herrenschildt. Compt. rend. 201,

780-2(1935).—With a solvent consisting of  $\text{COMe}_2$  + 1 AmOAc the crit soln temp (T C D) of a mixt of equal parts of mineral oil and solvent decreases linearly with percentage of AmOAc. With equal amts of solvent consisting of 9COMe<sub>2</sub> + 1AmOAc, the T. C. D. of slightly refined oils and those of av. degree of refining did not vary after 25 months in a transformer, but that of a highly refined oil decreased rapidly after 10 months of use (cf Müller, C A 29, 5255). The T. C. D. of a crude Columbia oil rose with amt (to about 9%) of  $\text{H}_2\text{SO}_4$  used in refining, and then remained approx. stationary. Plotted against percentages of superrefined oils in the same solvent the T. C. D. for all percentages of 4 (Pennsylvania, Russia, Venezuela and Texas) showed very slight decreases in this order, the T. C. D. of a new oil of varying degrees of refinement showed marked increase with increased refinement. C A Silberrad

Analysis of acid sludge from mineral oil treatment. E. Holzman and Stefan Suknarowski. *Ind. Eng. Chem., Anal. Ed.* 7, 378-80(1935).—A method of analysis which can be applied to all acid sludge, from both paraffin base and naphthene-base oils treated with dil. concd., or fuming  $\text{H}_2\text{SO}_4$ , in which the sepn. and detn. of neutral constituents, sulfonic acids, insol. parts, and free  $\text{H}_2\text{SO}_4$ , is described. The method is based on the ability of benzene to dissolve neutral constituents (after previous sludge neutralization) and the ability of AmOH to ext. the sulfonic acids, leaving the unchanged  $\text{H}_2\text{SO}_4$  in aq. soln. The  $\alpha$ - and  $\gamma$ -sulfonic acids can be further sepd. by formation of the Ca salts and extg. with ether. Further work is necessary for detg. the water content of a sludge, since the xylene method proves inadequate. J. L. E.

Inspection of oil refinery equipment. Franklin L. Newcomb. *Refiner & Natural Gasoline Mfr.* 14, 92-7, 158-62, 402-8, 449-54(1935).—A series of articles comprising comprehensive directions for the inspection of all equipment. Charts, diagrams and instructions are presented. J. L. E.

Theory of cracking [oils]. Gustavo A. Fester. *Rev. facultad quim. ind. agr. (Univ. nat. Mar del Plata, Argentina)* 3, 205-10(1934), cf C A 27, 47383. W. F. Bruce

Octane number improvement in naphtha reforming. S. D. Turner and E. J. Le Roi. *Ind. Eng. Chem.* 27, 1347-9(1935).—A correlation of plant-cracking data is effected that satisfactorily gives the octane no. obtainable in reforming naphtha in terms of the original octane of the charge and the amt. of cracking to which it is subjected. This amt. is expressed in terms of equiv. secs. at 900° F., which are derivable from or convertible to an actual time-temp. curve, on the assumption that the cracking rate doubles with a rise in temp. of 25° F. For purposes of design the method can be worked backward. J. L. E.

Polymerization of ethylene under high pressures in the presence of phosphoric acid. N. M. Yusaf and Vietnam Pines. *Ind. Eng. Chem.* 27, 1364-9(1935).—Polymerization of  $\text{C}_2\text{H}_4$  in the presence of  $\text{H}_3\text{PO}_4$  within the temp. range 250-330° and an initial  $\text{C}_2\text{H}_4$  pressure of 50-65 atm. yields a mixt. of paraffinic, olefinic, naphthene and aromatic hydrocarbons. Thermal polymerization under similar conditions yields higher-boiling hydrocarbons, but no aromatic compds. The catalytic polymerization gives isobutane, the yield of which increases from 2.5% by wt. of the  $\text{C}_2\text{H}_4$ , which reacted at 250° to 18.8% at 330°. Analyses of the gases at different temps. leads to the assumption that cracking does not take place to any appreciable extent. A mechanism of  $\text{C}_2\text{H}_4$  polymerization is suggested. P. J. Wilson, Jr.

The development of specifications for lubricants. O. L. Maag. *Blast Furnace Steel Plant* 23, 696-7(1935). E. H.

Selection of lubricants for industrial purposes. F. J. Slee. *Oil Colour Trades J.* 88, 1173-4(1935).—A general discussion of lubricants, with some detail on steam cylinder oils, steam turbine and enclosed steam engine oils. Specifications needed for purposes of identification only, and those to insure proper functioning are noted. W. H. Boynton

Analytical recognition of fat-containing lubricating oil. A. Baader. *Allgem. Oel- u. Fett-Ztg.* 32, 381-4(1935).—The usual method of detg. fat in mineral oil, i. e., the use of 0.1 N NaOH in 1.05 benzene alc. soln. was found unsuitable. On one sample, with 1.15 benzene alc. solns of 0.1, 0.2 and 0.5 N NaOH the sapon. values were 7.49, 14.60 and 24.36, resp.; and the results with 1.05 benzene alc. solns of the above concns. of NaOH were 5.50, 11.90 and 26.5. The use of the stronger concns. of NaOH is recommended for sapon. fat in the presence of mineral oil. M. M. Piskur

Certain sapinic acids obtained from various species of pine and spruce. Torsten Hasselström and Marston Taylor Bogert. *J. Am. Chem. Soc.* 57, 2118-21(1935).—The sapinic acids of *Pinus palustris*, *P. caribbea*, *P. taeda*, *P. serotina*, *P. sylvestris* and *Picea excelsa* consist chiefly of a mixt. of d. pimaric and l-sapinic acids. This finding is in accord with the results of other investigators. The presence of the former acid is proved by the formation of dihydropimaric acid when the sapinic acids are catalytically reduced; the latter is indicated by the fact that, when refluxed with glacial AcOH, the acids yield Steele's abietic acid as one of the products. The stability of d. pimaric acid and its existence in the sapinic acids explain its presence in ordinary colophony. Phys. consts. of the acids from the various sources are given. C. J. West

Polymerization of unsatd. acids [lubricating oils] (Chowdhury, et al.) 27. Tetraalkyl Pb (Fr. pat. 784,222) 10. Destructive hydrogenation of mineral oils, etc (Ger. pat. 618,315) 21. Polynuclear phenols and nitration and sulfonation products [as antioxidants and polymerization inhibitors for motor spirit] (Brit. pat. 431,045) 10. Emulsions [as lubricants] (Brit. pat. 431,642) 13

Petroleum oil distillation. Leo D. Jones (to Sharples Specialty Co.). U. S. 2,018,309, Oct. 22. Oil such as crude petroleum is heated to effect its partial vaporization, brought into contact with carrier vapor, and the heated liquid residue is also brought into contact with carrier vapor and the resulting mixed vapors are cooled to condense oil from them and the remaining vapors, con. carrier vapor, are used in the first mentioned contacting step. App. is described.

Breaking petroleum oil and water emulsions. Harmon P. Fisher (to Petroleum Rectifying Co. of Calif.). U. S. 2,018,302, Oct. 22. Various details of app. and operation are described for continuous treatment of the emulsion with a mixt. such as one contg. iron pyrites and quartz, etc.

Vapor-phase petroleum oil cracking. Charles B. Buerger (to Gulf Refining Co.). U. S. 2,019,070, Oct. 29. Hot cracked vapors from vapor-phase cracking of material such as a gas oil or fuel oil are intimately brought into contact with charge oil so as to vaporize vaporizable constituents of the latter; liquid residuum of the charge oil is removed and discarded, and the mixed vapors are subjected to reflux condensation in a refluxing zone, uncondensed vapors are removed and condensed, and condensate is withdrawn from the refluxing zone, heated to about 315° and returned to the refluxing zone. Condensate from the refluxing zone is subjected to vapor-phase cracking for production of addnl. hot cracked vapors for intimate contact with further quantities of charge oil. App. is described.

Cracking hydrocarbon oils. Guy N. Harcourt (to Cross Development Corp.). U. S. 2,017,860, Oct. 22. Vapors from oil cracking by heat and pressure are dephlegmated, passed through a purifying stage (such as may involve use of fuller's earth) where only those vapors are treated having approx. the h. p. range of the desired final products, other vapors being withdrawn, condensed and the condensate used for bringing the vapors being dephlegmated into contact. App. is described.

Cracking hydrocarbon oils. Pike H. Sullivan (to Gasoline Products Co.). U. S. 2,017,874, Oct. 22. A heavy oil contg. residual constituents such as a reduced crude oil

is subjected to a mild cracking temp. under a high superatm. pressure (initially a temp. of about 420° under a pressure of over 200 lb. per sq. in.) and the products are fractionated to recover a clean condensate, and the latter is separately subjected to more drastic cracking conditions and the products are fractionated to sep. gases, naphtha and heavier distillate, the gases are fractionated to sep. them into a lean fraction comprising principally H and CH<sub>4</sub> and a rich fraction containing a relatively large amt. of gaseous olefins and this fraction is commingled with the heavy hydrocarbon oil for solution in the mild cracking temp. and high superatm. pressure to effect a polymerization of gaseous olefins to form normally liquid products. App. is described.

**Cracking hydrocarbon oils.** Harold C. Weber (to Universal Oil Products Co.). U. S. 2,018,161, Oct. 22. A pair of electrodes at least one of which is made of a catalytic metal such as Ni is immersed in an oil such as a cracked residuum and a radio frequency current is passed between the electrodes by which the catalytic metal is dispersed in finely divided form throughout the oil. It is brought into contact with the oil and it is simultaneously subjected to cracking conditions of temp. and pressure.

**Cracking hydrocarbon oils.** Richard F. Trow (to Texas Co.). U. S. 2,018,175, Oct. 22. An oil such as a topped or gas oil is subjected to cracking in a series of cracking stages under superatm. pressure, residual liquid is withdrawn from an earlier stage and subjected to distn. in a zone of reduced pressure, a 2nd residual liquid is withdrawn in a more advanced state of cracking from a later stage; the 2nd liquid is cooled and introduced into the reduced pressure distn. zone mentioned, and a final condensed condensate is withdrawn from the reduced pressure distn. zone. App. and various details of operation are described. Cl. C. A. 29, 831417.

**Cracking hydrocarbon oils.** Charles H. Angell (to Universal Oil Products Co.). U. S. 2,018,699, Oct. 29. An oil is subjected to cracking conditions of temp. and pressure in a primary heating zone such as a pipe coil and the heated material is passed to a reaction zone from which vaporous and liquid products pass to a sep. zone, vapors are fractionated to sep. sufficiently converted components as vapor from insufficiently converted components as reflux condensate and the reflux condensate is subjected to conversion conditions of temp. and pressure in a secondary heating zone whence materials are passed to the sep. zone. App. is described.

**Cracking hydrocarbon oils.** Carbon P. Doherty (to Universal Oil Products Co.). U. S. 2,018,708, Oct. 29. A stream of oil such as a fuel oil is forced through a heating zone such as a pipe coil in which it is heated to a cracking temp. and is discharged into an enlarged reaction zone through substantially the entire length of which the material travels; vapors and unvaporized oil are withdrawn at places remote from the place of introduction of the heated material and superatm. pressure is maintained in the heating and reaction zones; vapors and unvaporized oil from the reaction zone are discharged into the lower and upper portions, resp., of a reduced pressure zone where vapors flow countercurrent to non-vaporous residue, residue is removed from the system, vapors are fractionated, and regulated portions of resulting reflux condensate are returned to the heating zone merged with the stream of charging stock being forced through it, and fractionated vapors are condensed as a final distillate. App. is described.

**Cracking hydrocarbon oils.** Walter G. Whitman (to Standard Oil Co. of Ind.). U. S. 2,018,986, Oct. 29. An app. is described comprising a means such as a pipe-still furnace for heating oil to a cracking temp. under superatm. pressure and discharging into a sep. chamber from which a vapor conduit of restricted cross-section leads to a fractionating column with cooling coils in its upper portion. Fresh oil is passed through the cooling coils and thence to an intermediate point of the vapor conduit (various other operative and structural details also being described).

**Cracking hydrocarbon oils.** Braunkohlen- und Brikett-

Industrie A.-G. Hulsing and Wöhlermar Allmer. Ger. 618,221, Sept. 1, 1935 (Cl. 23b, 1 041). Hydrocarbon vapors are passed through an externally heated vertical retort packed with coal or coke which is moved through the retort in the same direction as the vapors. The conditions are adjusted so that the velocity of the vapors in the cracking zone of the retort is at least 150 times that of the coal or coke. Steam may be blown in at the base of the retort. The products are light oils, gaseous hydrocarbons and C<sub>2</sub> or high-boiling liquid residues being obtained. Various methods of procedure are indicated.

**Cracking heavy hydrocarbon oils.** Universal Oil Products Co. Ger. 618,264, Sept. 4, 1935 (Cl. 23b, 1 041). See Brit. 249,601 (C. A. 21, 1000).

**Cracking and distilling hydrocarbon oils.** John C. Hlack (to Gasoline Products Co.). U. S. 2,018,654, Oct. 29. Oil is passed, under pressure sufficient to prevent any substantial vaporization, through a coil heated to a cracking temp., a portion of the oil is vaporized and the vapors are fractionated, a lighter fraction is condensed and withdrawn, and a heavier fraction is condensed and returned to the coil for re-cracking, crude oil contg. gasoline fractions is passed through a 2nd coil in the path of waste combustion gases from the first mentioned coil, a portion of the oil is vaporized and the vapors are fractionated in a 2nd fractionating zone, the lighter fraction is condensed and withdrawn, the heavier fraction is condensed and cooled and a portion of it is returned to the final passes of the first mentioned coil to prevent overcracking of the oil in the coil and to heat the heavier fraction to a cracking temp. App. is described.

**Distilling and cracking hydrocarbon oils.** Wm. L. Gomory (to Standard Oil Development Co.). U. S. 2,019,448, Oct. 29. Fresh charge oil is subjected to vaporization under pressure without cracking in a chamber divided into a deplegating zone and a vaporizing zone, reflux condensate from the deplegating zone is recovered and subjected to cracking conditions of temp., pressure and time in a heating and cracking zone comprising a heating coil and a conversion chamber, resulting products are discharged from the conversion chamber into the vaporizing zone, vapors are recovered, and residuum from the vaporizing zone is separately withdrawn and its lighter fractions are returned to the heating and cracking zone. App. is described.

**Coking, cracking and "reforming" hydrocarbon oils.** Charles H. Angell (to Universal Oil Products Co.). U. S. 2,017,846, Oct. 22. A charging oil such as a crude, topped or fuel oil is distd. to coke in a coking zone; resultant vapors are fractionated to form a reflux condensate heavier than gasoline and a lighter fraction contg. a substantial quantity of hydrocarbons of gasoline h. p., the reflux condensate is heated in a cracking temp. under pressure while flowing in a restricted stream as through a heated pipe coil and the lighter fraction is similarly and separately heated in a higher temp. to enhance its antiknock properties and is then mingled with the heated reflux condensate, the commingled oils are sep. into vapors and residual oil in a sep. zone, the residual oil is withdrawn from this zone and is introduced into the coking zone in admixt. with charging oil, and the last-mentioned vapors are fractionated and condensed. App. is described.

**Cracking and hydrogenating carbonaceous materials.** I. G. Tarbush and A.-G. Brit. 431,519, July 8, 1935. In the thermal treatment of carbonaceous materials having an acid reaction, corrosion of the treatment vessels by the acidic materials at such places where water tends to condense, e. g., at the outlet of the reaction vessel or in the heat exchangers and condensers and pipes leading thereto, is prevented by adding at such positions As compounds, e. g., As<sub>2</sub>O<sub>3</sub>, As<sub>2</sub>O<sub>5</sub>, or As compounds, As sulfide, cyanides or other N bases, e. g., Ph<sub>3</sub>NH<sub>2</sub>, pyridine, quinoline. In addn., the usual catalysts may be added. In the destructive hydrogenation of a coal contg. 0.28% Cl, 0.1% As<sub>2</sub>S<sub>3</sub>, dispersed in oil, is added to the reaction products before they enter the heat exchanger.

**Destructive hydrogenation of hydrocarbon oils.** Philip L. Young (to Standard Oil Development Co.). U. S.

120-220°F., preferably at 140-80°F. The oil and ddu-  
ent are preferably chilled at a slow rate and the wax is  
finally sepd. in a Sharples centrifuge with use of an im-  
miscible carrier liquid.

Removing waxes from hydrocarbon oils. Standard Oil  
Development Co. Brit. 431,306, July 4, 1935. See  
Fr. 780,999 (C. A. 29, 6043).

Separation of paraffins from oils. Standard Oil De-  
velopment Co. Fr. 784,570, July 22, 1935. Paraffins  
are sepd. from oils, particularly hydrocarbon oils, by  
dig. the oil with a solvent of a type heavier than the  
paraffin, adding a substance which is a modifier of the  
paraffin and is sol. in the mixt. of solvent and oil, cooling  
the mixt. to solidify the paraffin and sepg. it. The solvent  
may be a chlorohydrocarbon such as  $\text{CCl}_4$ ,  $\text{C}_2\text{H}_5\text{Cl}$ ,  
 $\text{C}_3\text{H}_7\text{Cl}$ ,  $\text{PhCl}$ , or a mixt. such as  $\text{C}_2\text{H}_5\text{Cl}$  70 and  $\text{C}_3\text{H}_7\text{Cl}$   
30% or dichloropropane 75, toluene 15 and xylene 10%.  
The modifier may be a condensation product of active  
derivs of paraffin such as chloro paraffins, polymers pro-  
duced from chloro paraffin and aromatic hydrocarbons,  
polymers produced by substituting paraffinic hydrocarbons  
to the action of an elec. discharge, or products obtained  
by condensing, with the aid of  $\text{AlCl}_3$ , distillates of high  
b. p. from tars which have been submitted to intense  
cracking.

Refining gasoline. Thomas T. Gray (in Gray Pro-  
cesses Corp.). U. S. 2,019,151, Oct. 29. Gasoline contg.  
S compds, difficult to remove in the ordinary manner is  
treated to convert such S compds into easily removable  
compds, by subjecting the gasoline in the vapor phase to  
contact with fuller's earth at a temp. of about 290-450°.

Device for separating gasoline from water and sediment  
by filtration. Leo E. Rush (to M. L. Joyce). U. S.  
2,018,001, Oct. 29. Structural details.

Strainer suitable for gasoline nozzles. Wm. H. Rice  
and Hancel M. Lyon. U. S. 2,019,044, Oct. 29. Struc-  
tural details.

Catalyst for polymerizing unsaturated hydrocarbons as  
in the production of gasoline from oil-cracking gases  
Vladimir Ipatieff (to Universal Oil Products Co.). U. S.  
2,018,005, Oct. 22. A mixt. of a phosphoric acid such  
as ortho- or pyrophosphoric acid and a solid adsorbent such  
as kieselguhr is heated to 180-300°, but not substantially  
higher, before the polymerization process.

Pellets for treating motor fuels with tetraethyl lead.  
Paul Poetschke. U. S. 2,018,570, Oct. 22. Pellets  
are formed with a shell of stearic acid contg. a solid core  
comprising Et<sub>4</sub>Pb and stearic acid.

Cracked motor fuel. LeRoy G. Story (to Texas Co.).  
U. S. 2,018,970, Oct. 29. Deterioration and gum forma-  
tion are inhibited by adding about 0.01% of a compd.  
such as 1,2-diaminofluorene or 1,9-dihydroxyfluorene or  
the like.

Lubricating oils. Mathias Pier (to I. G. Farbenind.  
A.-G.). U. S. 2,018,571, Oct. 29. A lubricating oil  
substantially free from asphalt and paraffin wax and hav-  
ing a lower-viscosity index than desired is treated with a  
liquefied normally gaseous hydrocarbon such as liquefied  
propane, the resulting soln. is removed from pptd. constituents  
of high mol. wt., the liquefied hydrocarbon solvent is  
removed, and there is added to the resulting oil an oil-sol.  
synthetic high mol. wt. product richer in H than the

1 pptd. constituents sepd. from the oil, to increase the vis-  
cosity of the oil.

Hydrocarbon lubricating oils. Eugene Ayres and  
Herschel G. Smith (to Gulf Refining Co.). U. S. 2,019,-  
047, Oct. 29. Admixed unrefined stocks of different hy-  
drocarbons such as a heavy and light oil are treated with  
 $\text{AlCl}_3$  to give a synthetic product contg. a suspended  
 $\text{AlCl}_3$  sludge, and, for finishing, most of the sludge is  
settled out, the oil is decanted, the remaining sludge is de-  
compd. with dil.  $\text{H}_2\text{SO}_4$ , and after sepg. the acid the oil is  
brought into contact with clay and filtered.

Lubricating oil mixture. Carleton Ellis (to Standard  
Oil Development Co.). U. S. 2,018,758, Oct. 29. About  
0.5% or more of the reaction product of an org. acid such  
as stearic or oleic acid with an alkyl group of an alkylol-  
amine such as triethanolamine is added to a mineral lubri-  
cating oil to increase the load-bearing capacity of the oil.

Lubricating and transformer oils. N. V. de Bataafsche  
Petroleum Maatschappij. Brit. 431,609, July 11, 1935.  
This corresponds to Fr. 775,701 (C. A. 29, 31507).

Apparatus for testing the condition of lubricating oil by  
use of light beams. Clarence E. Sherman and Howard  
P. Roak. U. S. 2,019,024, Oct. 29. Various structural  
detail and operative details.

"Snuffer composition" suitable for use in transformers  
or for lubricating, etc. Frank M. Clark (to General  
Elec. Co.). U. S. 2,019,339, Oct. 29. A C-contg. compd.  
(such as penta-chlorodiphenyl and trichlorobenzene) the  
vapor of which is combustible under flash-producing con-  
ditions is used together with about 10% or less of a  
halogenated olefin compd. such as a chlorinated ethylene  
to prevent solid glow combustion at vapor emanating  
from the compd.

Lubricants. Standard Oil Development Co. Brit.  
431,474, July 8, 1935. See Fr. 776,910 (C. A. 29, 32234).

Lubricants. Lise Wahlfors, Carl L. Johnson and Geo.  
Lacy (to The Glidden Co.). Brit. 431,508, July 6, 1935.  
Lubricants for high-pressure or other purposes consist of  
a hydrocarbon lubricating base and 1 or more chlora-  
derivs. of retene, mono-, di-, tri- and hexa-chlororetene  
being specified. Among examples, (1) 15 lb. of mono-  
chlororetene is blended with 85 lb. of Pennsylvania bright  
oil stock, and (2) dichlororetene is prepd. by (a) directly  
chlorinating retene and washing or distg. *in vacuo*, or (b)  
chlorinating retene dissolved in  $\text{CCl}_4$ , purifying by steam  
distn., dissolving in petroleum naphtha, filtering and  
evap. the solvent; 171 g. of the product is dissolved in  
2500 g. of Pennsylvania bright oil stock.

Lubricants. I. G. Farbenind. A.-G. Fr. 784,319,  
July 22, 1935. Stable oils are produced by chem. conden-  
sation or hydrogenation of carbonaceous materials, par-  
ticularly hydrocarbons, operating in the presence of an  
antioxidant such as elementary S, resorcinol, pyrocatechol,  
pyrogallol, hydroquinone, PhNH<sub>2</sub>, naphthylamine, amino-  
anthraquinone, benzylamine, acetonitrile, benzonitrile,  
pyridine, carbazole, thiocresol, aminothophene, amino-  
diphenylsulfone and diphenylthiourea. The products  
obtained may be added to other oils or greases which  
are thereby rendered stable.

Device for removing sludge from oil tanks, etc. Ben-  
jamin Thirley. U. S. 2,019,372, Oct. 29. Structural  
details.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

The homogeneity of native cellulose. I. Crasswise  
structural elements of vegetable fibers and their separation  
by preparative methods. A. Zakoshechkov and D. Tu-  
markina. *Melliand Textilber.* 16, 214-10, 360-7, 499-500  
(1935).—See C. A. 29, 7637.

Viscosity determinations at cellulose solutions. Tech-  
nical control methods and their practical importance. D.  
Kruger. *Zellulose-Faser* 32, 113-20 (1935).—In this dis-  
cussion, which includes the significance of viscosity  
measurements at different stages in the production of

rayon and cellulose derivs., the use of various types of  
viscometers, and the relationship between viscosity and  
chem. compn., mech. properties, and the "solvency" of cellu-  
lose and its derivs., K. presents a new expl. data, but  
includes 77 references.

Some aspects of the oxidation of cellulose. H. A.  
Turner. *J. Soc. Dyers Colourists* 51, 345-52 (1935).—A  
review with discussion.

Nitration of cellulose with nitrogen pentoxide. René  
Dalmon, Jean Chédia and Louis Brissaud. *Compt. rend.*

201, 664-5(1935) —The Raman spectrum of most nitrating mixts shows the presence of  $N_2O_4$ . Accordingly the nitrating power of  $N_2O_4$  in a neutral solvent was examd by treating cellulose (2.5 g. of dry degummed rape bleached with NaOH) with  $N_2O_4$  (45 g.) dissolved in  $CCl_4$  (105 g.) at 13° for 6 hrs in the dark. A 176% yield of nitrocellulose was obtained, contg 14.14 or 13.88% N according as the product was stabilized or not. Heated at 135° both products turned red after 32 and 29 min., resp., but neither emitted nitrous fumes after 1 hr. at that temp.

C. A. Silberrad  
Determination of the fineness of nitrocellulose by dye absorption. A. J. Phillips *Ind Eng Chem, Anal Ed* 7, 416-19(1935) —The method involves dyeing the fibers with a negatively charged dye (Congo red) and then depositing a positively charged dye (methylene blue) at and near the surface of the fibers which have been dyed red. The dyeing takes place in a borax- $NaCl-H_2BO_3$  buffer soln of  $pH = 7.9$  at 95°. The dyeing tests were confirmed by analysis under the microscope and not only could the products from different beaters be identified but products from the same beater could be differentiated. Such differentiation cannot be made by the standard fineness test. W. T. H.

Are the foundations of lignin chemistry unsettled? Karl Kurschner, *Zellstoff-Faser* 32, 132-4(1935) —K. shows that Hilpert and Hellwege (cf. C. A. 29, 3704\*) have presented data insufficient to discredit the preexistence of lignin in plant tissues. Louis E. Wise

Causes of "milky" spots on viscose rayon. Stefan Poznanski *Przemysł Chem* 19, 42-7(1935) —The "milky" spots are caused by the formation of bubbles in the filaments as a result of evapn of  $CS_2$  which did not succeed in diffusing through the surface skin to the acid bath. Their occurrence is increased by decreasing the quantity of  $CS_2$  used in prep., the xanthate, diminution of the viscosity of viscose, increase in concn. of free caustic in viscose, introduction of even a small quantity of sulfonated fatty oils, increase of acidity of the acid bath, in case of use of  $ZnSO_4$ , diminution of its content, diminution of the thickness of the filaments or the increase in their no per thread. A. C. Zachlin

Delustered rayon and its prospects. Fritz Ohl *Spinnerei u. Weber* 53, No. 27, 10-12(1935). —A review.

Leopold Scheidan  
The specific gravity of coniferous woods. Reinhard Trendelenburg *Zellstoff-Faser* 32, 129-31(1935) —The findings of previous investigators have been analyzed, and the following list includes, resp., the mean, the lowest and the highest sp. grs. observed for green wood, and in parentheses, the corresponding figures for bone-dry wood calcd on the basis of vol when green: spruce, 0.41 (0.38), 0.29 (0.27), 0.64 (0.55), fir, 0.42 (0.37), 0.29 (0.27), 0.00 (0.00), larch, 0.55 (0.48), 0.40 (0.36); 0.00 (0.00), Scots pine, 0.49 (0.43); 0.29 (0.27), 0.00 (0.00). With spruce, fir and larch, the greatest frequency in sp. gr. was very close to the mean sp. gr. This is not the case with fir. T. shows that marked variations in sp. gr. of spruce occur with varying site and altitude, and that in Scots pine variations are very wide even in the bole of a single tree. The relationship between width of annual rings and the sp. gr. of dry wood was also studied. In spruce, a correlation exists between sp. gr. and ring width. In Scots pine and larch, both very narrow and very wide annual rings give rise to wood of low sp. gr., indicating that there is an optimum ring width in these species.

Louis E. Wise  
The influence of the preheating of wood in water on the rate of delignification by sulfite liquor. A. J. Corey and O. Maass *Can J Research* 13, B, 149-55(1935) —The rate of delignification of wood chips has been measured and found to conform to the monomol. relation, provided that the standard method of penetration developed in this lab is used. Pretreatment of the wood chips by heating in liquid  $H_2O$  at 130° decreases the rate of delignification by subsequent cooking in sulfite liquor, and the rate no longer conforms to the monomol. relation. Preheating of the wood to 130° in the absence of  $H_2O$  does not influence the

rate of subsequent delignification. The results indicate the advantage of reducing the time of cooking, and a tentative explanation has been offered regarding the mechanism involved. J. W. Shipley

Friction losses in pipes carrying pulp stock. W. Brecht and H. Heller. *Wochschr. Papierfabr.* 66, Tech. Teil 264-8, 312-4, 380-3, 439-43, 474-6, 529-32, 587-9, 641-4, 714 17, 747-50(1935). —An unusually thorough expl. study of which friction losses, using water alone and water kaolin suspensions, were detd. An investigation was made of the effect of the following factors on the frictional losses in the case of pulp suspensions: stock d.; rate of flow, diam. of the pipe line, roughness of the inner surface of the pipe, the av. fiber lengths; slowness of stock; temp.; type of pulp used (including bleached and unbleached sulfite, unbleached sulfate, yellow and bleached straw pulp, and white and brown mech. pulps); kaolin addn to the pulp. Detailed descriptions and sketches of the expl. equipment used are included. B. and H.'s data are compared with those of other investigators. Sixty-five references. Louis E. Wise

Rayon fabrics (Schnell) 25. Retarding rancidity-cellulose wrappers (Morgan) 12. Soap [products used in glazing paper] (Swiss pat. 174,087) 27. Coating metal [used in the construction of a spinning pot for rayon] (Brit. pat. 431,816) 13

Cellulose. Erich Opfermann and Gustav-Adolf Feldmann to I. G. Farbenind. A.-G. U. S. 2,017,955, Oct. 22. A cellulose which can be bleached white is prepd by the continuous addn. of alkali such as NaOH to a cellulose pulp such as one produced from partial chlorination of kraft pulp while being produced by alk. digestion with  $Ca$  to maintain a  $pH$  between 6 and 9.

Cellulose. Henry Dreyfus. Fr. 781,333, July 22, 1935. Cellulose is extrd from lignocellulosic materials at a high temp. by a solvent mixt. contg. water and at least 2 org. liquids of different dipole moments, due to the presence in the mol. of groups of different types. Ex. samples are given of the use of mixts contg. (1) acetone 14, water 35 and EtOH 50 parts, (2) EtOH 65, water 25 and  $CaCl_2$  10 parts, (3) dioxane 50, water 30 and acetone 20 parts. Cf. C. A. 29, 7656\*

Cellulose and half-stuff. Hofstad A.-G. Brit. 431,542, July 10, 1935. In *imp. cellulose and half-stuff*, ground wood, washed until it is freed from fiber fragments and fiber mucilage, or the coarse material that accumulates during the manu. or sorting of ground wood, washed free from fine fibers, fiber fragments and fiber mucilage, is subjected to chem. treatment in the usual manner. Wood rich in resin, e. g., pine, is a suitable starting material. The cellulose or half-stuff obtained may be added in suitable proportions to ground wood to make a paper suitable for newspapers. Cf. C. A. 28, 7532\*, 29, 4579\*, 6428\*

Saccharifying cellulose. Holzhydrolyse A.-G. Ger. 618,145, Sept. 2, 1935 (Cl. 80s. 1,02). The recovery of cryst. glucose and xylose from cellulose saccharification products is promoted by adjusting the proportion of mannose in the products to 5-10%, calcd on the total sugar content. Thus, saccharification products of low mannose content, e. g., as obtained from wood of deciduous trees, may be mixed with saccharification products of high mannose content, e. g., as obtained from wood of coniferous trees, or mixts of these varieties of wood may be saccharified together. Other methods of procedure are indicated. Solns. having a total sugar content up to

85% may be treated. Methods of effecting crystn. are described.

Preserving cellulose materials such as canvas, ropes, wood, etc. Wallace T. Conn (to the Government of the U. S., represented by the Secretary of Commerce). U. S. 2,018,659, Oct. 29. Articles such as nets, ropes, etc., formed of degummed fibers or the like contain a toxic dye such as crystal violet, a fixer for the dye comprising  $K_2Cr_2O_7$ ,  $CuSO_4$ , and  $H_2OAc$  and carry a tar-like armoring U. S. 2,018,660 relates to the use of a tannic acid and tartar emetic mordant and a  $K_2Cr_2O_7$  oxidant. U. S. 2,018,661 relates to the use of tar and an oil-sol. residue resulting from the reaction of  $\alpha$ -naphthylamine with acetaldo.

Cellulose derivatives. Samuel Wild, Ernst Hugen-tobler and Erich F. Gellich. Swiss 174,060, May 16, 1935 (Cl. 41). App. is described for making concd. solns. of cellulose derivs. by circulating the solvent repeatedly over the deriv. The solns. are used for making formed articles

Aliphatic cellulose ethers R. I. du Pont de Nemours & Co. Brit. 432,277, July 21, 1935 To a ceude reaction product contg. an aliphatic ether of cellulose and an org. medium a dispersing agent adapted to form an emulsion of the said crude reaction mixt. and an aq. medium is added and the product is steam distd. The alkyl cellulose is obtained as a finely divided, porous solid, which is easily purified by washing. Examples describe the prepn. of an alkyl cellulose by treatment of alkyl cellulose with solid  $NaOH$ ,  $EtCl$ , which may be mixed with  $MeCl$ , or  $PrBr$ , and  $CaH_2$  or  $PhMe$  as diluent, in an autoclave. The product is treated with Turkey red oil or Na oleate and  $H_2O$  and then steam distd., the alkyl cellulose remaining in suspension in the liquid.

Cellulose ester and ether compositions British Celanese Ltd. Brit. 432,271, July 21, 1935 Comps. comprise cellulose esters or ethers that are plasticized by adding hexahydrobenzole esters of partial ethers of di- or polyhydric alcs. The comps. may be worked up into sheets, rods, tubes or blocks or molded under heat and pressure; as solns., they may be converted by wet or dry spinning processes into filaments or made into films, sheets or foils, or used as lacquers. In examples, (1) a soln. of cellulose acetate (I), the ester of ethylene glycol monomethyl ether with com. naphthene acid, and triacetin in  $Me_2CO$  is spread on the gelatin-covered surface of a film-casting wheel, the  $Me_2CO$  is evapd. and the film stripped off, and (2) a coating compn. comprises I, di- $Me$  phthalate, the same plasticizer as in (1), diphenylpropylene- $Cl_2$  resin,  $Me_2CO$ ,  $CaH_2$ , alc., dioxane etc., and a pigment

Cellulose acetate. Geo. W. Miles (to Celanese Corp. of America). U. S. 2,018,028, Oct. 22. For producing cellulose acetate of high acetyl value, cellulose is treated with a restricted quantity of acetylating agent not substantially greater than that required for esterification. In the presence of a catalyst such as  $H_2SO_4$ ,  $H_3PO_4$ ,  $ZnCl_2$  or  $NaHSO_4$ , and a substantial quantity of diluent such as  $CH_4$  or  $CCl_4$ , which has no solvent action on the cellulose acetate being formed, until a cellulose acetate of an acetyl value of 63 to 70% is formed.

Cellulose ester films, lacquers, plastic compositions, etc. Deutsche Hydrierwerke A.-G. Brit. 432,401, July 25, 1935. The films, etc., contain as soltizing or gelatinizing agent an ester of a hydroxypolycarboxylic acid with a mono- or poly-nuclear hydroaromatic alc. In examples, acetylcellulose (I) and dimethylcyclohexyl tartrate are dissolved in  $Et$  lactate and  $PhMe$  to form a lacquer, and I, didecahydro- $\beta$ -naphthyl tartrate and tricresyl phosphate are dissolved in  $EtOH$ ,  $Me_2CO$  and  $PhMe$ , the soln. being used to make films of high elasticity.

Saponifying cellulose esters. Henry Dreyfus. Brit. 432,028, July 15, 1935. The acetyl content of org. esters of cellulose is reduced by sapon. with an org. base in the presence of an alkali metal salt that is itself capable of sapon. the ester, e. g., of  $H_2C_2O_4$ ,  $H_2H_2O_4$ ,  $H_2S$ ,  $H_2SO_4$ , and  $PhOH$ . Among examples, cellulose acetate yarn is led in warp formation through a bath contg. aq.  $MeNH_2$  and  $Na_2CO_3$ , washed and dried. Substances that accelerate the reaction, e. g., metals such as  $Cu$ , as described in

Brit. 430,310 (C. A. 29, 7873\*) and 430,351 (C. A. 29, 7674\*), and swelling agents may be present.

Saponifying cellulose ester threads, etc. Henry Dreyfus. Brit. 432,027, July 10, 1935. Filaments, ribbons, etc., having a basis of cellulose acetate or other org. ester of cellulose are sapon. by treatment in a bath contg. a non-metallic base, preferably a lower aliphatic amine, e. g.,  $MeNH_2$ ,  $EtNH_2$ ,  $AmNH_2$ ,  $PrNH_2$ ,  $iBuNH_2$ ,  $Me_2N$ , allylamine,  $Me_2NOH$ , ethylenediamine, 1,2,3-triaminopropane,  $\alpha,\gamma$ -diamino- $\beta$ -hydroxypropane, piperidine, etc., and a nonhydroxy swelling agent, e. g.,  $Me_2CO$ ,  $Me_2C_2O$ , dioxane, methylene ethylene ether, cyclohexanone, the dimethyl ether of glycol, alkali thioyanates. To accelerate the sapon., the bath may receive an addn. of strong alkalies or of heavy metals, e. g.,  $Cu$ ,  $Ag$ ,  $Ni$  or  $Zn$  as described in Brit. 430,340-51 (C. A. 29, 7673\*)

Saponifying cellulose nitrate products Henry Dreyfus. Brit. 432,029, July 16, 1935 Artificial filaments, films, etc., having a basis of cellulose nitrate are sapon. by treatment with a liquid medium contg. an org. base, e. g., alkylamines, aromatic bases, cyclic bases, diamines and substituted diamines and piperazine. The sapon. action may be accelerated by a heavy metal, e. g.,  $Cu$ ,  $Ni$ , in the form of oxide or salt, and it may be assisted by alkalies or alk. salts, e. g., soaps. Swelling agents may be present.

Press rolls for removing water from cellulosic sheet materials, etc. Maschinenfabrik Imperial G. m. b. H. Ger. 618,431, Sept. 7, 1935 (Cl. 65d 20 01)

Apparatus for extruding a continuous web of pyroxylon composition or the like to form sheets Paul W. Crane and Reuben T. Fields (to Dupont Viscoloid Co.) U. S. 2,019,110, Oct. 29. Various details are described for the production of sheets from a compn. such as one contg. pyroxylon of 800 centipoises 40-21, camphor 18-8 and 1%  $IOH$  38-68% by extrusion through a slit-like aperture under a pressure of 30-400 lb. per sq. in.

Rayon Adrianus J. L. Moritz (to American Pnka Corp.). U. S. 2,018,665, Oct. 22. For the manuf. of rayon so that all parts of a wound package of the product will have substantially uniform dyeing properties, the spinning soln. is ejected from a spinnerette into a spinning bath and the filaments formed are tensioned by leading them over guides in advance of a collecting device, the tension being gradually increased during the formation of the package to compensate for different degrees of contraction normally occurring which would otherwise cause nonuniformity in the dyeing quality of the filaments in different parts of the package. App. is described. Cf. C. A. 29, 4592\*

Rayon Stefano Sordelli. Brit. 432,328, July 24, 1935. See Fr. 778,917 (C. A. 29, 4910\*)

Rayon Aceta G. m. b. H. Fr. 781,639, July 22, 1935. Rayon made from cellulose esters or ethers is made resistant to boiling by treating the freshly spun fibers with an aq. prepn. contg. soaps or soap components, the components forming the soap being in the cationic instead of the anionic state. Examples of preps. are (1) glue 20, oleyl acetate- $\alpha$ -pyridinium chloride 10, cacao butter 30, Japan wax 120 and water 2200 parts, and (2) glue 100, urea 50, lauryl acetate- $\alpha$ -pyridinium chloride 25, octadecyl acetate- $\alpha$ -pyridinium chloride 25,  $Me$  ester of stearic acid 400, Japan wax 100 and water 8300 parts.

Apparatus for winding freshly spun rayon. Carl Hamel Spinn- und Zwirnereimaschinen A.-G. and Edmund Hamel Ger. 615,592, July 8, 1935 (Cl. 29a.6.15) Addn. to 614,441 (C. A. 29, 6077\*)

Centrifugal "bucket" for use in spinning rayon. Fredrick S. Godfrey (to General Elec. Co.). U. S. 2,010,314, Oct. 29. A bucket body is provided with circumferentially extending rows of spaced holes in its side walls and channels on the outside surface of the side walls connecting holes in the several rows and extending to the top of the body; a reinforcing sleeve is disposed about the side walls, and an acid resisting internal covering which may be formed of hard rubber is placed on the sleeve and with the channels mentioned forms outlets at the top of the body.

Paper pulp Sidney D. Wells and Gerald D. Muggleton (to Lewis L. Alsted). U. S. 2,018,037, Oct. 29. Washed

fibrous material such as wood, straw or corn stalks is crushed in a rod mill and digested and disintegrated in a cooking liquor obtained in part by *lignin removal* from the pulp later in the process, steam is blown into the rod mill during the digestion and disintegration, and the material is thereafter washed countercurrently and finally bleached while maintained alk. so as to preclude chlorination of the lignin. An arrangement of app. is described and a bleached material may be obtained contg. not less than 20% of pentosans and not less than 10% of lignin, with the remainder substantially cellulose.

**Paper pulp from flax.** Edwin P. Jones and James M. Dempsey (to Champagne Paper Corp.). U. S. 2,018,490, Oct. 22. Mechanically decorticated flax is subjected to the action of water, and the washed fibers are cooked in a digester in the presence of an alk. chemical such as  $\text{Ca}(\text{OH})_2$ ,  $\text{Na}_2\text{CO}_3$ , or  $\text{NaOH}$  and of a sol. sulfite such as  $\text{Na}_2\text{SO}_3$ , and are then bleached. The resulting product is suitable for making paper.

**Apparatus for making paper pulp.** E. & M. Lamort. Fr. 784,117, July 22, 1935.

**Paper-pulp beating engines.** Walther Voith, Hermann Voith and Hanns Voith (trading as firm of J. M. Voith). Brit. 432,009, July 18, 1935.

**Hammer mills for paper pulp.** Wm. T. Doyle (to Sturtevant Mill Co.). Brit. 432,115, July 22, 1935. A stream of coned cellulose pulp is fed to a hammer mill wherein it is subjected to swift impacting, disintegrated, hydrated and mixed with diln.  $\text{H}_2\text{O}$  which is fed as a sep. stream to the roll.

**Machines for shredding wood pulp, etc., for the manufacture of paper.** John J. Warren. Brit. 431,322, July 4, 1935.

**Slides for Fourdrinier paper making machines.** Benjamin E. Teale. Brit. 430,981, June 24, 1935.

**Flong.** Walter E. Langley. Brit. 430,850, June 26, 1935. Flong used in making molds for casting printing-plates consists of paper pulp mixed with lithopone which may be added to the pulp in the beaters.

**Apparatus for damping paper, textiles, etc.** Orion Maschinen- und Apparatebau-Gesellschaft m. b. H. Brit. 431,932, July 17, 1935. Divided on and addn. to 428,975 (C. A. 29, 7077).

**Removing printing ink from paper.** Sidney D. Wells (to Lewis L. Aisted). U. S. 2,018,938, Oct. 29. The paper is disintegrated and agitated in a soapy soln. until the ink is loosened from the paper and a foamy mass is produced contg. substantially no free liquid and having the particles of the ink pigment carried by the films of the bubbles, and the bubbles and assoc. pigment are sep'd from the fibers. An arrangement of app. is described. Cf. C. A. 29, 2744.

**Thin porous paper sheets.** Alexander V. Alm (to Dennison Mfg. Co.). U. S. 2,018,244, Oct. 22. The surfaces of the fibers of a sheet of tissue paper of open

formation are quickly parchementized to bind the fibers together with a water resistant bond without filling the interstices of the paper. An arrangement of app. is described.

**Sized papers.** Geo. A. Richter (to Brown Co.). U. S. 2,018,375, Oct. 20. A paper web is treated first with a viscose soln. and then with an acidified glue soln., thus regenerating cellulose from the viscose and producing an exposed glue surface.

**Water-repellent coatings on paper or the like.** Alfred Earle Van Wirt (to Imperial Paper and Color Corp.) Brit. 431,218, July 3, 1935. See U. S. 1,930,279 (C. A. 28, 3234). The printing step may be omitted. Washable wallpapers are produced.

**Coated paper.** International Latex Processes Ltd. Brit. 430,933, June 27, 1935. Paper is rendered resistant to  $\text{H}_2\text{O}$ , oil or grease by treating with an aq. rubber dispersion, e. g., latex, contg. added protein, e. g., casein, glue, gelatin, egg- or blood-albumin, hemoglobin, drying and then coating with a soln. of the protective material in an org. solvent, e. g., lacquers contg. nitrocellulose or cellulose acetate, resins, PbOII aldehyde or alkyl resins or chlorinated rubber. A suitable latex compn. comprises NiII,OH as stabilizer, glue,  $\text{ZnO}$ , S, accelerator, phenylanthrathylamine as antioxidant, casein, NaOH and PbOH as preservative. The intermediate rubber film may be vulcanized after application of the lacquer. Cf. C. A. 29, 4912.

**Apparatus for impregnating paper webs with liquids such as preserving oils.** Max Oberdorfer. U. S. 2,018,280, Oct. 22. Various structural, mech. and operative details.

**Transparent paper.** Wm. M. Dnesen (to S. D. Warren Co.). U. S. 2,018,638, Oct. 22. A web of paper is formed of fibers of transparent material and a film matrix of cellulose deriv. material such as cellulose nitrate compn. with anhyd. lanolin dispersed in the material and having about the same  $n$  as the fiber substance.

**Compound paper.** Société pour l'ind. chim. & Bâle. Brit. 431,956, July 18, 1935. In the manuf. of fibrous sheet material consisting of a no. of superimposed sheets having a basis of partially hydrolyzed cellulose, a primary aromatic amine- $\text{CH}_3\text{O}$  resin is added to the cellulose material before, during or after its partial hydrolysis. The product has a high resistance to  $\text{H}_2\text{O}$ .

**Ply board or ply paper.** John W. Sale (to Hummel-Ross Fibre Corp.). U. S. 2,018,382, Oct. 22. Various mfg. details are described, involving use of an app. with a traveling endless wire for continuous operation.

**Apparatus for manufacture of corrugated paper board.** Geo. W. Swift, Jr. (to George W. Swift, Jr., Inc.). U. S. 2,018,240, Oct. 22. Various mech. and operative features.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

**Improvements in the stability of explosives.** A. Foulon. *g Nitrocellulose* 6, 183-4(1935).—A review. E. M. S.

**Unexpected explosive effects with various shapes and positions of the charge.** Alfred Stettbacher. *Nitrocellulose* 6, 59-62, 100-8(1935).—Perforations in metal plates caused by detonation of explosive charges of various shapes and positions on or above the plate are illustrated. E. M. Symmes.

**New considerations on elementary explosives production.** Alfred Stettbacher. *Nitrocellulose* 6, 79-83 (1935).—A review. E. M. Symmes.

**Thermostat for stability test of blasting gelatin.** J. v. Meerscheidt-Hullessem. *Z. ges. Schiess-Sprengstoffw.* 30, 301-2(1935).—A jacketed oven maintained at 75° by a mixt. of  $\text{H}_2\text{O}$  and MeOH is provided with glass windows through which the evolution of nitrous fumes from the samples in weighing tubes may be observed. C. G. S.

**Variation of detonation spectra with nature of surround-**

**ing gas.** Albert Michel-Lévy and Henri Marauar. *Compt. rend.* 201, 823-30(1935); cf. C. A. 29, 1649, 3169.—In view of the suggestion that the luminosity of an explosion depends on the nature of the gas, the spectra of explosions of the  $3\text{C}(\text{NO}_2)_2 + \text{C}_2\text{H}_2$  mixt. in A, Kr,  $\text{O}_2$ ,  $\text{CO}_2$ ,  $\text{N}_2$ , air, He,  $\text{H}_2$  and  $\text{Cl}_2$  were exam'd. The amt. of continuous background varied, being considerable with A, Kr,  $\text{O}_2$ ,  $\text{CO}_2$  and  $\text{Cl}_2$ ; and the luminosity and therefore the temp. decreased approx. in the increasing order of the sp. heats of the gases. But the only bands or lines identifiable seem to have been those attributable to the explosive (especially those of  $(\text{CN})_2$ ) or to its action on the metal supports. C. A. Silberrad.

**The so-called "Congreve friction match"** in Munich 100 years ago. Max Speter. *Z. ges. Schiess-Sprengstoffw.* 30, 299-300(1935).—Historical. C. G. Storm.

**Gases, explosions and fire in coal mines.** Frank Brera. *School Sci. Rev.* 17, 36-9(1935). O. R.

Dust disasters. Consequences, causes and control of dust explosions. David J. Price. *Foot Ind.* 7, 529 (1935); cf. C. A. 29, 316<sup>9</sup>.—Approx. 345 dust explosions with a loss of life of 311 persons have occurred in the past 10 years. Flour, feed and starch factories are often concerned in dust explosions. It is possible to vent grain-dust explosions without structural damage. Not less than 1.25 sq. ft. of venting area per 100 cu. ft. of space is recommended. Static electricity is a prominent cause of explosions and static charges should be eliminated in mfg. plants. The reduction of O<sub>2</sub> content by introducing an inert gas such as CO<sub>2</sub> in grinding and pulverizing operations is an effective means of control. The O<sub>2</sub> content should be reduced to approx 12%. C. R. Tellers.

Prevention of gas explosions by controlling oxygen concentration. O. W. Jones and R. T. Kennedy. *Ind. Eng. Chem.* 27, 1311-6 (1935).—Tests in an explosion tube 6 ft. long X 2" diam showed that the combustibles which occur in natural gases and in petroleum products are rendered nonexplosive when CO<sub>2</sub> is added to the combustible mixt., so as to reduce the O content below 12.6%, if N is used as the diluent the O content should be reduced below 10%. For CO and H mixts, the O content must be reduced below 5% to eliminate explosion hazard.

C. G. Storm.  
Explosion of mixtures of combustible gases with air, by nuclear drops of water and other nuclei and by x-rays. V. Experimental conditions required for the ignition of hydrogen-air mixtures by nuclei. R. O. King and Geo. Mole. *J. Inst. Petroleum Tech.* 21, 839-45 (1935), cf. C. A. 28, 7017<sup>9</sup>.—The view previously expressed, that self-ignition temp. rises as surface activity increases, was confirmed by exptl. results, with steel and silica tubes. The rate of steam formation in the silica tube was low

compared to that in steel tubes. The H<sub>2</sub>O produced was measured as liquid. Self-ignition occurs only in the layer of gas adjacent to the hot surface. VI. Nuclear drop ignition temperatures of ethylene-air mixtures passing through a silica combustion tube; the relation between wall and gas temperature and the effect on ignition temperatures of the central thermocouple sheath. *Ibid.* 845-53.—Wall temps. were found to be 16-30° higher than those indicated by the central thermocouple. The sheath itself is without effect on the ignition temp. VII. Effect of a variety of nuclei, mainly mineral dusts, to ignite and explode a mixture of hydrogen and air; the exceptional efficacy of Ni<sub>2</sub>O<sub>3</sub> dust to ignite mixtures of air with hydrogen, ethylene or methane. *Ibid.* 853-9.—With Ni<sub>2</sub>O<sub>3</sub> dust the nuclear ignition temp. of H<sub>2</sub>-air mixt. (40% H<sub>2</sub>) was more than 200° lower than that obtained with nuclear drops of water. In C<sub>2</sub>H<sub>4</sub>-air and C<sub>2</sub>H<sub>6</sub>-air mixts, the igniting effect of Ni<sub>2</sub>O<sub>3</sub> was less pronounced, but was still greater than that of water drops. C. G. Storm.

Polynuclear phenols and nitration and sulfonation products [as explosives] (Brit. pat. 471,045) 10.

Explosives. Hercules Powder Co. Ger. 618,500, Sept. 10, 1935 (Cl. 78c 17). See Brit. 299,802 (C. A. 23, 3576).

Pyrotechnic compositions. Westdeutsche-Anhaltische Sprengstoff-A.-G. chem. Fab. Ger. 618,083, Aug. 31, 1935 (Cl. 78d 1.01). As agents for regulating the rate of combustion of pyrotechnic compns., particularly of charges for light-producing weapons, use of mule of neoprene materials from which oil or fat cannot be expressed at a pressure up to 5000 atm. Ground nut shells of various kinds are suitable.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Dyes derived from seridic acid. Mahadeo Prasad Gupta and Sukhbirbhai Dutt. *J. Indian Chem. Soc.* 12, 581-4 (1935).—From theoretical considerations (C. A. 22, 3891), dyes derived from aeridic acid (I) should have the same color as the corresponding dyes derived from quinoline-1,2,3-tricarboxylic acid (II). A suspension of finely divided seridine was nitrated with 2% KMnO<sub>4</sub> and yielded stout prisms of I, m. 128-30° (decimon). I was condensed with PhOH, m. and p-HOC<sub>2</sub>H<sub>4</sub>OH, m-H<sub>2</sub>NC<sub>2</sub>H<sub>4</sub>OH, m-Me<sub>2</sub>NC<sub>2</sub>H<sub>4</sub>OH, m-TuNC<sub>2</sub>H<sub>4</sub>OH, 1,3,5-(HO)<sub>3</sub>C<sub>6</sub>H<sub>2</sub> and m-H<sub>2</sub>NC<sub>2</sub>H<sub>4</sub>NH<sub>2</sub>. The condensation takes place without condensing agent but the addn. of a trace of H<sub>2</sub>SO<sub>4</sub> improves the yields. The dyes resemble the corresponding phthalates but the fluorescence is slightly less and they are slightly more intense in color. They dye wool and silk beautiful and brilliant shades of orange, tan, brown, chocolate, chestnut, pink and violet. Compared with the corresponding dyes from II they are more intensely colored and far more absorptive. The extra CO<sub>2</sub>H group in the II dyes acts as a bathochrome in reducing the intensity of color and fluorescence. Tables of the dyes derived from I, giving m. p., appearance, color in alc., color with acid or alkali, shades on wool or silk and C and H analyses, and showing the adsorption max. of the acids and analogous dyestuffs are given. The compd. with m-HOC<sub>2</sub>H<sub>4</sub>OH was brominated in the corresponding tetrabromo-compd., m. above 200°. C. R. Adkisson.

The selection of dyestuffs for padding. H. C. Borghegyi and J. Zapanick. *Am. Dyestuff Repr.* 24, 639-40 (1935).

W. H. Boynton.  
Lako colors and paper. N. Holt. *Oil Color Trades J.* 83, 1219-50 (1935).—Surface-colored papers are discussed. The principal sizing agents are glue and casein and the latter required alkali which may cause the lake colors to bleed. Bleeding may also be caused by improper pphn. of the dye in the lake. W. H. Boynton.

Light fastness of dyes on vegetable fibers. C. M.

Dyeing jute yarn and jute and cotton piece goods—suitable basic, acid and substantive colors; methods of producing solid shades on union goods. James R. McIlveen. *Am. Dyestuff Repr.* 24, 600-2 (1935).

W. H. Boynton.  
Fast wool dyeings with particular consideration of the cloth supplied Herbert Brandenburger. *Monatsh. Textil-Ind.* 50, 213-6 (1935).—Dyeing expts. were carried out with various Cr and vat dyes. Measurements were made of the strength and elasticity (dry and wet) of the Cr and vat-dyed wool. Studies were made of the effect of the addn. of fiber preservatives on the strength and elasticity of Cr-dyed textiles. The results show that the difference between Cr and vat dyeings are very slight and that the preservatives used increase both the strength and the elasticity. Detailed dyeing directions are given and the results obtained are tabulated. Leopold Scheffan.

The printing of gold bronzes on wool textiles. A. Molnar. *Monatsh. Textil-Ind.* 50, 218 (1935).—The method of printing bronzes on cotton and rayon textiles with Serikose CL extra thickeners is not feasible for wool on account of the high degree of stretch of this textile. In this case it is better to employ egg albumin as thickener. The egg albumin is beaten with a little water until it forms a snow which is allowed to shrink, then linseed oil is added and finally the bronze powder. After printing, the fixation is carried out with steam. As this mixt. is unstable

it should not be stored but must be used right after its prepn. The spraying can also be done by means of gutta-percha soln. After the print has completely dried apply the powd. bronze and calender hot. Leopold Scheflan

The advantages of the hyposulfite glucose vat. H. Korb. *Monatsh. Textil-Ind.* 50, 246 (1935).—The mkt. contained 30 g indanthrene blue RS, 100 g NaOH 30%-Be and 3.5 g concd hyposulfite per l of H<sub>2</sub>O with or without glucose. Pieces of cotton were subjected to 6 dyerms. The alkali contents were detd. by titration and the hyposulfite was detd. by Pyrgos' Kuponometer. The dyerms without glucose yield a lighter and more turbid tone and are not as fast as those obtained with glucose. In the presence of glucose the alkali of the bath decreases rapidly while the hyposulfite contents drop only gradually. Acting as an aldehyde the glucose holds the hyposulfite loosely, thus preventing excess reduction. During the dyeing process the aldehyde groups oxidize to acid radicals which decrease the alkali concn. In the absence of glucose the action of the O of the air on the hyposulfite is much greater on account of the high temp. and the lack of protection of the hyposulfite. Conclusion: The glucose vat is carried out more readily and is more economical. Leopold Scheflan

Yarn-dyeing equipment. II. Chas. E. Mulla. *Textile Colorist* 57, 304-8, 388-91, 453-5 (1935); cf. C. A. 29, 3157<sup>2</sup>.—A description of the various types of machines used in dyeing yarns in package form, i.e., cops, cheeses, beams, etc., with a discussion of their advantages, disadvantages, operation, etc. Chas. E. Mulla

Further studies of the effect of sunlight on the strength and color of cotton fabrics. Mary Anna Grimes. *Tex. Agr. Expt. Sta., Bull.* 506, 5-42 (1935), cf. C. A. 28, 617<sup>2</sup>.—After exposure for 500 hrs. to sunlight 35 white cotton and dyed cotton fabrics showed losses in breaking strength of 18-49% in the warp and 84-65% in the filling. The mercerization of the Everfast settings and broadcloths increased their resistance to tendering. In 8 out of 15 dyed fabrics, less breaking strength was lost than in the undyed fabrics. Certain dyes are not equally fast when used alone and in combination with other dyes. The heavier, coarser fabrics were less tendered than the thinner, finer ones. Correlation analysis of the environmental factors shows that the no. of hrs. exposure had far more effect on loss of strength than had temp. and relative humidity. Exposure to sunlight affected the color of all white and dyed fabrics, as detd. by spectrophotometric analysis. White fabrics became increasingly yellow with increased exposures. In general, guaranteed fabrics were more fast in color than those not so guaranteed. C. R. Fellers

Progress in the textile industry. Heinrich Gölkel. *Monatsh. Textil-Ind.* 50, 225-7 (1935).—A review. Leopold Scheflan

List of the various grades of yarns. A Hamann. *Spinner u. Weber* 53, No. 16, 2-5, No. 17, 5-7; No. 18, 5-8, No. 19, 5-7; No. 23, 6-8, No. 24, 5-7; No. 27, 4-6, No. 28, 4-7 (1935).—The compas. of a no. of yarns are described. Leopold Scheflan

The uniformity of carded yarn. A Strang. *Spinner u. Weber* 53, No. 28, 1-4 (1935). Leopold Scheflan

Analysis of textiles for cellulose acetate rayon, silk, regenerated-cellulose rayon, cotton and wool. Ralph T. Mease and Daniel A. Jessup. *Am. Dyestuff Repr.* 24, 613-18 (1935); *Bur. Standards, Research Paper* No. 821 (1935); cf. C. A. 29, 7084<sup>4</sup>.—Cellulose-acetate rayon, silk, regenerated-cellulose rayon, cotton and wool are detd. by exin. of the mixed fibers with CCl<sub>4</sub>, desizing with a starch and protein hydrolyzing enzyme and with water, removal of acetate rayon with Me<sub>2</sub>CO, and silk and regenerated-cellulose rayons with solns. of Ca(SCN)<sub>2</sub> of sp. grs. of 1.2 and 1.25, resp. Cotton is detd. by removal with AlCl<sub>3</sub> and heat, to leave the wool, or by dissolving the wool in KOH soln. to leave the cotton. The accuracy of the method for each fiber is  $\pm 2\%$  of the wt. of the specimen analyzed. W. H. Boynton

Some problems of the cotton textile industry. B. B.

1 Cosset. *Textile Bull.* 49, No. 11, 3-5, 34 (1935).—A survey. Leopold Scheflan

The oiling of wool for the worsted spinning process. J. B. Speakman. *Melland Textiles*, 16, 528-41 (1935).—See C. A. 29, 7083<sup>2</sup>. J. A. Seilard

New methods of the finishing of blankets by means of fatty alcohol sulfonates. W. Pflumm. *Spinner u. Weber* 53, No. 38, 9-12 (1935).—Photomicrographs show wool damaged by alkalis, damages caused by the formation of Ca soap, and the appearance of a carefully washed woolen blanket. Detailed directions are given for washing and rinsing involving the use of Gardinol which was found to give very good results. Leopold Scheflan

Sulfonated and free fatty alcohols. E. Gibson. *Silk and Rayon* 9, 589 (1935).—The uses of these compds in finishing silk and rayon are discussed. M. Harris

Rayon fabrics. Arthur H. Schnell. *Textile Bull.* 49, No. 11, 6, 8, 10 (1935).—A review of the properties of rayon yarns and the manu. of rayon goods. L. S.

The finishing of pure rayon fabrics. Wilhelm Kegel. *Deut. Wollen-Gewerbe* 67, 1249-50 (1935).—Various formulas and sp. directions are given for sizing, treatment after bleaching and dyeing, finishing mixed fabrics from rayon and cotton, and printing and steaming of rayon fabrics. Strong alkali baths should not be employed for washing. A newly developed comp. finishing product is Ortozan K which is easily sol. in boiling water, is particularly adapted for the finishing of mixed fabrics from rayon and cotton and is employed in a concn. of 30-60 g/l. at a temp. of 20-35°. Putrefactive decomposition of Bengal silk cocoons. Sikkibhusan Dutt. *J. Indian Chem. Soc.* 12, 458-62 (1935).—The products of putrefaction of silk cocoons during the process of maceration in aq. liquids act as strong pressor substances for the heart. A preliminary examn. of cocoons obtained from the Government of Bengal showed that they contained 25.6% of serum, 70.4% of fibrin, 2.2% H<sub>2</sub>O and about 2.0% of moist matter. The bright yellow color is probably due to their carotene content. Complete hydrolysis and subsequent estn. of the amino acids gave 28.4, 22.85, 5.78, 0.85, 0.8, 0.8 and 12.8% of glycine, alanine, serine, leucine, glutamic acid, phenylalanine and tyrosine together with traces of aspartic acid and proline. On maceration with 50 times their wt. of H<sub>2</sub>O and incubation at 37° for 1 week, the cocoons underwent extensive putrefaction and lost 35% of their wt. The liquid expressed from the fibers had a nauseating odor and on systematic extn. yielded (in the form of HCl salts) 4.2, 1.8, 5.8, 2.1 and 0.3% of NH<sub>4</sub>, NH<sub>4</sub>Me, NH<sub>4</sub>Et,  $\beta$ -HOCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub> and HOCH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub>, resp. CO<sub>2</sub> was evolved freely during the incubation. Thus the putrefaction involves the simultaneous hydrolysis of the proteins into amino acids and the decarboxylation of the acids into amines. The presence of 24% of tyramine in the decoction accounts for its strong pressor action. The fibrous matter remaining consisted of practically pure bleached fibrin with the latter but only half the strength of ordinary silk. The large proportion of NH<sub>4</sub> evolved during the putrefaction must be due to the further degradation of the amines. C. R. A.

Recent developments in textile finishing. L. G. Lawrie. *Textile Bull.* 49, No. 10, 8, 34 (1935).—Reasons are given for the improvement of finishes, finishing methods and processes since the world war. Among the sulfonated textile acids are iso-Pr naphthalenesulfonic acids, sulfonated oils, alcs and long-chain compds. Commercially valuable textile acids are classified according to their effect on the finishing processes: they (1) simplify, (2) improve or (3) produce new or novel effects. Grouped

according to the effect they produce the finishing assistants are (1) detergents, (2) wetting-out agents or (3) solvents.

**The formulation of bat and fabric finishes.** P. H. Fawcett. *Paint, Oil & Chem. Rev.* 97, No. 19, 12, 14, 16 (1935).—The results desired with such products, factors controlling their properties and formulation methods are discussed.

**Hats.** T. A. Foister. *J. Soc. Dyers Colourists* 51, 351-61 (1935).—A brief review of modern hat manuf and dyeing.

**The development of the electron technic and its importance for the textile industry.** Rudolf Mehlo. *Monatsschr. Textil-Ind.* 50, 217, 240 (1935).—A discussion of the applications of high-vacuum tubes and Hg vapor rectifiers.

**Working with vacuum.** Teufer Z. *ges. Textil-Ind.* 38, No. 43, 101 (1935).—Applications in the textile industry are briefly discussed in connection with dyeing and drying.

**Bibliography on laundability of textiles.** L. M. Gugelman. *Am. Dyestuff Repr.* 24, 593-4, 607-9 (1935).—An extensive bibliography on this subject covering the period of 1910 to 1934.

**The lime soap problem in textile finishing.** A. Toulon. *Algem. Del.-u. Felt. Ztg.* 32, 363 5 (1935).—The use of Calgon (Na metaphosphate) is recommended to eliminate the formation of insol. Ca salts when hard waters are used for textile operations.

**Buckling experiments.** G. Coch. *Spinner u. Weber* 53, No. 18, 4-12 (1935).—Several series of buckling expts. were conducted with and without pressure with NaOH, Nuva B, Bait, water glass, soap, Percolloid B, Bicalcol, Gardinol R and Igepon T on crude cotton. Results: Except for Percolloid B, all buckling agents tested have an effect on the white appearance of the fabric only at such a high concn which hardly ever occurs in actual practice. Soap does not stand behind but passes all these buckling agents in this respect. A change of the wetting, foaming and dispersing properties of Nuva B, Gardinol R and Igepon T does not occur to any noticeable extent after boiling for 3 hrs. under a pressure of 1 1/2 atms. However, admixts. to the fiber which are extd. from the crude cotton will influence these phys. chem. properties.

**Mothproofing agents for textile goods.** Stötter. *Spinner u. Weber* 53, No. 36, 11-14 (1935).—A discussion of several patents on mothproofing materials and of the use of a no. of dyes for the manuf. of mothproof goods.

**Dyes.** Chemische Fabrik vorm. Sandoz. Swiss 174,541-1, Apr. 1, 1935 (Cl. 37b). Addn. to 169,707 (C. A. 29, 3846). Fulling-fast dyes are obtained by treating 1-amino-2-sulfo-4-phenylaminoanthraquinone with AcH in the presence of  $\text{H}_2\text{SO}_4$  (174,541). The AcH may be replaced by 3-aminobenzoaldehyde (174,542), or by 4-aminobenzaldehyde (174,543), or the anthraquinone deriv. in 1-amino-2-sulfo-4-(1'-methylphenylamino)-

anthraquinone (174,544). The structural formulas of the dyes are given.

**Dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 175,242, May 1, 1935 (Cl. 37a). A new dye contg. metal is obtained by treating the Cu compd. of the dye from diazotized 5-nitro-2-aminophenol and 2-naphthol-3,6-disulfonic acid with reducing agents which, in an alk. medium, cause the  $\text{NO}_2$  groups of 2 mols. to link up. The dye colors cotton and viscose in fast blue shades.

**Dyes.** Chemische Fabrik vorm. Sandoz. Swiss 175,893, June 1, 1935 (Cl. 37b). Addn. to 169,707 (C. A. 29, 3846). A new fulling-fast dye is obtained by treating Na 1-amino-4-phenylaminoanthraquinone-2-sulfonate with  $\text{CH}_3\text{O}$  in an aq. medium. The dye colors wool in fast blue shades. Its structural formula is given.

**Dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 176,240-2, June 17, 1935 (Cl. 37d). Addn. to 173,414 (C. A. 29, 5666).

A S dye is obtained by heating pyrene to high temps. with S. The dye colors cotton from a hyposulfite vat in fast bluish brown shades (176,240). Similarly fluoranthene is heated with S to give a dye which colors cotton from a Na-S bath in orange-brown shades fast to Cl (176,241). Also, amonopyrene, obtained by nitrating pyrene and reducing the  $\text{NO}_2$  compd. is heated with S to give a dye which colors cotton from a Na-S bath in brown shades (176,242).

**Dye composition.** Soc. pour l'ind. chim. à Bâle. Swiss 176,340, July 1, 1935 (Cl. 24a). The compn. consists of a dye contg. a sulfo group and capable of dyeing in AcOH, and less than 10% of a lyophilic dispersion agent contg. at least one basic N atom and at least one aliphatic or cycloaliphatic residue with at least 8 C atoms and capable of uniting with dye contg. a sulfo group. Thus, the finely powdered dye from diazotized 1-amino-8-naphthol-3,6-disulfonic acid and 1-phenylaminoanthraquinone-8-sulfonic acid is made into a paste with alc. To this is added  $\text{H}_2\text{PO}_4$  and N-dihydroxypropylimidazole-1-Cl. The paste is dried and pulverized to give a non-sticky powder suitable for making wool dyes. Other examples are given.

**Dyes.** Soc. pour l'ind. chim. à Bâle. Swiss 176,533, July 1, 1935 (Cl. 37d). Addn. to 173,414 (C. A. 29, 5666). A dye contg. S is obtained by treating 2-(4'-hydroxyphenylamino)anthracene with S-yielding agents, such as Na-S and S, at high temps. The new dye gives cotton from a Na-S bath olive black shades.

**Dyes.** I. G. Farbenind. A.-G. (Carl Winter and I. mil Kern, inventors). Ger. 618,121, Sept. 2, 1935 (Cl. 22b).

Yellow or orange dyes are obtained by the action of  $\text{NH}_3$  or primary or secondary amines on compds. of the formula below, in which R is H or an alkyl, aryl or aralkyl group, and X and Y are O or S. The keto chlorides of these compds. may also be used. The reaction may be effected at atm. or raised temp. in the presence or absence of  $\text{ZnCl}_2$  or like condensing agent. Water must be present if a cyclic amine is used. Examples are given. The products resemble the known dianilindimethane dyes but are relatively fast to boiling and acid.

**Azo dyes.** Clifford Paine (to Imperial Chemical Industries Ltd.). U. S. 2,018,764, Oct. 29. Diazotized p-nitrobenzoyl-p-phenylenediaminesulfonic acid or other diazotized amine of the general formula  $\text{YR}^1\text{XR}^2\text{NH}_2$ , in which Y represents a nitro or monosulfamoyl group,  $\text{R}^1$  and  $\text{R}^2$  represent arylene nuclei at least one of which has substituted thereon a sulfonic acid group, and X represents a carbonylamino or sulfoamino group, is coupled with an aromatic amine such as a N-substituted "J acid" and the resulting aminoazo compd. is diazotized and coupled with a N-substituted aminonaphthol-sulfonic acid having a diazotizable amino group in the N-substituent, the nitro

or monoacylamino group mentioned is converted to an amino group, and the resulting compd. is tetratized and coupled with 2 eqvs. of a "yellow end component" such as acetylacetanilide. The resulting dyes give green shades

**Azo dyes** Wilhelm Neelmeyer and August Modersohn (to General Aniline Works) U. S. 2,018,801, Oct. 29. Dyes of the general formula

where one X stands for H or the sulfonic acid group and the other X stands for the sulfonic acid group, alkyl or halogen, in such a manner that at least one X represents the sulfonic acid group, and the Y's stands for H, alkyl or halogen, in the form of their alkali metal salts generally yellowish to brownish powders, sol. in water, and dyeing wool from an acid bath, after chroming, generally yellowish to brownish shades of good fastness are obtainable by treating with a sulfonating agent an azo dye of the general formula as above without the X substituent in one ring, where X stands for H, alkyl or halogen and the Y's stands for H, alkyl or halogen, the manu. of these dyes being described for example in German Patent 278,613. Instead of starting with these dyes, there may be used the complex Cr compds. which are described, for example, in Fr 499,071 (C. A. 28, 650<sup>1</sup>) and which are obtainable by heating the 4-amino-1-hydroxybenzene-2-carboxylic acid or a nuclear substitution product thereof in the free form or in form of a water-sol. salt with a water-sol. Cr salt contg. the Cr in the trivalent form in water or in an org. solvent and, if desired, with the addn. of a non diazotizable base. Several examples with details are given

**Azo dyes** I. G. Farbenindustrie A.-G. Brit. 432,020, July 15, 1935. Dyes are prep'd by coupling a diazotized aniline of formula 2-H<sub>2</sub>N-3-XC<sub>6</sub>H<sub>4</sub>SO<sub>3</sub>H, where X is H or a univalent substituent and where the C<sub>6</sub>H<sub>4</sub> nucleus may contain further substituents other than OH, with a naphthalene deriv. of formula acyl-YN-1-HO-3-HO-5-C<sub>6</sub>H<sub>3</sub>, where Y is H, alkyl or aryl. The products dye animal fibers yellowish orange to bluish red shades. Examples are given

**Azo dyes** Williams (Hounslow) Ltd., Arthur G. Green, Herbert Ackroyd and Alexander Macmaster Brit. 432,355, July 22, 1935; Fr 784,207, July 22, 1935. Dis-, tri- and tetra-azo dyes are made from tetrazotized benzidine 2,2'-disulfonic acid, or the tetrazo compd. of the tolidinedisulfonic acid obtained from *p*-nitrotoluene by sulfonation, alk. reduction and intramol. change of the hydrazo compd., by (1) coupling with 2 mols of a sulfonic acid of 2,5- or 1,8-aminonaphthol with 1 mol of such an acid and 1 mol of another such aminonaphtholsulfonic acid, (2) 1 mol of a sulfonic acid of 2,5- or 1,8-aminonaphthol and 1 mol of  $\alpha$ - or  $\beta$ -naphthol or a sulfonic acid thereof, resorcinol,  $\beta$ -resorcylic acid,  $\beta$ -hydroxynaphthoic acid, salicylic acid, *o*-cresotic acid, PhOH, cresols, phenylpyrazolones or an aminophenolic or amino component, e. g., *m*-phenylene- or *m*-tolylene diamine, (3) 2 mols of an acyl deriv. of a sulfonic acid of 2,5- or 1,8-aminonaphthol contg. an acyl group derived from a fatty acid of 8 or less C atoms or from a substituted or unsubstituted aromatic acid, (4) 1 mol of an acylaminonaphtholsulfonic acid as defined in (3) and 1 mol. of the 2nd components stated in (2), (5) 2 mols. of a sulfonic acid of 2,5- or 1,8-aminonaphthol, 1 or both of which have been previously coupled with a diazo compd. or, alternatively, with 2 mols. of the said aminonaphtholsulfonic acid and subsequently with 1 or 2 mols. of the diazo compd., (6) 1 mol of a sulfonic acid of 2,5- or 1,8-aminonaphthol that is previously or subsequently coupled with a diazo compd., the 2nd diazo group of the tetrazo compd. being coupled with 1 of the 2nd components in (2), (7) in alk. soln. with either 1 or 2 mols. of a sulfonic acid of 2,5- or 1,8-aminonaphtholsulfonic acid, rediazotizing the product and

coupling with 2 mols. of 1 of the 2nd components of (2), or (8) with 1 or 2 mols. of a middle component other than 2,5- or 1,8-aminonaphtholsulfonic acid, rediazotizing the product and coupling with 2 mols. of a sulfonic acid of 2,5- or 1,8-aminonaphthol. They are suitable for leather dyeing. In examples, (1) benzidine-2,2'-disulfonic acid (I)  $\rightleftharpoons$  (alk.) II acid or J acid, (2) I or the tolidinedisulfonic acid  $\rightleftharpoons$  (alk.) acetyl II acid, (3) 1-phenyl-3-methyl-5-pyrazolone  $\rightleftharpoons$  I  $\rightleftharpoons$  (acid) II acid  $\rightleftharpoons$  (alk.)  $\beta$ -nitroaniline (II), (4) I or the tolidinedisulfonic acid  $\rightleftharpoons$  (alk.) II acid  $\rightleftharpoons$  (acid) II, (5) II acid  $\rightleftharpoons$  (acid) I  $\rightleftharpoons$  (acid) II acid  $\rightleftharpoons$  (alk.) PhNH<sub>2</sub> or  $\beta$ -naphthylamine, (6) II acid  $\rightleftharpoons$  (alk.) I  $\rightleftharpoons$   $\beta$ -xylylene  $\rightleftharpoons$  (alk.) II acid.

**Azo dyes** Soc. pour l'ind. chim. à Bâle. Swiss 174,319, June 1, 1935 (Cl. 37a). A new dye is produced by coupling *N*-nitroamine from 1-aminonaphthalene, with diazotized 1-amino-2-methoxybenzene

**Azo dyes** Soc. pour l'ind. chim. à Bâle. Swiss 174,517-18, Apr. 1, 1935 (Cl. 37a). Addns to 163,539 (C. A. 28, 2914<sup>1</sup>). A new dye is obtained by coupling diazotized 2,6-dichloro-4-nitro-1-aminobenzene with ethyl( $\omega$ -acetylhydroxyethyl)aniline (174,517). The diazo component may be replaced by diazotized 2,5-dichloro-4-nitro-1-aminobenzene (174,518). The dye colors acetate silk in yellowish brown and bluish red shades, resp.

**Azo dyes** Soc. pour l'ind. chim. à Bâle. Swiss 174,519, Apr. 1, 1935 (Cl. 37a). Addn. to 164,700 (C. A. 29, 3850<sup>1</sup>). A new dye coloring acetate silk in violet-red shades, is obtained by coupling diazotized 5-nitro-2-aminophenol with 1-ethylamino-2-methoxy-5-methylbenzene

**Azo dyes** Soc. pour l'ind. chim. à Bâle. Swiss 175,028, Apr. 16, 1935 (Cl. 37a). A new dye is prep'd by coupling diazotized 4-(1'-chlorophenoxy)acetylaminobenzene-2,5-diethoxy-1-aminobenzene with the 2-methylanilide of 2,3-hydroxynaphthoic acid. The dye colors vegetable fibers in fast blue shades. The structural formula of the dye is given.

**Azo dyes** Soc. pour l'ind. chim. à Bâle. Swiss 175,030, Apr. 16, 1935 (Cl. 37a). A new dye is prep'd by coupling 2-diazo-5-acetylaminobenzene-4,4'-dichloro-1,1'-diphenyl ether with the 2-methoxyanilide of 2,3-hydroxynaphthoic acid. The dye colors cotton and rayon in fast bordeaux red shades. The structural formula of the dye is given.

**Azo dyes** Soc. pour l'ind. chim. à Bâle. Swiss 175,031, Apr. 16, 1935 (Cl. 37a). A new dye is obtained by coupling 2-diazo-4-carboxylic acid 4'-methyl-1,1'-diphenyl ether with the anilide of 2,3-hydroxynaphthoic acid. The dye colors wool, cotton and rayon in fast orange shades. The structural formula of the dye is given.

**Azo dyes** Soc. pour l'ind. chim. à Bâle. Swiss 175,353-4, May 16, 1935 (Cl. 37a). A new dye is produced by coupling 2-diazodiphenylene dioxide with the 1-naphthylamide of 2,3-hydroxynaphthoic acid. The dye colors cotton, wool and rayon in fast Bordeaux red shades (175,353). A second dye is obtained by coupling 2-diazo-4-chloro-1,1'-diphenyl ether with the 2-naphthylamide of 1-hydroxy-3,4-dichloro-6-carboxylic acid. The dye colors wool, cotton and rayon in fast brown shades (175,354). Examples and the structural formulas of the dyes are given.

**Azo dyes** J. R. Geigy A.-G. Swiss 175,355, June 1, 1935 (Cl. 37a). Diazotized 6-chloro-2,4-dinitroaniline is coupled with monodihydroxypropyl- $\alpha$ -naphthylamide (obtained by condensing  $\alpha$ -naphthylamine with a tech. mixt. of isomers of chlorodihydroxypropane). The dye colors acetate silk in blue shades. An example is given.

**Azo dyes** Soc. pour l'ind. chim. à Bâle. Swiss 176,922, July 16, 1935 (Cl. 37a). A new dye is formed by coupling 2-diazo-4-acetyl-4'-chloro-1,1'-diphenyl ether with 2,3-hydroxynaphthoic acid-2'-methylanilide. The dye colors cotton, wool and rayon in fast red shades. The structural formula is given.

**Azo dyes** I. G. Farbenind. A.-G. Fr 784,330, July 22, 1935. Dyes are prep'd by combining diazotized amines of the formula H<sub>2</sub>NXSO<sub>3</sub>NHC(C(OH)C(COOH))

CH CY:CH (X is an aromatic radical which may contain

substituents and Y is H, NO<sub>2</sub>, Cl, Me or SO<sub>2</sub>H) with coupling components. Thus, *N*-(3'-amino)benzenesulfonyl-3-amino-2-hydroxybenzenecarboxylic acid  $\rightarrow$  1-(2'-chloro 5'-sulfo)phenyl-3-methyl-5-pyrazolone dyes wool in yellow shades. Other examples are given.

**Azo dyes** I. G. Farbenind. A.-G. Fr. 784,364, July 22, 1935. Dyes are prepd. by combining a diazotized alkyl ester of 1-amino-2-halobenzenecarboxylic acid with a coupling component. OH and having a coupling position next to the OH but contg. no other solubilizing groups, either in substance or on the fiber or in the presence of a substratum suitable for the prepn. of lakes. Thus, the Et ester and 1-(2',3'-hydroxynaphthylamino)-4-chloro 2,5-dimethoxybenzene give a dye which dyes fast orange shades. Several examples are given.

**Azo dyes** Soc. pour l'ind. chim. à Bâle. Fr. 784,509, July 22, 1935. Aryldes of aromatic  $\alpha$ -hydroxy carboxylic acids are coupled in substance or on the fiber with 4-halo-2-diazo-5-acylaminothiophenyl ethers, the 2nd phenyl group being substituted in any manner if desired. Thus a light Bordeaux red shade is obtained with 4-chloro-2-diazo-5-acylamino-4'-methoxydiphenyl ether  $\rightarrow$  2-anilide of 2,3-hydroxynaphthoic acid. Other examples are given.

**Azo dyes**, Soc. pour l'ind. chim. à Bâle. Fr. 784,514, July 22, 1935. Alkyl esters of 2-diazo-4-carboxy-1,1'-diphenyl sulfones in which the 2nd Ph group may be substituted in any manner or replaced by an alkyl group are coupled with any coupling components. Thus, 2-amino-4-carboxy-4'-methyl 1,1'-diphenyl sulfone  $\rightarrow$  *o*-chloro-anilide of 2,3-hydroxynaphthoic acid is an orange dye. Other examples are given.

**Triazo dyes** E. I. du Pont de Nemours & Co. Brit. 432,122, July 22, 1935. Dyes are made in accordance with the scheme, an amine of the C<sub>6</sub>H<sub>4</sub> or C<sub>6</sub>H<sub>5</sub> series (which may be substituted by halo, alkyl, alkoxy, SO<sub>2</sub>H, COOH or NO<sub>2</sub> groups but no OH)  $\rightarrow$  a *p*-coupling aryl amine other than an aminopyrazolone  $\rightarrow$  an aminohydroquinone dialkyl, diaralkyl or diaryl ether  $\rightarrow$  an aminobenzoylaminoanthraquinone sulfonic acid. They give bright green shades on cotton when diazotized on the fiber and developed, e. g., with 1-phenyl-3-methyl-5-pyrazolone. In examples, (I) aniline-2,5-disulfonic acid  $\rightarrow$  1-naphthylamine-7-sulfonic acid (I)  $\rightarrow$  aminohydroquinone dimethyl ether (II)  $\rightarrow$  *p*-aminobenzoyl-J acid, and (2) aminoterephthalic acid  $\rightarrow$  I  $\rightarrow$  II  $\rightarrow$  *p*-aminobenzoyl 1,8,4-acid.

**Indigoid dyes** Soc. pour l'ind. chim. à Bâle. Swiss 174,262-3, Apr. 1, 1935 (Cl. 37e). Addns to 163,703 (C. A. 29, 1935). 4,7-Dimethylsatin  $\alpha$ -halide is treated with a chlorinating agent in the presence of an indifferent diluent and the product is condensed with 4-chloro-1-naphthol. Thus, 4,7-dimethylsatin is converted to the  $\alpha$ -chloride by treatment with PCl<sub>5</sub> and PhCl. The  $\alpha$ -chloride is treated with SO<sub>2</sub>Cl<sub>2</sub> and the product condensed with 4-chloro-1-naphthol (174,270). Alternatively the  $\alpha$ -halide may be condensed with 1-naphthol (174,271). The dyes produce fast blue shades on cotton from a yellowish green vat.

**Indigoid dyes** Soc. pour l'ind. chim. à Bâle. Swiss 176,262-3, June 17, 1935 (Cl. 37e). Reactive  $\alpha$ -derivs. of 4-methyl-7-chlorosatin are condensed with 4-methoxy-1-naphthol to give dyes coloring cotton in fast blue shades. Thus, 4-methyl-7-chlorosatin is heated with PCl<sub>5</sub> and PhCl to give 4-methyl-7-chlorosatin  $\alpha$ -chloride. This is condensed with 4-methoxy-1-naphthol to give a dye, (176,262). Similarly, reactive  $\alpha$ -derivs. of 4,7-dimethyl-5-bromosatin are condensed with 1-naphthol to give dyes which color cotton in fast blue shades. The structural formulas of the dyes are given (176,263). Cf. C. A. 29, 1653<sup>1</sup> and preceding abstr.

**Triarylmethane dyes**, I. G. Farbenindustrie A.-G. Brit. 432,204, July 22, 1935. The dyes are obtained by condensing in the known manner in nonalk. media secondary or tertiary amines with aromatic aldehydes or with

aromatic compds. contg. 2 CH<sub>2</sub> groups, at least 2 H atoms of each CH<sub>2</sub> being substituted by halo atoms, and converting the resulting leuco bases into the corresponding triarylmethane dyes by oxidation in the presence of acids. In examples, terephthalaldehyde is condensed with dimethylaniline, diethylaniline and *N*-hydroxyethyltetrahydroquinoline in presence of ZnCl<sub>2</sub>, H<sub>2</sub>SO<sub>4</sub>, and HCl, resp. and the resulting leuco bases are oxidized by PhO<sub>2</sub> to dyes that give blue-black shades on cotton mordanted with tannic acid.

**Sulfur dyes**, Société pour l'ind. chim. à Bâle. Brit. 431,976, July 18, 1935. This corresponds to Fr. 776,145 (C. A. 29, 3350<sup>1</sup>) but the sulfuration of the SO<sub>2</sub>H and NH<sub>2</sub> groups and of perylene itself is excluded.

**Sulfur dyes** Soc. pour l'ind. chim. à Bâle. Swiss 174,545, June 1, 1935 (Cl. 37d). Addn. to 163,752 (C. A. 29, 606<sup>1</sup>). A black-dyeing S dye is prepd. by condensing 3-indophenol from carbazole and *p*-nitrosophenol, with 1-acetylaminio-4-aminobenzene and sulfurizing the product at temps. above 200°. Cf. C. A. 29, 7672<sup>1</sup>.

**Vat dyes** Soc. pour l'ind. chim. à Bâle. Swiss 175,027, Apr. 16, 1935 (Cl. 36q). An equimol. mixt. of 1-halo-2-acylaminoanthraquinone and 1-haloanthraquinone is heated with a halogen-seizing agent and the product saponified to give 2-amino-1,1'-bisanthraquinonyl.

**Vat dyes** Soc. pour l'ind. chim. à Bâle. Swiss 176,031, June 1, 1935 (Cl. 37b). The new dye 2,2'-dianthrimide 1,1'-carbazole is prepd. by the action of an acid condensing agent on 2-amino-1,1'-bisanthraquinonyl. It produces olive shades on cotton.

**Vat dyes**, Soc. pour l'ind. chim. à Bâle. Swiss 176,037, July 1, 1935 (Cl. 37b). Isodibenzanthrone is brominated with about 1.2 parts of Br in a PhNO<sub>2</sub> medium in the presence of at least 5% of ZnCl<sub>2</sub>. The product has a Br content of about 20% and colors cotton in violet shades.

**Vat dye** Soc. pour l'ind. chim. à Bâle. Swiss 176,027, July 16, 1935 (Cl. 37b). *Br*-1-Benzanthronyl-5-aminobenzanthrone is heated with a caustic alkali to give a dye coloring cotton from a blue vat in fast marine blue shades. The structural formula is given.

**Azo dyes** Soc. pour l'ind. chim. à Bâle. Swiss 177,266, Aug. 1, 1935 (Cl. 37a). A new dye is formed by coupling diazotized 6-oxo-2,4-dinitro-1-aminobenzene with 2-methoxy-5-methyl-1-*N*-bis(methoxyethyl)aminobenzene. The dye colors acetate silk in fast blue shades.

**Vat dyes** (acylaminoanthraquinones), Imperial Chemical Industries Ltd. Ger. 618,002, Aug. 30, 1935 (Cl. 22b 3 03). See I. 770,091 (C. A. 29, 1651<sup>1</sup>).

**Vat dyes**, I. G. Farbenind. A.-G. (Wilhelm Eckert and Ernst Ischer, inventors). Ger. 618,045, Sept. 2, 1935 (Cl. 22b 2 05). Blue vat dyes are obtained by the reaction of dihydroanthrone (I) or its substitution products with benzquinone or its substitution products. The reaction may be effected by boiling the reagents in PhCl for several hrs. under reflux. Green dyes are obtained by halogenating the products. The starting materials specified include 3,3'-dichloro-I, m. 217-8°, 2,2'-dimethyl-I, m. 208-9°, 3,3'-dimethyl-I, m. 279°, 1,1'-dichloro-I, m. 208-9°, 3,3'-dimethyl-I, m. 230°, 1,1'-dichloro-I, m. 296°, and 1,1'-8'-tetrachloro-I, m. 325°; methods of prep. these compds. are indicated.

**Vat dyes**, I. G. Farbenind. A.-G. Fr. 784,504, July 22, 1935. Dyes of the anthraquinonazone series are prepd. by treating  $\alpha$ -amino- $\alpha$ , $\beta$ -dianthrimides with halogenating agents. Thus, 3,3'-dibromo-4'-benzoylaminoanthraquinonediazine (dyes vegetable fibers in fast green-blue shades) is prepd. from 4'-benzoylamino-1-amino-2,1'-anthrimide, 4'-amino-3,3'-dibromo-*N*-methylanthraquinonediazine (green-blue shades) from the anthrimide obtained from 1-methylamino-2-bromoanthraquinone and 1,4-diaminoanthraquinone, 3,3'-dibromo-4-hydroxyanthraquinonediazine (blue-green shades) from the anthrimides obtained from 1-amino-2-bromoanthraquinone and 1-amino-4-hydroxyanthraquinones, also a dye from 1-methylamino-2,1'-anthrimide (by methylating 1-amino-2,1'-anthrimide).

Arylamino anthraquinonediazine derivatives Fritz

Raumann (to General Aniline Works) U. S. 2,017,936, Oct. 22. Compd. of the general formula

where X and Y mean aryl radicals of the benzene series, R stands for a radical of the benzene series, forming blue to bluish gray needles, dissolving in concd.  $H_2SO_4$  with a yellow to green coloration, drying cotton from blue-gray shades fast to blue are prep. by a process comprising reacting upon a 1,4-diaroamino-3-aminoanthraquinone, the aryl group being of the benzene, naphthalene, biphenyl, anthracene or anthraquinone series, with an  $\alpha$ -haloacetic acid of the benzene, naphthalene, anthracene or anthraquinone series, which acid may be esterified by a lower aliphatic alc., in the presence of a high-boiling inert org. solvent at a temp. above about  $100^\circ$  and causing acridone ring formation of the reaction product thus obtained. A Cu catalyst and an acid-binding medium are used and a reaction temp. of about  $150^\circ-200^\circ$  is suitable. Several examples with details of procedure are given.

**p-Arylene-thiazole- and aryleneoxazole-sulfonic acids.** Max Schupert and Ernst Herdeckerhoff (to General Aniline Works) U. S. 2,018,913, Oct. 29. *Isomeric derivatives of the main* of dyes and pharmaceutical products and which have the general formula arylene-N C(SO<sub>3</sub>H)<sub>2</sub>X,

where arylene means a radical of the  $C_{10}H_6$  or  $C_{12}H_8$  series and X stands for S or O, are obtained by treating the corresponding 2-mercapto compds. of the arylene-thiazole and -oxazole series in an alk. medium with a quantity of an oxidizing agent corresponding to at least 5 reactive O atoms. The formed new sulfonic acids are generally colorless powders which are water sol. in contradistinction to the corresponding disulfides, which are obtainable by oxidizing the same 2-mercapto compds. in an acid medium (with nitric acid). When heated with the addition of an acid such as HCl they split off  $SO_2$ . They form water sol. alkali metal salts which represent generally colorless crystals and yield when reduced with Na amalgam the corresponding fundamental compds. by replacing the sulfonic acid group by H in an analogous manner as with the  $\alpha$ -sulfonic acids of the  $C_{10}H_6$  series. Several examples are given, including the production of benzothiazole-2-sulfonic acid, 6-ethoxybenzothiazole-2-sulfonic acid and 6-benzoylamino-benzothiazole-2-sulfonic acid.

**Anthraquinone derivatives.** See pour l'ind. chim. à Bâle. Ger. 618,001, Aug. 30, 1935 (Cl. 22 3 32). 1-Hydroxyalkylamino-1-arylamino derivs. of an anthraquinone (I) are prep. (1) by the action of a hydroxyalkyl amine on a 1-arylamino-1 substituted in the 4-position with a reactive atom or radical, e. g., halogen or OH, or (2) by the action of an aryl amine on a similarly substituted 1-hydroxyalkylamino-1, or (3) by treating a 1-amino-4-arylamino-1 with (CH<sub>3</sub>)<sub>2</sub>CO or its homologs or analogs, or (4) by treating a leuco-1,4-bis(arylamino)-1 with a hydroxyalkyl amine, or a leuco-1,4-bis(hydroxyalkylamino)-1 with an arylamine, or leuco-1,4-diamino-1 with an arylamine and a hydroxyalkyl amine, and oxidizing the product in each case, during or after the reaction. The corresponding leuco compds. may also be used in methods (1) and (2), and the products similarly oxidized. Examples are given of the manifold products from (1) 1,4-bis(hydroxyethylamino)-4-methoxy- (or 4-thio)-1 and *p*-phenylenediamine (II), (2) 1-amino-4-(*p*-hydroxyphenylamino)-1 and (CH<sub>3</sub>)<sub>2</sub>O, (3) leuco-1,4-bis(*p*-hydroxyethylamino)-1 and II, (4) leuco-1,4-diamino-1, *p*-aminophenol, and NH C<sub>2</sub>H<sub>4</sub>OH, (5) leuco-1-hydroxy-4-(*p*-aminophenyl-

amino)-1 and NH C<sub>2</sub>H<sub>4</sub>OH (or NH<sub>2</sub>(CH<sub>2</sub>)<sub>2</sub>OH), (6) leuco-1-amino-1-phenylamino-1 and NH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OH, (7) 1-amino-4-phenylamino-1 and glycerol. The products dye acetate rayon in green shades.

**Naphthal derivative.** Chemische Fabrik vorm. Sandoz, Swiss 175,539, May 1, 1935 (Cl. 37g). Addn. to 159,446. The compd. 2-aceto-8-naphthol-3,6-disulfonic acid is obtained by heating 2,5,8,6-diazosulphohydro-sulfonic acid with HI. The compd. is used as an intermediate in the prep. of dyes and as a drug.

**Hydroxybiphenyl derivatives.** I. G. Farbenind., A.-G. (Oskar Haller and Heinrich Merschel, inventors), Ger. 618,215, Sept. 6, 1935 (Cl. 12a, 16). Arylides from 4-hydroxybiphenyl-3-carboxylic acid (I) and aromatic amines contg. no SO<sub>3</sub>H or COOH group are prep. by standard processes. Examples are given of the prepn. of the anilide, m.  $231^\circ$ , of I and of a condensation product, m.  $267^\circ$ , from 2 mols. of I and 1 mol. of benzamide. The *n*-amide, m.  $155^\circ$ , *n*-toluene, m.  $238^\circ$ , *m*-toluene, m.  $222^\circ$ , *p*-toluene, m.  $244^\circ$ , 2,4-dimethylaniline, m.  $217^\circ$ , *p*-chloroaniline, m.  $210^\circ$ , and 5 naphthalene, m.  $237^\circ$ , of I have also been prep. The products are useful in producing dyes on the fiber.

**Diazoamino compounds.** I. G. Farbenind., A.-G. (Carl Taubé and Ernst Tietze, inventors), Ger. 618,549, July 13, 1935 (Cl. 12g, 10). Addn. to 614,198 (Cl. 1, 29 4 749). Compds. similar to or identical with those obtainable by the process of Ger. 614,198 are obtained by coupling diazotized substituted aromatic amines with cyanamidoacetic acid and/or its salts.

**Carbazole derivatives.** See pour l'ind. chim. à Bâle. Swiss 175,579-5, June 1, 1935 (Cl. 37f). Addn. to 171,563. Addn. products of aminoanthraquinone and nitrochlorobenzene are treated with a diazotizing agent at raised temps. The structural formulas of the starting compds. and the carbazole derivs. are given. The derivs. are used as dye intermediates.

**N-Nitroamines.** See pour l'ind. chim. à Bâle. Swiss 177,018, June 17, 1935 (Cl. 37a). The compd. 1-benzylamino-4-N-nitroamine-2,5-dimethoxybenzene is obtained by treating the *N*-nitroamine of 1-amino-4-methoxy-2-methoxybenzene with a reducing agent to convert the 4-nitro group to an amino group and benzylating the product. The compd. is used as a dye intermediate.

**Intermediates and dyes.** Imperial Chemical Industries Ltd. Fr. 784,229, July 22, 1935. *p*-Arylamino-arylamides of 2,3-hydroxynaphthoic acids are prep. by coupling an aromatic carboxylic halide with a *p*-amino-arylamide of a 2,3-hydroxynaphthoic acid or by condensing a monoaralkyl-*p*-arylenediamine on a 2,3-hydroxynaphthoic acid halide. The products are coupling components for the production of azo dyes. Examples are given of the prepn. of benzoyl-*p*-aminobenzene (m.  $241^\circ$ ), 2'-chloro-4'-benzoylamino-*p*-aminobenzene (m.  $280-1^\circ$ ), 2'-methyl-5'-chloro-4'-benzoylaminoaniline (m.  $268^\circ$ ), 2'-methyl-4'-benzoylaminoaniline (m.  $257^\circ$ ), and 2'-methyl-4'-benzoylaminoaniline (m.  $230^\circ$ ), of 2,3-hydroxynaphthoic acid, and of dyes prep. with these.

**Intermediates for dyes.** See pour l'ind. chim. à Bâle. Fr. 784,543, July 22, 1935. *N*-Nitroamines of primary aromatic amines, nitrated in the ring, are treated with reducing agents so that the NO<sub>2</sub> group fixed directly to an aromatic ring is transformed. The products obtained may be acetylated. Examples are given of the prepn. of the Na salts of the nitroamine of 1-amino-4-methoxy-2,5-dimethoxybenzene, the mono-*N*-nitroamine of 1,4-diamino-2,5-dimethoxybenzene, 1-nitroamino-2-methyl-4-amino-2-benzene, 1-nitroamino-2,5-dichloro-2-aminobenzene, 1-*N*-nitroamino-2-amino-4-methylbenzene (I), *N*-nitroamine of 1-amino-4-methoxy-2,5-dimethoxybenzene, mono-*N*-nitroamine of 1,4-diamino-2,5-dimethoxybenzene, *N*-nitroamine of 1-amino-4-benzoylamino-2,5-dimethoxybenzene, and the dinitroamine of 4,4'-diamino-3,3'-dimethylazobenzene, also 1-nitro-3-methylbenzotriazole, m.  $91-2^\circ$ , by diazotizing I.

**Dye intermediates.** See pour l'ind. chim. à Bâle. Swiss 176 (Cl. 3a), June 1, 1935 (Cl. 3a). 6-Methylphenanthrene is treated with  $H_2SO_4$  of concn. in excess to

95% and Br, the reaction not being allowed to proceed beyond the monobromo stage. On condensing the product with 1-aminoanthraquinone, and fusing the product with alc. KOH, an olive vat dye is produced. Thus, by treatment with S gives Bz-1-Bz-1'-dibenzanthronyl sulfide, which, if fused with alc. KOH gives a violet-blue vat dye.

**Dyeing cellulose derivatives; acridine dyes.** E. I. du Pont de Nemours & Co. Brit. 432,360, July 23, 1935. See U. S. 2,005,303 (C. A. 29, 5282).

**Dyeing with vat dyes.** I. G. Farbenind. A.-G. Fr. 784,276, July 22, 1935. Basic compds resistant to alkalis, derived from tri- or quinquivalent N, quinquivalent P or quadrivalent S and contg. at least one aliphatic, cycloaliphatic or aromatic radical of at least 6 C atoms, is incorporated in the alk. dye vat. Examples are laurylamine, dimethylethylamine, dicyclohexylamine, decylmethanolamine, cetyltriethanolamine, dodecyltriethanolamine, condensation product of copra oil with triethylenetetramine, reaction products of polyglycerols or their halogen compds with *m*-phenylenediamine, reaction products of halo paraffins with NH<sub>3</sub> or amines, as well as their salts or derivatives. See also examples of dyeing are given.

**Coloring animal fibers with mordant dyes.** Philippe Brandt (to Durand & Huguenin S.A.) U. S. 2,018,436, Oct. 22. For producing prints or dyeings on animal fibers with acid mordant dyes, fast to rubbing and of deep intensity, there is added to an otherwise usual printing paste or padding soln. at least 4% of a nonvolatile acid or salt such as oxalic acid or NH<sub>4</sub> oxalate for 3% of dye, so that the acid condition is maintained throughout steaming, and the fabric is treated with this compn. and the dye is fixed on it by steaming for about 8 min.

**Coloring organic substitution derivatives of cellulose such as cellulose acetate, etc.** Edmund Stanley, Henry C. Olpin and Geo. H. Ellis (to Celanese Corp. of America) U. S. 2,017,995, Oct. 22. The material is treated with a relatively insol. coloring compd. in the form of an aq. dispersion obtained with the aid of a sulfonated condensation product of a higher alc. such as cetylalc. and a cyclic compd. such as naphthalene.

**Printing fabrics.** Soc. pour l'ind. chim. à Bâle. Swiss 177,231, Aug. 1, 1935 (Cl. 24c). A stable compn. for printing on cellulose or animal fibers contains a vat dye and a salt of monoalkylaminobenzenes-3-sulfonic acid. In an example, a compn. consisting of tribromo-2-thiophenethene-2-indoleindigo, potash thickening, Na monoethylaminobenzenes-3-sulfonate and Na formaldehydesulfoxylate, is used for printing on cotton fabrics. Other examples are given.

**Stripping dyes from textile materials.** John G. Evans and Leslie G. Lawrie (to Imperial Chemical Industries Ltd.) U. S. 2,019,124, Oct. 29. Textile materials dyed with alizarin, basic or vat colors are treated with a liquor contg. a substance such as cetyltrimethylammonium bromide or other amine or amine salt having an aliphatic radical which contains not less than 10 C atoms.

**Apparatus for treating articles with dyes and other liquids.** A. E. Hawley & Co. Ltd. and Albert E. Dawson. Brit. 432,317, July 24, 1935. Work-supporting elements, to which articles or material to be treated are attached, are moved automatically 1 or more at a time from 1 end of the dye tank or vat to the other and back again in reverse order, repeatedly by endless conveyor means, to trail the articles or material through the liquid.

**Dyeing-jigs.** Philbert Deck. Brit. 432,094, July 19, 1935.

**Breaking and scutching machines for preparing flax, hemp and like bast fibers.** Hugh J. Stewart, Wm. Gardner and Matthew Russell. Brit. 432,216, July 23, 1935.

**Artificial fibers.** Rudolph H. Kagi (to Heberlein Patent Corp.). U. S. 2,019,185, Oct. 29. An artificial silk yarn such as one formed from cellulose acetate or viscose is super-twisted, the twist is allowed to set and the yarn is then untwisted to obtain a product having a lasting curliness.

**Synthetic fibers.** Heberlein & Co. A.-G. Swiss 176,899, July 16, 1935 (Cl. 10c). Wool-like fibers are formed by over-twisting artificial fibers, winding and leaving for some time. The fibers are then untwisted, having acquired a wool-like nap with a soft touch.

**Apparatus for testing the suitability for weaving of threads.** Paul Faume U. S. 2,018,971, Oct. 29. Various mech. and operative details.

**Rayon yarns.** British Celanese Ltd., Robert W. Moncrieff and Frank B. Hill. Brit. 432,280, July 24, 1935. Artificial spun yarn of staple lengths of artificial filaments are stretched beyond the elastic limit so that the staple lengths of which the yarns consist are permanently elongated. The yarns may be made from cellulose acetate or other org. deriv. of cellulose and may be stretched in the presence of softening agent. The yarns may be assembled in warp form and stretched as described in Brit. 371,461 (C. A. 27, 3083) and, after stretching, they may be slightly shrunk as described in Brit. 389,504 (C. A. 27, 4102).

**Apparatus for drying wound rayon threads.** Vereinigte Glasstoff-Fabriken A.-G. Ger. 616,555, July 31, 1935 (Cl. 29a 608). Addn. to 613,242 (C. A. 29, 6219).

**Conditioning yarn in knitting machines by treatment with liquid.** Robert N. Apprich (to Textile Machine Works) U. S. 2,018,627, Oct. 22. Various details of app. and operation.

**Apparatus for treating threads with liquids.** Charles W. Strzalkowski and Edmund J. Wendt U. S. 2,019,201, Oct. 29. Structural, mech. and operative details.

**Fibrous solutions.** Emil Hubert, Wilhelm Fron and Herbert Mahn (to I. G. Farbenind. A.-G.) U. S. 2,019,225, Oct. 29. A soln. suitable for spinning, etc., is prep'd by dissolving fibron at a temp. not exceeding 30° in an aq. soln. contg. a major amt. of a water-sol. metal thiocyanate such as that of NaCNS which is itself incapable of dissolving fibron at a temp. not exceeding 30°, to which has been added a minor amt. of another thiocyanate of Na, Li, Ba, Mg, Zn or Mn.

**Textile materials.** Heberlein & Co. A.-G. Fr. 784,597, July 22, 1935. Vegetable fibers are treated with an ammoniacal soln. of Cu oxide, the fibers being in the crude state or covered with their natural incrustations. A wetting agent such as a sulfo oleate may be added to the bath and the treatment may be followed by mercerization or free NaOH may be added to the bath.

**Textile materials.** Tootal Broadhurst Lee Co., Ltd. Fr. 784,556, July 22, 1935. Textile material contg. an insol. substance, preferably a synthetic resin, is submitted to a swelling treatment, e. g., with a caustic alk.

**Apparatus for testing the tensile strength of silk, rayon, etc.** David C. Scott (to Henry L. Scott Co.). U. S. 2,018,385, Oct. 22. Various structural, mech. and operative details.

**Rayon resembling wool.** Georges Heberlein (to Heberlein Patent Corp.). U. S. 2,019,183, Oct. 29. A viscose yarn is given a super-twist, placed on bobbins, moistened at a high temp., dried, untwisted so that a soft woolly material is produced having a lasting curliness, and the curliness is increased and the yarn is rendered substantially nonshrinkable by wetting treatments by loosely supporting the yarn in a wet steam atm. at about 3 atm. pressure for about a half hr.

**Artificial wool.** Heberlein & Co. A.-G. Ger. 618,030, Aug. 31, 1935 (Cl. 29a 609). Untwisted or normally twisted rayon threads are wound with a twist at least 4 times the normal, moistened at a high temp., e. g., by steaming, and dried. They are then retwisted to beyond the zero point in the opposite direction. Curly products which resemble wool are obtained.

**Vegetable fibers treated to resemble wool.** Ralph H. McKee and Earle H. Morse. U. S. 2,018,276, Oct. 22. Vegetable fibers such as jute fibers are subjected to oxidizing treatment at a pH between 5 and 8, and are then crumpled by subjecting them to the action of a NaOH soln. of about 10% strength.

**Cotton bands.** Chemische Fabrik G. Zimmerli A.-G. Swiss 177,236, Aug. 1, 1935 (Cl. 24f). Tightly pressed

cotton fabric is swelled with  $H_2SO_4$  and  $NaOH$ , coated with opaque paper pulp and calendered to form a band.

Producing figured effects on textiles Heberlein & Co. A-G Brit 432,389, July 25, 1935 Figured effects accompanied by uniform stiffening are produced by printing the fabrics with cellulose-contg. soles mixed with pigments, fixing the printing (by drying), parchmentizing to stiffen the fabric and render the nonprinted portions transparent, washing and stretch-drying Suitable pigments are  $BaSO_4$ ,  $Ti$  white, metal oxides, colored varnishes with body colors, they must be insol in the parchmentizing agent In an example, a mercerized fabric is printed with a mass comprising cellulose acetate,  $Ti$  white, ethylene chlorohydrin and  $H_2O$ , dried, drawn for 8 sec through 54°Bé  $H_2SO_4$ , washed and stretch-dried

Imidazole derivative Soc. pour l'ind. chim. à Bâle Swiss 175,673, May 16, 1935 (Cl 36p). The deriv. *N*-lauryl- $\mu$ -methylbenzimidazole is obtained by treating  $\mu$ -methylbenzimidazole with an ester of lauryl alc. The deriv. is used as a softening agent for viscose silk

Bleaching textile fibers I. G. Farbenind. A-G Fr. 784,524, July 22, 1935 The chlorinated water, preferably sat'd or supersat'd, is caused to act on the material to be bleached directly after its prep'n. App. is described in which the bleaching and chlorination of the water form a closed system. Cf. C. A. 29, 8355

Apparatus for treating yarn packages with liquids such as sizing liquids, etc. Stephen M. Fulton and Geo. C. Tyce (to Celanese Corp. of America) U. S. 2,018,017, Oct. 22, 1935 Structural and operative details

Mercerizing Thomas Wm. Holt, Archibald S. Kilpatrick, and John F. W. Stuart Brit 432,483, July 29, 1935 Textile fibers, e. g., cotton, wool, in lap or sliver form are mercerized by treating with wetting out and mercerizing agents, mixed or otherwise, then neutralizing and finally washing. A suitable bath comprises cresylic acid, emphor oil and caustic lye of 35°Tw. App. is described

Mercerizing lyes I. G. Farbenind. A-G Fr. 784,359, July 22, 1935 Mixts. of phenols, halogenated phenols or sulfonates with amides of sulfonic acid, e. g., chloroxylenol and *p*-toluenesulfonobutyramide, are used as wetting agents in mercerizing lyes

Washing textiles Ehrhart Franz Brit 432,018, July 15, 1935 Impurities are removed from raw or manuf'd waste textile material by treatment with a  $H_2O$ -insol. carboxylic acid, e. g., a fatty acid, in amt. not less than half the wt. of the material, removal of the bulk of the acid, treatment with  $NH_4OH$  or alkali to convert the remaining acid into a soap and simultaneous or subsequent washing of the soap-contg. material. In examples, (1) raw wool contg. pitch is washed to remove sand, loose dirt and easily removable fat and is then soaked for 5-20 hrs. in twice its wt. of conc. oleic acid at normal or slightly raised temp., squeezed or centrifuged and washed in a weak alk. bath at 50°, and (2) raw cotton soiled with resin or coloring matter is soaked for 20 hrs. in twice its wt. of arachis-oleic acid, squeezed, placed in 5% potash lye, centrifuged and washed in a 2nd alk. bath

Bath for improving textiles, etc. Soc. pour l'ind. chim. à Bâle Swiss 177,226, Aug. 1, 1935 (Cl 24e) Textiles, leather, paper, etc., are improved by treatment with an aq. bath contg. dil. alkali hydroxide or mineral acid and products of the general formula  $MOC(-O)AYZ$ , in which A is an org. residue, Y a  $-C(=O)O-$  group, Z an aliphatic residue with at least 8 C atoms and M an alkali metal or  $NH_4$ . Thus, the  $NH_4$  salt of the product obtained by heating phthalic acid anhydride with a mixt. of hexadecyl and octadecyl alc. is dissolved in hard water and Glauber's salt added. Viscose silk, heated in the resulting bath, acquires a soft nap. Other examples are given

Textile lubricants British Celanese Ltd. Brit. 431,964, July 18, 1935 A textile lubricant comprises a sub-

stantially  $H_2O$ -insol. oil or fat or higher fatty acid and a small proportion of an aromatic compd. contg. an unsat'd aliphatic substituent group, e. g., vinyl, propenyl, allyl or crotonyl. The aromatic compd. may contain other groups, e. g.,  $OH$ , ether, halo or  $SO_2$  groups. Substituted  $PhOH$ , cresol, naphthol, catechol and resorcinol, e. g., or substituted phenol ethers such as anisole and phenetole may be used, and especially the propenyl, etc., derivatives of aromatic compds. contg. both ether and  $OH$  groups, e. g., guethol and guaiacol. Animal or vegetable oils or fats, e. g., olive, castor, coconut, neatfoot and, in general, glycerides of oleic, stearic, palmitic or other higher fatty acids, or the acids themselves may be used. Asustants, e. g., mineral lubricating oils, glycol, diethylene glycol, glycerol, etc., may be employed. The lubricant may be added to the spinning soln. or to the formed material

Waterproofing wool and other animal fibrous material. Studiengesellschaft für Faserveredlung m. h. H. (formerly Deutsche Kunstseiden-Studiengesellschaft m. h. H.) Brit. 431,670, July 12, 1935. See Fr. 777,714 (C. A. 29, 41887)

Benzimidazolium derivative Soc. pour l'ind. chim. à Bâle, Swiss 175,026, Apr. 16, 1935 (Cl 36p). The deriv.  $\mu$ -heptadecyl-*N*-benzyl-*N'*-ethylbenzimidazolium chloride is prep'd by the action of  $EtOH$  on  $\mu$ -heptadecyl-*N*-benzylbenzimidazole-HCl. The compd. is used in the textile industry. Cf. C. A. 29, 38561<sup>2</sup>

Triarylmethane derivatives I. G. Farbenind. A-G (Karl Berres and Walter Retter, inventors). Ger. 618,033, Aug. 31, 1935 (Cl 12g 20 04). Substituted triarylmethanesulfonic acids are prep'd by condensing 1 mol of a sulfonic acid of an aromatic aldehyde with 2 mols of an alkyl, cycloalkyl or aralkyl ether of a phenol or naphthol contg. no unethersified  $OH$  group. The reaction may be effected at a temp. below 50° in  $H_2SO_4$  of 87% concn. Examples are given in which (1) *o*-sulfobenzaldehyde and *p*-chloroanisole yield 2,2'-dimethoxy-5,5'-dichlorotriphenylmethane-2'-sulfonic acid, (2) *p*-sulfobenzaldehyde and anisole yield 4,4'-dimethoxytriphenylmethane-4'-sulfonic acid, (3) *o*-sulfobenzaldehyde and *p*-chlorophenyl benzyl ether yield 2,2'-dibenzoyloxy-5,5'-dichlorotriphenylmethane-2'-sulfonic acid, (4) *o*-sulfobenzaldehyde and cyclohexyl phenyl ether yield 4,4'-diethoxyloxytriphenylmethane-2'-sulfonic acid. The products are useful as reserves in printing textiles and as mothproofing agents

Impregnating textile materials with rubber latex Leon S. M. Leyeune and Jean B. C. Bongrand U. S. 2,019,420, Oct. 29. For facilitating the penetration of the latex, the  $pH$  of the latex and of the textile material are preliminarily adjusted to about the same value so that coagulation of the latex at the interfaces of the materials is avoided

Carpet backing Albert W. Holmberg (to U. S. Rubber Co.) U. S. 2,018,524, Oct. 22. The backing of a carpet is coated with a mixt. of raw starch and rubber, etc.

Upholstery padding Joseph A. Howard Brit. 431,353, July 8, 1935 For the manuf. of upholstery padding consisting of a mass of fibers held together by an adhesive, e. g., rubber, as described in Brit. 341,936 and 355,004, the hair is brought to the form of a web by passage downwardly between extending surfaces, of which 1 is stationary. The other surface may also be stationary, or it may consist of an endless band actuated so as to impart the desired profile to the padding. After passage between the surfaces, the latex may be applied either by spraying or by passage through a bath. Several applications of latex may be made and, after each application, the web is dried or dried and vulcanized so that, by reason of the accession of strength, the web may be passed between mangle rollers after a subsequent application of latex. A coagulant for the latex, e. g.,  $Ca(NO_3)_2$  powd.  $CaO$ , may be applied to the fibers before their formation into a web, or to the web as it leaves the die

## 26—PAINTS, VARNISHES AND NATURAL RESINS

A. H. BARN AND C. H. ROSE

Investigation of color permanency by the Philadelphia Paint and Varnish Production Club. Anon. *Paint Varnish Production Mfr.* 13, 22-3, 26, 28-9 (Nov. 1935); *Am. Paint J.* 19, *Concretion Daily*, 16, 17, 18, 19 (Oct. 29, 1935).—An attempt to develop a practical method for detg., evaluating and recording color changes occurring in paints. Sep. gradings appear necessary for the 3 color properties: (1) hue, or dominant wave length, (2) value of brightness and (3) purity, chroma or satn., and also for the color uniformity of the surface. Color change may be due to one or more of a no. of several different causes among them (1) photochem changes caused by actinic light, (2) changes in the exposed surface of the film, (3) changes in the relative indices of the film components and (4) chem reactions resulting in changes in compn of colored pigment constituents. The permanency of org. color is tremendously impaired by the addn of any other pigment. Also in *Paint, Oil & Chem Rev* 97, No. 21, 95-9 (1935).

W. H. Boynton  
Paint in the food factory T. Hedley Barry. *Paint Manuf.* 5, 297-300 (1935).—Wood, metal, plaster, cement and brickwork all require special attention and skilled application is necessary.

W. H. Boynton  
Paints and preservatives for engineering structures. C. J. Dodd. *Kansas Water Sewage Works Assoc.* 4, 18-23 (1934-5).—A discussion of the choice of and methods of application of the most suitable protective paints for wood, steel and concrete surfaces, especially those in water or sewage-treatment plants where protection from H<sub>2</sub>S, Cl, etc., is necessary.

M. G. Moore  
Bibliography of articles on weathering of paints, varnishes and lacquers. L. M. Gugelman. *Am. Paint J.* 19, *Concretion Daily*, 18, 20 (Nov. 2, 1935).—Contributions to the tech. literature from 1924 to 1934 inclusive are listed.

W. H. Boynton  
Use of metallic soaps in paint meets new problems. F. J. Licata. *Am. Paint J.* 19, *Concretion Daily*, 19 (Oct. 20, 1935).

W. H. Boynton  
The design of flat wall paints. John C. Gehant. *Paint, Oil & Chem Rev.* 97, No. 18, 16-18 (1935).—Modern requirements and formulations are discussed.

J. W. P.  
Examination of antirusting paints. A. V. Blom. *Paint Manuf.* 5, 292-6 (1935).—See C. A. 29, 2001.

W. H. Boynton  
Measurement of body color for practical purposes. Martin Witte. *Chem. Fabrik* 1935, 418-20.—The methods of Munsell (*cf.* C. A. 17, 3837) and Ostwald (*cf.* C. A. 11, 1083; 15, 1247) are compared and discussed.

J. H. Moore  
Pigment particles. G. A. Campbell. *Oil Colour Trades J.* 88, 1181-3 (1935).—Pigments vary enormously in their surface properties—whether finished off by grinding or by pulverizing. Grinding problems, shape of particle, pigment and the vehicle, and grinding and oil absorption are discussed.

W. H. Boynton  
Colloid chemistry of pigments with special reference to zinc oxide and basic lead carbonate. F. V. Evans. *J. S. African Chem. Inst.* 18, 36-41 (1935).—A general discussion of pigment particle size and its effect on plasticity; importance of "wetting" all surfaces, etc. White lead partially saponifies the acid in oil, causing the paint to have a "creamy" flow. The combination of ZnO and white lead in a paint prevents the brittle-film tendency of ZnO and the "chalking" tendency of white lead.

B. E. A.  
Development of zinc pigments keeps pace with consumer progress. R. M. Neumann. *Paint, Oil & Chem Rev.* 97, No. 21, 56-7, 76 (1935).—A brief review of recent progress.

J. W. Perry  
Zinc pigments in relation to southern climatic conditions. S. Werthan. *Paint, Oil & Chem Rev.* 97, No. 16, 16, 18, No. 17, 11 (1935).—See C. A. 29, 7100.

J. W. Perry  
Zinc white problems—economical and practical. A. Foulon. *Farbe u. Lack* 1935, 520-2.—A discussion em-

phasizing the nonpoisonous character of zinc white and the excellent results obtained when it is properly used in paint.

J. W. Perry  
Testing lithopone. W. Taut. *Farbe u. Lack* 1935, 531-2.—A discussion of various difficulties encountered in testing shade, texture, oil demand and consistency of lithopone-an-oil dispersions.

Recent developments in aniline inks. Alfred McNeill. *Am. Ink Maker* 13, No. 10, 15-17 (1935).

E. H.  
Recent developments in the utilization of soybean oil in paint. W. L. Burlison. *Ill. Agr. Expt. Sta., Circ.* 438, 3-8 (1935).—A survey of recent developments indicating the increasing use of the oil in the paint and varnish industries.

C. R. Fellers  
A study of the industrial value of the Argentine flaxea. Roberto E. Taura. *Bol. ministerio agr. nacion* (Argentina Rep.) 36, 245-8 (1934).—The linseed oil content of 3 North American varieties of flaxseed varied between 35.12 and 38.32%, that of 13 Argentine varieties between 35.36 and 41.35%. The l no. and n of the 3 North American oils ranged from 174 to 179 and 1.4839 to 1.4840, resp., that of the Argentine varieties from 174 to 181 and 1.4831 to 1.4844. A general discussion of acidity, color, compn. and drying power is given.

C. W. Whitaker  
Economic and commercial factors in development of a domestic tung-oil industry. C. C. Concanon. *Am. Paint J.* 20, 18, 20, 50, 52; 54, 56 (Oct. 28, 1935).

W. H. Boynton  
Importance of tung oil to the varnish industry. H. A. Gardner. *Am. Paint J.* 20, 18, 48, 50 (Oct. 21, 1935).—The most likely material for replacing tung oil is the alkyl type of resin, but no oil or resin product at present exactly matches tung oil in all formulations, particularly in waterproof spar varnish. Ottica and perilla oils may replace wood oil and linseed oil with fairly parallel results if the waterproof requirements of the varnish are not too rigid.

W. H. Boynton  
The tung-oil tree in Texas. P. R. Johnson and S. H. Yarnell. *Tex. Agr. Expt. Sta., Circ.* 75, 16 pp. (1935).—Soils for successful cultivation of tung-oil tree must have good drainage and at least moderate aeration. Southeastern Tex., with the exception of occasional cold injury, will grow this crop. Yields of nuts and the oil costs of 114 tung oil are given.

C. R. Fellers  
Perilla oil, center of interest, is assuming leadership based on its special features. Otto Eismenschand. *Am. Paint J.* 20, 16, 18 (Oct. 14, 1935).—Perilla oil has definite properties differing from those of linseed oil. It bodies more quickly than linseed oil and has to be watched more carefully, but is not nearly as delicate a product as China wood oil. It works well with synthetic resins but does not yield as waterproof or as hard a film as China wood oil.

W. H. Boynton  
Cincinnati-Dayton-Indianapolis Club presents a study of treated wood oils. V. N. Sheets. *Am. Paint J.* 19, *Concretion Daily*, 9 (Oct. 29, 1935); *Paint Varnish Production Mfr.* 13, 17, 18-19, 37 (Nov. 1935); *Paint, Oil & Chem Rev.* 97, No. 23, 70, 72.—Four treated wood oils in modified phenolic resin varnishes with 20- and 33-gal. oil lengths are compared with raw wood oil in similar varnishes. In addition, treated and raw wood-oil films are compared for relative gasproofness. Conclusions: (1) treated oils are inferior to raw oils in cooked varnishes as to drying and durability; (2) treated oils have less gassing tendency at the expense of drying; (3) treated oils have lost some of the valuable characteristics of the raw oil making them more closely related to linseed and perilla oils; and (4) treated oils with progressive fume proofness have progressing increase in acid value, drying time and miscibility with progressive darkening.

W. H. B.  
Effect of water on drying-oil films. J. Milligan. *Oil Colour Trades J.* 88, 1329, 1331 (1935).—Drying-oil films have been found to be capable of destructive liquefaction under prolonged conditions of heat and high humidity—

the resulting product being a sticky relatively nondrying mass. It will not dry on glass at room temp. over a long period. The mode of reaction between water and dried oil films is first hydrolysis of the more liquid phase in the film and then the gradual decomposition of the solid phase. Studies of the linocyn stability have yielded information on the relative water-resisting powers of linocyn made under different conditions. Different types of driers yield different results.

W. H. Boynton  
 Lacquer solvents in commercial use. Arthur K. Doolittle. *Ind Eng Chem* 27, 1169-79 (1935).—One hundred lacquer solvents are classified according to (1) mol. structure and (2) evap. rates. The properties given under (1) include mol wt., boiling range, m. p., flash p., vapor pressure, sp. gr., wt./gal., n, expansion coeff., purity of com. product, diln ratios, soly in H<sub>2</sub>O and soly of H<sub>2</sub>O in the solvent. A review of the theory of solvent action and the pertinent literature are also given. J. A. S.

Straight run petroleum thinners assume renewed importance. E. G. Richardson. *Am Paint J* 19, *Convention Daily*, 13-14 (Oct 29, 1935). W. H. Boynton  
 Triethanolamine in the resin, lacquer, paint and insulating industry. Emil J. Fischer. *Farbe u. Lack* 1935, 519, 533-5.—A review of recent literature and patents. Thirty references.

J. W. Perry  
 Replacing benzene and benzine with alcohol. L. Kern. *Farbe u. Lack* 1935, 507-8.—The possibility of using increased amts. of alc. in lacquers is illustrated by a no. of examples, and the necessity of saving benzene and benzine in Germany pointed out.

Old and new nitrocellulose and combination lacquers. Fritz Zimmer. *Nitrocellulose* 6, 180-2 (1935).—A review. E. M. Symmes

Differences in tautening power of nitrocellulose and acetylcellulose dopes with particular consideration of the effect of moisture. R. S. Dantuma and A. M. Mees. *Farben-Ztg* 40, 744-5 (1935).—The tautness of stretched aeronautical linen decreased less on exposure to moisture if treated with nitrocellulose dope rather than with acetylcellulose dope. Addn. of pigments to the dopes caused moisture to have a somewhat less detrimental effect on tautness. Applying further protective coatings, on the other hand, had little effect. Loss of tautness appeared to be assoc. with absorption of moisture by the dope film.

 Fundamental physical properties of lac. I. Mechanical properties. Lal C. Verma. *London Shellac Research Bur. Tech. Paper No. 3*, 28 pp (1935). II. Thermal properties. *Ibid.* No. 4, 20 pp.

E. H.  
 Plasticizers in nitrocellulose lacquers. Alfred Kraus. *Paint Varnish Production Mgr.* 13, 16, 18 (Aug., 1935); 20-1, 22-3, 24, 26 (Sept. 1935).—A brief review of the various properties of the different plasticizers, examd. as to their ability to gelatinize the nitrocellulose as well as their effects upon the viscosity of nitrocellulose solns. The most efficient plasticizer is the one which causes the greatest elongation with the lowest decrease in tensile strength per unit quantity added. It is concluded that the properties of mixts. of plasticizers can be calcd. with the sufficient accuracy from the known properties of the components. The action of ultraviolet upon the paint film is usually noticed as yellowing and as a change in film strength with a definite, yet very complex, relationship between the 2 phenomena. The degree of yellowing depends upon the nature of the plasticizer, its concn. in the film, and the intensity and duration of exposure. The volatility of the plasticizers was detd. and losses in wt. after 7 days' drying at 100° were tabulated. The influence of plasticizers in the cold resistance of lacquer films and that in water resistance are indicated.

W. H. Boynton  
 New England Club studies corrosive action of scrubber

water on coatings. A. F. de Ravignon, et al. *Am. Paint J.* 19, *Convention Daily*, 12-13 (Oct. 30, 1935); *Paint Varnish Production Mgr.* 13, 14-15 (Nov., 1935); *Paint, Oil & Chem. Rev.* 97, No. 23, 78-80.—Conclusions drawn after examn. of a no. of types of vehicles are: (1) for tung oil and modified oil varnishes, the longer the oil length the greater is the resistance to corrosion; (2) Vinylite-type resin shows excellent corrosion-resisting properties; (3) a short coumar varnish showed better resistance to corrosion than any other clear vehicle tested; (4) a lacquer film, although not affected very much by the scrubber water, showed poor adhesion to the metal panel, peeling off in sheets; (5) several types of vehicles, having excellent corrosion-resisting properties under many other conditions, were not effective when used as clears, in preventing the corrosive action of scrubber water; and (6) of pigments ground or mixed into a common 100% phenolic vehicle and used as a primer the specially prep'd. mica gave better results than all others used, red lead being slightly less efficient.

W. H. Boynton  
 Natural resins. Wladyslaw Stefanowski and Z. Kraczewicz. *Przemysł Chem.* 19, 152-3 (1935).—Resins collected from the forests of Poland were analyzed and compared with elem.

Resin	Acid value	Sapon value	Esterification value	I value
Pine	sh 130	about 160	about 30	about 85
Fir	ab 65	about 75	10-15	160-165
Larch	65-70	115-130	50-60	about 130
Elem.	10-20	25-45	15-25	about 50
Spruce	120-125	115-120	about 5	about 160

Another table gives these values for esters collected in various parts of the country. A. C. Zachim

The technique of using Brazil Jutahucia resin. Carl Busser. *Paint, Oil & Chem. Rev.* 97, No. 20, 18 (1935).—Details are given of a method for melting or running Jutahucia, which behaves very much like kauri gum.

 Resin-manufacturing equipment. John McE. Sander-son. *Paint, Oil & Chem. Rev.* 97, No. 21, 42 (1935).—An illustrated discussion.

J. W. Perry  
 Tung-oil tree (Newell, et al.) 15 Fireproofing paints (Pr. pat. 784,649) 13. Rubber compns. [used as ingredients of paints] (Brit. pat. 432,032) 30. CaSO<sub>4</sub> [for use with pigments] (U. S. pat. 2,018,955) 18. Polynuclear phenols and nitration and sulfonation products [as paints and varnishes] (Brit. pat. 431,945) 10. Cellulose ester films, lacquers, etc. (Brit. pat. 432,404) 23. Emulsions [as paints, color varnishes and printing inks] (Brit. pat. 431,642) 13.

Paints Metallgesellschaft A-G (Oskar Schöber, applicant in U. S.). Fr. 784,448, July 22, 1935. A paint for metals, etc., contains 25-60% of an Al-Si pigment in a state of such fine division that it passes, at least for the greater part, through a sieve of 10,000 mesh per sq. cm., and about 25-70% of one or more binders, such as boiled linseed oil or wood oil. A diluent about 25 and an inert filler about 25% may also be present. The Al-Si preferably contains Al about 30-68%.

Apparatus for preparing metal powders for paints. Erwin Kramer. Brit. 430,777, June 25, 1935. See Fr. 778,609 (C. A. 29, 43589).

Roller-and-breast mills for paints, etc. Anciens établissements le Clezio. Brit. 431,530, July 10, 1935.

**Pigments.** Gustave Widmer (to Société pour l'Ind. chim. à Rile). Brit. 171,168, July 2, 1935. A pigment powder that can be used in the manufacture of colors, painting colors, varnishes and lacquers contains a carbanilide- $\text{CH}_2\text{O}$  condensation product, e. g., those from  $\text{CH}_2\text{O}$  and urea, thionure, dicyandiamide, guanil, guanidine, guanylurea, cyanure acid or phenylurea, which has been brought by heat treatment into an insoluble and nonplastic condition, together with a pigment, e. g., ochre,umber, lampblack,  $\text{Fe}_2\text{O}_3$ , Prussian blue, ultramarine, chrome green, indigo and anthraquinone dyes, 5 dyes, fired, and dyes or pigments that are themselves color lakes, which under the prevailing conditions of the manufacture of the powder is not converted into a lake. In examples, (1) Indanthrene blue GGS4 is ground with a varnish consisting of a solution of a urea- $\text{CH}_2\text{O}$  condensation product containing added thionure, the mixt. is heated 4 hrs. at  $130^\circ$  and the product reduced to a fine powder, (2) lampblack is suspended in  $\text{H}_2\text{O}$ , the varnish of example (1) is added and dil. HCl stirred in, the curdy ppt. is washed with the lampblack, and, after filtration, the product is dried at  $80^\circ$  and pulverized, and (3) a heat-treated carbanilide- $\text{CH}_2\text{O}$  condensation product is finely powdered and ground with indigo.

**Emulsions for use as inks or paints.** The Whitehead Process Co. Ger. 618,244, Sept. 4, 1913 (Cl. 22g 2 01), See U. S. 1,906,042 (C. A. 27, 1027).

**Printing Ink.** August J. Gantsche. U. S. 2,018,040, Oct. 22. A printing ink for lithographic use consists of an oil ink each of which is mixed with about 0.5-2.0 oz. (according to the brilliancy desired) of a composition from a hard, resin-like phenol-condensation product 4-5, China wood oil 4, and wool grease 4 parts.

**Lacquer.** Jean Gsell. Swiss 170,051, June 17, 1935 (Cl. 51b). A lacquer for skin consists of 11 parts of colloidal wool, 4 parts of shellac, 11 parts of  $\text{AcOAm}$ , 3 parts of  $\text{AcOH}$ , 1 part of spirits and 5 parts of another solvent.

**Coating compositions.** Harold A. Auden and Hanns P. Standinger. Brit. 435,025, July 10, 1935. The compounds contain an org. ester of cellulose, particularly

cellulose triacetate (I), and 1 or more esters of pyruvic or l-valine acid, the esters used having a b. p. of at least  $150^\circ$  under normal pressure. In examples, the compounds consist of (1) I, methyl l-valine chloride (II),  $\text{AmOH}$ , Bu isovalinate and trimethyl, and (2) I, II,  $\text{EtOH}$  and Bu pyruvate. Other esters specified are those of  $\text{Am}$ , cyclohexyl and benzyl alcohols.

**Coating webs.** Wilfrid B. Pitt, Cyril A. Chester and Wm. McNeill. Brit. 431,511, July 10, 1935. In the surface of sheet material in continuous lengths with varnishes, pigments, etc., by the flotation process, the spreading and orientation of the film on the flotation medium is controlled by regulated elec. or magnetic potential applied to the film, the flotation medium and (or) the transfer surface. App. is described.

**Pyroxylin compositions.** Wm. Saman (to Standard Oil Development Co.) U. S. 2,018,707, Oct. 29. In forming compounds such as lacquers, films, etc., pyroxylin is used with a solvent containing an org. Saponin of the general formula  $\text{R-S-R'}$  in which R and R' represent sep. alkyl or aryl radicals or acyl radicals of fatty acids, e. g., ethyl or methyl or propyl thioether, and various other solvents and modifiers.

**Refining rosin.** Joseph N. Borghia (to Hercules Powder Co.) U. S. 2,018,611, Oct. 22. The rosin, in solution in a solvent such as gasoline which is substantially insoluble with resorcinol and a II compound such as boric acid, is admixed with resorcinol and such a II compound, and coloring substances are added together with the resorcinol and II compound by gravity separation. Cl. C. A. 29, 2001.

**Increasing the melting point of rosin.** Avery A. Morton (to Columbus Naval Stores Co. of Del.) U. S. 2,017,800, Oct. 22. Rosin dissolved in less than its own wt. of gasoline is treated with  $\text{H}_2\text{SO}_4$  proportioned so that for each gram of rosin treated less than 1 cc. of  $\text{H}_2\text{SO}_4$  (caustic, as conc. acid) is used, the materials are agitated together for a time sufficient to promote reaction (usually for about 2 hrs.) while minimizing erosion (as by agitation) and the treated rosin is recovered by distilling off the gasoline.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

### 1. ACIDIMETRY

**Melting points of solid animal fats and their mixtures.** H. Adam Koss, *Prezmysl Chem.* 19, 139-147 (117-8 in French) (1935); cf. C. A. 29, 60831.—Horse, pork, beef, goat and sheep fats were used individually and in combinations of 2 ranging by 10% steps in proportion from each pure fat to every other pure fat. The solidification points were determined by the methods of Linkner (modified), Zakow, and Wolfman, the first of which gave the lowest values but is regarded as the most reliable. The methods are critically compared. For the fats listed in the above order the values according to the 1<sup>st</sup> method were found to be: 35.32°, 41.01°, 44.63°, 47.31° and 50.13°. There is no regular relationship between percentage mixtures of any 2 fats and increase of the solidifying point. M. p. of the acids of these fats cannot be used as the only basis for identifying their identity, but the Polenske method and other chem. analytical methods should be applied. Mixtures of horse fat with beef, goat, and sheep fats, and of pork with sheep fat show minima in solidification values which may be regarded as eutectic mixtures corresponding to  $\text{C}_{18}\text{H}_{36}\text{O}_2$ ,  $\text{C}_{18}\text{H}_{34}\text{O}_2$ , or as solid solutions. Mixtures of goat with sheep fats showed a max. in the solidification temps. A. C. Zachin.

**Changes in fat during storage.** C. H. Lea, *Dept. Sci. Ind. Research, Rept. Food Investigation Board 1934*, 54-8 (1935); cf. C. A. 29, 3667.—A no. of typical curves for the rates of oxidation of various natural oils and fats, determined by the previously described method (C. A. 29, 12739), are given. The appearance of taint in the fat of chilled beef is usually to be attributed to the action of microorganisms, and the free acid content of the fat may conveniently be used as an index of spoilage. The acidity of tainted fat is almost invariably higher than normal, al-

though the actual values attained depend on the nature of the contamination. A practical test obtained from examination of chilled beef fat is given and compared with the free acidity of freshly killed beef fat and with that of fat inoculated with a suspension of spores of *Bacter. Bleached* grayish, brownish or white patches have sometimes been observed on the external fat of quarters stored in an atm. containing  $\text{CO}_2$ , usually appearing first in regions where the covering of fat is thin, or where contact between quarters or chafing has occurred. This discoloration is apparently due to the conversion of oxyhemoglobin to methemoglobin accompanied in more advanced cases by bleaching of the yellow pigment, and seems to be accompanied by oxidation of the fat. Deterioration in flavor of the fat of chilled beef may therefore be produced by the agency of microorganisms, by the absorption of odors, or by oxidation, but the last may become significant only when the meat has been unduly exposed to light, or subjected to the long periods of storage made possible by the use of  $\text{CO}_2$ .

**Fats of sea algae.** H. Ibi Takahashi, Kiyoshi Shirahama and Shun-ichi Tase, *J. Chem. Soc. Japan* 56, 1250-7 (1935); cf. C. A. 27, 5778.—The sapon. acids of the fats of sea algae were mainly palmitic acid with less stearic and myristic acids. Unsat. acids were oleic acid,  $\text{C}_{18}\text{H}_{32}\text{O}_2$ , and  $\text{C}_{18}\text{H}_{30}\text{O}_2$ . K. Kikuta.

**Antioxidants and the preservation of edible fats.** C. H. Lea, *Dept. Sci. Ind. Research, Rept. Food Investigation Board 1934*, 54-43 (1935).—A study of the possibility of utilizing aliphatic amino and hydroxy compounds as antioxidants for the preservation of lard. The efficiency of the antioxidant can most conveniently be expressed in terms of a "protection" factor (P. F.),

defined as the ratio of the lengths of the induction periods in the presence and absence of antioxidant. Curves are given, leading to the following conclusions: prooxidants ( $P/F$ , 0.05)—succinic, tartaric, citric and lactic acids; inactive ( $P/F$  1.0)—mannitol, weak antioxidants ( $P/F$ , 1.0–2.0)—glycerol, glucose, sucrose, fructose, Na maleate, Na succinate, moderate antioxidants ( $P/F$ , 2.0–3.0)—Na malate,  $\text{NH}_4$  lactate, Na tartrate, Na glycolate, Na lactate, powerful antioxidants ( $P/F$  4.5)—glycine, asparagine, Na citrate, Na malonate. The rates of oxidation of films of lard stored in contact with a series of acetate, phosphate and borate buffers indicated a maximum stability slightly to the acid side of the neutral pt, with a very rapid fall as the soln. became alk. Lard in contact with pickle also became less stable with increasing acidity, which is presumably due to a prooxidant effect of free  $\text{HNO}_3$ , the data for water, on the other hand, showed no evidence of more rapid oxidation in the acid solns. other than can be accounted for by change in the buffer system. Lard oxidizes much more rapidly in borate than in phosphate solns. of approx. the same  $\text{pH}$ , except at high alkalinities when the distinction vanishes, whence it is probable that phosphate possesses antioxidant properties. Na citrate, Na malonate and glycine all exerted a protective effect at  $\text{pH}$  8.0 and at  $\text{pH}$  values of 5.8, 6.7 and 8.2.

A. Papineau-Conture  
Rate of formation of fully saturated glycerides during hydrogenation of different natural fats. T. P. Hilditch and H. Paul. *J. Soc. Chem. Ind.* 54, 336–8T (1935).—Rape, olive and cottonseed oils, 2 varieties of palm oil and pig back fat were hydrogenated progressively. The results show that the glyceride structure of a hydrogenated fat depends on the glyceride structure of the original fat, the manner in which the fat acid radicals *per se* are affected during hydrogenation, and the manner in which mixed glycerides of different configurations behave differently toward catalytic hydrogenation (i.e., the apparent reluctance with which an unsatd.  $\beta$ -acyl group is hydrogenated in comparison with an unsatd.  $\alpha$ -acyl group in the glyceride mol.). The proportions of fully satd. glycerides of the 6 fats when 50% of the original unsatd. acids have been hydrogenated are

	50 % hydrogenated fully satd. glycerides (mol.)	Original Fat Total acid % (mol.)	Palmitic acid % (mol.)
Rapeseed oil	20	3	2
Olive oil	24	14	12
Cottonseed oil	29	27	25
Cape Palm oil	32	41	36
Belgian Congo palm oil	37	50	45
Pig back fat	41	44	30

E. Scherubel  
Detection of nickel in hydrogenated fats. M. Struszynski. *Przemysł Chem.* 19, 48–9 (1935).—From 2 to 10 g. of the fat is melted and left on the hot bath to settle out such impurities as rust, and then the clear liquid is poured off for analysis. About an equal vol. of  $\text{HCl}$ , sp. gr. 1.12, together with a small quantity of  $\text{HNO}_3$  or  $\text{KClO}_4$  is added and the mixt. is shaken well and frequently, the flask being heated on a water bath. The two layers are then allowed to settle out. When solidified the fat is punctured and the acid ext. is poured off into an evap. dish and brought to dryness. The residue is taken up with 2–3 drops concd.  $\text{HCl}$  and 1 drop  $\text{HNO}_3$ . The soln. is washed down into a small bottle with about 2 cc.  $\text{H}_2\text{O}$ . A bit of tartaric acid or  $\text{K}$  tartrate is added, then a few drops of dimethylglyoxime in alc. and finally a small excess of  $\text{NH}_4\text{OH}$ . The liquid is shaken with 1–5 cc. purest  $\text{CHCl}_3$  which is then collected in a pipet and placed in an evap. dish where it is dried out while blowing at the liquid in order to collect the residue in the smallest possible area. The min. quantity of  $\text{Ni}$  detectable by this method is  $2 \times 10^{-4}$  mg. In case the residue or the  $\text{CHCl}_3$  soln. is colored brown (presence of  $\text{Fe}^{++}$  or  $\text{Co}$ ) the residue is washed with a few drops of  $\text{H}_2\text{O}$  whereupon the red color becomes clearer. Since  $\text{Fe}^{++}$  does not

interfere with the test all  $\text{Fe}$  should be in the oxidized state.

A. C. Zachlin  
Selectivity of hydrogenation. M. Zaayer. *Chem. Weekblad* 32, 393 (1935).—The selectivity of more and less active catalysts was studied by using peanut oil, at  $120^\circ$ , 3% catalyst (usual  $\text{Ni}$  kieselguhr either freshly made or kept for 2 months). Whereas the activity difference was marked, the more selective hydrogenation results were obtained with the most active catalyst as shown from a table and a graph of percentage of said acid or I addn. no. of fatty acids. B. J. C. v. d. H.

An innovation in the hydrogenation of oils. R. Heublyum. *Mal. grasses* 27, 10758–90, 10618–9 (1935).—Attention is drawn to Bag's highly active  $\text{Ni-Al}$  catalyst (C. A. 26, 2075) and to its advantages, one of the most important of which is the possibility of working continuously instead of in batches.

A. Papineau-Conture  
Polymerization of some unsaturated fat acids. J. K. Chowdhury, A. C. Chakraborty and A. Majumder. *J. Indian Chem. Soc.* 12, 441–54 (1935).—Polymerization of oleic (I) and other unsatd. acids in the presence of  $\text{SnCl}_4$  produces highly viscous polymers which yield lubricating oils, similar to those obtained from petroleum, on decarboxylation. A known vol. of  $\text{SnCl}_4$  was added to a definite quantity of I in a new Nessler's tube provided with a mech. stirrer. The reaction was carried on at  $101^\circ$  for 10 hrs. and the product was extd. with petr. ether. The ext. was washed with dil.  $\text{HCl}$  and with  $\text{H}_2\text{O}$ , dried over anhyd.  $\text{Na}_2\text{SO}_4$  and evapd. Progress of polymerization was observed by noting changes in the phys. const. The amt. of  $\text{SnCl}_4$  added has a considerable influence on the degree of polymerization. Evolution of heat during the process suggests the formation of unstable intermediate compds. of I with  $\text{SnCl}_4$  which, on breaking down, activate the mol. and cause polymerization. This decomn. with evolution of  $\text{CO}_2$  indicates that the  $\text{CO}_2\text{H}$  group is involved in the reaction. It was found that stearic acid (II) was produced during the polymerization and that the polymer had a lower acid value. The Me ester of I polymerized very slowly and it is evident that the  $\text{CO}_2\text{H}$  group exercises an influence on the course of polymerization. The polymerization of linoleic acid (III) took place through the conjugated system rather than the  $\text{CO}_2\text{H}$  group since the acid value remained const. though the I value fell quickly and the viscosity rose with the degree of polymerization. Mol. wt. detns. showed that several mols. had combined to form the polymerized product which was sepd. by extn. with  $\text{Et}_2\text{O}$  in place of petr. ether. In the polymerization of ricinoleic acid (IV) the I value remains const. except when 20% or more  $\text{SnCl}_4$  is added. The acid value remains const. though the Ac value falls quickly. Mol. wt. detns. show that at least 6 mols. is involved in polymerization of ester formation. Decarboxylation of the polymers from I, III and IV was effected by heating 30 g. of the products with 25 g. of  $\text{Zn}$  dust and  $365^\circ$  for 2.5 hrs. The acidified product was extd. with petr. ether and the degree of decarboxylation was estd. by detns. of the acid value. The products were dark green, slightly fluorescent, highly viscous hydrocarbons with the following properties: Polymers from I, II, III and their resp. decarboxylation products had  $n_D^{20}$  1.462, 1.491, 1.488, 1.513, 1.524, 1.516, I value 27.7, 45.6, 52.8, 23.6, 37.7, 44.6 and acid value 124.1, 209, 177.9, 7.6, 12.9, 11.1. The similarity of the decarboxylated polymerized products to petroleum lubricating oils seems to support the theory that petroleum hydrocarbons were formed by the polymerization and depolymerization of unsatd. fat acids followed by decarboxylation.

C. R. Addinall  
Component acids and glycerides of partly hydrogenated rape oil. T. P. Hilditch and H. Paul. *J. Soc. Chem. Ind.* 54, 331–6T (1935).—Rape oil and also the Me esters prepd. from the mixed fat acids were submitted to progressive hydrogenation. In the mixed esters, hydrogenation of the linoleates proceeds selectively (as compared with that of the oleates) in the customary manner, and oleate is converted into stearate somewhat more readily than erucate into behenate. In the glycerides, the selectivity of the linoleic-oleic hydrogenation is much less

marked, while subsequently stearic and behenic glycerides appear at almost the same rate throughout. It is suggested that the differences in hydrogenation, as between the glycerides and the mixed esters, are due to the configurational positions of the unsatd radicals in combination in the glycerides. The proportions and compn of the fully satd, glycerides produced during progressive hydrogenation of rape oil have been investigated with reference to the general glyceride structure of the original oil. Neither tri- $C_{18}$  glyceride nor trierucin is present in rape oil, which conforms to the usual "even distribution" rule characteristic of the glyceride structure of seed fats. Apart from about 6% of mixed palmito-oleo-erucins, the oil investigated contained about 50% of di- $C_{18}$ -erucin and about 44% of mono- $C_{18}$ -erucin (the  $C_{18}$  acid being either oleic or linoleic). Consideration of the above observations on the course of hydrogenation of the 3 unsatd acid radicals leads to the belief that both  $\alpha$ - and  $\beta$ -oleo-(linoleo)-erucins and  $\alpha$ - and  $\beta$ -erucodoleins (linoleins) are present in the oil. E. Scherubel

The supposed occurrence of acids with uneven number of carbon atoms in vegetable oils and fats. I. Daturic acid from the seeds of *Datura stramonium*, Linn. B. L. Manjunath and S. Siddappa. *J. Indian Chem. Soc.* 12, 400-4 (1935).—Extn. of 6.2 kg. of specially grown and carefully collected seeds with petr ether yielded 1020 g. of pale yellow oil,  $d_4^{20}$  0.9184,  $n_D^{20}$  1.4735, sapon value 187.1, I no. 122.6, acid value 5.6, Ae value 25.6, Reichert-Messl value 0.44, total fatty acids 87.7, contg 2.6% of unsapon matter. The oil was sapon and extd with Et<sub>2</sub>O. Acidification gave 835 g. of fatty acids, mean mol wt. 289.1, I no. 120.7 contg 13.1% of solid acids, mean mol wt. 203.2 and liquid acids, mean mol wt. 304.4 and I no. 126.5. The fatty acids were sepd into unsatd and satd, components by Twitchell's method. The unsatd acids were purified by distn of their Me esters under reduced pressure and the presence of oleic and linoleic acids was established by oxidation with  $KMnO_4$  and bromination. Crystn. of the unsapon matter from 95% alc. gave a phytosterol, m. 134°, acetate, m. 129°. The Me esters (111 g.) of the satd acids were fractionated into 8 fractions and a residue. Fractions 1-5 (91.23 g.) consisted of pure Me palmitate yielding palmitic acid (I), m. 61° on sapon. Fraction 6 contained stearic acid (II) and I, and fraction 7 yielded 6 g. of pure II. Fraction 8 was pure Me stearate. The residue contained 3 g. of lignoceric acid, m. 76-78°;  $p$ -phenylphenacyl ester (C. A. 24, 5030) m. 101-2°. No daturic acid (III) was detected at any point in the investigation. The m. p. recorded for III varies from 54 to 60° and an approx. eumol. mixt. of I and II, m. 57.5 (C. A. 27, 2423), may be mistaken for III which has been stated to be the only acid with an uneven no. of C atoms known to exist in an oil. II. Acid fraction of mean molecular weight 354, from the seeds of *Butea frondosa*, (Roxb.). U. S. Krishna Rao and B. L. Manjunath. *Ibid.* 611-15.—During the examn. of the fatty oil from the seeds of *Butea frondosa* (C. A. 24, 2319) 2 fractions (one m. 74.5-8.5°, mol. wt. 353 and the other m. 77.5-9°, mol. wt. 383) were isolated. Esterification of the 1st fraction, fractionation of the Me ester, m. 54-5° and liberation of the acid from the residue gave 2 g. of lignoceric acid (I), m. 78-80°, mol. wt. 366;  $p$ -phenylphenacyl ester, m. 102-3°;  $p$ -bromophenacyl ester, m. 93-4°. Attempts to sep the 1st fraction by fractional crystn. of the  $p$ -phenylphenacyl and  $p$ -bromophenacyl esters appeared to point toward the individuality of the fraction. That these derivs may not be suitable for the characterization of the higher fatty acids is apparent from a list of the mixed m. ps. of these esters of palmitic (II), stearic (III), behenic (IV) and lignoceric acids. M.-p. curves of mixts. of II, III and IV with I were detd. to find out if any evidence regarding the formation of a eutectic mixt. could be obtained. IV was prepd by the catalytic reduction in the presence of Ni of erucic acid ( $p$ -phenylphenacyl ester, m. 72.5-3.5°;  $p$ -bromophenacyl ester, m. 60.0-0.5°). Eumol. proportions of IV and I form a eutectic mixt., m. 74-5°, which could not be sepd. into IV and I by the usual processes. It is probable that the

1st fraction is a eutectic eumol. mixt. of I and erucic acid (V). The oil of *Butea frondosa* evidently contains IV and V and the presence of tricosic acid has not been established. C. R. Addinall

Oils and fats. O. E. Jones. *Oil and Soap* 12, 266-71 (1935).—An address E. Scherubel

New developments in ultraviolet irradiation of oil and fat. A. Salmony-Karsten. *Allgem. Oel-u. Fett-Zig.* 32, 358-61 (1935).—A review. Several new types of app. are described. M. M. Piskur

Oils and fats (of fresh- and salt-water fish and plants) J. A. Lovren. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 80-92 (1935); cf. C. A. 29, 948°. An extended study is being made of the fats of zooplankton and of marine and fresh-water plants. The fats of the zooplankton all show several peculiarities compared with the fats of fish, and the high degrees of unsatn. are particularly noteworthy for the fresh-water species. The characteristic differences between the fats of fresh-water and marine fish are increased proportions of  $C_{18}$  and  $C_{19}$  unsatd acids and decreased proportions of  $C_{20}$  and particularly  $C_{24}$  acids in the "fresh-water" type and the fat from the marine species of the "marine" type. With the algae, the 2 fresh-water species have fats very similar in type to those of the fresh-water zooplankton; the 1 marine alga so far examd. had a most unusual type of fat with relative proportions of fatty acids not previously encountered (satd acids— $C_{17}$  0.3,  $C_{18}$  9.2,  $C_{19}$  7.3,  $C_{20}$  1.9, unsatd acids— $C_{18}$  0.5,  $C_{19}$  5.0,  $C_{20}$  62.5,  $C_{22}$  13.5%). A. Papineau-Couture

Seed oils of Formosan plants. XII. Sapotaceae oil. Kanzo Kakufo and Chuta Hata. *J. Chem. Soc. Japan* 56, 1081-3 (1935), cf. C. A. 28, 5267°. The oil of *Sideroxylon ferrugineum* Hook and Arn is a nondrying oil, it has  $d_4^{20}$  0.9082,  $n_D^{20}$  1.4650, acid no. 20.41, sapon no. 189.13, I no. 77.63, unsaponifiable substance 0.37%. It contains 23.6% solid acids (mostly palmitic acid and small amt. of myristic and stearic acids) and 76.4% liquid acids (of which 77% is oleic acid and 23% is linoleic acid). *Palaeospermum formosanum* Hay contains 53.7% oil, solidifies at 27°, m. 57-60°, has  $d_4^{20}$  0.8335,  $n_D^{20}$  1.4520, acid no. 9.41, sapon no. 189.75, I no. 44.96 and unsaponifiable substance 0.87%. It contains 60% solid acids (mostly stearic and less arachidic acid) and 40% liquid acids (mostly oleic). K. Kutsuta

Influence of gossypol on color of cottonseed oil. M. Podolskaya. *Fettechem. Umschau*, 42, 96-100 (1935).—See C. A. 29, 8376°. J. W. Perry

A rapid visual method for estimating the amount of lint on cottonseed. Egbert Freyer. *Oil and Soap* 12, 259-62 (1935); cf. C. A. 29, 7105°. It was found that a difference could easily be detected visually in the case of 2 samples differing in the amt. of lint by no more than 0.5%. A graded series of mull delinted seed samples was prepd. covering a range of 3.7 to 6.5% lint whose values were established by repeated detns. using the acid method. The seeds were spread out in flat cigaret tins, covered with glass and mounted on a masonite board. The standards were placed in 2 horizontal rows in order that the unknown sample might always be either directly adjacent to the standard which it matched or between the 2 which it most nearly matched. The reliability of this method using 21 samples indicated no greater difference than 0.5% when compared with the acid method. The comparison may be made under 2 conditions: at close range under a strong light, and with the light subdued and the observer standing at a distance of 15 feet, when the seeds are not seen as individuals and the comparison is made by judging the relative grayness of the surfaces and the relative distribution of light and dark patches. E. Scherubel

Treatment of olive oil. R. Fusteig. *Mit. grasst.* 27, 10619-20 (1935).—A brief discussion describing the production of olive oil by extn. with solvents and bringing out its advantages over pressing processes. A. P.-C.

Adulteration of peanut oil with coconut oil. H. Reubenbauer. *Przemysl Chem.* 19, 9-10 (1935).—A 10% admixt. of coconut oil can be detected because it has a lower sp. gr.,  $n_D$  and I value, but a higher sapon. value, Reichert

and Meissl, and Polenske values. Polish laws prescribe labelling of mixed edible oils as "edible oils" to distinguish them from olive oil in native parlance.

**Analysis of national grape-seed oil** Rodolfo Rouzant *Rev. facultad quim. ind. agr. (Univ. nat.itoral, Argentina)* 3, 102-(1934).—Oil from fresh grape seeds has the following characteristics:  $d_4^{20}$  0.9255,  $n_D^{20}$  1.4769,  $n_D^{25}$  1.4628,  $n_D^{30}$  1.4584, acid no. 2.084, oleic acid 1.046%, SO<sub>2</sub> 0.148%, sapon index Kottstorfer 159.5,  $\eta_{sp}$  no. (Hubl) 133.7, volatile acid no. (Reichert-Meissl) 0.537, thermocouple test (Tortelli) 77.2°, crit temp of soln (Valenta) 8.1°, (Crismer) 69.5, butyrefractometer reading at 25°, 73. It gives a neg. claudin and Halphen tests, pos. Belier, Heydenreich, Hauehecorne and resin (Morawski) tests. The value of this oil as a food has hitherto been largely disregarded.

**Volatile oil of Piperaceae** Kinzo Kafuku and Ryo Kato *J. Chem. Soc. Japan* 56, 1150-4 (1935).—Steam distn. of dried leaves of *Piper betle* Linn. gives 0.62% oil. It has  $d_4^{20}$  1.024,  $n_D^{20}$  1.5035,  $n_D^{25}$  1.481,  $n_D^{30}$  1.4685, ester value 145.69 (after acetylation 371.03). The oil contains chavicol and allylpyrocatechol. K. K.

**The chemical composition of the chinaberry** R. W. Bost and Dan Fore, Jr. *J. Elisha Mitchell Sci. Soc.* 51, 131-42 (1935).—The fruits of *Melios oederach* contain a semidrying oil, glucose, other hydrocarbons, protein and a poisonous constituent of unknown compn. The oil consists chiefly of the glycerides of palmitic, oleic, linoleic and stearic acids. No linolenic, chaulmoogic or hydrocarpic acids were found. Picrotoxin is absent.

**Unsaturated acids of natural oils** I. Highly unsaturated acids from *Onoclea* (Lycania rigida) Wm. B. Brown and Ernest H. Farmer. *Oil Colour Trades J.* 38, 1090-1100 (1935).—See C. A. 29, 3294. W. H. B.

**Finnish stickleback oil** Toivo Karttunen. *Suomen Kemistilehti* 8A, 119 (1935).—Oil is prepd from the stickleback (*Gasterosteus aculeatus* L.) by boiling in water and finally pressing. The remaining meal has the compn: raw fat 20, raw protein 50 and ash 18%. The oil prepd by skimming was light orange in color, with a faint odor resembling whale-oil. Light reduced the color considerably. The following consts. were detd:  $d_4^{20}$  0.9329, acid no. 6.14, sapon no. 158.29, ester no. 150.15, Hehner's no. 91.00, hydroxyl no. 242.28, Reichert-Meissl no. 2.4, Polenske no. 3.6 and i no. 142.46. The oil yielded 47.02% of ether-insol. bromides contg. 48.24% Br. The glycerol content was 8.06% and cholesterol 24%. E. E. J.

**Gadusene, an unsaturated hydrocarbon occurring in animal and vegetable oils** Jiro Nakamura. *Soc. Papers Inst. Phys. Chem. Research (Tokyo)* 28, 16-26 (1935).—*Gadusene* (I),  $C_{11}H_{20}$ , an unsatd. hydrocarbon, has been obtained from the nonsaponifiable fraction of fish-liver oils of *Gadus macrocephalus*, *Theragra chalcogramma*, *Stereolepis ischnopus*, and further from the same fraction of rice embryo and soy oils. Catalytic hydrogenation of I gives *gadusane*,  $C_{11}H_{22}$ , b. 85-6°,  $n_D^{20}$  1.4632. I has 5 characteristic absorption bands, A (3333, 3273, 3210), B (3090, 3020), C (2865, 2785, 2721), D (2544), E (2407, total absorption).

**Tetradecenoic acid and dodecenoic acid in sperm oil** I. Tetradecenoic acid and dodecenoic acid in sperm blubber oil. Yoshiyuki Toyama and Tomotaro Tsuchiya. *J. Chem. Soc. Japan* 56, 1030-4 (1935).—Tetradecenoic acid (I),  $C_{14}H_{28}O_2$ , and dodecenoic acid (II),  $C_{12}H_{24}O_2$ , were isolated. Consts. of I are  $d_4^{20}$  0.9046,  $n_D^{20}$  1.4571,  $n_D^{25}$  1.4552, M. R. 67.86 (theory 67.92), acid no. 248.8, i no. 107.8. Consts. of II are  $d_4^{20}$  0.9130,  $n_D^{20}$  1.4535, M. R. 58.72 (theory 58.69), acid no. 282, i no. 118.7. Examn. of decompn. products from oxidation indicated that the structure of I is  $Me(CH_2)_4CH=CH(CH_2)_7CO_2H$  and that of II  $Me(CH_2)_3CH=CH(CH_2)_6CO_2H$ . II. Dodecenoic acid in sperm head oil. Ibid. 1045-7.—Dodecenoic acid (I),  $C_{12}H_{24}O_2$ , is isolated. Oxidation of I by Harzura's method gives dihydroxydicarboxylic acid and tests on oxidation products from methylhydroxydicarboxylic acid indicated that the structure of I is exactly

the same as that obtained from the sperm blubber oil (cf. above).

**Hexadecenoic and tetradecenoic in sperm head oil** Yoshiyuki Toyama and Tomotaro Tsuchiya. *J. Chem. Soc. Japan* 56, 1052-6 (1935).—Hexadecenoic (I) and tetradecenoic (II) were isolated from the unsaponifiable fraction of the oil. Consts. of I are  $d_4^{20}$  0.8337,  $d_4^{25}$  0.8503,  $n_D^{20}$  0.4605,  $n_D^{25}$  1.4584, i no. 98.6, M. R. 77.15 (theory 77.14); acetate of I b.p. 195.8°, has  $d_4^{20}$  0.8760,  $n_D^{20}$  1.4506. Consts. of II are  $d_4^{20}$  0.8507,  $d_4^{25}$  0.8473,  $n_D^{20}$  1.4573,  $n_D^{25}$  1.4533, i no. 111.2, M. R. 67.98 (theory 67.91); acetate of II b.p. 185.70°, has  $d_4^{20}$  0.8529,  $n_D^{20}$  1.4477, M. R. 77.93 (theory 77.28). Studies on oxidation products of the acetates of I and II indicated that the structure of I is  $Me(CH_2)_4CH=CH(CH_2)_7CO_2H$  and that of II  $Me(CH_2)_3CH=CH(CH_2)_6CO_2H$ . Since these are related to zoamaric acid ( $\Delta^5$ -hexadecenoic acid) and physetic acid ( $\Delta^5$ -tetradecenoic acid), the names *zoomarylic alc.* for I and *physetyl alc.* for II are given.

**Hexadecenoic in sperm blubber oil** Yoshiyuki Toyama and Goroku Akirama. *J. Chem. Soc. Japan* 56, 1077-81 (1935).—A small amt. of  $\Delta^5$ -hexadecenoic was isolated from the unsaponifiable fraction.

**Application of the technic of chromatographic adsorption to the study of the composition of thin unsaponifiable residue of fish oils** J. C. Drummond, A. Santos Ruiz and T. Thorbjarnarson. *Anales soc. esp. fis. quim.* 33, 690-91 (1935).—The Twett chromatographic adsorption method (Aberhalden. *Handbuch des Biochem. Arbeitsmethoden*, 6, 100 (1912)) of sepg. and detg. different constituents of the unsaponifiable fraction from various oils is reliable and simple. In cases where the classical method of fraction crystn. and distn. gave little or no success, adsorption by  $Al_2O_3$  was effective. With  $Al_2O_3$  as adsorbent, and light petroleum fractions as solvent, satd. hydrocarbons usually pass most readily through the column, while unsatd. hydrocarbons, at least those of the squalene type, pass into the filtrate. Unsatd. alcs. tend to wash down into the lower layers of the columns, but their distribution is, to some extent, detd. by the nature of other substances present. A relatively large proportion of highly unsatd. hydrocarbon, e. g., squalene, tends to bring down unsatd. alcs. lower in the column, and may even cause leakage into the filtrate. Sterols tend to be adsorbed in a relatively well-defined belt  $1/2$  of the distance down the column. Certain lipochromes of the xanthophyll type may be assoc. with sterol or may be found coned in adjacent zones. Satd. alcs. are usually held at the top of the column.

**The highly unsaturated acids in sardine oil** VII. The separation of highly unsaturated  $C_{20}$  acids. Yoshiyuki Toyama and Tomotaro Tsuchiya. *Bull. Chem. Soc. Japan* 10, 433-40 (1935), cf. C. A. 29, 5378. —A coned fraction of highly unsatd. acids was sepd. from sardine oil by the Na soap-acetone method. It was converted into Me esters and the latter subjected to a fractional distn. which yielded a fraction consisting of the Me esters of  $C_{20}$  acids. This fraction and the free fat acids liberated from it showed I nos. which were close to those of Me elupanodonic and elupanodonic acid, resp., but on sepg. the fat acids of this fraction by a fractional pptn. of Na soap in acetone soln. they were found to contain, in addn. to elupanodonic acid, some acids of different degrees of unsatn. After a repeated sepg. elupanodonic acid was sepd. in a much purer state than before, and a more highly unsatd. portion consisting of docosahexenoic acid,  $C_{22}H_{40}O_2$ , was also sepd. A portion less satd. than elupanodonic acid was also obtained, this was a mixt. contaminated with cetoleic acid,  $C_{21}H_{40}O_2$ . Docosatetraenoic acid,  $C_{22}H_{38}O_2$ , was not sepd. although it could not be deemed to be absent. VIII. The constitution of elupanodonic acid  $C_{20}H_{38}O_2$ . Ibid. 441-53.—The following products were found when Am elupanodonic acid was subjected to ozonolysis: propylaldehyde and acetaldehyde,  $CO_2$ , succinic acid, amyl H succinate and also lower acids, probably propionic and acetic. Of these compds. acetaldehyde, acetic acid and  $CO_2$  are attributable to the secondary

with yeast and invert sugar present is fermented without inversion of the sucrose. *alc.*, is added to the fermented molasses in the substantial absence of invert sugar, an alk earth oxide or hydroxide such as  $\text{Ca}(\text{OH})_2$  is added in an amt. sufficient to ppt or impurities but insufficient to ppt sucrose, the ppt formed is sepd and the *alc.* sucrose soln is neutralized with an acid such as  $\text{H}_2\text{SO}_4$  capable of forming substantially insol  $\text{Ca}$  and  $\text{K}$  salts, pptd salts are sepd from the substantially neutral soln, *alc.* is removed from the soln and the sugar is then comcd and sugar is crysd from it. An arrangement of app. is described.

Sugar-cane mills Wm Murray. Brit. 430,532, June 20, 1935. In a mill having circumferentially grooved or corrugated rollers, the dumbturner or trash-plate is formed on its upper face with a series of transverse grooves extending the entire width of the plate and mating with the grooves in the top roller.

Roller-mills for sugar cane, etc. Fawcett, Preston and Co Ltd, John C Margillivray and Gordon Chapman. Brit 431,655, July 12, 1935.

Starch Maximilian Sprockhoff. Ger. 618,265, Sept. 4, 1935 (Cl 52k 2 01). Refined potato starch is converted into a product suitable for making puddings, etc., by treating it first with  $\text{Cl}_2$  or a hypochlorite at about  $45^\circ$  and then

with a reducing agent, e.g.,  $\text{SO}_2$ , until a product is obtained which is converted completely into an easily subdivided gel when it is loaded with water.

Starch preparations Ernest E. Pendlebury. Brit. 431,275, July 4, 1935. Preps. for drying or otherwise finishing textiles are composed of a  $\text{H}_2\text{O}$ -sol. starch and 1 or more compts of stearic, oleic or ricinoleic acid with triethanolamine, ethylene glycol, diethylene glycol or triethylene glycol. There may be added a sol. sulfonated vegetable oil,  $\text{H}_3\text{BO}_3$  or a borate, talc, and stearic, palmitic, oleic or ricinoleic *alc.* or esters thereof. Glycol and cetyl *alc.* are included in examples. The preps. may be added to "cold" or "boiled" starch.

Cold soluble starch N. V. Chemische Fabriek "Servo" and Meindert D. Rozenbroek. Brit. 430,872, June 26, 1935. Cold sol. starch, obtained by drying starch, materials contg starch or derivs of starch in thin layers, e.g., on metal plates or rollers, is moistened and gently heated, e.g., to  $50^\circ$ , to reduce its swelling capacity in  $\text{H}_2\text{O}$  and its bulk. To the treated material there may be added untreated cold sol. starch, salts, borax, soap, weak or strong alkalis, talc, china clay, gelatin, glue, milled gums or resins, dextrin, starch, rubber latex, fat, oil, wax, paraffin or fatty *alcs.*, if desired in soln. or suspension in the  $\text{H}_2\text{O}$ .

## 29—LEATHER AND GLUE

ALLEN ROGERS

The Finnish leather industry and its products. Lauri Pakkala. *Suomen Kemistilehti* 8A, 71-6 (1935)—Various kinds of leather are described. E. E. Jukkola.

Blanching animal skins with permanganate preparatory to tanning John A. Wilson. *Hides & Leather* 90, No. 19, 17, 24-7 (1935)—Skins are bleached with  $\text{KMnO}_4$ ,  $\text{NaHSO}_4$ ,  $\text{H}_2\text{SO}_4$  and  $\text{NaCl}$  after bating or pickling, to remove discolorations (salt stains, black hair bulbs, etc.). After bleaching, the skins are brought back to the pH value normally existing before tanning, and are tanned in the usual way. The bleached stock is now white. Comparative tests with sides showed marked improvement in shade after tanning and after coloring. Photomicrographs, analyses, phys. tests and practical exam. showed no deleterious action resulted from this bleach. H. B. M.

The theory and practice of combination tanning. H. Oivartskil. *Collegium* 1935, 178-80—See C. A. 29, 71141.

One bath chrome tanning process E. W. Merry. *Leather World* 26, 253 (1934), J. Am. Leather Chem. Assoc. 30, 577 (1935)—When one or more acidic groups are assoc. with the  $\text{Cr}^{+3}$  in a manner such that the assoc. persists upon soln. and ozonization, the  $\text{Cr}$  atoms is said to be masked. Masking makes the  $\text{Cr}$  liquor less astringent, and is therefore useful in the early stages of tanning. Tanning in a liquor of basicity = 33% is advised.

A theory of mineral tanning I. The flocculation and turbidity which occurs when aluminum and chromium salt solutions are made basic. A. Kuntzel and G. Königfeld. *Collegium* 1935, 257-70; cf. C. A. 29, 31839.—When alkali is added to solns. of  $\text{AlCl}_3$  and  $\text{Al}(\text{NO}_3)_3$ , a ppt. forms with every drop, on shaking, this ppt. decomposes into rod-like, double-refracting particles and rapidly or slowly disappears. Solns. of the corresponding  $\text{Cr}$  salt, at the pptn. point, give a similar cloudiness which disappears on standing. Solns. of  $\text{Al}$  salts and  $\text{Na}_2\text{CO}_3$  form carbonate complexes which are sol. but which decompose very rapidly and the soln. soon becomes cloudy as with  $\text{NaOH}$ . Sulfate solns. of  $\text{Cr}$  and  $\text{Al}$  form insol. dihydroxy-tetraaquo solts, so that there is a max. basicity, which sulfates can reach without pptn., while chloride and nitrate solts can be made almost 100% basic.  $\text{Cr}$  salts are much more strongly hydrolyzed in the first step than in the second and third,  $\text{Al}$  salts are about equally hydrolyzed in all 3 steps. The reversal of pptn. is mostly caused by acids which are formed during slow hydrolysis. II. Ag-

ing phenomena in basic solutions of aluminum and chromium salts. A. Kuntzel, C. Riess and A. Königfeld. *Ibid* 270-89.—Solns. of basic salts of  $\text{Cr}$  and  $\text{Al}$  both become more acid on standing (aging) or heating. A slow hydrolysis is responsible for this increase in acidity, and for dissolving the ppt. or cloudiness which first forms on making the solts. basic, and is caused by the formation of high mol. aggregates which are not sensitive to acid and do not enter the hydrolysis equil. The aggregates are not of uniform size, the size increases with increasing basicity, and in  $\text{Al}$  systems the size is smaller than in  $\text{Cr}$  systems of the same basicity.  $\text{Al}$  aggregates form and age much quicker than  $\text{Cr}$  aggregates. Aged  $\text{Cr}$  aggregates are much more stable to acids than  $\text{Al}$  aggregates; detn. of degree ofolation is possible only with  $\text{Cr}$ , not with  $\text{Al}$  salt solts. For the formulation of the constitution of the aggregates, the elation theory of Sturany is not as satisfactory as the O-bridge theory of Jander (C. A. 26, 4765) but the 2 can be combined easily. I. D. Clarke.

The theory of mineral tanning—chromium tanning of gelatin XXVI. Bating and dyeing processes. E. Evid and Th. Schachowsky. *Kolloid Z.* 72, 67-74 (1935), cf. C. A. 29, 3721, 31921.—Changes of light absorption of  $[\text{Cr}(\text{NH}_3)_4\text{Cl}_2]\text{Cl}$  in gelatin, of green  $\text{CrCl}_3$  in gelatin and of  $\text{CrCl}_3$  with addns. of  $\text{NaOH}$  and of glycerol and  $\text{NaOH}$  were investigated. The tanned end products are all similar; no glycerol like compts between gelatin and  $\text{Cr}$  occur. Tanning expts. with polyvinyl *alc.* support the theory that in mineral tanning attraction forces between mols. play decisive roles. Tanning with various  $\text{Cr}$  hydroxide solts prep'd. by dialysis with approx. equal basicity (20-43% basic) show that the degree of tanning for equal amts. of  $\text{Cr}$  is decidedly dependent on the particle size—the greater the dispersion, the more intensive the tanning. No support was found for the assumption that in the tanning of gelatin with  $\text{CrCl}_3$  compts, complexes occur which in their inner sphere are especially rich in  $\text{Cl}$  ions. It seems more probable that the tanning  $\text{Cr}$  compts formed in the gelatin are of a highly basic nature.

The natural tannins Alfred Russell. *Chem. Rev.* 17, 155-66 (1935)—A review. Louise Kelley.

Determination of the plumping of skin during tanning. Fernand Pothier, J. Intern. Soc. Leather Trades Chem. 19, 534-43 (1935).—Turbidity coeff.,  $T$ , is defined as  $(100e)/E$ , where  $e$  = thickness of specimen under standard pressure and  $E$  = thickness under zero pressure. A

special micrometer caliper, in which contact between the specimen and the movable jaw is detected electrically, is used to measure  $E$ .  $e$  is measured by a method similar to that of Wilson and Gallun (C. A. 17, 649, 1901). Pieces of cow hide, about  $5 \times 7$  cm., were unharmed with time, delimed with  $\text{NaHSO}_3$ , and demineralized with satd.  $\text{CO}_2$  soln.  $T$  was measured at 6 points for each piece before tanning. Pieces were tanned in strong solns. (sp. gr. = 1.030) of exts.: I chestnut, II oak, III quebracho, IV pine, V myrobalsam, VI mimosa and VII valmeca.  $T$  was measured for each piece at intervals up to 30 days. For all exts. studied,  $T$  increased by 10–20% during the first 2 to 10 days, and thereafter declined slightly. The initial increase is ascribed to "hydration" under the influence of nontanning, and the subsequent decrease to dehydration by tanning.  $e$  increased rapidly at the outset, and reached a nearly const. value after about 15 days, but the initial rate of increase and the max. value attained varied widely between the different exts. I excepting for VI and VII, which showed lag periods, the final value of  $e$  increased with rate of initial increase of  $e$ .  $e_{\infty}$  exceeded  $e_0$  by about 120% for I and II, 100% for VI, 80% for VII, 60% for IV and V and 50% for III. Differences in  $T$  were detd. primarily by differences in  $e$ , final values for I were about 80 for I and II, 80 for VI and VII and 70 for III, IV and V. For untanned skin,  $T = 60$ . The high values of  $T$  for I and II are attributed to their high natural acidities. With 2 exceptions,  $T$  increased with decreasing initial  $p_n$  value of the ext. When the  $p_n$  value of III was lowered from 4.95 to 3.10 by adding 10%  $\text{AcOH}$ , the initial rate of increase of  $T$  was even greater than in the case of I, but  $T$  reached a max. in 6 days and thereafter declined considerably. The leather thus tanned was very brittle. Slight acidification of III, to  $p_n = 3.60$ , produced only a slight increase in  $T$ .  $T$  was measured for com. leathers, after wetting with  $\text{H}_2\text{O}$ , and values obtained increased with the firmness of the leathers as detd. by the hand bending test. Conclusion. To obtain a firm leather, employ exts. such as I and II giving high values of  $T$  by reason of their high natural acidities and favorable tannin non-tannin ratio. II B. Merrill

Experiments on the action of vegetable-tanned leather on metallic iron. I. Effect of leather greases on iron. V. Kulekha, V. Nemec and S. Zuravlev. *Chim. tech.* 24, 300–4 (1935).—The fact that certain leathers in contact with Fe rapidly corrode the metal with concomitant darkening and deterioration of the leather, while other leathers show no such action after years of contact, indicates that certain constituents of the leather are at fault. Iron, in thin plates, was stored with various greases for 75 days, with intermittent heating on the water bath, with and without the addn. of pulverized vegetable-tanned leather (free from mineral acids and syntans). No action occurred with satd. hydrocarbons or glycerides contg. chiefly satd. acids; slight action occurred with glycerides of unsatd. acids, and marked action with unsatd. and oxidized free acids. The action resulted in corrosion of the metal, darkening of the oil and increase in free fatty acid content. The presence of leather accelerates the action. Most of the dissolved Fe is absorbed by the leather. II B. Merrill

Drying heavy leather in five hours. T. K. Sherwood and L. L. Carono. *Chem. & Met. Eng.* 42, 639 (1935).—The skins are coated with a paste of kieselguhr. Sol tannin drawn to the surface by capillarity during drying is deposited on the coating instead of on the grain of the skin, and is brushed off with the kieselguhr. This permits drying at much higher temps. than can safely be employed for non-coated leather. II B. Merrill

Comparative wear of chrome, vegetable and retanned sole leather. R. C. Bowler and W. E. Fmley. *J. Am. Leather Chem. Assoc.* 30, 672–6 (1935).—Practical wear tests were made with com. soles tanned with Cr, with vegetable tanning materials and with various combinations. Results of 996 tests show that the av. time required to wear through a Cr-tanned sole exceeds that for vegetable-tanned by about 75%. Combination tanned or retanned soles have intermediate wear resistance and

the lighter the vegetable retannage the greater the wear. In general wear resistance increases with the percentage of hide substance, falls with the percentage of  $\text{H}_2\text{O}$ -sol. matter and is unaffected by variations in grease content or percentage of insol. mineral matter. Also in *J. Research Natl. Bur. Standards* 15, 223–7 (1935) (Research Paper No. 834).

Causes and prevention of decay in leather. R. F. Innes. *Leather World* 26, 927 (1934); *J. Am. Leather Chem. Assoc.* 30, 577 (1935).—A résumé. Cl. C. A. 28, 1215<sup>4</sup>, 29, 3547<sup>4</sup>. II B. Merrill

Copper staining. M. P. Ralfe. *Leather World* 26, 1130 (1934); *J. Am. Leather Chem. Assoc.* 30, 577 (1935); cl. C. A. 25, 8500<sup>7</sup>.—Cu introduced into the liquors largely by corrosion by chestnut ext. is pptd. as sulfide by  $\text{Na}_2\text{S}$  carried over from the lime liquors. The presence of large amts. of  $\text{SO}_2$  in the liquors will prevent this pptn.

Theory of leather dyeing. Gerhard Otto. *Collegium* 1935, 371–4, cl. C. A. 29, 4204<sup>4</sup>.—Dyeing leather with acid or substantive dyes has been shown to be a primary valence reaction between the basic groups of the hide and acid groups of the dye, but there is a great difference between different dyes and leathers. The affinity of dye for hide substance and for sumac and gambier tanned leather was measured by detg. the  $p_n$  at which the hide or leather took up the max. amt. of free dye acid. This  $p_n$  is much lower for vegetable leather than for hide substance, dyeing is better the lower this  $p_n$  "limit". The results indicate that the primary valence reaction, for vegetable but not for Cr leather, is regulated by secondary valence forces which, if active, permit disson. of new basic groups and the absorption of more dye. In leather dyeing there is no fundamental difference between acid and substantive dyes, they should both be called anionic dyes. I D. Clarke

Some notes on the construction and operation of an experimental rocker section. Wm P. Doelger. *J. Am. Leather Chem. Assoc.* 30, 678–72 (1935). II B. M. A study of keratin. Leonor Michaels. *J. Am. Leather Chem. Assoc.* 30, 677–68 (1935).—An address.

Restraining substances in gelatin (Steigmann) 5 Sulfurization of oils and sulfur tanning (Abbassi) 27 Azo dyes [for leather] (Brit. pat. 432,355) 25.

Treating hides and skins. I. G. Farbenindustrie A.-G. (Richard Klein, Heinrich Ulrich and Paul Kording, inventors). Ger. 618,049, Aug. 31, 1935 (Cl. 29, 1). Addn. to 679,374 (C. A. 27, 4715). Dried hides and skins are softened by treatment with aq. solns. of the salts or other products obtained by reacting aliphatic hydroxyamines with  $\text{SO}_2$  or a water-sol. sulfite. Examples are given.

Soaking hides. I. G. Farbenindustrie A.-G. Brit. 430,767, June 25, 1935. Addn. to 344,851. Hides are soaked in aq. baths contg. salts or other conversion products of  $\text{H}_2\text{SO}_4$  with amines contg. 1 or more alkyl radicals having not more than 8 C atoms substituted with 1 or more OH groups. The products may be obtained by leading  $\text{SO}_2$  into solns. of the amines or by reaction of the latter with aq. sulfite solns. Suitable amines are monoethanolamine, triethanolamine, methylbutanolamine, cyclohexylethanolamine, diethylbutanolamine, hydroxyethylmethylamine, etc.

Depilatory. Oonah M. Hedberg (to Oonah Ltd.). U. S. 2,018,379, Oct. 22. A compn. suitable for application to the flesh side of hides is formed with Na sulfide, a thickening agent and a soap, etc.

Tanning compositions. Alphonso O. Jaeger (to American Cyanamid & Chemical Corp.). U. S. 2,017,963, Oct. 22. A "syntan" of the sulfonic acid type such as a sulfonaphthyl methane tan is mixed with a sol. carbohydrate material such as sugar which serves to facilitate

obtaining of a permanently light-colored leather. Nat-  
ural tanning agents also are used.

Phenolic condensation products. I. G. Farband  
A-G (Ludwig Orthner and Arnold Doser, inventors).  
Ger. 614,034, Sept. 5, 1935 (Cl. 12g 20 04). Complex  
alkali sol substances containing phenolic OH groups are  
treated at a raised temp. with an alkylene oxide, and the  
products are sulfonated. Suitable starting materials are  
phenolic synthetic resins, various types of which are  
specified. The alkylene oxide may be replaced by a  
corresponding acid or ester, e.g., glycidic or epichloro-  
hydrin. Numerous examples are given. The products  
are sol in water and are useful as *toning and dispersing*  
*agents and as resins in dyeing*.

Filling leather. Lester M. Whitmore (to Leas and Mc-

Vitty, Inc.). U. S. 2,018,588, Oct. 22. A vegetable  
tanning ext. such as quebracho ext., an aldehyde such as  
 $\text{CH}_3\text{CHO}$  and an  $\text{NH}_4$  salt such as  $(\text{NH}_4)_2\text{SO}_4$  are coupled  
to react between and on the fibers and fibrils of the leather to  
deposit insol material.

Azo dyes for leather. Francis H. Smith and Crayton K.  
Black (to L. L. du Pont de Nemours & Co.). U. S.  
2,018,234, Oct. 22. A dye which dyes leather chocolate  
brown is formed by coupling diazotized sulfanilic acid with  
resorcinol, coupling this compd. with diazotized picramic  
acid, treating to convert the nitro group, ortho to the  
hydroxy group, to an amino group, then diazotizing and  
coupling with *m*-phenylenediamine sulfonic acid. Similar  
dyes may be obtained with various similar components and  
numerous examples are given.

## 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Research in the cultivation and preparation of raw rub-  
ber. J. Grantham. J. Roy. Soc. Arts 83, 1031-68  
(1935). E. H.

The acetone extraction of raw rubber. V. The influ-  
ence of heating at 100° and of storing of the acetone ex-  
tract on the saponification value. Hidemaro Endo. J.  
Nov. Chem. Ind., Japan 38, Suppl. binding 359-81 (1935),  
cf. C. 1 29, 6795<sup>1</sup>.—Heating of the acetone ext. at 100°  
gave an initial decrease in the sapon. no. of the ext. with a  
subsequent increase, while storage gave an initial increase  
with a following decrease, and a return to the original  
value. *Detn. of the sapon. no.*—After extn. evap. the  
acetone as rapidly as possible, dry the flask on a steam bath  
for as short a time as possible (not over 15 min., and  
usually 5 min. is sufficient), cool, weigh, add 20 cc. of 0.2 N  
ale. KOH, heat on a water bath for 60 min. and titrate the  
excess alkali with 0.1 N HCl (phenolphthalein).  
Exptl. data are presented. VI. The saponification value of  
the acetone-extracted residue of raw rubber. Ibid.  
433-6.—The acetone-extd. residue, not specially dried,  
showed a considerable increase in the sapon. value (R)  
after 60 min. of heating. This may have been due to the  
absorption of KOH. R was in general higher after 8 hrs.  
extn. than after 16 and 24 hrs. Drying of the extd. residue  
for 1 hr. in a desiccator and heating for 30 min. in the  
detn. of the sapon. value gave the best results. Part of  
the free acids and saponifiable substances decomposed  
and escaped by volatilization during acetone extn. for 16 and  
24 hrs. Karl Kammmermeyer.

Rubber latex as a manufacturing material. D. F.  
Twiss. J. Roy. Soc. Arts 83, 1075-91 (1935).—See C. A.  
29, 494<sup>1</sup>. E. H.

The bacterial decomposition of the rubber in the latex  
of Hevea in relation to the question of the function of the  
rubber in the living plant. D. Spence. J. Research  
Issac Brit. Rubber Manufs. 4, 87-91 (1935), cf. C. A.  
29, 8393<sup>1</sup>.—Rubber in the cortical tissue of guayule has  
been decomposed by each of several strains of aerobic  
organisms. Rubber in dialyzed and dried Hevea latex was  
practically all decomposed in 1 month at 30° by 4 different  
forms of *Actinomyces* under aerobic conditions.

D. F. Cable

Natural and synthetic rubber. XV. Oxygen in rubber.  
Thomas Midgley, Jr., A. L. Henne, A. F. Shepard and  
Mary W. Renoll. J. Am. Chem. Soc. 57, 2318-21 (1935);  
cf. C. A. 28, 4903<sup>1</sup>.—Natural rubber contains O, while  
synthetic rubber is O free. This O appears to be in an  
HO form, and its quantity corresponds to about 1 HO  
group for each 1000 isoprene units of the rubber mol. As  
rubber oxidizes, either by milling or exposure to O and  
sunlight, the following events occur: the H/C ratio de-  
creases, the combined O increases, the active H increases  
and the mol. wt. (measured by cryoscopic in  $\text{C}_6\text{H}_6$ ) de-  
creases. The thionyl Grignard results still lack signifi-  
cance. The O attaches to the rubber mol. in some per-  
oxide linkage, this linkage rearranges to an HO group,  
with liberation of O, and one of the HO groups joins with H

and are eliminated as  $\text{H}_2\text{O}$ , hence the lowering of the H/C  
ratio. The mol. is ruptured during or as the result of 1  
of the above reactions. C. J. West.

Chlorinated rubber. E. Fraser Smith. *Oil Colour  
Trades J.* 88, 1251-3 (1935).—A review from 1899 to  
date, of the chlorination of rubber, its manuf. and the  
application and uses of chlorinated rubber. W. H. B.

Research steadily broadening rubber's automotive  
usefulness. J. D. Morton. *Automotive Ind.* 73, 206  
(1935).—A résumé of the increasing uses of rubber in  
automotive construction made possible by the bonding of  
rubber to metal. The old process of brass-plating steel  
and then bonding rubber to the brass has been sup-  
planted by newer methods, and even Duprene can be  
adhered to practically all metals and alloys, except those  
contg. Mg, with a uniform bond which does not sep. under  
a stress of 250 lb. per sq. in. A. L. Kaye.

A fatigue-cracking test for tire-tread compounds.  
Some of the laws of fatigue. F. T. Raimer and R. H.  
Geile. *Ind. Eng. Chem., Anal. Ed.* 7, 308-73 (1935).

A new app. and technique for evaluating the resistance of  
tire-tread vulcanizates to fatigue-cracking is described and  
illustrated in detail. The novel features of this method  
are the precision of the strain cycle, the quant. measure-  
ment of the degree of cracking and the initiation of the  
cracks with  $\text{O}_3$ , all of which enhance the validity of the  
method. Tests show that cracking by  $\text{O}_3$  and through  
fatigue are additive, that the rate of growth of cracks is a  
function of the max. strain, that endurance limits may  
exist, and that the addn. of antioxidants decreases the  
rate of growth and increases the limit of endurance.  
Results obtained by this method are shown to agree in a  
comparative way with shoulder-cracking of tires in service.  
The test is useful in evaluating antioxidants, accelerators,  
softeners, etc. Data obtained by this method also make  
possible the deduction of certain general laws of fatigue-  
cracking. C. C. Davis.

Rubberizing fabrics by calendaring. Antoine Trépan.  
*Caoutchouc & gutta percha* 32, 17031-3 (1935), cf. C. A.  
29, 6466<sup>1</sup>.—A further description, illustrated with dia-  
grams. C. C. Davis.

Hydraulic presses for vulcanizing rubber floor coverings  
(Brit. pat. 430,999) 1. Impregnating textile materials  
with rubber latex (U. S. pat. 2,019,420) 25. Transform-  
ing hydrocarbons [product for vulcanizing rubber] (Brit.  
pat. 432,568) 22.

Creaming latex. Rubber Research Institute of Ma-  
laya Brit. 430,935, June 27, 1935. Gum extd. from  
the seeds of the locust bean is used as a creaming agent for  
latex, preferably as a 3% soln. in  $\text{H}_2\text{O}$ . The rate of  
creaming is augmented, and stability of the cream in-  
creased, by an increase of alk. of the latex prior to the  
operation, e.g., by the addn. of  $\text{NaOH}$  up to 1.5% of the  
rubber. The addn. of 0.3 part of gum to 100 parts  $\text{H}_2\text{O}$

in such a latex yields a cream of approx. 60% rubber content in 48 hrs.

**Rubber.** Archie R. Kemp (to Electrical Research Products, Inc.). Brit. 430,887, June 26, 1935. Partially depolymerized rubber is produced by heating crude rubber in soln. in an org. solvent, e. g., decahydronaphthalene, tetrahydronaphthalene, in an autoclave at well above 100° for a sufficient time to cause the rubber to become and remain a viscous liquid after cooling, and sepr the solvent.

**Rubber.** Ralph M. Ungar and Philip Schidrowitz Brit. 431,869, July 17, 1935. The process of Brit. 368,902 (C. A. 27, 2538) for softening crude rubber is applied to initial crude rubber, defined as rubber 1st or 2nd formed upon coagulation, gelling or pptn from latex, or upon spray drying thereof, in contrast to smoked sheet, crepe and like known forms of crude rubber. In an example, latex is coagulated by  $\text{AcOH}$  and the coagulum is washed, crumbed and drained. Further  $\text{H}_2\text{O}$  may be removed by centrifuging, pressing or air-drying. The crumbs are filled into trays which are placed on steam-heated shelves in a Passburg oven, the oven is closed and the air evacuated and the shelves are heated to heat the rubber to about 270–290°F. until it is completely dried. Air is then admitted and the heating continued for 10–30 min. The trays are then removed and stacked with an air space of about an in. between them. When the rubber has cooled to about 120°F, it is removed from the trays and may be agglomerated to condition it for shipment or use.

**Rubber compositions.** Alfred L. Hook and Peter Spence & Sons Ltd. Brit. 430,789, June 10, 1935. A  $\text{H}_2\text{O}$ -sol. inorg alkali or alk. salt and an org. accelerator are incorporated in a rubber mix contg. a highly adsorbent siliceous filler. The preferred alkali is water glass and the filler is preferably pptd  $\text{SiO}_2$  prepd as in Brit. 294,681 (C. A. 23, 1999), 299,453 (C. A. 23, 3314) and 337,903 (C. A. 26, 4022). In an example, the accelerator is diphenylguanidine.

**Rubber compositions.** Pure Calcium Products Co. and Arthur H. Stevens. Brit. 432,033, July 15, 1935. Addn to 379,942 (C. A. 27, 4130). The ingredient of rubber mixes of 379,942 that is made by grinding an earthy material, e. g., whitening, with 0.1–10% of an org. acid, salt or ester in a ball mill having balls of less than 3 in. in diam., occupying at least 15% of the vol. of the mill and being driven at least 25% of the crit. speed is here prepd. in a pebble, rod, tube or like mill under the same conditions of size, vol. and speed. The material may be used as an ingredient of paints, pulvers, etc.

**Rubber compositions, etc.** Edward A. Murphy, Frank T. Purkis and Douglas F. Twiss (to Dunlop Rubber Co., Ltd.) U. S. 2,018,313, Oct. 22. For producing substantially uncoagulated aq. compns. of rubber or the like from their aq. dispersions and suitable for use as adhesives in securing fibrous materials to rubber, a rubber dispersion or the like, without coagulation, is admixed with an aq. emulsion of a rubber solvent such as coal-tar naphtha in the presence of one or more suitable destabilizing agents such as acetone. Cf. C. A. 29, 3104.

**Porous rubber.** International Latex Process Ltd., Wilfred H. Chapman, Eric W. B. Owen and Donald W. Pounder. Brit. 431,575, July 11, 1935. Aq. dispersions of rubber or like material are converted into a froth in which the rubber is still in the reversible condition and the mass is allowed to coagulate, the pressure being reduced before, during or immediately after the coagulation. Before frothing, froth-forming agents, e. g., soap, saponin, synthetic, waste or reclaim rubber, or natural or concd. latex, may be used. The product may subsequently be vulcanized, dried and otherwise treated.

**Cellular and porous rubber.** Ugo Pestalozza and Società Italiana Pirelli. Brit. 431,410, July 8, 1935. Latex or a like dispersion is mixed with a separately prepd foam and the dispersion is coagulated. The cellular coagulum, unless the dispersion used is pre-vulcanized, is usually subjected to vulcanization. Among examples, 1

rubber dispersion mixing comprising 55% latex preserved with 0.5% of  $\text{NH}_4\text{I}$ , 180, mineral oil, 5,  $\text{ZnO}$ , 1,  $(\text{AcO})_2\text{Zn}$ , 1,  $\text{Zn}$  dimethylthiocarbamate 0.4 and 8.2 g., having a 50% final concn. in solids, is mixed with 120 cc. of a foam obtained by introducing air into a 5% aq. soln. of gluc contg. 0.5% of an alkali soap, in a whipping machine, and the resulting mixt. is poured into a mold and heated 30 min. at 60° and then 1 hr. at 100°.

2 Granulated rubber suitable for compounding with various materials. Royce J. Noble (to Hexatex Corp.) U. S. 2,019,055, Oct. 29. An insolubilizable hydrophilic stabilizer such as  $\text{NH}_4$  casinate is added to rubber latex, the latex is flocculated with an agent such as  $\text{ZnCl}_2$  which insolubilizes the stabilizer, the mass of rubber flocs is sepd. from the latex water and the wet mass is dewatered until it becomes a firm but crumbly cake, and the latter is granulated.

3 Hard-rubber dust International Latex Processes, Ltd. Ger. 618,181, Sept. 5, 1935 (Cl. 39b 5). See Brit. 417,031 (C. A. 29, 16824).

4 Coloring rubber and like materials. I. G. Farbenind. A.-G. Ger. 618,342, Sept. 5, 1935 (Cl. 39b 5). Use is made of water-insol. disazo dyes obtained by coupling tetrazotized benzidine or its alkyl, alkoxyl or halogen substitution products with the Me or Et esters of 1-phenyl-5-pyrazolone-3-carboxylic acid or its derivs. substituted in the phenyl residue by a halogen atom or an alkyl or alkoxy group. Fast yellow to violet colorings are produced. Several dyes are described. Cf. C. A. 29, 84067.

5 Isomerizing rubber. Walter E. Lawson (to F. I. du Pont de Nemours & Co.) U. S. 2,018,678, Oct. 29. Anhyd. HF is added to a soln. of rubber dissolved in a solvent such as  $\text{C}_6\text{H}_6$ .

6 Plasticizing rubber. Ira Williams and Carroll C. Smith (to E. I. du Pont de Nemours & Co.) U. S. 2,018,643, Oct. 22. Unvulcanized rubber is plasticized by subjecting it, in the absence of more than 3% of  $\text{S}$ , to sufficient amts. (suitably about 0.5%) of an unsym. substituted hydrazine such as phenyl hydrazine for sufficient time (suitably about an hr. at 70°) to effect a marked increase in the capacity of the rubber to flow under a load. U. S. 2,018,644-5 also relate to plasticized rubber products and rubber cements formed with unsym. substituted hydrazines and give numerous examples.

7 Preserving rubber. Imperial Chemical Industries Ltd., Wm. Baird and Tom Birchall. Brit. 431,577, July 11, 1935. The aging of rubber is retarded and its resistance to flexing increased by the addn. to the mix of an  $N$ -alkyl- or  $\alpha$ -alkyl-2-amino-1,3,5-xyleneol, e. g., 2-ethylamino-1,3,5-xyleneol, made by heating EtBr and 2-amino-1,3,5-xyleneol (I) at 170°, and 2-benzylamino-1,3,5-xyleneol, made similarly from benzyl chloride and I.

8 Rubber-preparing machines. Rupert T. Cooke and Francis Shaw & Co. Ltd. Brit. 431,012, June 28, 1935. Machines, e. g., for milking and kneading rubber, comprise 2 or more rollers having raised portions of comparatively large area, these portions and the bodies proper of the rollers being substantially concentric with the roller axes and the portions on 1 roller passing through the hollows left by the raised portions of the other roller.

9 Rubber threads. Hans Schuller, Emil Matzner and Armand Kalich. Brit. 430,982, June 25, 1935. Threads of rubber or similar material are made by depositing a band, from a liquid contg. rubber or the like, continuously on a moving support of the same or substantially the same width as the band being produced and feeding the latter directly and continuously into a twisting device to form the thread. The band may be dried or vulcanized before entering said device but only to such an extent as leaves it sufficiently adhesive to enable thread formation. App. is described. In 431,031, June 25, 1935, divided on 430,982, a continuously produced rubber band is twisted under tension by rotation about its longitudinal axis in a partially dried and vulcanized adhesive condition by means of a twisting device rotating continuously about the longitudinal axis of the band. The vulcanization of the threads is then completed.

Rubber threads, etc. 1 brochure. Kuntze Industriell

Gomma Torino and Alexander T. Maxmoff. Brit 430,828, June 26, 1935 Rubber threads, ribbons, strips or films are made from aq dispersions of rubber, etc., vulcanized or not, by forcing the dispersion through a die into a coagulating medium, the dispersion being displaced from a closed tank by means of an auxiliary liquid which is delivered from a measuring pump. The auxiliary liquid may enter into direct contact with the latex, in which case it must be a liquid which is immiscible therewith and easily separable therefrom, e.g., Hg. Alternatively, a 2nd auxiliary liquid, which is immiscible with the dispersion, or a piston, plunger or membrane may be used. In this case, H<sub>2</sub>O may be used in the measuring pump.

Coating surfaces with liquids, etc. Dunlop Rubber Co. Ltd., Wm H. Pearce and Geo H. Perry. Brit 431,381, July 8, 1935 For improving the gas-retaining qualities of inner tubes for tires and like hollow and distensible articles, the collapsed article, prior to vulcanization, is inserted within a chamber of an internal diam. equal to the external diam. of the unvulcanized article, the pressure between the article and the chamber is reduced so that the tube is positioned without deformation against the wall of the chamber under atm. pressure and the tube is subjected on its internal surface to a coating operation.

Means for spreading rubber dispersions on sheet materials. International Latex Processes, Ltd. (Charles Hamilton Dennison, inventor). Ger 618,180, Sept. 5, 1935 (Cl. 39a 10 06). See Brit 417,559 (C. A. 29, 2394<sup>1</sup>).

Rubber products. Rubber-Latex-Poeder-Compagnie N.V. Fr 784,169, July 22, 1935 Rubber dust is mixed with a vulcanizing agent, fillers, etc., in the dry state, plastified and vulcanized.

Rubber articles having a wrinkled surface. Arthur L. Barnard (to U.S. Rubber Co.). U.S. 2,018,508, Oct. 22, 1933 (C. A. 29, 4633<sup>4</sup>).

Hollow rubber articles such as inner tire tubes. Fred T. Roberts (to Frank A. Daly, as trustee). U.S. 2,019,361, Oct. 29, 1933 App. and various operative details of manufacture are described.

Articles such as shoe soles, etc., from rubber dispersions. Douglas F. Twiss and Eric W. B. Owen (to Dun-

lop Rubber Co. Ltd.). U.S. 2,019,239, Oct. 29, 1933. In producing articles such as soles or matting from mixtures of aq dispersions of rubber material, cement such as portland cement and "Ciment fondu" and a gelatin or sol alginate, the hydrophobic colloid in the mixt. is converted by an addnl. gelling reagent into an irreversible gel prior to setting of the cement and coagulating of the aq dispersion. Various examples are given.

Rope formed of strands embedded in and surrounded by rubber composition. Andrew Robertson (to Robertson's Rope (Patents) Ltd.). U.S. 2,018,230, Oct. 22, 1933. Various structural and mfg. details are described.

Trimming devices for tire-building machines. National Rubber Machinery Co. Brit 431,217, July 3, 1935.

Extrusion apparatus for molding and vulcanizing coverings on cables. Archie Reed Kemp (to Electrical Research Products, Inc.). Brit. 432,110, July 22, 1935.

Heavy cables are covered with thick layers of very soft rubber compn. by extrusion and the coating is vulcanized while the cable is maintained in a vertical position to prevent decentralization. A typical coating compn. is crepe rubber 100, S 1, ZnO 1, stearic acid 0.5, diphenylguanidine 0.5, aldehyde-amine condensation product 3, petrolatum base wax of high m.p. 2 and phenyl- $\alpha$ -naphthylamine 2 parts.

Vulcanizing. Alexander Johnston and The North British Rubber Co. Ltd. Brit 430,911, June 24, 1935.

In vulcanizing rubber goods or treating other articles under heat and gas pressure, the heat is obtained by compressing the gas, which travels in a closed circuit, above the working pressure and allowing it to expand against that pressure. App. is described.

Vulcanized rubber solution. Walter Alexander. U.S. 2,019,207, Oct. 29, 1933. A rubber soln. suitable for use in varnishes, etc., is prepd. by depolymerizing rubber at 200-300° until a syrupy consistency is attained, then dissolving and vulcanizing the depolymerized rubber in a solvent (such as xylene) for the depolymerized rubber and the resulting rubber product formed by the vulcanization.

Machine and method for vulcanizing rubber belting and like articles. Boston Woven Hose and Rubber Co. Brit. 430,885, June 29, 1935.

# CHEMICAL ABSTRACTS

Vol. 30

JANUARY 20, 1936

No. 2

## 1—APPARATUS, PLANT EQUIPMENT AND UNIT OPERATIONS

W. L. BADGER

An efficient fume hood. Geo. W. Muhleman. *J. Chem. Education* 12, 591 (1935).  
German lumber as building material in the chemical industry. Romstetter. *Chem. Fabrik* 1935, 449-50.—Various uses of wood, some of its advantages over metals for certain purposes, and methods of protection are discussed. J. H. Moore

Theory and calculation of the two-phase process in a rectifying column. I. P. Kalitov. *Khimstrol* 7, 402-10 (1935).—A discussion with math treatment. C. B.

A flexible-spiral manometer for measurement of low pressures. Louis Henry. *Bull. soc. chim. Belg* 44, 311-14 (1935).—Movement of the manometer pointer tip is detected by an amplified photoelectric circuit provided with compensation for variations in intensity of the incident light source. This method nullifies the effect of vibration of the pointer, and permits a sensitivity of 2  $\mu$  of lig difference in pressure. H. A. Beatty

Application of the methane cycle in the liquefaction of air. M. Z. Ruzman and Yu. M. Ryabinin. *Khimstrol* 7, 464-81 (1935).—An auxiliary methane cycle for the reduction of energy consumption in the liquefaction of air by the Linde method is treated mathematically. The calculations include the simple methane cycle, methane cycle with ammonia cooling and methane cycle with high pressure and preliminary cooling. Chas. Blanc

Theory and calculation of the diffusion burner and its application in industry. A. K. Shakh. *Khimstrol* 7, 420-6 (1935).—A discussion of literature with 10 references. Chas. Blanc

An x-ray powder camera for specimens at various known temperatures. W. H. Barnes and W. F. Hampton. *Can. J. Research* 13A, 73-81 (1935).—An x-ray camera designed specifically for pin-hole photographs of frozen gelatin gels at temps. between 0° and -60°C. is described. The novel feature of the camera is the method of mounting the specimen on the surface of a copper block, the temp. of which depends on a controllable circulation of acetone at a controllable temp. The adaptability of the camera to modifications required by specific conditions of specimen or temp. other than those for which it was primarily designed is pointed out. It is shown that the camera appears to be suitable for the study of a great variety of materials over a considerable temp. range both below and above 0°, whenever a single crystal spectrograph, or an ionization spectrometer, is not required. Also in *Rev. Sci. Instruments* 6, 342-4 (1935). J. W. S.

Neon lamp as a counter. II. Potential and delay in discharge, processes of extinction and rekindling. Giorgio Valle. *Nuovo cimento* 12, 426-40 (1935); cf. C. A. 29, 2399.—The critical time is of the order of 10<sup>-7</sup> sec. Beyond this the counter is not effective. J. B. Austin

Mercury-vapor pumps with somewhat elevated back pressures. Louis Henry. *Bull. soc. chim. Belg* 44, 307-10 (1935).—A simple Hg-vapor ejector is described, which operated at a vapor pressure of 250 mm. against a back pressure of 15 mm. produces a vacuum of 0.001 mm. H. A. Beatty

Diffusion coeffs. in alc-water mixts (Mouquu, Cathcart) 2.

Bubbler plate column suitable for fractional distilla-

329

tions. John H. West. U. S. 2,020,761, Nov. 12. Structural and operative details.

Means for transforming an intermittent distillation installation into a continuous one. Koehler, Bosshardt & Cie. Fr. 784,699, July 22, 1935.

Apparatus for distilling and rectifying alcoholic liquids, etc. Akt.-Ges. vorm. Skodawerke und Eugen Gregor. Austrian 142,882, Sept. 25, 1935 (Cl. 6c).

Rectification apparatus. Dösterreichische Agas-Werke A.-G. Austrian 142,786, Sept. 10, 1935 (Cl. 6c).

Crystallizing salts. Soc. générale d'évaporation (Procédés Frache & Bouillon). Fr. 784,753, July 24, 1935.

App. for circulating the soln. through a crystallizer and a heat exchanger. Mixing devices. American Machine & Foundry Co. Brit. 432,849, Aug. 2, 1935. A whisk or stirrer is described.

Gas-pressure regulator. Edward Zahm (to Zahm & Nagel Co.). U. S. 2,020,492, Nov. 12. Various structural, mech. and operative details.

Photoelectric color comparator. Clarence G. Stone and Abraham Edelman. U. S. 2,020,281, Nov. 6. Various structural, optical and operative details.

Oil-temperature regulator suitable for use with aircraft engines. Roland Chilton (to Reed Propeller Co.). U. S. 2,021,129, Nov. 19. Various structural and operative details.

Stream-lined hydrometer bulb. Geo. Ruehfel. U. S. 2,020,968, Nov. 12. Structural details.

Manometer. Enoch Bandy (to Taylor Instrument Cos.). U. S. 2,021,250, Nov. 19. Structural details.

Thermocouple pyrometer. Charles H. A. F. L. Ross. U. S. 2,019,695, Nov. 5.

Thermometer with a glass tube. Herman Neuwirth. U. S. 2,021,697, Nov. 19. Structural details.

Tubular thermometer. Harry D. Bolton (to Taylor Instrument Cos.). U. S. 2,021,263, Nov. 19. Structural details.

Annealing furnace. Wilhelm H. Engelberts. Ger. 616,787, Aug. 5, 1935 (Cl. 18c, 10 D1).

Filters. Wm. A. Hoveman and Frederick C. Hoveman. Brit. 431,886, July 8, 1935. To facilitate efficient cleansing by reverse upward flow, filter beds are divided into small areas by partitions, each of which supports a trough.

Filters. Joseph A. Pickard. Brit. 432,102, July 22, 1935. Filter cells are formed with walls of paper or textile fabric sufficiently stiff or rigid to form a self-supporting structure without internal supporting means, the walls being spaced apart only by the inherent roughness of the material or by inequalities produced by suitable treatment of the material.

Filters. Frank W. Young. Brit. 432,852, Aug. 2, 1935. A filter comprises a rotary drum mounted in a tank and having independent filtering compartments on its periphery, each compartment being provided with a port communicating with the interior of the drum and opened and closed successively by a gravity-operated valve, and the 2 ends of the drum being closed except for a passage through 1 end establishing communication between the interior and exterior of the drum.

Rotary-drum filter. Frank W. Young. Fr. 785,671, Aug. 16, 1935.

Filtering apparatus (with a rotary filtering drum) suitable for use with various liquids. Kinya Nagao. U. S.

330

2,021,081, Nov 12 Various structural, mech. and operative details

Gas filters Louis Raichlen, André Gottraux and Jean Laroche Fr 784,773, July 24, 1935 Finely powd. charcoal, activated carbon, lampblack or animal black is incorporated in paper or paper pulp during its manuf. for use in filtering air, e. g., in gas masks

Gas filter (plate type). Midwest Steel & Supply Co. Inc. Ger 619,183, Sept 25, 1935 (Cl 12e 2 01) This corresponds to Brit 322,684 (C A 24, 2644)

Air filter Lutilius L S Nelson U. S. 2,019,867, Nov 5 Structural features

Air filter Charles A Winslow (to Catherine B Winslow) U. S. 2,021,215, Nov 19. Structural details

Air filters St George's Engineers Ltd. and Frederick W Wilson Brit 432,760, Aug 1, 1935.

Air filter including cotton fiber. Robert S Curley (to Saco-Lowell Shops) U. S. 2,021,853, Nov. 19. Structural features

Air filtering and -cleaning device containing oil Leonard A Sondburg U. S. 2,021,524, Nov. 19 Structural details

Air-filtering and -heating apparatus, carried as a unit in a casing below a railway or other vehicle J. Stone & Co Ltd and John F B. Vidal Brit. 432,117, July 22, 1935

Dust filters Società italiana Filippi Brit 433,186, Aug 9, 1935 A filter for removing aerosols, etc., from the atm. comprises an intimate mixt. of fibers, e. g., of wool, cotton, kapok, rayon or asbestos, with an inert powder, e. g., talc, cork, ebonite or resin, 1 of the 2 constituents being fusible by heat and the constituents being bonded by such fusion In 433,190, Aug 9, 1935, a filter is formed of an intimate mixt. of fibers with an inert powder, e. g., wool and resin, spun into a yarn and used as such or as a fabric woven wholly or partly therefrom The mixt. may be produced by twisting the fiber in a liquid suspension of resin and ebonite, or the materials may be bonded by slight fusion of 1 of them.

Apparatus for removing dust from gases. Joseph C E V Le Gras de Marillac Fr 785,917, Aug 22, 1935

Filtering materials Società italiana Filippi Fr 784,857, July 27, 1935 A material such as that of Fr 744,530 (C A 27, 4325) is heated till either the fibrous materials or the powder begins to melt and is kept at that temp. until an intimate union of the constituents takes place Settling out of the powder is thereby prevented

Apparatus for cleaning sand filters Norman G Elliot Brit 432,742, Aug 1, 1935

Discharging filter cake from filter elements of a continuous rotary suction filter Horace B Whitmore. U. S. 2,022,069, Nov 26 The filter cake is washed from the filter element by a projected stream opposite in direction to the direction of rotation of the filter elements so that the discharge cake will pass over filter areas still under suction Various app details are described

Sifting apparatus and dust bins Rance H Stevens Brit 432,890, Aug 6, 1935

Pneumatic separating Blaw-Knox Co Brit 433,147, Aug 9, 1935 In cleaning sepg. or classifying granular material by the winnowing action of an air current, the material is poured in a hollow freely-falling stream and the air is blown downwardly into the hollow space and passes out through the material transversely

Centrifugal separator of solids or liquids from gases Maschinenfabrik Friedrich Haas Gm b H Fr. 784,911, July 29, 1935

Magnetic separators Herbert H Thompson and Alfred F Davies Brit 432,431, July 26, 1935

Gravity separation apparatus The Dorr Co., Inc. Brit 433,051, Aug 8, 1935 A rectangular settling tank is provided with scrapers which, as they move from 1 end to the other in either direction, push the deposited matter laterally into a longitudinal channel or zone from which it is discharged by another scraper.

Gravity separation apparatus Alexandria Water Co. Ltd Brit 433,372, Aug. 6, 1935 A settling basin is of less depth than its length or diam. and the upper portion

of its walls is vertical The liquid under treatment enters from conditioning tanks through a chamber and an inlet-opening extending upward from the lower end of the vertical part of the wall and controlled by adjustable gates and arranged so that the liquid enters so as to give a rotary motion to the liquid in the basin.

Apparatus for separating materials such as grease and waste water by gravity. Maurice Loch U. S. 2,022,118, Nov. 26 Structural and operative details

Apparatus for separating powders of different sizes by the action of air currents Paul S Roller. U. S. 2,019,507, Nov 5 Structural and operative details.

Apparatus for separating dust and other light material from heavier matter, e. g., from abrasive after its use in sand-blast apparatus St George's Engineers Ltd. and Frederick W Wilson Brit 432,222, July 23, 1935

Apparatus for treating gases in the presence of contact agents Soc. anon française pour la fabrication des essences & pétroles (Saffey). (Harrison, applicant in U. S.) Fr. 785,698, Aug. 16, 1935 The vessel, containing the contact material and inlet and outlet tubes for the gas in the material, is so shaped on its inner walls that the tubes near the walls are surrounded by approx. the same amt. of contact material as the rest of the tubes.

Apparatus for washing air and other gases. Kurt Reichert. Ger 611,483, Sept. 30, 1935 (Cl. 36d, 1,13)

Apparatus (with superposed liquid pools) for cooling gases as in oxidation of ammonia Stanley L Handforth (to E. I. du Pont de Nemours & Co.) U. S. 2,019,533, Nov 5 Structural and operative details

Liquefying gases. The General Electric Co Ltd and Robert E. Keelan Brit. 433,232, Aug. 12, 1935 In obtaining gases, e. g., O, from the atm., an engine is used in which compressed gases are expanded, the power of the engine driving an induction generator which is electrically connected with a -e power supply

Apparatus (with Venturi tube eductors) for mixing liquids and gases as in precipitating zinc sulfide, etc. Arne J. Myhren and Byron Marquis (in New Jersey Zinc Co.) U. S. 2,020,850, Nov 12 Various structural and operative details

Balanced valve for controlling the rate of flow of liquids through conduits Hans Ernst (to Cincinnati Milling Machine Co.). U. S. 2,020,773, Nov. 12 Numerous structural, mech. and operative details

Pressure-actuated meters for measuring the flow of liquids through conduits full of liquid. Electroflo Meters Co. Ltd. and Friedrich V A E Engel Brit. 432,416, July 25, 1935

Storage and delivery apparatus for highly volatile liquids such as liquefied propane and butane. Henry N Wade U. S. 2,021,394, Nov 19 Various structural, mech. and operative details

Sedimentation apparatus suitable for sludge separations and liquid clarifications Harlowe Harding (to Harding Co.). U. S. 2,021,304, Nov. 19 Various structural, mech. and operative details

Solidifying liquid materials such as milk, fruit juices, soap or rasins, in finely subdivided form Robert R Bottoms (to Girdler Corp.) U. S. 2,020,719, Nov 12

A liquid material to be solidified and a liquefied refrigerant gas such as liquefied  $\text{C}_2\text{H}_6$  are introduced into a chamber (of a described app.) in such relative proportions that the first mentioned material is completely solidified and the refrigerant is completely gasified

Spraying liquids in air to effect its purification Frederick P. Bingham (to R. C. Mahon Co.). U. S. 2,021,251, Nov. 19 Various details of app. and operation are described, suitable for cleaning air for paint spray booths

Rotating-drum drier. Büttner-Werke A-G Ger 616,823, Aug 6, 1935 (Cl. 82a 19 04).

Apparatus for drying crystals obtained from solutions Ateliers Neyret Beyer Fr 785,720, Aug 17, 1935

Vertical apparatus for drying descending comminuted materials by hot gases Albert Hantla (to Mid-Co Products Co.). U. S. 2,020,504, Nov 12 Various structural and operative details

Centrifugal apparatus suitable for drying small coated

metal articles. Irving H. Peck. U. S. 2,020,959, Nov. 12 Various structural and operative details

Multiple-effect evaporator. Hugh K. Moore (to Brown Co.). U. S. 2,020,038, Nov. 5. Centrifugal pumping of liquor at its b. p. from one effect to another is facilitated by injecting into the centrifugal chamber a small stream of cold liquor of higher concn. Various structural and operative details are described

Evaporating apparatus operated with superheated steam. Irma Rud. O. Meyer. Ger. 619,072, Sept. 21, 1935 (Cl. 12a, 2). The app. is useful for the recovery of salts of low-water content from solns, particularly for the recovery of anhyd or approx anhyd  $MgSO_4$  from solns of crude kieserite

Multi-stage evaporating apparatus operated with superheated steam. Hermann Klingler. Ger. 619,073, Sept. 21, 1935 (Cl. 12a, 4)

Apparatus for evaporating liquids and solutions. Paul Knochlik. Fr. 784,847, July 25, 1935

Rotary evaporation or distillation apparatus. Edwin M. F. Guignard. Ger. 619,092, Sept. 27, 1935 (Cl. 12a, 2)

Method of joining tubes to plates in evaporating apparatus of the type in which heating fluid circulates through concentric tubes mounted in an evaporating chamber. Appareils et évaporateurs. Kestner. Brit. 432,934, Aug. 6, 1935

Gas-heated regenerative furnace. Offenbau-Ges. m. b. H. Ger. 619,301, Sept. 30, 1935 (Cl. 24c, b)

Rotating drum furnaces. Metallgesellschaft A. G. (Carl P. Debusch, inventor). Ger. 616,686, Aug. 28, 1935 (Cl. 40a, 550). Details of the gas- and liquid-tight joint between the rotating and stationary parts are given

Regulation of air and liquid fuel supply to furnaces. Barton H. Noland. U. S. 2,020,955, Nov. 12 Various details of app. and operation

Wall for high-temperature furnaces such as open-hearth furnaces. Arthur S. Nichols (to Illinois Clay Products Co.). U. S. 2,021,742, Nov. 19 Various structural details

Relief valve for use at high temperatures as in high-pressure steam lines. Perry H. Gentzel (to Crosby Steam Gage & Valve Co.). U. S. 2,021,773, Nov. 19 Various structural, mech. and operative details

Heat-exchanger. Maschinenfabrik Hans Simon. Austrian 142,817, Sept. 25, 1935 (Cl. 17c). Addn. to 117,563 (C. A. 24, 3407)

Tubular heat-exchangers, e. g., for refrigerant condensers or evaporators. The Liverpool Refrigeration Co. Ltd. and James Allan. Brit. 432,230, July 23, 1935

Straight-tube heat-exchangers, e. g., for gas condensers and coolers. Joseph Bishop, Wm. A. Leaver and Newton, Chambers & Co. Ltd. Brit. 432,080, July 19, 1935

Circulatory heat-exchange apparatus for effecting exothermic or endothermic reactions between fluids in flow. Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Ger. 619,295, Sept. 27, 1935 (Cl. 12g, 1.01). Details are given of the use of the app. in the manuf. of acetone from  $C_2H_5$  and steam and from EtOH and steam

Tube bundle heat-exchange apparatus. James B. Forbes (to Alco Products Inc.). U. S. 2,021,856, Nov. 19 Structural features

Tube and fin heat-exchange apparatus suitable for use with heating gases. Charles E. Lucke (to Babcock & Wilcox Co.). U. S. 2,021,117, Nov. 12 Structural details

Tube, fin and chamber heat-transfer apparatus suitable for use with liquids and gases. Cive M. Alexander. U. S. 2,022,173, Nov. 26 Structural details

Tube and header heat-exchange apparatus suitable for use with steam and water, etc. Thomas H. Ireland. U. S. 2,021,009, Nov. 12 Structural details

Metallic plate heat-exchange apparatus. Delos P. Heath. U. S. 2,021,995, Nov. 26. Structural details of a device suitable for use as an evaporator in a refrigerating system

1 Gilled tubes for heat-exchangers. Charles A. Hubert. Brit. 432,936, Aug. 6, 1935 Addn. to 337,236 (C. A. 25, 1713)

Thermoclement. G. Siebert G. m. b. H. Ger. 616,623, Aug. 1, 1935 (Cl. 42, 8.01). The element consists of Pt, Rh or a Pt-Rh alloy contg. 5-15% Rh.

Apparatus for heating and filtering suction air for starting direct-injection engines. Soc. anon. Adolphe Saurer. Brit. 432,150, July 22, 1935

2 Impact pulverizers. International Pulverizing Corp. Brit. 432,191, July 22, 1935. Fluid under pressure is injected into a pulverizing chamber to rotate and pulverize a mass of material therein, the fine material being classified by the action of centrifugal force opposing the force exerted on the material by the pressure fluid as it escapes toward a coaxially disposed outlet

Jet-impact pulverizers. Paul Anzer. Brit. 433,034, Aug. 7, 1935. In a pulverizer in which material is fed to the bottom of a funnel-shaped vessel where it is blown by an air jet through a mixing tube onto an impact member, the discharge of the pulverized material is principally at the sides of the pulverizer

Combined roller mill and impact pulverizer for seeds, bones, etc. Cathrina Gudman Jørgensen (trading as P. Jørgensen's Maskinfabrik ved C. Jørgensen). Brit. 433,001, Aug. 7, 1935

4 Ball or tube mills. Ernest Newell & Co. Ltd., Geo. L. Woodhouse and Arthur H. Moss. Brit. 432,999, Aug. 7, 1935. In a tube mill wherein the material is discharged through peripheral openings in the end of the drum which are surrounded by a stationary casing communicating with a discharge shoot, a chimney or shaft is provided on the casing to draw air through a hollow trunnion and through the discharge openings to exhaust from the mill the vapor

5 generated by the grinding

Roller and breast mills. Franz Bernhard Lehmann (trading as firm of) J. M. Lehmann. Brit. 432,708, July 31, 1935

Disk mills. Frederick J. E. China and Premier Colloid Mills Ltd. Brit. 432,570, July 30, 1935. In a disk mill in which the distance between working faces of the rotor and stator decreases from the point of entry of the material toward their periphery, the contours of the working

6 faces of the rotor and stator are identical

Gyratory crushers. Jean Meaux. Brit. 432,848, Aug. 2, 1935

Gyratory crushers. Société atehers Neyret Beyher. Brit. 432,954, Aug. 6, 1935

Air-conditioning apparatus. Geo. W. Langford. U. S. 2,019,575, Nov. 5. Structural and operative details

Air-conditioning apparatus. Clarke Redfield. U. S. 2,019,583, Nov. 5. Structural and operative details

7 Air-conditioning apparatus. Frank P. Walsh. U. S. 2,021,437, Nov. 19. Various structural details

Air-conditioning apparatus. Don A. Sargent. U. S. 2,021,521, Nov. 19. Various structural and operative details

Air-conditioning apparatus. Frank A. Whiteley. U. S. 2,021,583, Nov. 19. Various structural and operative details

8 Air-conditioning apparatus. Clark T. Morse and Edward L. Hogan (to American Blower Corp.). U. S. 2,022,133, Nov. 26. Structural and operative details

Air-conditioning apparatus utilizing ice. Samuel M. Anderson (to B. F. Sturtevant Co.). U. S. 2,020,093, Nov. 5. Various structural and operative details

Control device suitable for regulating the flow of fluids in air-conditioning apparatus, etc. Wm. G. Hillen and Frederic W. Bailey (to Carrier Engineering Corp.). U. S. 2,021,727, Nov. 10. Structural, mech. and operative details of a device which has thermostatic controls

Air-cooling device of the air-expansion type. Ernest A. von Seggern. U. S. 2,020,923, Nov. 12. Various structural and operative details

Vacuum apparatus and method for preserving perishables, drying, tanning, impregnating timber, etc. Harry Hotcock. Brit. 432,532, July 22, 1935

Purifying and sterilizing liquids. Katady A. G. Brit.

431,872, July 17, 1935 This corresponds to Fr 760,287 (C. A. 29, 3924)

Rotary-drum apparatus for treating materials with hot gases Johan M. Pehrson and Ragnar V. Pehrson. U. S. 2,020,900, Nov. 12 Structural and operative details

Apparatus suitable for taking samples of pulverized materials from conveying air currents Thorleif Thorsten U. S. 2,020,529, Nov. 12 Various structural and operative details

Apparatus for shipping pulverulent or granular materials such as flour, malt, cement, wheat or coal Graham C. Woodruff (to L. C. L. Corp.) U. S. 2,020,628, Nov. 12 Various structural features

Apparatus for applying coating or filling material to fabrics British Celanese Ltd., Albert Melior and Ralph J. Mann Brit 432,429, July 26, 1935

Apparatus for coating cores such as metal tubes with cement plaster by spiral windings, etc. Agostino Rocca U. S. 2,022,009, Nov. 26 Mech. features

Machine for coating bodies with metal, particularly for coating the interior surfaces of hollow cylindrical bodies Heinrich Schlupmann Brit 432,209, July 22, 1935

Apparatus (with rotary pockets) suitable for the discharge of materials from vertical calcining retorts Edward P. Gillette (to Gillette Research Corp.) U. S. 2,019,903, Nov. 5 Mech. and operative details

Nozzle for the shockless expansion of hot liquids such as water Henri B. Reulinger (to Office national des recherches scientifiques et industrielles et des inventions and Camille Husson) U. S. 2,019,694, Nov. 5 Structural details

Apparatus for carbonating water Wm. C. Buttner (to Bastian-Blessing Co.) U. S. 2,019,479, Nov. 5 Various structural and operative details

Apparatus for removing solid deposits from the mouth of conduits such as vapor outlets of oil-conversion apparatus Howard Dummig (to Gasoline Products Co.) U. S. 2,020,241, Nov. 5 Mech. details

Apparatus (with a storage tank and compressor) for control apparatus using compressed air Willy Oehl (to A. Borsig Maschinenbau, A.-G.) U. S. 2,019,723, Nov. 5 Structural, mech. and operative details

Gas-storage cylinders Joseph H. L. Trevor and The Chesterfield Tube Co. Ltd. Brit 432,718, Aug. 1, 1935

Solid carbon dioxide. Charles L. Jones (to Adico Development Corp.) U. S. 2,020,189, Nov. 5. Materials such as water 0.01-0.18% and diethylene glycolmonoethyl ether 0.01-0.04% are added to improve the physical properties of solid CO<sub>2</sub>. Normal octane, glycerol, ethyl-

ene glycol, triethanolamine or clean low-cold-temperature oil also may be used, as may also EtOH, etc.

Solid carbon dioxide. Guido Mauri (to Mauri Refrigeration Patents Ltd.). U. S. 2,021,073, Nov. 12 For obtaining a dense block of solid CO<sub>2</sub>, the CO<sub>2</sub> is absorbed in an absorption medium such as a soda solution and the CO<sub>2</sub> is driven off by heat and the sensible heat of the driven-off CO<sub>2</sub> and the sensible and latent heat of the jointly vaporized absorption medium are used as the "prime mover" of a refrigerating system, the driven-off CO<sub>2</sub> is compressed to slightly above its triple-point pressure, and the compressed CO<sub>2</sub> is cooled by the refrigerating system to a solidifying temp. App. is described

Container suitable for holding solid or "semi-solid" carbon dioxide Harry B. Rudd (to Rudd Patents Corp.) U. S. 2,020,329, Nov. 12. Various structural details of a self-sealing container.

Apparatus for use of solid carbon dioxide as a refrigerating medium. Duncan McNeil (to Chas. R. McCormick Lumber Co.). U. S. 2,019,759, Nov. 5 Structural and operative details

Portable shipping container suitable for holding "dry ice" or various gases under high pressure. Percy C. Avery (to Avery Products Co.). U. S. 2,021,622, Nov. 19 Various structural and mech. details

Electrically controlled valve suitable for refrigerating systems Charles C. Hansen (to Refrigerating Specialties Co.). U. S. 2,020,833, Nov. 12 Mech., elec. and operative details

Endless belt, etc., in apparatus suitable for freezing ice cubes, etc. Ralph H. Chilton (to General Motors Corp.) U. S. 2,021,047, Nov. 12 Various structural, mech. and operative details.

Refrigerating apparatus suitable for use with ammonia, etc. Gordon Varney U. S. 2,019,531, Nov. 5 Various structural and operative details

Separating components of solutions such as dichloro methane and oil in refrigerating systems Mahlon W. Kenney (to General Household Utilities Co.). U. S. 2,021,691, Nov. 19. A porous device such as a wick-like material is placed on an inclined wall having a discharge at its lower end and extends over the upper end of the wall and dips into the solution and takes it up by capillary attraction, pressure and temp. conditions being such as to effect selective evaporation of one component of the solution such as CH<sub>2</sub>Cl<sub>2</sub> and leave another, such as oil. App. is described. Cf. C. A. 29, 64774.

Acetylene generator Rudolf Brendler, Ger. 616,533, July 31, 1935 (Cl. 26b 25). Details of construction and arrangement are given

Magnetoelectrical investigations of organic substances III. The deeply colored dimeric ketene of W. Langenbeck. Eugen Müller. *Ber.* 68B, 1883-5(1935) -The exptl. method previously described (C. A. 29, 5320, 61164) indicates that neither Langenbeck's formula (C. A. 22, 2740) nor Wittig's formula (C. A. 23, 134) is adequate for L's dimeric ketene. More exptl. data are necessary for establishing its formula. L. E. Steiner

When and by whom was alcohol first prepared from ethylene? B. Horstein *Chemistry & Industry* 1935, 831-4 -Berthelot has often been incorrectly credited with

this discovery. Hennell made the discovery and presented partial proof, but the extension of this reaction to olefins generally belongs to Berthelot. J. S. Hicks

Boron content of sea water of the North Atlantic coast Norris W. Rakestraw and Henry E. Mahneke. *Ind. Eng. Chem., Anal. Ed.* 7, 425 (1935).—Moberg and Harding (C. A. 27, 4142) detd. the B content of samples drawn for the most part from the Pacific Ocean and found an av. of 4.50 mg. B per kg. of water. Some 75 samples taken in the Atlantic, analyzed by the same method, contained 4.005 mg. per kg. of water. The av. ratio of B/Cl was 0.0024.

The organic metabolism of sea water with special reference to the ultimate food cycle in the sea. Ansel Keys, E. H. Christensen and August Krogh. *J. Marine Biol. Assoc. United Kingdom* 20, 181-96 (1935).—Sea water, sterilized by filtration, loses little O when stored in the dark. Metabolic activities of sea water stop when there is still a reserve of  $\text{NH}_4^+$ ,  $\text{O}_2$  and org. matter. Phosphate may at times limit bacterial activity in sea water but this activity is independent of  $\text{NH}_4^+$ .

The rate of liberation of phosphate in sea water by the breakdown of plankton organisms. L. H. N. Cooper. *J. Marine Biol. Assoc. United Kingdom* 20, 197-200 (1935).—The phosphate content of sea water was detd. after addn. of animal and plant plankton. The former decomposes rapidly and sets free some of the org. P of the water as well as that in the plankton. Phytoplankton sets free only part of its P.

Magneto-optics. C. G. Darwin. *Proc. Roy. Soc. (London)* A151, 512-39 (1935).—Most discussions of magneto-optics lack generality because they are based on particular at. hypotheses and hence must be re-examined, if not revised, whenever changes are made in the atom models used. To avoid this difficulty, D uses a process, originally developed by Born, but now generalized to include the consideration of the absorption of light. All magneto-optic effects are described in terms of the "refractive tensor" and involve no appeal to the fundamental nature of the material. After a study of the properties of the "refractive tensor," various special problems are considered, such as what constitutes the effective static magnetic field for the purposes of optics, the development of formulas for the refractive effects of a general magnetized substance contg. both free and bound electrons, changes introduced by quantum theory, etc. The expl. data of the Kerr effect are applied to test the theory at various stages but, because of the uncertainties in the expl. values, these checks are qual. rather than quant.

Chemical elements and the unity of matter. I. F. A. Paneth. *Scientia* 58, 219-28 (1935).—A philosophical discussion.

Periodic classification of the rare earths. Herman Yagoda. *J. Am. Chem. Soc.* 57, 2329-30 (1935).—General discussion. A study of the radioactivity of thulium preps. is desirable.

Preliminary study of the fractionation of isotopic isomers by distillation. D. F. Stedman. *Can. J. Research* 13B, 114-21 (1935).—Slight traces of some isotopic isomers were achieved by equil. rectification. With Cl the total sepn. amounted to 0.048 at. wt. units; 28.6% of the  $\text{O}^{18}$  was also removed from normal O by the fractionation of water, and in a short run with liquid O the normal concn. of  $\text{O}^{18}$  was raised from 0.2 to 0.25%. The last-mentioned sepn. can be carried considerably further with present equipment.  $\text{CH}_3\text{D}$  was synthesized. Its b. p. appears to be 0.5° lower than that of  $\text{CH}_4$ . The vapor pressures of a 56.8% soln. of  $\text{D}_2\text{O}$  were measured, and it is suggested that the published values of the vapor pressure of  $\text{D}_2\text{O}$  at temps. lower than 40° may be slightly too high.

The critical increment of ionic reactions. Influence of dielectric constant and ionic strength. W. J. Scruby and J. C. Warner. *J. Am. Chem. Soc.* 57, 1883-6 (1935).—On the assumption that ionic reaction rates are functions only of temp., dielec. const. (D) and ionic strength ( $\mu$ ), equations are derived to predict the effect of D and  $\mu$  upon the crit. increment. The predictions agree satisfactorily

with observed effects in the reaction between  $\text{NH}_4^+$  and  $\text{CNO}^-$  ions to form urea in water soln. at 50° to 70° and in MeOH- $\text{H}_2\text{O}$  mixts. at D = 63.5 and D = 55.0.

The mechanism of ionic reactions. The heat of ionic substitution reactions. R. A. Ogg, Jr. *Trans. Faraday Soc.* 31, 1385-92 (1935); cf. C. A. 29, 3901.—The study of exchange reactions between alkyl halides and halogen ions was extended to the reaction of Me halides with the following neg. ions:  $\text{SO}_4$ ,  $\text{SO}_3$ ,  $\text{OH}$ ,  $\text{HS}$ ,  $\text{CN}$ ,  $\text{C}_2\text{H}_3\text{O}$ ,  $\text{C}_2\text{H}_5\text{O}$ ,  $\text{CH}_3\text{O}$ ,  $\text{CH}_3\text{COO}$ . The theorem suggested previously, i. e., if a compd. is substituted by a series of neg. ions, whose repulsive forces are approx. const., arranged as to increasing heats of reactions, the energies of activation decrease in that order, is confirmed experimentally. Activation energies do not vary as widely as the heats of reaction, indicating some variation of repulsion. This affects identical substitution. The racemization of methylphenylcarbamol by alc. KOH, claimed by Ogg, Polanyi and Werner, C. A. 28, 6429, was due to oxidation, for no reaction occurred over long periods in the absence of air. This indicates an activation energy greater than 40 Cal. This result confirms the theory.

Magnetic double refraction and light scattering in fused nitrates. V. N. Thaitte. *Proc. Indian Acad. Sci.* 2A, 244-8 (1935); cf. C. A. 28, 6635.—The depolarizing factor, intensity of light scattering, and magnetic double refraction of fused  $\text{Zn}(\text{NO}_3)_2$  and  $\text{Cd}(\text{NO}_3)_2$  were measured at several temps. The ease with which these fused salts can be maintained in a supercooled condition extended the temp. range from 140° to 30°. The magnetic and optical anisotropies of the  $\text{NO}_3$  ion calcd. from these data are practically identical with those found for it in soln. and in crystals.

Influence of a magnetic field on the coefficient of viscosity of liquids. H. S. Venkatarajah. *Current Sci.* 4, 156 (1935).—In view of a recent publication by Raha and Chaitarjee (cf. C. A. 29, 7143) attention is called to expts. made in 1932 by V. on the rate of flow of  $\text{CaH}_2$  through a viscometer, with and without a transverse magnetic field. The effect noted was less than 0.5% and the results at the time were considered indicative.

Experiments at very low temperatures obtained by the magnetic method. II. New superconductors. N. Kfir and F. Simon. *Proc. Roy. Soc. (London)* A151, 810-23 (1935); cf. C. A. 29, 3885.—Methods of cooling materials by means of a paramagnetic salt are discussed. The method adopted was to press  $\text{FeNH}_4$  alum and the material to be cooled into a pill. The existence of supercond. was indicated by magnetic measurements at low temps. Cd, Zr, and Hf became superconductive, the transition points on the abs. scale being 0.54°, 0.70° and 0.35°, resp. Au, Cu, Bi, Mg and Ge did not become superconductive down to 0.05°.

The validity of Becker's relation for the initial permeability of stretched nickel wire. Gertrud Schaff. *Z. Physik* 97, 73-82 (1935); cf. Becker, C. A. 24, 5191.—The relation between the initial susceptibility of stretched Ni wire and the temp. is investigated, for temps. up to the immediate neighborhood of the Curie point. The results obtained confirm Becker's magneto-elastic theory.

The negative Matteucci effect. E. Englert. *Z. Physik* 97, 83-93 (1935); cf. Becker and Kersten, C. A. 24, 241.—Becker's theory of magnetization is extended to twisted Ni wires and the neg. Matteucci effect is evaluated theoretically for Ni and (92% Fe + 8% Ni) and also for a Ni tube. The temp. dependence of the neg. Matteucci effect and the magnetization of a twisted Ni wire are investigated expl. Approx. quant. agreement between theory and expt. is obtained.

Phenomenon of negative hysteresis in nickel. S. Sharan. *Current Sci.* 4, 157 (1935).—Specimens of Ni wire were first cycled through a few complete magnetization cycles and then left in a weak field to produce a small pos. magnetization while alternating fields were applied. Longitudinal alternating fields produced effects similar

to those in Fe. Circular alternating fields, produced by passing an a. c. through the specimen itself, brought out the phenomenon of neg. hysteresis, similar to effects observed in studies of the magneto resistance change in Ni. S. calls attention to the fact that in both cases the Ni is carrying current so that the effect may be assoc. with moment of the conduction electrons. W. W. S.

Magnetochemical investigations. XVII. The magnetic behavior of chalcogenides of bivalent chromium. Haakon Haraldsen and Elisabeth Kowalski. *Z. anorg. allgem. Chem.* 224, 329-36 (1935); cf. C. A. 29, 7719<sup>1</sup>. The magnetic susceptibilities of CrS, CrSe and CrTe were measured over a wide range of temp. and field strength. CrS and CrSe are paramagnetic at all temps. studied (90-629°K.). CrTe is ferromagnetic at lower temp. The Curie point is 70°. The results confirm the belief that at binding between the metal atoms exists in a whole series of compds. of the transition elements.

C. E. P. Jeffreys  
Measurement of the gyromagnetic effect in pyrrhotite. Frederik Coetier, *Helv. Phys. Acta* 8, 522-64 (1935).—The math. theory of the gyromagnetic effect, the inherent difficulties of the various methods of studying it, and the magnetic properties of pyrrhotite are discussed. Several samples, both cryst. and powd., were investigated by the resonance method of Einstein and de Haas, which is treated at great length. The mean of 30 detns gives  $g = 0.63$ . If this be taken to be  $1/2$ , it corresponds to the case of a spinning electron revolving in a p-orbit, the spin moment and the orbit moment being oppositely directed. According to Hund's calcn, this gives a magnetic moment of 0.57 Bohr or 2.3 Weiss magnetons. This corresponds approx. to results obtained by Weiss by extrapolation from exptl. results. W. W. Stiller

Diamagnetism of the trivalent bismuth ion. S. S. Bhatnagar and Bhims Sanj Bahl. *Current Sci.* 4, 153-4 (1935).—From measurements made on 10 of its compds., values for the diamagnetic susceptibility of the trivalent Bi ion are calcd. The extrema values for  $\chi \times 10^4$  are 38.45 and 41.45, with 41.24 as the mean value. The susceptibility is also calcd. by Slater's theory to be 43.8. It is pointed out that Angus's modification of Slater's method would give still better agreement between theoretical and exptl. results. W. W. Stiller

Diamagnetism of copper. S. Ramachandra Rao. *Proc. Indian Acad. Sci.* 24, 249-52 (1935); cf. C. A. 29, 7719<sup>1</sup>.—Colloidal Cu was prepd. by an elec. dispersion method in  $C_6H_6$  or  $PROH$ , and the diamagnetic susceptibility measured by the Curie method. For Cu in water  $\chi = -0.080 \times 10^{-4}$  and the larger particles give approx. this value. As the particle size diminishes, the abs. value of  $\chi$  increases gradually at first, but for particles less than  $0.8 \mu$  in diam. the increase is quite rapid. These results are correlated with those of Honda and Shimizu on the effects of cold working, indicating that the lattice const. for the surface layers is greater than that for the interior of the metal. The thickness of this layer is estd. as  $239 \text{ \AA}$ , its diamagnetic susceptibility as  $-0.200 \times 10^{-4}$ , and its  $d$  as  $5.494$ . Thomson's (cf. C. A. 29, 3933<sup>1</sup>) expts. on electron diffraction by electrolytic Cu are interpreted as confirming this theory of a surface layer with larger lattice const. W. W. Stiller

Influence of the formation of hydrates on the diamagnetism of chemical compounds. V. S. Varadachari. *Proc. Indian Acad. Sci.* 24, 161-79 (1935).—The magnetic susceptibilities of  $H_2SO_4 \cdot H_2O$  mixts. were studied at various concns. Above 86% of the acid, the susceptibilities are greater than those given by the additive law, while below 86% the values are lower than the additive values. Max. deviations were observed at concns. corresponding to  $2H_2SO_4 \cdot 15H_2O$ ,  $H_2SO_4 \cdot H_2O$ ,  $H_2SO_4 \cdot 3H_2O$ ,  $H_2SO_4 \cdot 6H_2O$  and  $H_2SO_4 \cdot 18H_2O$ . These hydrates are also indicated by the other phys. properties of the mixt. The deviations are attributed to increased deformation of the anion in the acid in one case and decreased deformation in the other. The results show that the additive law is obeyed even at equimol. concns. of the components, although a

compd. is formed at this concn. The decahydrate of  $Na_2SO_4$  was studied both in the solid state by the Curie method and in soln. by the modified Quincke method used for  $H_2SO_4$  water mixts. When the hydrate was heated to more than  $33^\circ$  (at which temp. the water of cryst. breaks away and the crystal becomes anhyd.) no change of magnetic susceptibility was noted. This suggests that the binding of the water mols. to the  $Na_2SO_4$  is very loose in contradistinction to the case of the hydrates of  $Li_2SO_4$ . The theoretical basis for the increase of susceptibility on hydration suggested by Cabrera and Fahlenbrach (C. A. 29, 14<sup>1</sup>) to explain their results in aq. solns. of KI is critically examd. and evidence is advanced to show that no such changes are likely to occur. H. G.

Dipole moments of hydrazine and its derivatives. H. H. Ulich, H. Pensker and L. F. Audrieth. *Ber.* 68B, 1677-82 (1935); cf. C. A. 27, 1791<sup>1</sup>.—Dipole moments (in Debye units) calcd. from measurements of the dielec. consts. of hydrazine derivs. in dil.  $C_6H_6$  solns. are: methylhydrazine,  $1.68 \pm 0.14$ , p-tolylhydrazine,  $2.04$ , m-tolylhydrazine,  $1.64$ , o-tolylhydrazine,  $1.54$ , p-bromophenylhydrazine,  $2.50$ , p-nitrophenylhydrazine,  $7.2 \pm 0.5$ , and 2,4-dinitrophenylhydrazine,  $5.8 \pm 0.6$ . These moments and those previously reported (C. A. 27, 1791<sup>1</sup>) are inconsistent with free rotation on the N-N axis in hydrazine and with a trans position. They can be explained almost quantitatively on the basis of Penney and Southerland's model for hydrazine, which allows "inner" and "outer" positions of the substituent group. Discrepancies between the moments observed and calcd. for p-nitrophenylhydrazine can be explained by inner-salt formation. L. E. Steiner

Paramagnetism of metallic gadolinium above its Curie point. Felix Trombe. *Compt. rend.* 201, 632-3 (1935); cf. C. A. 29, 5370<sup>1</sup>.—The ep. susceptibility,  $\chi$ , of Gd was detd. from  $10^\circ$  to  $300^\circ$ . The  $1/\chi \cdot T$  (temp. curve) is curved below  $90^\circ$ , a straight line above. At  $27.4^\circ$ ,  $\chi = 4797 \times 10^{-4}$ . The paramagnetic and ferromagnetic Curie points are at  $29.5^\circ$  and  $16^\circ$ , resp., the paramagnetic moment by Langevin's formula is 23.28 Weiss magnetons, the theoretical value for the  $Gd^{3+}$  ion being 29.28.

C. A. Silberrad  
Refinement of the Heisenberg theory of ferromagnetism, applicable to simple cubic crystals. Charles H. Fay. *Proc. Natl. Acad. Sci.* 21, 637-42 (1935).—In the "simple" form of the Heisenberg theory of ferromagnetism, the energy levels of the spin multiplets of the microcrystal for a given spin quantum no.  $s'$  are replaced by the av. energy for  $s'$ . The assumption of a Gaussian distribution of energies for  $s'$ , as used by H. as a possibly better approximation, leads to the introduction of energies lower than that of the state of max.  $s'$  for very small spins, with the result that the crystal becomes paramagnetic at very low temps. instead of approaching its true satn. magnetization. The case of simple cubic crystals in which each microcrystal contains 8 atoms is treated. This makes it possible to treat half the interaction between atoms rigorously, and to the remainder an av. energy approximation, similar to that of the "simple" theory, is applied. The results are in close agreement with those of the simple theory but differ widely from those based on a Gaussian distribution. It is concluded, therefore, that except at low temps. the simple approximation is probably valid as the other assumptions of the Heisenberg theory. The treatment is highly math. throughout. W. W. Stiller

The measurement of dielectric constants and the conductivities of electrolytes at ultra-high frequencies. V. Tatarinov. *J. Exptl. Theoret. Phys.* (U. S. S. R.) 5, 533-9 (1935).—Theoretical. F. H. Rathmann  
Motion of an electron in an electric and a magnetic field with allowance for the space charge. S. Ya. Braude. *J. Exptl. Theoret. Phys.* (U. S. S. R.) 5, 621-6 (1935).—A plane condenser system was used and the trajectory, potential distribution and charge  $d$  were detd. The electron  $d$  is a max. at  $e/mHl = 2\pi$  and a min. at  $e/mHl = (2k + 1)\pi$ , where  $k$  takes on values of 0, 1, 2, ... time,  $e$  and  $H$  are elec. charge, mag. and magnetic fcl., resp. F. H. Rathmann

Dependence of the dielectric properties of Rochelle salt crystals on mechanical stresses. René David. *Helv. Phys. Acta* 8, 431-84 (1935).—Rectangular parallelepipeds, about  $20 \times 20 \times 9$  mm., were cut from Rochelle salt crystals with the two largest faces perpendicular to the *a*-axis and the others parallel to it and at  $45^\circ$  to the *b*- and *c*-axes. Electrodes of Al foil, with guard rings, were cemented to the larger faces. A Braun tube oscillograph with suitable amplifying system was used to study the dielectric behavior at various field strengths, without mech. stress, when the crystal was subjected to pressure perpendicular to the *a*-axis from 2 or 4 faces, and when pressure was applied in all directions. The results in general are analogous to those obtained in similar investigations of the magnetic behavior of ferromagnetics, viz. dielec. hysteresis and satn are observed. Up to 50 v./cm. hysteresis is absent and the polarization is proportional to the field and reversible, the dielec. const. (parallel to the *a*-axis) having a const. value of approx. 500. Above 50 v./cm. the dielec. const. increases very rapidly, reaching 20,000 at about 100 v./cm., when satn is reached. For higher fields it decreases with increasing field. When the crystal is subjected to mech. pressure, the hysteresis loop becomes unsymmetrical although the reversible part at small field strengths persists. From analogy with ferromagnetic theory, the dielec. const. of the reversible polarization is ascribed to "wall displacements" of spontaneously polarized domains. This spontaneous polarization in turn is detd. by the distortion of the domains. The results, given in detail, both graphically and in tabular form, are discussed and are correlated quantitatively with the piezoelec. properties of the cryst. Sixty references. W. W. Stiller.

Measurement of the variation of the dielectric constant of water with extent of adsorption. G. H. Argue and O. Maass. *Can. J. Research* 13B, 166-68 (1935).—An expl. technic was devised for measuring the dielec. consts. of cellulose materials contg. various amts. of adsorbed  $H_2O$ . From measurements made with standard cellulose the dielec. const. of the adsorbed  $H_2O$  was calcld. over the concn. range 0 to 18% of  $H_2O$ . The dielec. const. of the  $H_2O$  initially adsorbed is less than one quarter of that of liquid  $H_2O$ , but it increases with the amt. of  $H_2O$  subsequently adsorbed, until the dielec. const. approximates that of liquid  $H_2O$  as the  $H_2O$  content of the fiber approaches the satn point. These results agree with the hypothesis concerning the nature of the system cellulose-water. J. W. Shipley.

Friction dispersion of polsr solutions by short electric waves. Wilhelm Möller. *Ann. Physik* 24, 99-112 (1935).—Dielec. consts. of 10% solns. of  $PhNO_2$  in paraffin oil and in a mineral oil of high viscosity, and of the pure solvents were measured at a wave length of 60.0 cm in the temp. range  $2^\circ$  to  $40^\circ$ . The dielec. consts. of the pure solvents and of  $PhNO_2$  in paraffin oil were independent of temp.; that of the soln. in the high-viscosity oil increased with temp., indicating that the applied frequency lay within the region of friction dispersion for this soln. The relaxation time of the  $PhNO_2$  mol. in the high-viscosity oil and the coeff.  $\alpha$  (ratio of apparent to actual viscosity) of the solvent were calcld. from the results.  $\alpha$  increases rapidly with temp. Measurements at longer wave lengths (500 m.) appear to confirm the results of Luthi (*C. A.* 27, 3371) that solns. of  $PhNO_2$  in a high-viscosity solvent have a second dispersion in addn. to the dispersion region at short wave lengths. The change of dielec. const. in the long wave dispersion region is smaller than in the principal region of dispersion at short wave lengths. A. S. S.

Electric breakdown in gases and in solid insulators. A. v. Hippel. *Ergebnisse exakt. Naturw.* 14, 79-129 (1935).—A review. C. D. West.

Relations between chemical constitution and dielectric properties. P. Debye. *Bull. soc. chim. Belg.* 44, 167-75 (1935).—A review.  $H_2O$ ,  $H_2S$ ,  $SO_2$ ,  $CO$ ,  $CS_2$ , as well as hydroquinone, *o*-, *m*-, and *p*-chlorobenzene and the halogen acids are discussed. R. E. DeRicht.

Studies in the physical chemistry of betaine and related substances. I. Studies of dielectric constants and apparent molar volume. John T. Edsall and Jeffries Wy-

man, Jr. *J. Am. Chem. Soc.* 57, 1064-75 (1935).—Dielec.-const. increments and apparent molar vols. were detd. for various betaines, and for *N*-dimethylanthranilic acid (I) and its Me ester in a variety of solvents ranging from  $H_2O$  to  $C_4H_{10}$ . For the rigid betaines, approx. dipole moments were calcld. on the basis of known interatomic distances. These were compared with the values calcld. from the observed dielec. increments. In solvents of low dielec. const., the dielec. increments (and probably the moments) of all betaines studied fall below their values in  $H_2O$ . This effect appears to be an actual deformation of the mols. rather than an asocn. I appears to exist largely as an amphoteric ion, in  $H_2O$  and alc. as well as  $C_4H_{10}$ , in which its dipole moment is about 3 times greater than that of its Me ester. The electrostriction of the solvent produced by betaines in  $H_2O$  is less than that produced by similar  $NH_2$  acids but that due to the betaines is much greater in solvents of low dielec. const. than in  $H_2O$ . The magnitude of the effect is in good accord with theory.

H. W. Leahy.

Dipole moments of ethyl and isosmyl borates and triphenyl phosphates. I. G. Cowley and J. R. Partington. *Nature* 136, 643 (1935).—In  $C_4H_{10}$  as solvent, in an all-glass cell, with Pt plates, the following values were obtained:

	$\mu^p$	$\mu^{**}$	$\mu^{\dagger}$	$\mu^{\ddagger}$
4 $Et_2B_2O_4$ , 110 $^\circ$ 2756 mm.	0.8635	1.3741	50.5 cc.	
$1:10$ $Am_2B_2O_4$ , 256 $^\circ$ 1761 mm.	0.8514	1.4156	94.3 cc.	
$Ph_3PO_4$ , 40 $^\circ$ 8 m. p.)			252.5 cc.	
	$P_K$		$\mu^{\ddagger}$	
	38.63 cc.		0.75D	
	80.20 cc.		0.81D	
	87.41 (calcd.)		2.70D	

Gregg M. Evans.

An elementary derivation of the law of the space-charge current. P. Selényi. *Z. Physik* 97, 395-7 (1935).—The laws giving the space-charge current in a high vacuum and in a dense gas can be obtained, apart from a numerical factor, from elementary considerations. B. Swirles.

The variation of the viscosity of gases with temperature over a large temperature range. A. B. Van Cleave and O. Maass. *Can. J. Research* 13B, 140-8 (1935)., cf. *C. A.* 26, 3416.—The coeffs. of viscosity of  $NH_3$ , propylene,  $C_4H_8$ , and  $Me_2O$  over the temp. range  $23^\circ$  to  $-80^\circ$ , were measured. The present data are compared with those of other authors for temps. above  $0^\circ$ . It is stsd. that the authors' results are correct to 0.2% and have a relative accuracy of 0.1%. It is claimed that they are the most accurate data for the viscosity of gases at low temps. to date. The validity of a number of viscosity-temp. relations was tested with the present data and those previously published. In general, it is found that the equations of Sutherland and Jones hold at high temps. but fail at low temps. for substances such as  $CO_2$ ,  $SO_2$ ,  $NH_3$ ,  $Me_2O$  and propylene, which have viscosity-temp. curves that are convex to the temp. axis below room temp. An empirical equation is suggested which adequately represents the variation of viscosity with temp. for these five gases over the temp. range  $23^\circ$  to  $-80^\circ$ . However, this relation fails at high temps. for all gases, and even at low temps. for substances such as  $H_2$ , air and  $C_4H_{10}$ . The viscosity-temp. curves for  $CO_2$ ,  $SO_2$ ,  $NH_3$ ,  $Me_2O$  and propylene each show a definite inversion or inflection point. Below this inversion temp. the viscosity curves are convex to the temp. axis; above it they are concave to the temp. axis. In general, it seems that this inversion temp. bears a direct relation to the polarity of the mol. and to the crit. temp. J. W. Shipley.

The effect of dissociation on flame temperatures. L. Remgold. *Chaleur & Ind.* 16, 463-72 (1935); cf. *C. A.* 29, 6810<sup>1</sup>.—The reciprocal influence of the simultaneous dissocs. of  $H_2O$  and  $CO_2$  is formulated for combustion with insufficient, theoretical and excess air.

H. A. Beatty.

A simple modification of Victor Meyer's method for finding molecular weights of substances of high boiling points. H. C. Palmer. *School Sci. Rev.* 17, 138 (1935).

O. Reimnuth.

The experimental proof of the theory of the new equation of state Vitold Jacyna *Z. Physik* 96, 119-20 (1935).—The new equation of state is applied to the experimental data of Haasen, Roebuck and Osterberg on air and A, also to the data of Kapitza on He. Proof of the calculation of the inversion of the Joule-Thomson effect is briefly shown. Air and A are similar to He as previously reported. Tables are given showing the inversion point of the Joule-Thomson effects in both air and A. W. George Parks.

A kinetic interpretation of the "inner effect" V. Njegovan *Z. Physik* 97, 390-4 (1935).—An interpretation of the "inner effect" on the kinetic theory of an ideal gas. B. Swirles.

Expansion of alcohol and water Curt L. Knecht *Pharm. Zentralhalle* 76, 641-2 (1935).—The phys. data reported are essentially identical with those in Landolt-Börnstein. W. O. E.

Surface tension and solvation H. G. Trieschmann *Z. Physik Chem.* B29, 329-34 (1935).—Surface tension was measured at 22° by the max.-bubble method for  $H_2O$ ,  $EtOH$ ,  $C_2H_5$ , hexane, cyclohexane,  $BuOH$  and hexyl alc. and also for binary mixt. with hexane, cyclohexane and  $C_2H_5$  for solvent. From the results, certain conclusions could be drawn with regard to the surface activity and degree of solvation. G. M. Murphy.

The refractive dispersion of eugenol and isoeugenol G. Thompson *Pharm. J.* 134, 290 (1935); cf. Pickard and Hunter, *C. A.* 17, 1949.—The Sellmeier equation (1871) can be resolved into an expression (1) for  $n$  at different wave lengths, believed to be equal to another expression (2) for the various wave lengths in which  $\lambda_0 = 2820 \text{ Å}$  and  $2910 \text{ Å}$ , resp. for eugenol and isoeugenol. To test the equality of (1) and (2),  $n$  was determined for eugenol and isoeugenol at 9 different wave lengths (6703 to 4678 Å) and the results were inserted in (1). Calculation of the corresponding values in (2) gave results fairly equal for isoeugenol, but deviating for eugenol. S. W.

Influence of the proximity of a solid wall on the consistency of viscous and plastic materials. IV. R. K. Schofield and G. W. Scott Blair, *J. Phys. Chem.* 39, 973-81 (1935).—The rate of flow of an aqueous paste of  $BaSO_4$  through tubes differing considerably both in radius and length was measured under a series of pressure heads. For tubes of the same radius, and under the same pressure gradient, the rate of flow is independent of the length of the tube. From this it is concluded that, under the conditions of these experiments, this material shows no progressive breakdown with time under shear, as suggested by Ambrose and Loomis (*C. A.* 27, 5231) for bentonite. For different radii, however, curves for  $V/\pi R^3$  against  $PR/2L$  were obtained, which, as previously recorded, do not coincide as they should if at every point in the tube the velocity gradient depends only on the shearing stress. The hypothesis previously advanced that the proximity of the wall of the tube causes a sheath of material to shear more easily than does the bulk of the material appears, therefore, to be the only one so far advanced that accounts for the facts. The case of  $BaSO_4$  is particularly interesting because the particles are roughly cubic in form and the thickness of the modified layer is many times the average particle diam. Harold Gershmowitz.

The parachor V. Desreux *Bull. soc. chim. Belg.* 44, 249-57 (1935).—The parachor,  $P$ , cannot be taken equal to the mol. vol. at the temp. where  $\gamma = 1$ , because at that temp.  $d$ , in the formula  $P = M/\gamma(\gamma - d)$ , cannot be neglected. Hence a comparison of values of  $P$  at equal values of  $\gamma$  is possible only at low temps. Comparison at unequal values of  $\gamma$  may be uncertain, since the exponent in the relation  $\gamma = K(D-d)^{1/2}$  is not strictly constant but for a large no. of compounds over a 15-20° range is found to vary from 3.1 to 4.8, the mean value being 3.8. The following values of  $d$ ,  $\gamma$  (dynes/cm<sup>2</sup>) and  $P$  (accurate to 0.2%), resp. were determined at 20°:  $BnF$  0.7763, 17.72, 201.5, *sec-BuF* (at 15°) 0.7700, 16.93, 201.0.  $AmF$  0.7905, 20.06, 241.4,  $Cl_3H_5F$  0.8004, 21.83, 281.2, *sec-C\_4H\_9F* 0.7914, 20.39, 279.7;  $C_2H_5F$  0.8071, 23.20, 231.2,  $CH_3FCO_2Et$  1.0912, 29.35, 226.2,  $CH_3CO_2Et$  1.1765, 24.60, 234.8,  $CH_3CH_2Ac$  1.2075, 27.13, 234.5,

$CF_3CO_2Et$  1.1905, 16.76, 241.7,  $CH_3CICO_2Et$  1.1504, 31.70, 252.7;  $CHCl_3CO_2Et$  1.2827, 31.34, 289.54,  $CCl_4CO_2Et$  1.3836, 30.87, 326.1;  $CCl_3F$  (at 15°) 1.4995, 19.09, 192.2,  $CHBr_3$  2.8905, 41.91, 222.5,  $CB_3F$  2.7648, 31.68, 232.4;  $CH_3BrCH_2F$  1.8169, 27.02, 182.1;  $CHBr_2CH_2F$  2.2303, 31.60, 228.7;  $CH_2FCH_2I$  2.2259, 31.08, 203.7,  $CHClFCH_2I$  1.5393, 29.95, 230.1;  $CH_2ClCH_2Cl$  1.4405, 33.57, 222.9,  $PhF$  1.0252, 27.71, 215.0,  $m-C_6H_4F$  1.572, 25.93, 222.4, *p-C\_6H\_4F* 1.17006, 27.05, 222.35,  $m-C_6H_4I$ ,  $PhCl$  0.9974, 27.97, 233.7,  $PhCF_3$  1.1880, 23.39, 270.2,  $PhCCl_3$  1.3723, 34.03, 353.6, trifluoromethylcyclohexane 1.0818, 22.44, 305.9. Consideration of all available data shows that atomic  $P$ 's are not strictly constant but may exhibit marked constitutive effects. Recalculation of the atomic  $P$  for the normal primary aliphatic series gives  $CH_3$ , 39.9,  $C_2H_5$ , 8.3,  $H$ , 15.8,  $F$ , 26.1,  $Cl$ , 55.0,  $Br$ , 68.5,  $I$ , 90.0. Replacement of  $H$  by halogen in mixed halides, esters and aromatic compounds gives  $P$ 's that may differ considerably from those calculated from the foregoing values. No correlation is shown between the parachor and other functions of mol. vol., and it appears that these are not similar functions of the same phys. property. H. A. Beatty.

Aluminum alkyl oxides and their parachors. Robert A. Robinson and Douglas A. Peck, *J. Phys. Chem.* 39, 1125-33 (1935).—The following compounds were prepared and their surface tensions and densities were determined: Al acetylacetonate, Al Et acetylacetonate, Al diethyl malonate, Cr acetylacetonate and Al ethoxide, propoxide, isopropoxide, butoxide, isobutoxide and sec-butoxide. Sb ethoxide also was studied. The Al alkoxides do not have a simple structure and are unsuitable for parachor determination. Details of mol. wt. indicate a fourfold polymerization. If single linkage formulations are assumed for the other Al compounds, the atomic parachor of Al is 39.5. The parachor deficiency found with the Al alkoxides is larger than that of Sb ethoxide. E. J. Rosenbaum.

Linear thermal expansion of sodium tungstate between 20° and 600° J. B. Austin and R. H. Pierre, Jr. *J. Chem. Phys.* 3, 683-6 (1935).—The linear thermal expansion of anhydrous  $Na_2WO_4$  was determined in the range 20-600° with an interferometer (*C. A.* 27, 2077). The results are  $\alpha = 11 + 53.194(t - 20)10^{-6} + 41.5(t - 20)^2 10^{-9}$ ,  $d\alpha/dt = 17.73(t - 20)10^{-6} + 83.3(t - 20)10^{-9}$ ,  $\alpha_0 = 17.73 \times 10^{-6} + 13.83(t - 20)10^{-9}$ ,  $\alpha_0 = 17.73 \times 10^{-6} + 27.66(t - 20)10^{-9}$ . The salt is trimorphic at atm. pressure. Modification III is stable up to 585°, where it changes to II with an increase in vol. of 17.4%. Form II is stable over a very short temp. interval, and changes to  $Na_2WO_4$  I with a decrease in vol. of 0.12%. G. M. P.

Temperature dependence of the shearing strength of glass rods Karl Mengelkoch, *Z. Physik* 97, 46-63 (1935).—Cylindrical glass rods were examined, the cross section being maintained constant. The temp. dependence of the shear strength was measured between -100° and 545°. A relation is found between the values of the breaking strengths and the size of the mirror-like portions of the torn surface. The theory is discussed. S. T.

The change in brittleness during the formation of crystals with increasing temperature G. Tammann and W. Müller, *Z. anorg. allgem. Chem.* 224, 194-212 (1935).—The action of crystals on deformation is discussed at length. The effect on rock salt is particularly stressed. The method of preparation of flawless brittle crystals is described. The dependence of etched figures on temp. and the effect of edge angles is noted. Fractures in the different planes of the crystal give characteristically different fissures. Pressure by means of a needle point on a surface gives sectors of a cube face and pressure figures when viewed by crossed nicols are observed. Effects of temp. and pressure are described also for galena, fluorapatite, calcite, calcite, quartz and diamond. Some experiments were made with certain plastic easily melted compounds to which pressure was applied. They seem to fall into 3 classes, namely, (1) those forming thin layers with rounded edges, (2) those having irregular boundaries with the interior transparent and (3) those falling into an entirely opaque powder. Raymond H. Lambert.

Thickness of the amorphous layer on polished metals

H. G. Hopkins. *Trans. Faraday Soc.* 31, 1095-1101 (1935); cf. *C. A.* 29, 3593.—Au was selected as a metal with which to work because interference with oxide films would be minimized. Electron diffraction patterns were made after successive removal of portions of the Beilby layer by sputtering. The specimen, 1 cm. square, was ground smooth on 00 and 000 emery with  $\text{CaH}_2$ . The metal was ground finally with 0000 emery paper and it was then polished on clean chamois leather. Four min. rubbing on 0000 emery, 2 min. in each of 2 directions at right angles, with  $\text{CaH}_2$  as a lubricant, and a subsequent 15-min. polish on chamois was sufficient to induce the polish layer. Electron diffraction patterns alternating with spottering showed the thickness of the Beilby layer to be about 30 Å. There is a gradual increase in crystal size below the polished surface and at 100 Å. below the surface the crystals are still extremely small, about 5 to 6 atoms in the edge.

H. A. Smith. Molecular layers of fatty substances on metals. J. J. Trillat and H. Motz. *Trans. Faraday Soc.* 31, 1127-35 (1935).—On almost all electron diffraction photographs of metallic and org. surfaces there appear reticular distances among which are 4.20, 3.80, 3.0, 2.50, 2.35, 2.20, 2.02, 1.87, 1.60, 1.76 Å. as calcd. from diffraction rings. Spot diagrams correspond to a rectangular lattice with sides of 4.80 and 7.30 Å. On a carefully prepd. Au film such diffraction effects are eliminated. If such a film is impregnated with paraffin wax rings appear that are identical with those obtained from metallic films as well as from films of cellulose or polyoxymethylene. Similar expts. were made with octadecane, stearic acid, tristearin, ceryl alc., hecswax, cehalic acid and oleic acid. With the exception of the last two acids all of these compds. gave reticular distances that are included in the above list. It is concluded that all films and surfaces unless special precautions are taken show diagrams corresponding to those of long-chain aliphatic compds. These diagrams gradually disappear and are missing altogether if a single region is irradiated with electrons for several min. The orthorhombic form of paraffin always appears after irradiation of the monoclinic form.

H. A. Smith. Crystallization of thin metal films. E. N. da C. Andrade. *Trans. Faraday Soc.* 31, 1137-50 (1935).—The polarizing microscope was used for examg. sputtered films of Ag and Au 50 atoms thick on glass. The microscopic method possesses 2 advantages over the electron diffraction method, viz (1) the microscope can delineate the distribution in space of the units which the electron beam detects, (2) the microscope gives certainly the crystal size. The Ag and Au films were heated at 250-280° and 400°, resp. After an hr. small spherulitic crystals about 1  $\mu$  across were found. Continued heating increased the no. of these spherulitic centers but not their size. On further heating Ag films at temps. up to 350° the spherulites change to the usual crystal form of Ag with the (111) faces parallel to the glass surface. The crystals grow reluctantly in a direction perpendicular to this face. In building up these crystals the surrounding film is decreased in thickness. The temp. at which spherulites form is inversely proportional to the thickness of the films. Quartz glass, glass, diamond and mica substrates yield the same results. The behavior of Au films is similar but changes occur at about 100° higher. When films are contaminated with Hg the same sort of initial spherulitic aggregation occurs at room temp. Small Au particles (1-2  $\mu$ ) grown by slow reduction in silicic acid gel first presented this optically anisotropic form of aggregation. It appears that when Au and Ag atoms are brought together by slow diffusion the first stage in crystn. is the spherulitic aggregation. The discussion of the paper brings out some doubt as to the validity, (1) of calling the initial particles spherulites and (2) of assuming the sputtered film to be monocryst. H. A. S.

Optical research on evaporated metal layers. L. S. Ornstein. *Trans. Faraday Soc.* 31, 1158-66 (1935).—The importance of measurements of optical transmissivity and reflectivity for the study of metallic films and surfaces is emphasized. A new theorem is presented which simplifies the exptl. technic needed. If a surface of opaque ma-

terial is illuminated homogeneously from all sides, the ratio of the intensity reflected within a solid angle,  $d\Omega$ , in a direction  $A$  to the intensity incident within an equal solid angle (is equal) to the total reflectivity for direction  $A$ . This makes necessary only one measurement of the reflected intensity. The method may be used for the study of the transition points in metals. H. A. Smith.

Validity of Drude's optical method of investigating transparent films on metals. Leif Tronstad. *Trans. Faraday Soc.* 31, 1151-8 (1935).—The optical method of Drude for examn. of thin transparent films and of the assumptions on which the method is based are reviewed. The validity and applicability of the method for a wide range of surface problems are discussed. The limitations are not yet thoroughly investigated, but considering the disadvantages of other methods for the examn. of thin surface films, the optical method deserves wide attention by investigators of surface problems. H. A. Smith.

The oxidation of metals. II. Copper, brass, aluminum brass, aluminum bronze, magnesium and some magnesium alloys. G. D. Preston and L. L. Bircumshaw. *Phil. Mag.* 20, 706-20 (1935), cf. *C. A.* 29, 2813<sup>4</sup>.—The structure of thin oxide layers was studied by electron diffraction. The oxide film formed on pure Cu in air or O at temps. up to 183° consists of  $\text{Cu}_2\text{O}$  crystals with a (111) plane parallel to the polished surface. Repeated oxidation and reduction produced a surface that consisted of many very small crystals oriented at random. No evidence of  $\text{CuO}$  was found. With brasses of various compns. it was found that small amts. of As had no effect on the results. Al inhibits the formation of  $\text{Cu}_2\text{O}$  on the surface at lower temps., probably by the formation of a film of  $\text{Al}_2\text{O}_3$ . At 400° all the samples showed lines resembling those of ZnO. ZnO and  $\text{Cu}_2\text{O}$  existed as sep. phases. Pure Mg and alloys of Mg with Mn, Zn, Cd, Cu and Al were studied. In all cases, even when the Mg content was very small, the surface of the metal oxidized at 400° consisted of cubic MgO. At lower temps. the spectra could not be interpreted. The nature of the orientation of thin films is discussed. E. J. Rosenbaum.

Inner adsorption in salt crystals. Nature of the inclusion of zinc sulfide in copper sulfide. D. Balarev. *Z. anal. Chem.* 102, 408-11 (1935).—It is shown by expts. that the copptn. of ZnS by CuS is a typical case of inner adsorption and not one of postpptn. as Kolthoff and Pearson assumed (*C. A.* 26, 1831).

Grain changes in polymorphic conversion. G. Tamman and W. Boehme. *Z. anorg. allgem. Chem.* 223, 365-8 (1935).—Discussion of the change in grain size and number when a substance undergoes a change from one crystal form to another. The number of grains per unit area increased from 4 to 70 during the conversion of  $\text{KNO}_3$  at 120°; from 2 to 36 for  $\text{NH}_4\text{NO}_3$  at 87°; and from 10 to 175 for AgI at 145°. The number decreased from 7 to 4 for  $\text{AgNO}_3$  at 160° and from 2 to 1 for TiNO<sub>2</sub> at 72.8°.

Arthur A. Vernon. Inner potentials of crystals and the electron diffraction. V. E. Lashkarev. *Trans. Faraday Soc.* 31, 1081-95 (1935).—The difficulties encountered in the detn. of inner potentials by electron diffraction methods are discussed at length. Most of the present difficulties with fine structure and "prohibited" maxima may be eliminated mathematically by further development of wave mechanics along the lines set down by Bethe (*C. A.* 23, 332) and Morse (*C. A.* 24, 5604).

H. A. Smith. The mechanism of ionic motion in solid electrolytes. W. Schottky. *Z. physik. Chem.* B29, 335-55 (1935).—The theory of elec. cond. of solids of Stohr (cf. *C. A.* 27, 4457) is discussed. The method used there for estg. the abs. value of the conen. of empty spaces in the crystal lattice is not exact enough. A few qual. conclusions can be drawn. The alk. earth oxide lattices are also assumed to conduct ionically by a mechanism of empty spaces. The variation in the anodic and cathodic cond. in alkali halides is due not to different nos. but to different mobility of the two kinds of empty spaces. If the vapor pressure of the metallic component is raised, at first a decrease and then, with further increase in the vapor pressure, an increase in

the total value of the electrolytic cond. takes place. Llectronic cond. of alk. earth halides now can be calc'd semi-empirically and an approach to the fundamental theory seems possible.

**G. M. Murphy.**  
Internal and superficial conductivity of cuprous oxide. Leon Dubar. *Compt. rend.* 201, 883-5(1935), cf. *C. A.* 29, 4985<sup>2</sup>.—Comparison of the cond. of a rod and plate of Cu O before and after drying over  $P_2O_5$  shows this to depend on both the internal ( $\sigma$ ) and superficial ( $\sigma_s$ ) cond., the latter alone being affected by adsorbed moisture. In similar fashion  $\sigma$  for a dried sample was reduced to  $1/10$  of its initial value after slight attack with dil.  $H_3PO_4$  followed by washing and drying.

**C. A. Silberrad.**  
The temperature dependence of the electro-optical Kerr effect of nitrobenzene at the transition point. W. Herzog. *Z. Physik* 97, 233-41(1935).—No discontinuity in the Kerr const. could be detected as the temp. passed through the Wollke-Mazur transition point (*C. A.* 29, 2758).

**H. Swirles.**  
Displacement of the Curie point due to tension. E. Englert. *Z. Physik* 97, 94-6(1935).—A displacement of the Curie point was found for a wire under tension by Ray-Chaudhuri (*C. A.* 26, 3154), this was in contradiction to the expts. of Adams and Green (*C. A.* 25, 5806). In the present expts. no effect was detected, it can certainly be no more than  $1/20$  that found by Ray-Chaudhuri.

**H. Swirles.**  
The atomic factor of zinc. Cecilia Mossin Kottu and Jose Losada. *Anal. soc. espan. fis. quim.* 33, 567-601(1935).—The scattering factor of Zn is det'd., the first obtained from an element belonging to the hexagonal system. The photometric method was used to measure the intensities of the reflections, according to which the curve of relative values is drawn. Intensity of the (101) reflection of Zn is compared to intensity of the (200) reflection of NaCl, and for an  $\lambda/2 = 0.234$ ,  $f_{101} = 31.0$ , which permitted the curve of the exptl. values to be drawn. Comparison of the exptl. with the theoretical curve shows a greater slope for the first, and 2 undulations not found in the latter.

**E. M. Symmes.**  
Fine structure of x-ray absorption edges in close-packed cubic and close-packed hexagonal crystal lattices. D. Coster. *Physica* 2, 605-10(1935).—The fine structure of x-ray absorption edges was compared for Ca and Ti of cubic and hexagonal close packing, resp. By reducing the distances of the max and min absorption for Ti by a factor  $(2/9)^{1/3} 97^{1/3}$ , corresponding to the distances of neighboring atoms in the 2 structures, the Ca and Ti curves are found identical. Likewise curves for  $\alpha$ - and  $\epsilon$ -brass are found identical after reduction to a common distance between atoms. Thus the positions of the edges in the spectrum are found the same, however, there still are typical differences in the form of the max and min due to the difference in lattice.

**B. J. C. van der Hoeven.**  
The law of the points of fusion and the lattice bonds. Robert Forrer. *Ann. phys.* (11), 4, 202-69(1935).—Continuing previous work on the Curie point, F. shows that in ps. of ordinary metals obey the same law as that detg. the Curie points, namely:  $T = F/N$ , where  $F$  is a const. close to  $300^\circ$  and  $N$  is the no. of "contacts" attributed to the atom. These contacts are interpreted as representing contacts between the external electron orbits of neighboring atoms, these orbits forming an "electronic lattice".

**Morris Muskat.**  
Lattice constant of galena determined with a new x-ray spectrometer. Evald von Zeipel. *Astr. Mot. Astron. Fysik* 25A, No. 8, 18 pp (1935).—By precision methods developed in Siegbahn's laboratory the  $Ag K_{\alpha}$  line was measured in the first four orders of reflection from the cube face of a selected galena crystal. Results are  $2d_{100} = 323.34 \times 10^{-8}$  cm, and  $d_{100} = 8.0 \times 10^{-8}$  cm.  $\lambda = 0.2102 \times 10^{-8}$  cm. The latter agrees well with the theoretical value  $7.3 \times 10^{-8}$  cm based on the measured  $d = 7.82$ . The half-width of the first-order line,  $5.6^\circ$ , showed the crystal used to be of good quality.

Differences in lattice constants. G. Wassermann. *Metallwirtschaft* 14, 813-15(1935).—A review of recent literature. Thirteen references.

C. E. Macfarlane

**1 Crystal structure of silver azide.** Marc Bassière. *Compt. rend.* 201, 735-7(1935).— $AgN_3$  is orthorhombic with  $a$  5.58,  $b$  5.93,  $c$  6.04 Å,  $d$  4.81, 4 mols in the unit cell, space group  $I_{2h}^{21}$ .—*Idem.* The structure closely resembles those of  $KN_3$  and  $RbN_3$  (Hendricks, *et al.*, *C. A.* 20, 318; Günther, *et al.*, *C. A.* 24, 2930), being some and consisting of alternate planes parallel to (100) of Ag and N<sub>3</sub> ions, the latter being linear with N-N = 1.18 Å.

**2 C. A. Silberrad.**  
The crystal structures of rubidium and ammonium fluoroborates. J. L. Hoard and Virginia Blair. *J. Am. Chem. Soc.* 57, 1985-8(1935).—X-ray data show orthorhombic units of structure  $RbBF_4$ ,  $a_1 = 9.07$ ,  $b_1 = 5.60$ ,  $c_1 = 7.23$  Å, and for  $NH_4BF_4$ ,  $a_2 = 9.06$ ,  $b_2 = 5.64$  and  $c_2 = 7.23$  Å. In the latter there is some evidence for the existence of H bonds between N and F.

**L. W. Elder.**  
The crystal structure of hexagonal silver iodide. Lindsay Helmholz. *J. Chem. Physics* 3, 740-7(1935).—From oscillation data, a structure is assigned to hexagonal AgI at room temp. in which the Ag atoms are distributed at random among 4 positions tetrahedrally surrounding the ideal position in the wurtzite structure. Previous work is discussed, and evidence favoring this structure is presented. At liquid-air temps. the structure approximates closely that of wurtzite with the ideal parameter value of  $1/8$ . Phys. characteristics of AgI are discussed in relation to the proposed structure.

A study of the molecular structure of diiodoethane. Iodine bond resonance and the molecular structure of diiodoethylene. Molecular packing in their crystal lattices. Harold P. Kjug. *J. Chem. Physics* 3, 747-53(1935), cf. *C. A.* 29, 7731<sup>1</sup>.—From data obtained by an x-ray study of the crystal structure of  $(C_2H_4I)_2$  and *trans*- $C_2H_2I_2$  the positions of the I atoms in the crystal cells were located. I band resonance is discussed and a factor of 0.92 of the length of the longer bond proposed for evaluating the interatomic distance for any resonating bond. On the basis of the concepts of tetrahedral C bonds, bond resonance, Pauling's normal covalent bond radii, etc., reasonable mol. models for these compds. were predicted. Comparison of these with the x-ray data showed that the I-I distances agree excellently with certain I-I distances within the crystal cells, thus locating the mols. within the cells. These models together with Mack's concept of the atomic domain radius of atoms in crystals permitted a consideration of the packing of the mols. in the crystal lattice, thus locating the atomic coordinates of the C and I atoms in the cell. The domain radii were: I = 1.97 Å, H = 1.23 Å. The resulting mol. packing explains and agrees excellently with observed phys. properties of the two crystals.

Formation of new nuclei in crystallization. I. Dependence of the time of incubation on the deformation and the heating conditions. M. O. Kornfeldt. *J. Exp. Theoret. Phys.* (U. S. S. R.) 5, 556-62(1935).—K. discusses the concepts: speed of formation of centers, recrystallization wave and tendency toward recrystallization. Al wires tempered at  $410^\circ$  were deformed by tension, and allowed to recrystallize at  $300^\circ$ . For samples deformed 4.5, 5.0 and 7.0%, the speeds of nuclei formation are not linear functions of time or degree of deformation but increase more rapidly than linearly with time and deformation. The linear speed of the growth of nuclei is greater for smaller deformation and falls rapidly and linearly with time.

**F. H. Rathmann.**  
The adsorption of methane by coal. J. Bartlett Sutton and Earl C. H. Davies. *J. Am. Chem. Soc.* 57, 1785-7(1935).—The adsorption of  $CH_4$  by coal was measured at

10.94°, 17.77° and 24.60° at pressures up to about 1 atm. The results agree with the Freundlich equation. The heat of adsorption calcd. from the adsorption data is about 5000 cal. per mol of  $\text{CH}_4$ . P. H. Emmett

Densities of adsorbed gases. I. Carbon dioxide on charcoal. Thos. De Vries. *J. Am. Chem. Soc.* 57, 1771-4 (1935).—By using  $\text{He}$  as an inert gas the  $d$  of adsorbed  $\text{CO}_2$  on C detd. at 80° was found to lie in the range 0.83 to 0.91. From the exptl. results together with an  $\epsilon$ - $\phi$  curve calcd. according to Polanyi's theory it was shown that  $\text{He}$  did not penetrate the  $\text{CO}_2$  layer when its  $d$  was more than 0.09 g. per ml. P. H. Emmett

The sorption of dimethyl ether on alumina. J. Edwards and O. Maass. *Can. J. Research* 13B, 133-9 (1935), cf. *C. A.* 28, 18°, 29, 3894°.—The sorption of  $\text{Me}_2\text{O}$  on alumina was investigated at pressures from 0.5 to 52 atm., the crit. pressure, over the temp. range 25-135°. The results are comparable to those for the propylene,  $\text{Al}_2\text{O}_3$  system. No discontinuity in the sorption accompanies the transition of sorbate from vapor to gas at the crit. temp., this differs from the previous results for the liquid-to-gas change. The initial stages of the sorption involve the formation of a unimol layer followed, with increasing pressure, by a multimol layer of increasing depth. It is unlikely that condensation to liquid occurs in the pores except at high relative pressures. The increase in crit. temp. of such a liquid must be exceedingly great to account for the continuous form of the isobars up to 135°. J. W. Shipley

Effect of temperature on selective adsorption by silica gel from binary mixtures. M. R. Aswathanarayana Rao. *J. Indian Chem. Soc.* 12, 371-5 (1935).—The variation of selective adsorption with temp. was measured;  $\text{SiO}_2$  gel was used with  $\text{C}_2\text{H}_6$ ,  $\text{C}_3\text{H}_8$ ,  $\text{EtOH}$ ,  $\text{C}_4\text{H}_{10}$ , and  $\text{C}_4\text{H}_9\text{N}$ - $\text{H}_2\text{O}$  mixts. over an entire range of concns. It was found that the selectivity (apparent adsorption) decreases with a rise in temp. By plotting selectivity against the equl. concn. by the selectively adsorbed component, U- and S-shaped curves were obtained. The equation  $S = C_1(K'x + b/T) - m'$  where  $m'$  is the wt. of the mixt. adsorbed by 1 g. of the gel was derived for a U-shaped curve, which indicates that selectivity decreases with rise in temp. The equation applies to dil. solns. only and can be used for S-shaped curves if these are considered as being made up of 2 U-shaped curves each representing the selectivity of one of the components. When  $C_1$  is const., the variation of  $m'$  with temp. is comparatively small, and for small values of  $C_1$  a straight line should be obtained when  $\log S$  is plotted against  $1/T$ , a prediction verified by the exptl. findings. C. R. Addinall

Surface potential differences of unimolecular films of fatty acids. Yohei Yamaguchi and Saburo Mizuno. *Bull. Chem. Soc. Japan* 10, 453-64 (1935).—See *C. A.* 29, 5718°.

Unimolecular films of molecules which lie flat on the surface of water. I. Surface pressures and potentials of films of long molecules: Polymers of  $\omega$ -hydroxydecanoic acid. Wm. D. Harkins, Everett F. Carman and Herman E. Ries, Jr. *J. Chem. Physics* 3, 692-8 (1935).—Film pressures and surface potentials were measured for a series of linear polymers of  $\omega$ -hydroxydecanoic acid, with mol. wts. of 780-25,200. The mols. are oriented parallel to the surface. An improved form of the Harkins and Fischer app. (*C. A.* 29, 954°) was used. The chief modification in the procedure was the use of two radioactive Po electrodes over the film. The pressure-area relations show that the area per mol. in the condensed films is nearly proportional to the mol. wt. and that the compressibility of the films is large. The film  $d$  is lowest for the polymers of smallest mol. wt. The films are not very sensitive to changes in  $pH$ , but on changing from an acid to an alk. substrate the films in the expanded state give higher mol. areas at given pressures, and the pressures for film collapse are considerably higher. The vertical cross section of the mols. lies between 19.4 and 19.9 sq. Å, nearly the same as the horizontal cross section of vertically oriented mols. such as stearic acid. Differences between films with perpendicular and with parallel orientation are tabulated

1 The surface potentials of the polymer films rise to 400-50 mv., although the surface  $d$  of the polar groups is only  $1/2$  to  $3/4$  that of stearic acid type films, which give comparable potentials. The contribution of each polar group is, therefore, considerably greater than that of the dipole of the vertically oriented stearic acid mol. The surface potential of a condensed film increased about 13% less rapidly than the surface  $d$  of the dipoles. G. M. P.

2 Colloidal chemical study of systems of three liquid components. I. The colloidal behavior of critical mixtures of three liquids. Naoyasu Sata and Osamu Kimura. *Bull. Chem. Soc. Japan* 10, 409-20 (1935).—Systems consisting of condensible  $\text{H}_2\text{O}$  as one component (A),  $\text{C}_6\text{H}_6$ ,  $\text{C}_6\text{H}_5\text{Me}$ ,  $\text{C}_6\text{H}_5\text{Et}$ ,  $\text{C}_6\text{H}_5\text{Cl}$ ,  $\text{C}_6\text{H}_5\text{NO}_2$ ,  $\text{C}_6\text{H}_5\text{NH}_2$ ,  $\alpha$ -xylene,  $m$ -xylene,  $p$ -xylene, cyclohexane,  $n$ -pentane,  $n$ -hexane,  $\text{CCl}_4$ ,  $\text{CHCl}_3$ ,  $\text{CS}_2$ , chloroethylene and  $\text{Et}_2\text{O}$  for component B and  $\text{MeOH}$ ,  $\text{EtOH}$ ,  $\text{PrOH}$ ,  $i$ - $\text{PrOH}$  and  $\text{Me}_2\text{CO}$  for component C, were studied. The presence of a colloiddally dispersed phase was shown by a bluish opalescence in the Tyndall cone in the systems contg. the cyclic compds.,  $\text{CCl}_4$ ,  $\text{CHCl}_3$ , and  $\text{CS}_2$  with the A's, but those contg. pentane, hexane,  $\text{Et}_2\text{O}$  and  $\text{Me}_2\text{CO}$  did not show this effect, this indicates some relation between chem. structure and the formation of emulsions. The most stable emulsions were obtained with the 2 systems contg.  $\text{C}_6\text{H}_5$  with  $\text{MeOH}$  and  $\text{EtOH}$ . The opalescent range for the system  $\text{C}_6\text{H}_5$ - $\text{EtOH}$ - $\text{H}_2\text{O}$  is shown on a triangular diagram by a space between 2 branches of the curve, called an island. The temp. range in which the emulsion is stable was also detd. for this system, and the resp. increases in vol. of the  $\text{H}_2\text{O}$  and  $\text{C}_6\text{H}_5$  layers were measured, this showed that  $\text{H}_2\text{O}$  has the greater attraction for the  $\text{EtOH}$ . The bluish opalescence is due to a dispersed phase consisting principally of  $\text{C}_6\text{H}_5$  in a dispersion medium of  $\text{EtOH}$  and  $\text{H}_2\text{O}$ . E. R. Rushton

3 Measurement of colloid-osmotic pressure by Krogh and Nakazawa's method. Hiroshi Nagao. *J. Biochem. (Japan)* 22, 351-66 (1935).—Equilibration of the colloid-osmotic pressure requires at least 24 hrs. Also the exptl. error of the detn. decreases as the reading at equl. is taken. The pressure is proportional to the abs. temp., which confirms the earlier findings of Jmas. The colloid-osmotic pressure decreases more rapidly than the concn., the relation between the values being expressed by the general formula  $P = aTC/(1 - bC)$ , where  $P$ ,  $C$  and  $T$  are the pressure, colloid concn. and abs. temp., resp., while  $a$  and  $b$  are consts., which are detd. empirically. S. Morgulis

4 Studies in electroendosmosis. VII. Some measurements with nonaqueous liquids and high voltages. Harold P. Dakin, Fred Fairbrother and Alfred E. Stubbs. *J. Chem. Soc.* 1935, 1229-33; cf. *C. A.* 29, 4649°.—By use of an improved app. with photographic recording, the rate of electroendosmosis of 9 alcs and ethers through a Jena Cerate glass diaphragm is found to increase linearly with the potential at low voltages and more than linearly at high voltages up to 6000 v. per cm. The flow rate becomes const. within 0.002 sec. after the application of potential. H. A. Beatty

5 The electrical conductance of colloidal solutions at high frequencies. Howard J. Curtis and Hugo Fricke. *Phys. Rev.* 48, 775 (1935); cf. *C. A.* 29, 5719°.—Measurements of elec. cond. were made on colloidal solns. at frequencies up to 16,000 kc. per sec. At higher frequencies there is a rise in cond. assoc. with a small decrease in dielec. const. Measurements were made on powd. glass and kaolin suspended in  $\text{KCl}$ , mineral oil in  $\text{Na}$  oleate, and colloidal solns. of  $\text{Al}_2\text{O}_3$ ,  $\text{V}_2\text{O}_5$ , starch and gelatin (at its isoelec. point). The concn. of the  $\text{KCl}$  was varied to give sp. conductances of  $10^{-4}$  to  $10^{-2}$  mho/cm. with no appreciable change in the cond.-frequency curves. The aged  $\text{V}_2\text{O}_5$  soln. showed a marked increase in the high-frequency conductances. Most of the frequency-cond. curves show a sharp change in their rate of increase between 500 and 2000 kc. per sec. This increase in cond. of suspensions and colloidal solns. is probably due to an effect of the same type as the Debye-Falkenhagen effect in strong electrolytes (*C. A.* 22, 2703°), the static forces

between charges on the colloidal particles and those in the adjacent portion of the continuous phase produce, in an external field of low frequency, an interference with the displacement of the ions of the continuous phase, which disappears at high frequencies. Soils show similar increased cond. of high-frequency radio waves (Strutt, *Elek. Nach. Ted.* 7, 387 (1930). Feldman, *Proc. Inst. Rad. Eng.* 21, 764 (1933). Smith-Rose, *J. Inst. Elect. Eng. London* 75, 221 (1934)).

Highly polymerized compounds CXVII. The classification of colloids H. Staudinger, *Ber.* 68B, 1682-91 (1935). cf. C. A. 29, 7135.—Colloids may be classified either as globular colloids (spherocollids) or as fiber colloids (linear-collids). The former form only slightly viscous solns. which follow Einstein's formula (cf. following abstr.) up to relatively high concns (5%), and deviate only slightly up to 10%. The viscosity is independent of the sphere size, for a given concn. The solns. obey the Hagen-Poiseuille law. To this group belong most lyophobic colloids or suspensions. The fiber colloids form solns. that do not obey Einstein's formula, the viscosity increases rapidly with concn. and with length of fiber (size of particle). Highly viscous solns. form gels. These solns. do not obey the Hagen-Poiseuille law. Lyophilic colloids (emulsoids) belong to this group. Fiber colloids have much greater surface than globular colloids of the same mass and differ in all properties associated with large surface. Most inorg. colloids are globular; the silicic acids are linear. Org. colloids are classified as macromol., held together by covalent bonds, and as micelles, which consist of simple mols. held together by van der Waals' forces. Both macromols. and micelles may be either spherocollids or linear-collids. CXVIII. Viscosity investigations on organic spherocollids and linear-collids. H. Staudinger and E. Husemann, *ibid.* 1691-7.—The Einstein viscosity formula,  $\eta = 1 + 0.025 c/\epsilon$ , where  $\eta$  is the relative viscosity of the soln.,  $c$  the concn. and  $\epsilon$  the d. of the solute, holds for S solns. as well as for true solns. of sugars and polyalcs. with approx. spherical mols. The emulsification of a monomeric styrol by Na oleate results in a polymeric styrol latex (similar to rubber latex) in which the polystyrol particles are spherical and obey Einstein's formula. The polystyrol may be pptd. from the latex and then redissolved by  $\text{CaCl}_2$  in the form of fibers. The viscosity of the fiber solns. does not follow Einstein's formula, the sp. viscosity of a 1% soln. of the fiber being 1000 times greater than that for the latex. Similar differences are obtained between the viscosities of emulsions of vinyl acetate and vinyl butyrate, and those of the corresponding  $\text{Me}_2\text{CO}$  solns. L. E. S.

The structural viscosity of solutions of high polymers. J. Coumou, *Chem. Weekblad* 32, 426-9 (1935).—Liquids have structural viscosity if the rate of flow in capillaries is not proportional to the pressure and the viscosity decreases with pressure. The Hess viscometer was used to det. the effect. Structural viscosity is found in gelatin solns. (3.7%). In 4% starch solns. it is found provided the soln. has not been heated more than 2 hrs. at 122°; after 30 min. at 150° there is no longer any structural viscosity. Com. dextrin shows slight structural viscosity; concd. sucrose or glucose solns. do not. Oil plant materials carobin soln. (0.5%), tragacanth soln. (0.5%) and huseud mucilage show the effect, gum arabic (20%), cashew gum (30%) do not; pectin soln. (4%) and hehenin soln. (5% in dil. alk.) do slightly. No structural viscosity is found in solns. of phenol-formaldehyde resins, but polystyrene (tetralin soln. 2%) does show it if the polymer is prepd. at low temp. (100°) in the absence of  $\text{O}_2$  and  $\text{H}_2\text{O}$ . The conclusion is that structural viscosity is found only in solns. contg. long stretched particles of a min. size. Solns. with structural viscosity have considerably higher viscosity values, a 0.5% carobin soln. has a viscosity equal to that of a 20% gum arabic soln.

B. J. C. van der Hoeven. Viscosity of solutions of substances of high molecular weight, especially cellulose. J. Marchlewska, *Przemys. Chem.* 19, 160-9 (1935).—A review with more than 85 references.

A. C. 7

Distances between colloidal particles in iridescent strata of some ferric oxide sols. Wilfried Heller, *Compt. rend.* 201, 831-3 (1935); cf. C. A. 24, 2029; 29, 5330.—The distance,  $d$ , between the layers of tactoids which produce by interference the iridescent colors in sols of  $\text{Fe}_2\text{O}_3$  prepd. under certain conditions by hydrolysis of solns. of  $\text{FeCl}_3$  is given by the equation  $d = (\lambda\lambda - 2d_1\sqrt{n_1^2 - \cos^2\alpha}) / 2\sqrt{n_1^2 - \cos^2\alpha}$ , where  $d_1$  is the thickness of the tactoid assumed const.,  $\lambda$  wave length of light,  $\alpha$  order of color,  $\alpha$  inclination of incident beam,  $n_1$  and  $n_2$  are refractive indexes of the tactoid and liquid, resp. Such distances were detd. for solns. of  $\text{FeCl}_3$  of (initial) concn. (c) 0.0408-0.0628 M, after periods (t) of 59-1695 days. For t const. d is a max. (2000-3000 Å.) for approx.  $c = 0.05$  M, for c const. d increases with time, but with some indication of a max. between 190 and 248 days and subsequent decline. The changes are consistent with slow increase in charge of the particles resulting from increase in concn. of H ions through slow continuing hydrolysis. C. A. Silberrad.

The properties of silver halides peptized in gelatin by supersonic waves. H. W. Dangers, *Z. Physik* 97, 31-45 (1935).—The photographic behavior of peptized emulsions that are mechanically produced by high-frequency sound waves only, is examd. The properties of the emulsions are affected by heat treatment. The effects of varying binding materials upon the grain and on the character of the emulsions are studied. Under suitable conditions the sensitivity and the color sensitivity can be made very high. The importance of the surface state of the Ag halide grains before the addn. of the gelatin is discussed in relation to opening. S. Tolansky.

The chemical and physical characteristics of water of crystallization. I. Hydrates containing up to three mols. of water. Luigi Passerini, *Gazz. chim. Ital.* 65, 502-11 (1935).—The present paper begins a systematic investigation of the infrared absorption of the  $\text{H}_2\text{O}$  of crystn. in inorg. and org. compds. The infrared absorption spectra between approx. 1.30 and 2  $\mu$  of 8 compds. were detd. with an app. already described (cf. C. A. 27, 4801) and with a technic which is described in detail. The following data give the compds. examd. and the wave lengths of the maxima of their 2 bands in  $\mu$ : water vapor (I), 1.35, 1.83 (cf. Hettner, C. A. 13, 1550). Sclator and Phelps, C. A. 19, 3218). liquid water (II) at 18°, 1.443, 1.930 (cf. Collins, C. A. 17, 684; Dreisch, C. A. 19, 770). ice (III), 1.474, 1.970 (cf. Saunders, *Johns Hopkins Univ. Circ.* 18, No. 180, 58 (1899); Bode, C. A. 4, 274).  $(\text{CO}_2\text{NH}_2)_2\text{H}_2\text{O}$  (IV), 1.385, 1.828.  $\text{HO}_2\text{CCH}_2\text{C}(\text{CO}_2\text{H})(\text{OH})\text{C}_4\text{H}_9\text{CO}_2\text{H}$  (V), 1.380, 1.832.  $(\text{CO}_2\text{H})_2\text{H}_2\text{O}$  (VI), 1.468, 1.967;  $\text{BaCl}_2\cdot 2\text{H}_2\text{O}$  (VII), 1.475, 1.973.  $\text{CaSO}_4\cdot 2\text{H}_2\text{O}$  (VIII), 1.426, 1.904;  $\text{K}_2\text{Fe}(\text{CN})_6\cdot 3\text{H}_2\text{O}$  (IX), 1.412, 1.881;  $\text{AcONa}\cdot 3\text{H}_2\text{O}$  (X), 1.470, 1.908.  $(\text{AcO})_2\text{Pb}\cdot 3\text{H}_2\text{O}$  (XI), 1.474, 1.970. For IV and V the bands correspond to those of water in the vapor state; for VI, VII, X and XI they are almost the same as those of ice; and for VIII and IX they occupy intermediate positions. The coincidence in the positions suggests that in the 1st group the  $\text{H}_2\text{O}$  of crystn. has a mol. structure analogous to that of water vapor, i. e., simple  $\text{H}_2\text{O}$  mols., in the 2nd group to that of ice, i. e., dimer  $(\text{H}_2\text{O})_2$ , or trimer  $(\text{H}_2\text{O})_3$  mols., and in the 3rd group to a mixt. of the different types of mols. To test this theory, a mixt. of compds., the absorption bands of which differ approx. the same as 1 and III were examd., viz.,  $\text{CaCl}_2$  and hexane, and a 1:1 mixt. of them, in the range of 1-2  $\mu$ .  $\text{CaCl}_2$  showed bands with maxima at 1.175, 1.419 and 1.704  $\mu$  (cf. Leconte, *Le spectre infrarouge*, 1928, 215. C. A. 22, 4333). hexane at 1.228, 1.439 and 1.778 (cf. Ellis, *Phys. Rev.* 23, 48 (1924)). The mixt. showed bands at 1.198, 1.430 and 1.741, compared with theoretical values of 1.200, 1.429 and 1.739  $\mu$ , resp. These results support the theory that the  $\text{H}_2\text{O}$  of crystn. in compds. such as VIII and IX is composed of different kinds of mols. A similar theory of nonhomogeneous  $\text{H}_2\text{O}$  of crystn. in hydrated salts has been advanced by several investigators to explain the varying behavior of the several mols. of  $\text{H}_2\text{O}$  of crystn. during dehydration. II. Hydrates containing more than

three molecules of water. *Ibid.* 511-17.—The absorption bands between approx. 1.30 and 2  $\mu$  of 16 more hydrated salts were measured. The following data give the compds. examd., and the wave lengths (in  $\mu$ ) of the maxima of the 2 bands:  $\text{NaNH}_4\text{H}_2\text{PO}_4$  (I), 1.451, 1.941;  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ , 1.465, 1.900;  $\text{MnSO}_4 \cdot 5\text{H}_2\text{O}$ , 1.464, 1.938;  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ , 1.464, 1.938;  $\text{Na}_2\text{SO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$  (I), 1.470, 1.971;  $\text{ZnSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$  (II), 1.471, 1.973;  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ , 1.451, 1.955;  $\text{Na}_2\text{SO}_4 \cdot 7\text{H}_2\text{O}$ , 1.460, 1.958;  $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$ , 1.459, 1.957;  $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$ , 1.453, 1.943;  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ , 1.462, 1.904;  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ , 1.466, 1.965;  $\text{Al}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$ , 1.443, 1.930;  $\text{K}_2\text{SO}_4 \cdot \text{Al}_2(\text{SO}_4)_3 \cdot 24\text{H}_2\text{O}$  (III), 1.473, 1.970;  $\text{K}_2\text{SO}_4 \cdot \text{Cr}_2(\text{SO}_4)_3 \cdot 24\text{H}_2\text{O}$  (IV), 1.471, 1.973;  $(\text{NH}_4)_2\text{SO}_4 \cdot \text{Fe}_2(\text{SO}_4)_3 \cdot 24\text{H}_2\text{O}$  (V), 1.474, 1.977. As in the previous work (cf. above), some of the hydrates (I, II, III, IV and V) give evidence of contg.  $\text{H}_2\text{O}$  of crystn. in the same form as ice; in the other salts, the  $\text{H}_2\text{O}$  of crystn. is probably a mixt. of mols. like those in ice and in water vapor.

C. C. Davis

The chemical and physical characteristics of the water contained in colloidal substances. I. An investigation of some organic colloids. Luigi Passerini *Gazz. chim. ital.* 65, 518-28(1935), cf. preceding abstr.—The infrared absorption spectra between approx. 0.8 and 2  $\mu$  of 6 hydrophilic colloids (3 gels and 3 sols) were examd. by the same method as before. The following data give the substances examd. and the wave lengths (in  $\mu$ ) of the maxima of the bands: water (at 18°), 1.203, 1.443, 1.930, agar-agar gel (3%), 1.472, 1.973, starch (30% sol), 1.443, 1.930,  $\text{Fe}(\text{OH})_3$  (40% sol), 1.448, 1.937,  $\text{Fe}(\text{OH})_3$  (50% sol), 1.460, 1.950,  $\text{Fe}(\text{OH})_3$  (60% sol), 1.465, 1.957, egg albumin (natural) (I) 1.210, 1.454, 1.940,  $\text{Fe}(\text{OH})_3$  (10% sol), 1.443, 1.930,  $\text{Fe}(\text{OH})_3$  (20% sol), 1.443, 1.930,  $\text{Fe}(\text{OH})_3$  (30% sol), 1.443, 1.930,  $\text{Fe}(\text{OH})_3$  (40% sol) (II), 1.450, 1.937;  $\text{Fe}(\text{OH})_3$  (60% sol) (III), 1.455, 1.942, dextrin (30% sol), 1.443, 1.930,  $\text{Fe}(\text{OH})_3$  (40% sol), 1.443, 1.930; gum arabic (30% sol), 1.443, 1.930,  $\text{Fe}(\text{OH})_3$  (40% sol), 1.443, 1.930,  $\text{Fe}(\text{OH})_3$  (40% sol) (IV), 1.460, 1.945. The spectra of all the substances contain the individual bands of the water present. In the gels the bands are displaced considerably, viz., up to approx. 0.05  $\mu$ , toward greater wave lengths with respect to the bands of pure water. The greater the concn. of a given substance the greater is this displacement, and at a given concn. the displacements vary among the individual substances. There is a certain parallelism between the extent of this displacement and certain phys. properties of the colloid, e. g., its rigidity, but no explanation can be offered for this parallelism. In the sols the bands are displaced noticeably (0.01-0.02  $\mu$ ) toward greater wave lengths only for sols with relatively high viscosities, viz., I, II, III and IV. In an analogous way to the  $\text{H}_2\text{O}$  of crystn. in hydrated inorg. salts (cf. preceding abstr.), this behavior of colloids may depend on the fact that the mol. compn. of their water differs from the mol. compn. of pure water. The direction of the displacements indicates that there is an increase in the no. of mols. of the type of those in ice, i. e.  $(\text{H}_2\text{O})_n$  or  $(\text{H}_2\text{O})_m$ . In gels this increase is greater than in sols. The hypothesis that a colloidal substance forms, with the dispersing medium, labile compds. similar to solvates must be discarded, both because in the present work there was no difference in the intensity of the bands of the colloids and that of pure water, and because with changes in the concn. of the colloids there would have been no displacements such as those observed. II. An investigation of some inorganic colloids. *Ibid.* 529-33.—The same technique was used as before. The range was approx. 1.30 to 2.00  $\mu$ . The following data give the substance (its percentage of water in parentheses) and the wave lengths (in  $\mu$ ) of the maxima of the absorption bands:  $\text{H}_2\text{SiO}_3 \cdot \text{nH}_2\text{O}$  gel (I) 46; 62; 89; 1.443, 1.930;  $\text{Sn}(\text{OH})_4 \cdot \text{nH}_2\text{O}$  gel (52; 68; 83); 1.443, 1.930;  $\text{Al}(\text{OH})_3 \cdot \text{nH}_2\text{O}$  gel (41; 55; 70, 82); 1.443, 1.930;  $\text{Ti}(\text{OH})_4 \cdot \text{nH}_2\text{O}$  gel (50; 81); 1.443, 1.930;  $\text{ZnH}_2\text{AsO}_4 \cdot \text{nH}_2\text{O}$  gel (48, 76); 1.443, 1.930;  $\text{MnH}_2\text{AsO}_4 \cdot \text{nH}_2\text{O}$  gel (54; 78); 1.443, 1.930;  $\text{FePO}_4 \cdot \text{nH}_2\text{O}$  gel (47; 54; 76); 1.443, 1.930;  $\text{NiH}_2\text{PO}_4 \cdot \text{nH}_2\text{O}$  gel (56; 61; 78); 1.443, 1.930; 1 after aging (15 S), 1.466, 1.955; *Aln* opal

(II) (13 S), 1.457, 1.946; Caselle opal (III) (8 O), 1.457, 1.946; Silesia opal (IV) (6 O), 1.457, 1.946; pure water (at 18°) (V) 1.443, 1.930. The water in all the colloids except I, II, III and IV gave the same bands as did that in V, indicating that the water is absorbed physically by a phenomenon analogous to capillarity. In I, II, III and IV the water is united by firmer bonds, in which eases the displacements depend upon a change in the mol. compn. of the water. Inorg. colloids can be divided in 2 groups. (1) substances of the type of hydroxides, phosphates and arsenates, in which the water is not intimately bound but only absorbed, and which may be called *pseudo-colloids*, and (2) substances of the type of opal, in which the water is at least in part united chemically with the rest of the mol., and which are *true colloids*. The great differences in the infrared absorption by org. and inorg. colloids correspond to differences in the chem. behavior of the 2 groups with water, which lead to their classification as hydrophilic and hydrophobic colloids.

C. C. Davis

An investigation of the constitution of zeolites. Luigi Passerini *Gazz. chim. ital.* 65, 534-42(1935), cf. preceding abstracts.—The extn. are of importance in throwing light on the long-standing controversy of the state of water in zeolites and the intimate constitution of the latter. The infrared absorption spectra, between approx. 1.30 and 2.00  $\mu$ , of 6 zeolites, including analcite (I) from Flinders, natrolite (II) from Langesund, heulandite (III) from Teigarhorn, stilbite (IV) from Teigarhorn, ehaustite (V) from Paterson and from Idar, scolecite (VI) from Teigarhorn, and an opal were examd. The following data give the wave lengths (in  $\mu$ ) of the maxima of the bands: water (at 18°) 1.443, 1.930, I, 1.443, 1.930, II, 1.443, 1.930, III, 1.443, 1.930, IV, 1.443, 1.930, V, 1.443, 1.930, VI, 1.455, 1.913, opal, 1.457, 1.916. These results, in conjunction with those obtained with inorg. colloids and hydrated salts (see preceding abstracts), controvert the idea that the water in the zeolites examd. is in the form of  $\text{H}_2\text{O}$  of crystn. On I, II, III, IV and V it is in a different form from that in hydrophilic inorg. colloids, for in I, II, III, IV and V the water is simply absorbed physically. In VI on the contrary it is at least in part in the same form as that in inorg. colloids such as opal, and probably in VI that part of the water which causes a displacement of the bands is united to the 3  $\text{SiO}_2$  groups. The results in general indicate that the characteristic state of water in zeolites is in a simple state of absorption brought about by phys. forces alone.

C. C. Davis

Extension of the theory of complex coacervation to ionic disperse systems. II. R. Kruyt and II. G. Bungenberg de Jong. *Proc. Acad. Sci. Amsterdam* 38, 714-21(1935).—Ummixing in supersatd. solns. of electrolytes is a frequently occurring phenomenon which in many cases cannot be demonstrated on account of the exclusion of expts. at low temp. because of the nature of the solvent,  $\text{H}_2\text{O}$ . Coacervates have been demonstrated with luteo and hexal cations reacting with  $\text{K}_2\text{C}_2\text{H}_3\text{O}_7$  and  $\text{K}_2\text{CO}_3(\text{CN})_2$ . When drops of the following pairs of salts were allowed to run together under a cover glass upon a microscope slide, thus attaining all degrees of mixing, droplets due to unmixing could be observed,  $\text{Cd}(\text{NO}_3)_2 \cdot \text{Na}_2\text{C}_2\text{H}_3\text{O}_7$ ,  $\text{Cd}(\text{NO}_3)_2 \cdot \text{Br}_2\text{ONa}$ ,  $\text{Pb}(\text{NO}_3)_2 \cdot (\text{CH}_3\text{COO})_2$ . With proper mixing proportions coacervates were shown with  $\text{BaCl}_2$  and  $(\text{NH}_4)_2\text{MoO}_4$  and with  $\text{SnCl}_4$  and  $(\text{NH}_4)_2\text{MoO}_4$ .

C. E. P. Jeffreys

Phosphatide autocomplex coacervates as ionic systems and their relation to the protoplasmic membrane. II. G. Bungenberg de Jong and J. Bonner. *Proc. Acad. Sci. Amsterdam* 38, 797-806(1935); cf. C. A. 29, 4651<sup>1</sup>.—The phosphatide autocomplex coacervates are considered as fluid, ionic, autocomplex systems. The interactions of the phosphatide ions are detd. by the electrostatic attraction due to oppositely charged ionic groups, repulsion due to hydration, and attraction due to lyophilic groups. The behavior of the coacervates toward surfaces, such as C and glass, similar to that of paraffin, as well as theoretical considerations lead to the conclusion that phosphatide ions at the surface of the coacervates are oriented with

polar groups inside and hydrocarbon chains outside. It is assumed that when 2 such oriented films meet, a highly stable double film is formed. This assumption explains the peculiar behavior of vacuoles in the phosphatide auto-complex. It is suggested that the special properties of protoplasmic membrane depend upon one or more double layers of phosphatide ions similar to the double films of these coacervates. C. E. P. Jeffreys

The iodine-starch reaction. G. van Isteron, Jr., and J. C. Mounou. *Proc. Acad. Sci. Amsterdam* 38, 700-6 (1935).—The I starch soln is considered to contain crystallites made up of mols of the structure  $(R)(R)O(M)(I)_2$ , where M represents a univalent metal or H atom. The addn of KI and  $I_2$  to starch soln raises the point of gelatinization up to an increase of  $5.9^\circ$  at a concn of 0.05% KI, with 0.014%  $I_2$ . This concn of KI or stronger ones alone had no effect. 1 xpts. with I ions from a long series of acids and salts indicate the specific effect of this ion as required by the theory. Also, multivalent cations exert a greater effect than univalent on the change in gelatinization point. Neither  $Cl^-$  nor  $Br^-$  with or without KCl affects this property.  $Br^-$  in the presence of KBr produces a gelatinous ppt. C. E. P. Jeffreys

Interaction of amino acids and salts. I. Zinc chloride. Norman R. Joseph. *J. Biol. Chem.* 111, 479-87 (1935).—Potentiometric detns of activities in systems of amino acids and strong electrolytes in soln. possess the advantage over f-p and soly methods of permitting temp. and concn to be varied. Cells of the type  $Ag|AgCl|NaCl|H_2M|NaCl|amino\ acid|AgCl|Ag$ , similar in design to those of Harned and Akerlof (*C. A.* 21, 1051), were studied by II and A's exptl. procedure. From the data thus obtained for mixts. of  $ZnCl_2$  (I) and glycine (II), alanine,  $\alpha$ -aminobutyric acid,  $\beta$ -alanine and  $\beta$ -alanine activity coeffs. ( $\gamma$ ) were calcd. Amino acids of the glycine leucine series decrease  $\gamma$  of I, hence I decreases  $\gamma$  for these acids. The effect of I on each amino acid appears to vary relatively little with concn. of the latter and the relation between  $\gamma$  of I and amino acid concn. is substantially linear. The results thus obtained were correlated with f-p data in the case of II and the interaction of I and II as detd. is characteristic of that observed by the f-p method for salts of the same valence type. By means of the interionic force theory the results were compared with those of soly studies in media of low dielec. const. II. Sodium chloride and thallous chloride. *Ibid.* 489-90.

—By a similar method the interaction of amino acids with TlCl was studied. The value for  $\log(\gamma/\gamma_0)$  ( $\gamma_0$  = activity coeff. of the isomolal salt soln.) at 0.4 M amino acid concn. decreases from about 0.06 for glycine to 0.03, 0.02 and 0.01 for amino acids contg., resp., 2, 3 and 4  $Cl^-$  groups. This value in dil. solns. of  $ZnCl_2$  is about 3 times as great as the corresponding value for TlCl. Measurements with NaCl were complicated by decompn. of NaHg by the amino acids. At  $1.4^\circ$  reversible conditions were approached with low concns. and at  $25^\circ$  with salt concns. higher than 1 M.  $\log(\gamma/\gamma_0)$  at high salt concns. increases linearly with the concn. of the amino acid and the proportionality factor is independent of the concn. of the electrolyte. Salting-out coeffs. as detd. by this method compare favorably with those obtained by soly detns. The results are interpreted as indicating not only electrostatic attraction between ions and amphiprotic ions, but also repulsive forces which are relatively greater, the greater the hydrocarbon chain of the amino acid and the dielec. const. of the solvent. R. C. Elderfield

Studies in the physical chemistry of amino acids, peptides and related substances. V. Influence of amino acids, urea and alcohol upon the velocity constants of chemical reactions. Danella Straup and Edwin J. Cohn. *J. Am. Chem. Soc.* 57, 1704-1800 (1935).—The rates of reaction of  $S_2O_8^{2-}$  with  $ClI_2$ - $CO_2$  ions and uncharged alkyl iodide mols were studied. The rates were increased by 1 OH and to a small extent by  $(NH_4)_2CO_3$ , and decreased by ions and amino acids. The rate of reaction with ions is increased by salts, amino acids and  $(NH_4)_2CO_3$  but slightly affected by  $FiOH$ . The effect of amino acids and  $(NH_4)_2CO_3$  varies with the concn., salts increase the log

of the velocity const. in proportion to the sq. root of the concn. Kirkwood's equation extended for reaction rates describes satisfactorily the observed results. H. W. L.

Physicochemical studies of the colloidal state of cholesterol, cholesterol esters and lecithin. X. Reducing power of cholesterol solns. Igor Remezev and Olga Zepalova. *J. Biochem. (Japan)* 22, 71-83 (1935).—Cholesterol solns. have strong reducing power, a 5% sol. corresponding to about 63 mg. and a 10% sol. to 108 mg. pure glucose. Pptn. of proteins by alk.  $ZnSO_4$  causes a loss of 50-60% of this reduction by cholesterol. Addn. of cholesterol sol. to glucose likewise increases the total reduction materially. An injection of 5% cholesterol sol. into the portal vein in rabbits results in a marked rise in the reducing power of blood from various vessels, which sometimes represents a doubling of the value previous to the injection. Histochemical examn. of the liver fails to reveal even a trace of the cholesterol but there is a tremendous increase in the glycogen content. S. Morgulis

The concentration of heavy isotopes in cellulose. Kenzo Okabe and Toshizo Titani. *Bull. Chem. Soc. Japan* 10, 465-6 (1935), cf. *C. A.* 29, 6139<sup>4</sup>.—Several substances contg. cellulose were dried in air at  $100^\circ$ , then burned in a current of air and the  $H_2O$  formed was collected. Measurements of the sp. gr. of the  $H_2O$ , by means of a quartz float, were expressed in  $\gamma$  units ( $\gamma = 10^{-4}$ ) as follows: filter paper +6.3, cotton +5.7, cedar wood +4.5, bamboo +4.4, peeling of bamboo sprouts +4.4, contents of sprouts +0.6 and sap pressed out of the sprouts +1.0, compared with a standard cond.  $H_2O$ . The sp. gr. increases with the purity of the cellulose, and is not greater in the growing parts of the plant. Cf. *C. A.* 28, 3637, 7151<sup>4</sup>. E. R. Rushton

Solubility of several compounds of the mannose series in alcohols. I. Fred W. Upson, Edwin A. Fluevog and Walter D. Albert. *J. Phys. Chem.* 39, 1070-91 (1935).—Soly. data were detd. for the following carbohydrate derivs. in 9 different alcs.: l-mannose,  $\alpha$ -D-mannose,  $\beta$ -D-mannose,  $\beta$ -D-mannono- $\gamma$ -lactone,  $\alpha$ -D-mannono- $\gamma$ -lactone,  $\alpha$ -methyl-D-mannoside and D-mannitol. The concn. in terms of mols. of solute per 100 mols. of solvent and the soln. temp. are given for each detn. H. W. Leahy

Solubility of some strong, highly soluble electrolytes in methyl alcohol and hydrogen peroxide-water mixtures at  $25^\circ$ . Gösta Åkerlöf and Harlow E. Turek. *J. Am. Chem. Soc.* 57, 1746-50 (1935); cf. *C. A.* 21, 1051. —Soly. measurements at  $25^\circ$  were made for NaCl, KCl,  $NaNO_3$ ,  $KNO_3$ , KBr, KI,  $K_2SO_4$ ,  $NH_4Cl$  and  $Pb(NO_3)_2$ , as solutes in  $H_2O$ -MeOH mixts. and for NaCl, KCl,  $NaNO_3$ ,  $KNO_3$ ,  $K_2SO_4$ ,  $KClO_4$  and NaI as solutes in  $H_2O$ - $H_2O_2$  mixts. The data for  $H_2O$ -MeOH mixts. are compared with corresponding data for mixts. of  $H_2O$  with other org. solvents, in most cases the soly. varies with the dielec. polarization of the solvent. A tentative explanation of the soly. changes in the  $H_2O$ - $H_2O_2$  mixts. is based on the changes in the dielec. const. of the medium and Hückel's theory for concd. solns. of strong electrolytes. J. W. Shipley

Mutual solubility of heavy water and organic liquids in systems with negative saturation curve. Jean Timmermans and Gustave Poppe. *Compt. rend.* 201, 698-10 (1935), cf. *C. A.* 29, 7769<sup>4</sup>.—While addn. of 1.07% KCl to a 31.1% soln. of a picoline in  $H_2O$  produces sepn., the upper and lower crit. soln. temps. ( $t_{up}$ ,  $t_{lo}$ ) being  $128.5^\circ$  and  $87.5^\circ$ , the corresponding figures for the same addn. to a 33.2% soln. of the same in  $D_2O$  are  $112.5^\circ$  and  $92.0^\circ$ , complete miscibility occurring at  $102.5^\circ$  under 90 kg./sq. cm. Similarly 1.85% KCl added to a 40.8% soln. of  $tert$ -BuOH in  $H_2O$  causes sepn.,  $t_{up}$  being  $137.5^\circ$  and  $t_{lo}$   $71^\circ$ , while 1.55% KCl does the same in a 37.2% soln. in  $D_2O$ ,  $t_{up}$  being  $135.5^\circ$ ,  $t_{lo}$   $72^\circ$ . Thus more KCl is required to produce sepn. in  $H_2O$  than in  $D_2O$ , the latter having a larger domain of immiscibility. C. A. Silberrad

Equilibrium distribution of acetic acid between isopropyl ether and water. Andrew A. Smith and Joseph C. Igun. *J. Phys. Chem.* 39, 1149-53 (1935).—The distribution at  $20^\circ$  of AcOH between purified iso- $Pr_2O$  and distd.  $H_2O$  and between technical iso- $Pr_2O$  and tap water was detd. by titration of each layer with standard alic. NaOH after

they had stood 48 and 170 hrs. with frequent vigorous shaking. The results agreed closely. In order to approach the equil. from both sides the  $\text{AcOH}$  was dissolved initially in the  $\text{H}_2\text{O}$  in some cases, in the ether in others. The apparent distribution coeff.  $D = C_a/C_w$  slowly increases from 0.185 to 0.242 as the equil. concn. in  $\text{H}_2\text{O}$  increases from 0.0732 to 2.7500; i. e., the distribution law is only approx. obeyed, a result expected because  $\text{AcOH}$  is assoc. in ether and disso. in  $\text{H}_2\text{O}$ . The results with tap  $\text{H}_2\text{O}$  and technical ether are slightly higher, probably because of the presence of about 3% iso- $\text{PrOH}$  in the ether. The equation  $C_a/C_w^{1.08} = 0.148$  may be used for approx. calcn. of the distribution ratio, but the equation  $D_{\text{apparent}} = C_a/C_w = 0.027 C_w + 0.178$  (based on the slope 0.027 and intercept 0.178 of the plot of  $C_a/C_w$  against  $C_w$ ) is recommended and the calc'd values are probably more accurate than the individual values. From the equation  $C_a/C_w = 2 K_1 K_2 C_w + K_1$  (cf. *C. A.* 28, 953<sup>4</sup>) the distribution const. for single mols. of  $\text{AcOH}$  between iso- $\text{PrO}$  and  $\text{H}_2\text{O}$  is  $K_2 = 0.178$ , and the assocn. const. of  $\text{AcOH}$  in iso- $\text{PrO}$  is  $K_1 = 0.43$  (concns. in mols. per l.).

Janet E. Austin

Alteration of chemical equilibria by adsorption at interfaces illustrated by color changes of dyes. A. J. Mee *School Sci. Rev.* 17, 298-301 (1935).—Directions are given for demonstration or student expts.

O. Reimnuth

Apparent volumes and apparent compressibilities of solutes in solution. II. Concentrated solutions of lithium chloride and bromide. Arthur F. Scott and G. L. Bridger *J. Phys. Chem.* 39, 1031-9 (1935).—New measurements of the ds. and compressibility coeffs. of conc'd solns of  $\text{LiCl}$  and  $\text{LiBr}$  are reported. On the basis of these and previous measurements, the irregular properties of the conc'd solns of these electrolytes are discussed. A graphic method for calcg. the factor  $f = (d\rho/dc)/(d\rho/dp)$  is described.

Harold Gershwinowitz

Compressions and specific volumes of aqueous solutions of resorcinol and methanol at 25° and the behavior of water in these solutions. R. E. Gibson *J. Am. Chem. Soc.* 57, 1551-7 (1935), cf. *C. A.* 28, 1245<sup>7</sup>, 3292<sup>9</sup>, 3643<sup>1</sup>, 29, 4995<sup>7</sup>.—The sp. vols. and compressions of 6 solns of resorcinol and 15 solns. of  $\text{MeOH}$  in  $\text{H}_2\text{O}$  were measured at 25° and the corresponding apparent and partial quantities computed. The apparent compression of resorcinol varies slightly with concn. and an equation linear in the sq. root of its concn. expresses this variation within the exptl. error. The apparent vols. of resorcinol and of  $\text{MeOH}$  and the compressions of  $\text{MeOH}$  in aq. solns. are not linear functions of the sq. roots of their concns. The curves of the apparent compressions and apparent vols. of  $\text{H}_2\text{O}$  in  $\text{MeOH}$  solns. against the sq. root of the concn.  $\text{H}_2\text{O}$  are sigmoid but a linear function fairly represents the data over the whole concn. range.  $\text{MeOH}$  and resorcinol apparently promote the assocn. of  $\text{H}_2\text{O}$ , thus differing from most other types of solutes. The sp. compressions of all solns. of  $\text{MeOH}$  up to 15% are the same as the sp. compressions for pure  $\text{H}_2\text{O}$ . The values for the compression of  $\text{MeOH}$  up to 1000 bars do not agree with those cited in the literature.

J. W. Shipley

The solute as liquid. Wilder D. Bancroft. *Science* 82, 388-9 (1935).—All liquid solns. are mixts of liquids, regardless of whether any or all of the pure components are solids, liquids, vapors or gases at the temp. of the expt. The ions in a fused salt or in a soln. are present as liquids and may exert a pptg. or a solvent action. In low concn. a dissolved liquid or a suspended particle will behave in some respects as a gas. This postulate reconciles the conclusions of van't Hoff on true solns. and of Einstein on solns. with the fact that true solns. are mixts of liquids, and with the fact that the dispersed phase in a sol is rarely a gas. While it is customary and profitable in phys. chemistry to treat the solute thermodynamically as a gas under certain circumstances, it is actually a liquid and is a gas only in a metaphysical sense. The osmotic pressure may be that of a gas in a vol. into which the liquid solute could not possibly be compressed. In dealing with the effect of one salt on the soly. of another salt, it is not safe to ignore the direct or indirect solvent or pptg. effect of the third

ion or the undissoc. salt on the soly. of the second salt. G. M. P.

Pyrosulfuric acid as a solvent. C. R. de Robles and E. Moles. *Anales soc. espah. fis. quim.* 33, 643-54 (1935).—The cryoscopic const., detd. by the aid of sulfonal, veronal, tronal and  $\text{PhNO}_2$ , is 111.5, in good agreement with the Auerbach value 105 (*C. A.* 21, 1746). Abs.  $\text{H}_2\text{SO}_4$  is highly polymerized. The mol. magnitude near the f. p. is about 300. Its solns. in  $\text{H}_2\text{O}$  probably react as  $\text{H}_2\text{SO}_4 + \text{H}_2\text{O} \rightarrow 2\text{H}_2\text{SO}_4$ . The mol. wt. of  $\text{SO}_3$ , at first near that of  $(\text{SO}_3)_2$ , falls rapidly; this explains the abnormal f. p. of fuming  $\text{H}_2\text{SO}_4$ .

E. M. Symmes

The application of equations for the chemical potentials to equilibria between solid solution and liquid solution. George Scatchard and Walter J. Hamer. *J. Am. Chem. Soc.* 57, 1809-11 (1935).—Calcs. are made for the systems Ag-Pd and Au-Pt. These and the earlier results of others are discussed.

F. D. Rossini

The application of equations for the chemical potentials to partially miscible solutions. George Scatchard and Walter J. Hamer. *J. Am. Chem. Soc.* 57, 1805-9 (1935).—Equations for the free energy of mixing are calc'd, from the mutual solubilities of partially miscible substances; the vapor compns. and pressures computed therefrom are in accord with exptl. data.

F. D. Rossini

Velocity of sound in solutions. Horace M. Trent. *Proc. Indiana Acad. Sci.* 44, 192-5 (1934).—An app. is described for detg. the change in velocity of sound through  $\text{H}_2\text{O}$  while a salt is dissolving. Data are obtained for  $\text{Na}_2\text{PO}_4$ ,  $\text{SnCl}_4$ ,  $\text{NaOAc}$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{CuSO}_4$ ,  $\text{ZnSO}_4$ ,  $\text{NaCl}$ ,  $\text{CaCl}_2$ , and powdered quartz as solutes. In general the velocity rose from its initial value. After a certain value was reached, the velocity remained const. A change of 2.3% was observed between the velocity in pure  $\text{H}_2\text{O}$  and that in a 10%  $\text{NaCl}$  soln.

W. J. Peterson

Diffusion coefficients in alcohol-water mixtures. H. Mouquin and W. H. Cathcart. *J. Am. Chem. Soc.* 57, 1791-4 (1935), cf. Ostwald and Quast, *C. A.* 24, 3039. An improved app. is described, consisting of a rotating totally enclosed cell with fritted-glass diaphragm and provision for stirring by means of glass balls. Diffusion coeffs. ( $D$ ) are reported for 0.1% crystal violet solns. in solvents covering the range 100%  $\text{EtOH}$  to 100%  $\text{H}_2\text{O}$ . A discontinuity in the curve relating  $D$  to the percentage of  $\text{EtOH}$  in the solvent at 65 wt. %  $\text{EtOH}$  is correlated with other irregularities in phys. properties of solns. in 65%  $\text{EtOH}$ .

L. W. Eider

The rate of diffusion of deuterium hydroxide in water. W. J. C. Orr and J. A. V. Butler. *J. Chem. Soc.* 1935, 1273-7; cf. *C. A.* 29, 999<sup>1</sup>.—The diffusion of  $\text{H}_2\text{O}$  contg. about 3%  $\text{DOH}$  through sintered-glass membranes was studied at different temps. The diffusion coeff. of  $\text{DOH}$  increases from  $1.46 \times 10^{-4}$  at 0° to  $4.75 \times 10^{-4}$  at 45°. From the results the rate of self-diffusion in  $\text{H}_2\text{O}$  was estimated. The diffusion was also measured in  $N$   $\text{H}_2\text{SO}_4$  and in  $N$   $\text{Na}_2\text{SO}_4$  soln. at 13.5° and 13.85°, resp.; it differs only slightly from that in pure  $\text{H}_2\text{O}$ .

H. S. van K.

The vapor pressure of phosphoric acid solutions. I. A. Kablukov and K. I. Zagorodkin. *Z. anorg. allgem. Chem.* 224, 315-21 (1935).—See *C. A.* 29, 1308<sup>7</sup>.

G. G.

Viscosity of dilute solutions of nonelectrolytes. Balaghadra Prasad. *J. Indian Chem. Soc.* 12, 499-503 (1935).—The  $m$  and  $k$  coeffs. in the straight-line equations connecting the viscosity and vapor pressure of dil. solns. and  $\text{H}_2\text{O}$  differ by 0.8 and 1.3%, resp., for 1% sucrose solns. On the assumption that in still more dil. solns. the difference would become negligible, the 2 equations, one for the soln. and the other for the solvent, could be combined to give an equation which, on substitution and expansion, would assume the form  $\eta/\eta_0 = 1 + aC$ , where  $a = 0.00652$  if  $C$  is measured in g. mols. per l. To test this equation and, consequently, the assumption made, the viscosity of aq. solns. of various concns. ranging from 0.002 to 0.027 g. mols. per l. of sucrose (I) and fructose (II) were measured at 30°, 35° and 40°, and of glucose (III) at 35° and 40°. The variation of  $a$  with temp. was found to be within exptl. error and its value was fairly const. for

a given solute. The values of  $\alpha$  for solns. of I, II and III are 0.78, 0.42 and 0.44 and consequently depend on the nature of the solute, conclusively proving the invalidity of the assumption on which the equation was based.

C. R. Addinall

Cryoscopic investigation of anomalies in the behavior of ethylene chloride. Hugo Huettner, Jr., and Charles P. Smyth. *J. Am. Chem. Soc.* 57, 1923-6 (1935).—F. p. were measured on solns. of  $\text{C}_2\text{H}_4\text{Cl}_2$  in  $\text{C}_2\text{H}_5\text{Cl}$  and in  $(\text{C}_2\text{H}_5)_2\text{O}$  to investigate the possibility of intermolecular compd. formation. Equil diagrams constructed from the  $f$ - $p$  data gave no indication of compd. formation in the  $\text{C}_2\text{H}_4\text{Cl}_2$ - $\text{C}_2\text{H}_5\text{Cl}$  system but the formation of an unstable compd.  $\text{C}_2\text{H}_4\text{Cl}_2 \cdot 3(\text{C}_2\text{H}_5)_2\text{O}$  was indicated in the  $\text{C}_2\text{H}_4\text{Cl}_2$ - $(\text{C}_2\text{H}_5)_2\text{O}$  system.

J. W. Shipley

Cryoscopic determination of total hydration of ions of sodium nitrate. F. Bourion and O. Hun. *Compt. rend.* 201, 660-2 (1935).—By the method of (C. A. 29, 7759) the hydration of the ions in M and 0.5 M  $\text{NaNO}_3$  corresponds, resp., to  $\text{NaNO}_3$ , 9.31H<sub>2</sub>O and  $\text{NaNO}_3$ , 11.11H<sub>2</sub>O. If the hydration of the  $\text{NO}_3$  ions is regarded as nil (cf. Manchot, et al., C. A. 19, 916) the above amts. of H<sub>2</sub>O would represent the hydration of the Na ions.

C. A. S.

Mobility of the hydrogen ion constituent in aqueous mixtures of hydrogen chloride and calcium chloride at 25°. L. G. Longworth. *J. Am. Chem. Soc.* 57, 1698-1700 (1935), cf. C. A. 26, 4325.—The transference nos. of the H<sup>+</sup> in eq. mixts. of HCl and  $\text{CaCl}_2$  at a const. total concn. of 0.1 N were measured at 25°. The conductivities of the same mixts. were also detd. and from the combined data obtained the mobility of H<sup>+</sup> was calcd. The decrease in the mobility of the H<sup>+</sup> in passing from a soln. of pure HCl to one of pure  $\text{CaCl}_2$  was compared with the value computed from the interionic attraction theory of electrolytic cond. and with a similar effect observed in mixts. of HCl and KCl solns.

J. W. Shipley

The transference number and valence of silver in liquid silver amalgam. Karl Schwarz. *Monatsh.* 66, 218-21 (1935).—Electrolysis was performed in the same way as with Au amalgam (C. A. 27, 5007) with a const. current of 2 amps. for periods of 20 to 88 days. The Ag is carried to the cathode. The av. value for the transference no. divided by the concn. ( $n/z$ ) is  $4.0 \times 10^{-4}$ . To det. the  $n/z$  of the Ag, an approx. detn. of the sp. gr. of the 0.025% amalgam was made, and gave 1.00040 compared with Hg as 1. From this,  $V_{Ag} = 6.67$  cc. Diffusion consts. were calcd. for valences of 1-3, and from the analogy to Au, the value  $1.0 \times 10^{-4}$  cm. per sec., corresponding to a valence of 2, is the most probable.

E. R. Rushton

The predominant role of association in the dissociation of simple straight-chain sulfonic acids in water. I. Conductivity. J. W. McBain and Margaret D. Betz. *J. Am. Chem. Soc.* 57, 1905-9 (1935).—In dil. solns. the straight-chain sulfonic acids are simply partially dissociated electrolytes. At about 0.05 N the cond. goes through a max. and then with increasing concn. rises above the min. by 18, 36 and 45% for undecyl, lauryl and myristyl sulfonic acids, resp. This behavior is explained by an assocn. of like ions to form ionic micelles, whose equiv. cond. in concd. solns. is as large as that of the OH ion. The assocn. masks the effects of interionic attraction. II. Freezing point. *Ibid.* 1909-12.—The osmotic coeffs. of undecyl and lauryl sulfonic acids pass through a min. in dil. soln., rising again with concn. by about 25%. The graphs of  $\rho/\sqrt{m}$  against  $\sqrt{m}$  (C. A. 24, 3417) exhibit a highly characteristic form, which departs strikingly from that of strong electrolytes or that of any simple weak electrolyte or nonelectrolyte. The interpretation of the data is that, whereas in dil. soln. they are simple moderately weak electrolytes, with increased concn. mols. and ions assoc. into neutral and ionic micelles, resp., but that some micelles, owing to the wide spacing of their charges, have ionic strength similar to that of univalent electrolytes. III. Electromotive force. *Ibid.* 1912-16.—Existing  $e. m. f.$  data for HCl with a 3.5 N KCl bridge were compared with values computed from diffusion potentials and the activity coeffs. of HCl on the assumption that  $f_{\text{H}^+} =$

$f_{\text{Cl}^-} = f_{\text{HCl}}$ . Discrepancies were noted which became large, rising to 10 mv. for 1 N HCl. The addn. of HCl to these colloidal electrolyte solns. of sulfonic acids produced more effect upon  $e. m. f.$  than in water, showing that the ionic micelles cannot be regarded as equiv. to multivalent ions in which the charges are concd. in a point. In very dil. soln. the sulfonic acids behave as weak electrolytes and the degree of dissocn. rapidly falls, but in more concd. soln. remains almost const. or tends to rise again. IV. Comparison of results, and so-called "Hammarsten effects". James W. McBain. *Ibid.* 1916-20.—The H-ion concn. deduced from cond.,  $f$ ,  $p$ , and  $e. m. f.$  for solns. of simple sulfonic acids above 0.1 N are compared. Cond. and  $e. m. f.$  (single electrode) agree in showing that the dissocn. of the colloidal electrolyte is about 50%. If the data for thymonucleic acid and for undecyl, lauryl, myristyl and cetyl sulfonic acids are valid, it is shown that the activity coeffs. of single ions may be measured. For example, in more concd. solns. of HCl, the activity coeff. of the H ion appears to be about half that of the Cl ion and  $f_{\text{H}^+} < f_{\text{Cl}^-}$  where  $f_{\text{HCl}} = f_{\text{H}^+} f_{\text{Cl}^-}$ . A new explanation of the genuine Hammarsten effect is given, based upon steric hindrance to close packing.

E. R. Smith

The conductance of nonaqueous solutions. I. Sodium triphenylboron and disodium tri- $n$ -naphthylboron in diethyl ether. Henry E. Bent and Maurice Dorfman. *J. Am. Chem. Soc.* 57, 1924-7 (1935).—The sp. resistances of Na triphenylboron and of disodium tri- $n$ -naphthylboron at dilns. from  $10^{-4}$  to  $10^{-7}$  mols. per l. in Et<sub>2</sub>O were measured at 0° and 25° by both a  $c$ - and  $d$ - $c$  methods. The bearing of these results on the structure of disodium tri- $n$ -naphthylboron is discussed.

L. W. Elder

Structure of electrolytic solutions. H. Falkenhagen. *Ergebnisse exakt. Naturw.* 14, 130-200 (1935).—A review of the Milner-Debye theory of strong electrolytes. This accounts quantitatively for thermodynamically reversible and irreversible processes in very dil. solns. Investigation of concd. solns., and of those in which the solvent has a lower dielec. const. than water, is only just beginning from this standpoint.

C. D. West

Verification of Brønsted's principle. Seiji Kaneko. *J. Chem. Soc. Japan*, 56, 1035-6 (1935).—The Brønsted principle (cf. C. A. 16, 2057) was derived from the theory of a strong electrolyte.

T. Katsura

The dissociation constant of cresol red in sea water. Philip H. Mitchell and Ivon R. Taylor. *J. control. ions exploration* 10, 169-72 (1935).—Values for  $pK_a$ , the logarithm of the reciprocal of the indicator dissocn. const., were calcd. for  $\alpha$ -cresol red in sea water, from the equation  $pH = \log (\text{depth alk. standard}/\text{depth acid standard}) + pK_a$ . The  $pK_a$  was detd. by the glass electrode and the ratio of the two indicated colors by a Hastings bicolorimeter. At 30°  $pK_a$  varied with chlorinity between 7.761 at 20.63 g. per kg. and 8.058 at 3.38 g. per kg.; at 20°  $pK_a$  was 7.879 at a chlorinity of 19.92 g. per kg. and 8.102 at 4.07 g. per kg.

Rex J. Robinson

The second dissociation constant of carbonic acid. Y. Kauko and V. Mantere. *Suomen Kemistilehti* 88, 34 (1935) (in German).—A preliminary report. Measurements were made in soln. with a concn. less than  $10^{-4}$  from which extrapolation to infinite diln. gave value for  $K_2$  of  $5.0 \times 10^{-11}$  at 18°.

E. E. Jukkola

Titration curves and dissociation constants of  $\beta$ -isocrotonic acid (vitamin C) and diethyl dihydroxymaleate. W. D. Kumler and T. C. Daniels. *J. Am. Chem. Soc.* 57, 1929-30 (1935).—The titration curves of  $\beta$ -isocrotonic (I) and diethyl dihydroxymaleate (II) in alc.-H<sub>2</sub>O soln. and of I in H<sub>2</sub>O soln. were detd. The  $pK_a$  values of these compds. were measured and I was found 1000 times as strong as II. The apparent inability of the enolized  $\alpha$ -hydroxy- $\beta$ -ketone ester type of compd. to account for the acid properties of I suggests that some other grouping is responsible for its large first dissocn. const.

W. L. L.

The activity coefficient of bicarbonate ions. Yrjö Kauko and J. Carlberg. *Z. Elektrochem.* 41, 721-4 (1935).—Kauko (C. A. 28, 3337) worked out a method for detg. the concn. of CO<sub>3</sub> by measuring the change in  $pH$  of a bicarbonate soln. through which the air is passed,

and calcg. the partial pressure of  $\text{CO}_2$  from a formula, in which one of the terms is the activity coeff. of the bicarbonate ion. This coeff. is calcd. from the  $p_n$  obtained by the authors (C. A. 29, 5721) and found to agree with the value found by E. Güntelberg and E. Schüdt (C. A. 23, 1335). The soly. of  $\text{CO}_2$  did not vary with the rate at which it was passed through the soln., as reported by McInnes and Belcher (C. A. 28, 231). It is necessary to work very carefully to keep the temp. const. The heat of the reaction  $\text{CO}_2 + \text{H}_2\text{O} \rightleftharpoons \text{H}^+ + \text{HCO}_3^-$  was calcd. thermodynamically and found to agree with the values detd. calorimetrically.

The "salting-in" of hydrogen peroxide by electrolytes M. H. Gorin. *J. Am. Chem. Soc.* 57, 1075-8 (1935); cf. Livingston, C. A. 23, 755.—The activity coeff. of  $\text{H}_2\text{O}_2$  detd. by measuring its distribution between  $\text{H}_2\text{O}$  or salt soln. and isomyl alc., is less than unity in solns. of  $\text{KCl}$ ,  $\text{NaCl}$ ,  $\text{NH}_4\text{Cl}$ ,  $\text{KNO}_3$ ,  $\text{NaNO}_3$ ,  $\text{NH}_4\text{NO}_3$  and  $\text{NH}_4\text{Cl}$ . The phenomenon is attributed to the higher dipole moment of  $\text{H}_2\text{O}_2$  relative to  $\text{H}_2\text{O}$  in salt solns. The order of salting-in is  $\text{K}^+ > \text{NH}_4^+ > \text{Na}^+ > \text{H}^+$  and  $\text{SO}_4^{2-} > \text{Cl}^- > \text{NO}_3^- > \text{ClO}_4^-$ . The relation of this series to the salting-out series for other nonelectrolytes is discussed on the basis of the relative configurations of  $\text{H}_2\text{O}_2$  and  $\text{H}_2\text{O}$ .

L. W. Fisher

Activity coefficients of bismuth chloride in hydrochloric acid solutions Thos. De Vries and F. M. Hattor. *Proc. Indiana Acad. Sci.* 44, 133-43 (1934).—Cells of the type  $\text{Bi}|\text{Hg}_2\text{Cl}_2$  (2 phase),  $\text{BiCl}_3(m)$ ,  $\text{HCl}(m)|\text{Hg}_2\text{Cl}_2$ ,  $\text{Hg}$  were studied at 25° at 3 different  $\text{HCl}$  concns. and widely different  $\text{BiCl}_3$  concns. The results show that practically all the  $\text{Bi}$  is in the soln. as the complex ion  $\text{BiCl}_4^-$ , with a dissociation constant of the order of magnitude  $2.88 \times 10^{-4}$ . The molal electrode potentials for the cells  $\text{Bi}(s)$ ,  $\text{Bi}^{+++}$  and  $\text{Bi}(s)$ ,  $\text{BiCl}_4^-$ ,  $\text{Cl}^-$  are 0.277 and 0.1678. The mean activity coeff. for  $\text{BiCl}_3$  in  $\text{HCl}$  solns. with an ionic strength  $\mu$  is  $\log \gamma = \frac{-1.612\sqrt{\mu}}{1 + 0.0231\sqrt{\mu}}$ . This assumes that the activity coeff. is the same for  $\text{BiCl}_3$  as for  $\text{Cl}^-$ .

W. J. Peterson

Activity of chlorine ions in solutions of some complex chlorides of cobalt and chromium. Marcel Chatelet and I. Iancoski Kertesz. *Compt. rend.* 201, 817-19 (1935).—The potential of the  $\text{AgCl}$  electrode in the cell  $\text{Ag}|\text{AgCl}, \text{X}, \text{gelose}|\text{Hg}_2\text{Cl}_2$ ,  $\text{Hg}$ ,  $\text{HCl}$  was detd. for  $\text{X} = \text{KCl}$ ,  $\text{BaCl}_2$ ,  $[\text{Co}(\text{NH}_3)_4]\text{Cl}_2$  (I),  $[\text{Co}(\text{NH}_3)_5]\text{Cl}_2$  (II), and  $[\text{Cr}(\text{NH}_3)_6]\text{Cl}_3$  (III). The results for I and II closely resemble those with  $\text{KCl}$ , those with III those with  $\text{BaCl}_2$ , implying that I and II apparently have only one ionizable  $\text{Cl}^-$ , while III, especially in solns. of concn. less than 0.0005  $M$ , has two.

C. A. Silberrad

Standard electrode potential of lithium in methyl alcohol. Angus MacLachlan and Harold Hartley. *Phil. Mag.* 20, 611-16 (1935); cf. C. A. 23, 3127.—The e. m. f. of the cell  $\text{Li amalgam (0.3\%)}|\text{LiCl}$  in  $\text{MeOH}|\text{AgCl Ag}$  is 2.296 v for a 0.1  $M$   $\text{LiCl}$  soln. and 2.321 v for a 0.05  $M$  soln. From these data in conjunction with others previously found, the standard electrode potential of  $\text{Li}$  in  $\text{MeOH}$  is  $-3.095$  v. The failure of the Born equation to reproduce the values of the partial molal free energy of transfer from infinitely dil. solns. is discussed.

F. J. Rosenbaum

First ionization constant of carbonic acid, 0° to 38°, from conductance measurements. Theodore Shidlovsky and D. A. MacInnes. *J. Am. Chem. Soc.* 57, 1705-10 (1935).—To check the results of MacInnes and Belcher (C. A. 28, 231), who detd. the first ionization const. of  $\text{H}_2\text{CO}_3$  working with concn. cells this const. was detd. from cond. measurements at 0°, 15°, 25° and 38°. The relative conductances of satd.  $\text{CO}_2$  solns. and of 0.001  $N$  solns. of  $\text{KHCO}_3$ ,  $\text{KCl}$  and  $\text{HCl}$  were detd. The conductivities of  $\text{H}_2\text{CO}_3$  and  $\text{KHCO}_3$  were measured at 25°. The thermodynamic dissociation const. of  $\text{H}_2\text{CO}_3$  as a monobasic acid was calcd. from the data and the ionization const.  $K_1$  found. The values of  $K_1$  are  $4.31 \times 10^{-7}$  at 25° and  $1.82 \times 10^{-7}$  at 38°, corresponding closely to the values of  $4.5 \times 10^{-7}$  and  $4.0 \times 10^{-7}$  obtained at these temps. by MacInnes and Belcher. The heat  $\Delta H$  of the reaction  $\text{H}_2\text{O} + \text{CO}_2 =$

$\text{H}^+ + \text{HCO}_3^-$  was calcd. for each of the temps.

J. W. Shipley

Ionization constant of acetic acid in methyl alcohol-water mixtures from 0° to 40°. Herbert S. Harned and Norris D. Embree. *J. Am. Chem. Soc.* 57, 1669-70 (1935); cf. C. A. 28, 6611.—The e. m. f. of the cells  $\text{H}_2|\text{HIOAc}(m), \text{NaAc}(m), \text{NaCl}(m)|\text{AgCl Ag}$  in 10 and 20% by weight  $\text{MeOH-H}_2\text{O}$  mixts. were measured at 0°, 10°, 20°, 25°, 30° and 40° in cells without liquid junctions. From these and the molal electrode potentials of  $\text{Ag}|\text{AgCl}$  electrode in these mixts. the ionization const. was computed. Apparently  $\log K$  varies linearly with  $1/D$ ,  $D = \text{dielec. const.}$

J. W. Shipley

Some thermodynamic properties of univalent halide mixtures in aqueous solution. Herbert S. Harned. *J. Am. Chem. Soc.* 57, 1865-73 (1935).—Measurements of the e. m. f. of the cells,  $\text{H}_2|\text{HCl}(0.01 M), \text{NaCl}(m)|\text{AgCl Ag}$ , with  $m$  varying from 0 to 3, and at temps. from 0° to 60°, are reported. Calcs. were made for other halide mixts. from previous data, and the results are discussed in relation to the original and extended theory of ionic interaction.

F. D. Rossini

The thermodynamics of ionized water in sodium chloride solutions. Herbert S. Harned and George E. Mannweiler. *J. Am. Chem. Soc.* 57, 1873-6 (1935).—Data are reported on the e. m. f. of the cells,  $\text{H}_2|\text{NaOH}(0.01 M), \text{NaCl}(m)|\text{AgCl Ag}$  and  $\text{H}_2|\text{HCl}(0.01 M), \text{NaCl}(m)|\text{AgCl Ag}$  at temps. from 0° to 60°, and with  $m$  varying from 0 to 3. From these data were calcd. the ionization const. of water, the ion activity coeff. product of water in  $\text{NaCl}$  solns., the heat of ionization of water, and the partial molal heat of ionization of water in  $\text{NaCl}$  solns. The logarithm of the ionization in alkali halide solns.,  $\log m_{\text{H}_2\text{O}}$ , at a given concn. varies linearly with the sum of the reciprocals of the ionic radii.

F. D. Rossini

Hydrogen-ion concentration ( $p_n$ ) determination with two-color indicators by a dilution method. J. McCrae. *J. S. African Chem. Inst.* 18, 62-6 (1935).—The accuracy of results from the double-wedge and the colorimeter methods of detg.  $p_n$  is due to the continuous changing of the comparison colors. Results comparable in accuracy with the double-wedge method are achieved by maintaining the concn. of an indicator in one condition (acid or alk.) const., while reducing by diln. the concn. of an indicator in the other condition (alk. or acid).

B. E. Anderson

Glass electrodes. Philip I. Varney. *Science* 82, 396-7 (1935).—The construction of glass electrodes is described in detail.

G. M. P.

Potential oscillations of iron in nitric acid. H. M. Karschulan. *Z. Elektrochem.* 41, 664-7 (1935); cf. C. A. 29, 4214.—When Arno Fe is placed in a 30 or 40%  $\text{HNO}_3$ - $\text{H}_2\text{O}$  soln. a thin red-brown layer is formed in the soln. at the metallic surface. The film is thinner in the less concd. soln. In the less concd. acid a fine gray etched surface is formed on the Fe while with the higher acid concn. the surface is etched with the higher luster. The metal goes periodically into soln. with the periodic formation of gas. The absorption spectrum of this brown film of liquid is identical with that of  $\text{Fe}(\text{NO})_2(\text{NO})_2$ . The periodic soln. of Cu in  $\text{HNO}_3$ - $\text{HCl}$  mixts. behaves similarly in the formation of such a complex.

H. A. S.

Equilibrium between propyl alcohol, propyl ether and water at 190°. N. G. Gayendragad and S. K. K. Jankar. *J. Indian Chem. Soc.* 12, 486-93 (1935).— $\text{Et}_2\text{O}$  is of little use industrially in India on account of its low b. p. and consequently studies of the equil. of the prepn. of  $\text{Pr}_2\text{O}$  (I) by the dehydration of  $\text{PrOH}$  (II) have tech. as well as theoretical importance. Dehydration of II in the vapor phase in the presence of fresh activated  $\text{K}^+$  alum was carried out in the app. previously described (C. A. 27, 654). The products were analyzed by sepg. the I with satd.  $\text{NaCl}$  soln. and removing II by the addn. of 60%  $\text{H}_2\text{SO}_4$ . The opt. temp. for the reaction is 190°, at which temp. the equil. corresponds to 84% conversion. I is more stable than II to the action of the catalyst and conse-

quently I cannot be the intermediate product in the dehydration of II to propylene. C. R. Addinall

Hydrolysis of cupric sulfate solutions. Ossiander. *Compt. rend.* 201, 893-4 (1935); cf. C. A. 28, 4997<sup>1</sup>.—A series of aq. solns. of  $\text{CuSO}_4$  of varying concn. was boiled for 1 hr., and a second series, all of the same concn., for periods of 0.25–12 hr. In all the  $p_n$  decreased, the more so as concn. was greater. Examd. by the method of residues the solid phases were  $\text{CuO} \cdot \text{SO}_3 \cdot 4\text{H}_2\text{O}$  when the concn. did not exceed 0.08 M, and  $3\text{CuO} \cdot \text{SO}_3 \cdot 2\text{H}_2\text{O}$  from more concd. solns. Both are insol and show characteristic x ray spectra. There was no trace of Powles' salts (C. A. 20, 3401). C. A. Silberrad

The dissolving of silver in cyanide solution. A. Simon and H. Deckert. *Z. Elektrochem.* 41, 737-8 (1935).—The presence of 82.5% of the theoretical amt. of  $\text{H}_2\text{O}_2$  as an intermediate product in the soln. when air was passed in showed that the reactions are analogous to those for Au. The addn. of  $\text{H}_2\text{O}_2$  increased the rate of soln., a max. being obtained at 0.3%  $\text{H}_2\text{O}_2$  in 1% CN soln. At higher concns. of  $\text{H}_2\text{O}_2$  and lower concns. of CN, the Ag was colored yellowish brown to brownish black by oxidation products which interfere with soln. Fe, Cu and Mn salts and  $\text{K}_2\text{SO}_4$  decrease the rate of soln. in the presence of  $\text{H}_2\text{O}_2$ .  $\text{MnSO}_4$  forms a dirty green adherent deposit which stops soln. almost completely. Data on the effect of  $\text{FeSO}_4$  are given. Its effect may be due either to the formation of complex CN ions or to the catalytic decompn. of  $\text{H}_2\text{O}_2$ . The velocity of the air-stream has a decided effect, in proportion to the concn. of CN, on the rate of soln., which also varies with  $p_n$ . Ag is insol in aq. HCN, which retards soln. in the presence of air. Alkalis and  $\text{Ce}(\text{OH})_3$  also decrease the rate of soln. E. R. Rushton

Thermal decomposition of  $\text{CrO}_3 \cdot 3\text{NH}_3$ . Wm. F. Ehret and Arthur Greenstone. *J. Am. Chem. Soc.* 57, 2330-1 (1935).— $\text{CrO}_3 \cdot 3\text{NH}_3$  (I) loses practically no  $\text{NH}_3$  upon standing for 4 months over concd.  $\text{H}_2\text{SO}_4$  in vacuo at room temp.; at 1 mm or less and at 120° there results the compd.  $\text{CrO}_3 \cdot \text{NH}_3$  (II), at 1 cm a mixt. of the 2 compds. results. The presence of small amts. of impurities has a marked effect on the rate of decompn. of I, which may be explosive. Radiation is essential for starting the reaction. I detonates near 200°, leaving  $\text{Cr}_2\text{O}_3$ , the d. is 2.073 at 23°. C. J. West

Considerations of the mechanism of chemical reactions. C. N. Hinshelwood. *J. Chem. Soc.* 1935, 1111-25, cf. C. A. 28, 1254<sup>1</sup>.—Various uncoordinated results of chem. kinetics are discussed in an endeavor to bring them into relation. The efficiency of activating collisions, the catalysis of many homogeneous unimol. reactions by I vapor, and the occurrence of bimol. reactions in soln. are discussed particularly. P. H. Emmett

Kinetics of the reaction between permanganate and manganous ions. Milton J. Pohsarr. *J. Phys. Chem.* 39, 1057-66 (1935).—In acid soln. the reaction between  $\text{MnO}_4^-$  and  $\text{Mn}^{2+}$  to give  $\text{MnO}_2$  is autocatalytic and has an incubation period.  $\text{MnO}_2$  prep'd. in neutral soln. is a more effective catalyst than that prep'd. in acid soln. The reaction rate is increased by a decrease in the acidity. Sulfate and fluoride ions form complexes with the manganous ion. In a mixt. of  $\text{MnO}_4^-$ ,  $\text{Mn}^{2+}$  and oxalic acid, the oxalic acid can form a manganous oxalate complex or it can be oxidized. The amt. oxidized depends on the ratio  $[\text{Mn}^{2+}]/[\text{H}_2\text{C}_2\text{O}_4]$ . E. J. Rosenbaum

Rates of reaction of sodium atoms with hydrogen and deuterium chlorides. C. E. H. Bawn and A. G. Evans. *Trans. Faraday Soc.* 31, 1392-1400 (1935).—The rates of these reactions were studied by the diffusion flame method. For  $\text{Na} + \text{HCl} \rightarrow \text{NaCl} + \text{H}$  the rate is 0.412 cc. mol<sup>-1</sup> sec<sup>-1</sup>, while for  $\text{Na} + \text{DCl} \rightarrow \text{NaCl} + \text{D}$  the rate is 0.344 cc. mol<sup>-1</sup> sec<sup>-1</sup>. The activation energies calcd. from the rates differ by 300 cal. This is approx. equal to the difference between the zero point energy differences in the initial and crit. transition states of HCl and DCl. E. J. Rosenbaum

Mechanism of the chain reaction in the oxy-hydrogen mixture. Marcel Prettre. *Compt. rend.* 201, 728-30 (1935); cf. C. A. 29, 3900<sup>1</sup>.—By detg. the velocity of the

reaction  $2\text{H}_2 + \text{O}_2 = 2\text{H}_2\text{O}$  during the time in which the proportion combined increases from 10 to 20% at various pressures the equation  $-dp/dt = k_1 p^{1/2} / (1 + k_2 p^{1/2})$  is deduced. The figure thus derived, 95,000 = 6000, for the energy of activation agrees fairly well with that (80,000) deduced from Haber's representation of the mechanism of the reaction (cf. C. A. 23, 772). C. A. Silberrad

Kinetics of oxidation of metallic wires. Gabriel Valeau. *Compt. rend.* 201, 602-4 (1935); cf. C. A. 29, 7843<sup>1</sup>.—The rate of oxidation of metallic wires is investigated mathematically. For cases where the oxide forms a protecting layer, the rate of diffusion of O across the layer is the chief detg. factor. The results agree with expt. for Ni wires of varying diam. C. A. Silberrad

The factors determining the velocity of reactions in solution. The formation of quaternary ammonium salts in benzene solution. C. A. Winkler and C. N. Hinshelwood. *J. Chem. Soc.* 1935, 1147-51.—The rates of 12 reactions of alkyl halides with tertiary amines and with pyridine and quinoline in  $\text{C}_6\text{H}_6$  solns. were detd. at a series of temps. In the general equation for a bimol. reaction,  $\text{rate} = PZ e^{-E/RT}$ , it is found that P is of the order of  $10^{-4}$  to  $10^{-5}$  for the 12 reactions. E varies from 8790 cal. for  $\text{Me}_3\text{N}$  and  $\text{MeI}$  to 18,000 cal. for pyridine and  $\text{iso-PrI}$ . In general the rate of reaction seems to depend primarily upon the value of E though marked decreases in the values of P occur on passing from Et halides to Pr halides, from  $\text{Me}_3\text{N}$  to  $\text{Et}_3\text{N}$ , from pyridine to quinoline and from iodides to bromides. P. H. Emmett

The homogeneous unimolecular decomposition of gaseous alkyl nitrates. IV. The decomposition of isopropyl nitrate. L. W. R. Steacie and G. T. Shaw. *Proc. Roy. Soc. (London)* A151, 685-93 (1935); cf. C. A. 29, 4999<sup>1</sup>.—The thermal decompn. of  $\text{iso-PrONO}$  is a homogeneous first-order reaction in the range 170–210°. The mechanism of the decompn. is analogous to those of the other alkyl nitrates:  $\text{Me}_2\text{CHONO} = \text{NO} + 1/2 \text{Me}_2\text{CO} + 1/2 \text{Me}_2\text{CHOH}$ . The rate of reaction  $K = 1.2 \times 10^{11} e^{-11000/RT}$  sec<sup>-1</sup>. For  $\text{PrONO}$ ,  $K = 2.75 \times 10^{11} e^{-11000/RT}$  sec<sup>-1</sup>. The ratio  $K_n/K_o$  is 1.09. The decompn. activation energies are: n., 37,560, iso., 37,000 cal/g. mol. G. M. P.

The thermal decomposition of triethylamine. F. A. sin Taylor and Edwin E. Juterbock. *J. Phys. Chem.* 39, 1103-10 (1935).—The thermal decompn. of  $\text{Et}_3\text{N}$  over a pressure range of 15–400 mm. at temps. from 450° to 500° is homogeneous with an energy of activation in its early stages of 50,000 cal. Analysis of intermediate products suggests that the mechanism involves the formation of  $\text{Et}_2\text{NNEt}$  and  $\text{C}_2\text{H}_5$  with subsequent decompns. H. W. Leahy

The thermal decomposition of nitromethane. H. Austin Taylor and Vladimir V. Vesselsky. *J. Phys. Chem.* 39, 1095-1101 (1935).—The main reaction appears to be a homogeneous unimol. splitting of  $\text{MeNO}_2$  into  $\text{MeNO}$  and O, with an energy of activation of approx. 61,000 cal. The complexity of the subsequent reaction does not permit a further analysis of the observed kinetic data. H. W. Leahy

Photolytic and thermal decomposition products of azo methane. Thermal reaction rates in quartz, 260° to 290°. Lawrence J. Heidt and Geo. S. Forbes. *J. Am. Chem. Soc.* 57, 2331 (1935).—Pressure readings at room temp. –78° and –183° at various stages of decompn. of azo methane (I), show that upon complete decompn. the pressure is approx. double the initial pressure of I and the ratio of the pressure increase at room temp. due to the presence of "permanent" gases formed by the reaction diminishes from a value of at least 2, in the initial stages, to 1 at complete decompn. To explain these facts it is assumed that the products include, with N, largely  $\text{CH}_4$ . These observations hold for photochem. decompn. at 30° and for thermal decompn. at 300°. The thermal reaction rates in quartz fit the unimol. formula, like Ramsperger's, but the rate consts. are roughly half as great as his. The 10° coeff. from the dark reaction rates at 260°, 270°, 280° and 290° is 2.9 and apparently affected but little by the presence of Hg vapor. C. J. West

**Kinetics and mechanism of thermal conversions of unsaturated hydrocarbons. I. Thermal polymerization of 1,3-butadiene at atmospheric pressure.** V. G. Moor, N. V. Strigaleva and L. V. Sinyayeva. *J. Gen. Chem. (U. S. S. R.)* 5, 818-29 (1933).—The kinetics and mechanism of the thermal polymerization of 1,3-butadiene were studied at atm. pressure and a temp. interval of 400° to 700°. The reaction was performed in a Cu coil heated in a Pb bath and in a vertical porcelain tube heated electrically. The primary thermal reaction is bimol of the general formula:  $2C_4H_6 \rightarrow C_8H_{12}$ . The rate is expressible by the formula  $\log_{10} K = (9400/T) + 7.32 \pm 0.04$ . The energy of activation is  $E = 28,000$  cal/mol. The temp. coeff. is 1.24. The 2 methods of thermal polymerization produced substantially equal results. C. B.

**The kinetics of the reaction between carbonyl sulfide and water.** H. W. Thompson, C. F. Kearton and S. A. Lamb. *J. Chem. Soc.* 1935, 1033-7.—The kinetics of the reaction between COS and H<sub>2</sub>O occurring in aq. soln. in alc. and in the gas phase were examd. In the latter 2 cases, the bimol. reaction observed is some powers of 10 slower than would be calcd. from theory by use of the observed energy of activation. In aq. soln. the measured rate is slightly greater than the calcd. rate. O<sub>2</sub> is apparently being an effective catalyst. P. H. I.

**The kinetics of absorption of oxygen by catechol.** M. A. Joslyn and G. E. K. Branch. *J. Am. Chem. Soc.* 57, 1779-85 (1935).—The rate of O<sub>2</sub> absorption by catechol solns. ranging from  $pH$  0.5 to 10 is  $k[cat][O_2]/[C](C+A)$ , where  $cat$  is the concn. of the univalent catechol ion,  $C$  the concn. of total catechol and  $A$  is a const. The effects of  $pH$  outside of this range and of added KCl are also reported. The heat of activation from 20° to 35° is higher in phosphate buffer than in NaOH soln. because of the difference in heats of neutralization of phosphate and OH anions by catechol. L. W. L.

**Kinetics of solid-phase reactions of certain carbonates with mullite, silses and alumina.** Gordon R. Pole and Nelson W. Taylor. *J. Am. Ceram. Soc.* 18, 327-37 (1935).—Rates of reactions between sized solids were detd. at several temps. by detg. the CO<sub>2</sub> evolved as a function of time. While the abs. rate is a function of grain size and other factors, the temp. coeff. gives a const. characteristic of the chem. system involved. The reaction product is found to lessen the period of reaction in accordance with the relation  $dy/dt = k/y$ , where  $y$  = thickness of the layer of reaction product. Under comparable conditions, Na<sub>2</sub>CO<sub>3</sub> attacks mullite most easily, with less attack on quartz, and least on corundum. The activity of CaCO<sub>3</sub> on mullite, quartz and corundum is less marked. The results have direct bearing upon the mechanism of glass melting and the corrosion of refractories. In prep. mullite by heating mixts. of cristobalite and Al<sub>2</sub>O<sub>3</sub> plus a little CaO as flux, batches that lie in the compn. triangle mullite-aorthite and SiO<sub>2</sub> give best results. C. H. Kerr.

**The determination of the absolute temperature of the freezing point of water.** V. Vitold Jaczyca. *Z. Physik* 97, 107-12 (1935).—By use of the exact form of the Joule-Thomson expression for  $\mu$ , it is deduced from exptl. data of Holborn, Otto, Heuse, Roebuck, Osterberg and others that  $273.17 < \mu_0 < 273.23$ . B. Swales.

**The change, with time, of the vapor pressure of mixtures of the hydrogen isotopes at 20.38° absolute.** K. Steiner. *Physik. Z.* 36, 659-60 (1935).—Mixts. contg. 2.4, 13.9, 24.6, 47.8 and 94.3 atoms % of D, resp., showed lowerings in vapor pressure, in 10 hrs., of 5.6, 13.2, 18.6, 23.3 and 50 mm. Hg. The observed relation between the change in vapor pressure and the atoms % of D is approx. parallel with the H/D content of the resp. samples. F. D. R.

**Difference in vapor pressures of ortho- and para-deuterium.** F. G. Brickwedde, R. B. Scott and H. S. Taylor. *J. Chem. Phys.* 3, 653-60 (1935); cf. C. A. 29, 6005.—The differences between the vapor pressures,  $\Delta P(e-n)$ , of the 20.4°K. equl. mixt. and the normal mixt. of the ortho and para varieties of D<sub>2</sub> were detd. from 15° to 20.4°K.  $\Delta P(e-n)$  for D<sub>2</sub> is small as compared with  $\Delta P(e-n)$  for H<sub>2</sub>, but  $[\Delta P(\text{ortho-para})/P(n)]$  is approx. equal for D<sub>2</sub> and H<sub>2</sub> at the same temp. The uncatalyzed

change with time of the vapor pressure of liquid normal D<sub>2</sub> is less than 1 mm. Hg in 200 hrs.; that of liquid normal H<sub>2</sub> increases 1 mm. in 4 hrs. The difference in rates is attributed to the difference in magnetic moments. If Wigner's theory of ortho-para conversion by paramagnetic mols. in the gaseous phase is extended to the liquid phase, a ratio of  $1/\omega$  is obtained for the ratio of the rates of change of the vapor pressures of liquid normal D<sub>2</sub> and H<sub>2</sub>. By use of purer D<sub>2</sub> than that previously used, the b. p. was found to be 21.59°K. and the triple point 18.71°K. and 128.7 mm. Hg. Differences between the latent heats of vaporization of the ortho- and para-forms of solid and liquid D<sub>2</sub> are calcd., and are found to be smaller than that for liquid H<sub>2</sub>. There is free rotation in condensed states of D<sub>2</sub> just as with H<sub>2</sub>. G. M. P.

**Vapor pressures of solid krypton.** W. H. Keessom, J. Mazur and J. J. Meihuizen. *Physica* 2, 669-72 (1935).—Vapor pressures of solid Kr were detd. at temps. from 78 to 116° abs. by the Cath app. (C. A. 13, 2477). The triple point is at 115.94° abs.  $\pm 0.03$ ,  $p = 54.9$  cm.  $\pm 0.15$ . The values are in fair agreement with a 5-term theoretical equation in which the heat of vaporization at 0° abs. is taken as 2633 cal. per mole, the at. heat of the solid is calcd. from a Debye equation with  $\theta = 55$ . Values for  $p$  in cm. are at 75°  $\pm 0.101$  and at successive 5° points up to 115° abs. 0.311, 0.834, 2.005, 4.294, 8.92, 16.94, 30.2 and 50.7 cm. B. J. C. van der Hoeven.

**Comments on "vapor pressure measurements of high-boiling metals" by Baur and Brunner.** Joseph Fischer. *Helv. Chim. Acta* 18, 1028-9 (1935), cf. C. A. 29, 973\*.—The app. of von Wartenburg as used by B and B is unsuitable for b. p. measurement. Reply: Emil Baur and Roland Brunner. *Ibid.* 18, 1030. L. W. Elder.

**The interpretation of the dissociation pressures of the palladium-hydrogen system.** Max H. Hey. *J. Chem. Soc.* 1935, 1254-8. cf. C. A. 29, 7718\*.—A kinetic equation was derived for expressing the behavior of compds. of a volatile and a nonvolatile component that can undergo partial or complete dissociation without the formation of a new solid phase. This equation was applied to the Pd-H<sub>2</sub> system on the assumption that only one phase is present throughout. From the available data, which do not strictly represent equilibria, the conclusion is drawn that the limiting compn. is PdH<sub>3</sub>, which has possibly the same structure as NaCl. H. S. v. K.

**Piezometric researches. I. Effect of high pressures on the temperatures of fusion and transformation of organic compounds.** Louis Deleff. *Bull. soc. chim. Belg.* 44, 97-139 (1935); cf. C. A. 29, 3221\*.—3 for the temps. of fusion and transition, resp. are: cetyl alc., 1.070, 1.058, C<sub>18</sub>H<sub>38</sub>, 1.067, 1.065, methylcyclopentanol, 1.058, 1.071, acetophenone, 1.071, 1.071. Values of  $\Delta T$  for the m. p. of the stable and unstable forms, resp., are: cetyl iodide, 1.060, 1.055;  $\alpha$ -nitrotoluene, 1.075, 1.073;  $\alpha$ -toluidine, 1.071, 1.068; salol, 1.082, 1.082; MeI, 1.067, 1.066. Complete data of values for other compds. are tabulated. The equation  $\delta = 1 + \frac{\Delta V}{V}$ ,  $\Delta V$  = changes

in vol. with pressure,  $V$  = the heat of fusion, is shown to apply. An attempt is made to relate  $\delta$  with the chem. structure. R. E. DeKraft.

**The dimorphism of trinitroresorcinol, bromophenylhydrazine and benzaldehyde p-nitrophenylhydrazide.** R. Fischer and A. Köfler. *Mikrochimie* 19, 35 (1935).—As a result of microsublimation tests, 2 kinds of crystals are found with each of the 3 substances mentioned. With trinitroresorcinol the stable crystals are monoclinic and  $m$ . at 177°, the unstable crystals are trigonal and  $m$ . at 165.5°. The stable modification of bromophenylhydrazide forms monoclinic crystals  $m$ . 165°, the unstable crystals are also monoclinic but  $m$ . at about 159°. With benzaldehyde p-nitrophenylhydrazide, both species of crystals appear to be monoclinic. The  $m$ . p. of the more stable form is 251-2° and of the less stable form 234-6°. W. T. H.

**Application of the "thaw-melting point" method to binary inorganic systems.** A. Benrath, P. Hartung and

M. Wüden *J. prakt. Chem.* 143, 208-204 (1935), cf. Rheinboldt, *C. A.* 29, 693. —The results are given in 20 diagrams. Binary melts of  $M(NO_3)_3 \cdot 6H_2O$ , where  $M = Co, Ni, Mn, Mg$ , all give a single solid soln, while systems of  $Zn(NO_3)_2 \cdot 6H_2O$  with the preceding show 2 solid solns. The systems  $Ni(NO_3)_2 \cdot 6H_2O - M(NO_3)_3 \cdot 6H_2O$ ,  $M = Co$  or  $Zn$ , are of the single solid-soln type. Systems of  $Ni(NO_3)_2 \cdot 6H_2O$  or  $AgNO_3$  with these nitrate hexahydrates are of the eutectic type. The m. ps. of  $M(NO_3)_3 \cdot 6H_2O$ ,  $M = Ni, Mg, Co, Zn, Mn$ , are 204°, 193°, 191°, 163° and 153°, resp. Binary systems of these compounds with one another are all of the single solid-soln type. The systems  $M - NO_3 \cdot 6H_2O - M(ClO_4)_3 \cdot 6H_2O$  are of the eutectic type. The reciprocal salt pair  $Mg(ClO_4)_2 \cdot 11H_2O - Ni(NO_3)_2 \cdot 6H_2O$  is discussed. Michael Fleischer

Solubility studies in the systems benzene-*p*-nitrotoluene and benzene-*o*-nitrotoluene. H. D. Crookford and E. C. Powell, Jr. *J. Elisha Mitchell Sci. Soc.* 51, 143-6 (1935). —Temp.-compn. data give no evidence of compd. formation in these systems. The eutectic temp. for the *p*-nitrotoluene system is -7.2°, for the *o*-system -10.3°. The latent heats of fusion were calculated for each component as follows: *o*-nitrotoluene 2905, *p*-nitrotoluene 4100 and benzene 2475 for the *o*-system and 2750 cal. for the *p*-system. A. L. Mehring

Heterogeneous equilibrium in two-component systems with thymol as one component. Konstanty Hrynokowski and Maryja Smyt. *Arch. Pharm.* 273, 418-27 (1935). —Among other data reported for the systems thymol-urea, -acetanilide, -phenol, -salicylic acid, -salol, -antipyrine and -camphor are the eutectic values, resp., 45.0°, 30.5°, 6.7°, 46.3° and 15.6° (none obtained with antipyrine and camphor), the corresponding contents of thymol were 93.8, 15.0, 49.2, 90.2 and 37.5%. W. O. E.

The system calcium oxide-sulfur dioxide-water. I. Determination of vapor pressures and conductivities. G. W. Gurd, P. E. Gubler and O. Maass. *Can. J. Research* 13B, 579-17 (1935), cf. 27, 531, Beuchem and Conrad, *C. A.* 28, 7824. —The system  $CaO - SO_2 - H_2O$  is being investigated to det. the nature of existing equilibria, and the way in which these vary with concn. and temp. A technique is described by means of which vapor pressures and conductivities were measured over the temp. range 23° to 180° and over the concn. range 0 to 2.5%  $CaO$  and 0 to 6%  $SO_2$ . The data are systematized in tabular form. J. W. Shipley

The system  $NH_4Cl - NH_4NO_3 - H_2O$  at 0°, 25° and 50°. C. F. Prutton, J. C. Brosnec and S. H. Maron. *J. Am. Chem. Soc.* 57, 1656-7 (1935). —Sol. relationships in the system  $NH_4Cl - NH_4NO_3 - H_2O$  were detd. at 0°, 25° and 50°. The results indicated no complex salt, solid soln. or hydrate formation. J. W. Shipley

The ternary system stannous oxide-sulfur trioxide-water. Henry G. Denham and William E. King. *J. Chem. Soc.* 1935, 1251-3. —By Schreinemakers' residue method the system  $SnO - SO_3 - H_2O$  was studied at 25° and 50°.  $SnO_2$ , when dissolved in  $H_2SO_4$  at 25° and 50° does not form a hydrated normal sulfate, the only other stable phase being  $SnSO_4 \cdot SnO$ . In ternary solns the ternary phase stable at 25° is  $SnSO_4 \cdot 2SnO \cdot 4H_2O$  and the one stable at 50° is  $SnSO_4 \cdot 2SnO \cdot 2H_2O$ . H. S. v. K.

The ternary system isomyl alcohol-propyl alcohol-water. James Coul and Henry B. Hope. *J. Phys. Chem.* 39, 967-71 (1935). —The solubilities,  $d_s$  and  $w_s$  were detd. for the system iso-AMOH-*n*-POH- $H_2O$  at 25°. The lines were detd. for 9 pairs of solns. H. G.

Studies of equilibrium and surface processes in the system water-formic acid-phenol. V. I. Nestorova, N. N. Petru and K. V. Topchieva. *J. Gen. Chem. (U. S. S. R.)* 5, 848-61 (1935), cf. *C. A.* 26, 3168. —Study of the changes in the vol. surface concns. of liquid two-phase systems with 3 components and of the electrochem. properties of these solns was begun with the system  $H_2O - HCO_2H - PhOH$  by the method previously described. In the presence of sufficient  $HCO_2H$  in the mixt.  $H_2O$  and  $PhOH$  are miscible at room temp. The conductometric method of titration is most suitable for the detn. of the concn. of  $HCO_2H$  in the presence of  $PhOH$  and  $H_2O$ ,

when  $PhOH$  is not present in excess. Detd. by this method the coeff. of distribution of  $HCO_2H$  between  $PhOH$  and  $H_2O$  begins to increase with rising concn. of the acid and on reaching the value 1.732 (at the concn. of  $HCO_2H$  in the mixt. of  $10.76 \times 10^{-4}$  g./mol. per l.) drops to the mixing point. The agreement in the results of detn. of  $HCO_2H$  in the contiguous layers by the conductometric method and the "vol. method" of Kahlavok indicates that the latter procedure can be used in the study of the equal of 2-phase systems with 3 components. The "vol. method" of detn. of the changes of the concns. of  $H_2O$  in the top and bottom layers disclosed that at the crit. point of concns. these tend sharply to equalize, while the coeff. of distribution of  $H_2O$  between the contiguous layers decreases rapidly nearing 1 asymptotically. With the increasing concn. of  $HCO_2H$  in the sp. elec. cond. of the lower layer ( $PhOH$ ) invariably increases up to the crit. point, while that of the upper layer ( $H_2O$ ) at first sharply increases and then drops, whereby the position of the max. is observed at the same partial concn. of  $HCO_2H$  as in us. aq. solns. in absence of  $PhOH$ . The position of this max. also nearly corresponds with that of the coeff. of distribution of  $HCO_2H$  ( $C_1/C_2$ ). The consts. of disson of  $HCO_2H$  for the bottom  $PhOH$  layer, called by Ostwald's law of diln., show a definite trend toward an increase on approaching the crit. point, while those for the aq. solns. of  $HCO_2H$  and for the top  $H_2O - PhOH$  layer remain const. All 3 consts. differ in magnitude from each other about 100 times. Computed on the basis of elec. cond., the coeff. of distribution of undissoc. mols. of  $HCO_2H$  shows the same course in relation to its total concn. as the coeff. of distribution of the entire acid. The surface tensions of the contiguous layers at the boundary with air are equal and are independent of the total concn. of  $HCO_2H$ , remaining practically equal to the surface tension of the two-component system of  $H_2O$  and  $PhOH$ . With increase of the total concn. of  $HCO_2H$  in the system, the magnitude of surface tension at the boundary of liquid phases increases nearly rectilinearly to a crit. point. This increase is parallel to the increase of the coeff. of distribution of  $PhOH$ ; it is almost proportional to the increase of the total concn. of  $HCO_2H$  and is not in any simple relation to the coeffs. of distribution and partial concns. of  $HCO_2H$  and  $H_2O$ . Chas. Blane

Inner adsorption in salt crystals. II. Reason for inhomogeneity in a precipitate and the requirements for forming an homogeneous a precipitate as possible. D. Balazs. *Z. anorg. Chem.* 102, 241-62 (1935), cf. *C. A.* 29, 2815, 3570, 3573. —Theories concerning the formation and aging of ppts. are explained which suggest that a chemist can never hope to obtain a perfectly pure ppt., conforming absolutely to the laws of definite and multiple proportions. Ppts. as they begin to form are colloids and as such are inclined to adsorb dissolved ions or molecules present in the soln. and this adsorption is, to some extent at least, selective. The purity of a ppt. depends upon such factors as the size and habit of the "growth conglomerate," the rate of pptn., the time it is allowed to remain in contact with the mother liquor, the lattice structure of the solid changes that may take place (such as hydrolysis) on heating the crystal, etc. A few expts. are described for illustration. W. T. H.

Catalysis of hydrogenation. II. Technique of hydrogenation. A. S. Ginzberg. *J. Gen. Chem. (U. S. S. R.)* 5, 795-8 (1935), cf. Ginzberg and Ivanov, *C. A.* 25, 4173. —With the use of the previously described catalysts prep. by the addn. of Pd or Pt chloride to powd.  $Ni$ ,  $Al$ , etc., it is possible to measure exactly the amt. of  $H$  consumed in the hydrogenation of a definite quantity of an unsatd. compd., and, therefore, to det. its degree of unsatd. state, or the "H no." (cf. Grün and Holden, *C. A.* 18, 912, Fokun, *C. A.* 3, 1009). In the preliminary discussion, the app. is illustrated and described. Chas. Blane

The energetics of catalysis. V. The temperature coefficient of hydrogenation processes. Edward B. Masted and Charles H. Moon. *J. Chem. Soc.* 1935, 1190-2, cf. *C. A.* 29, 4639. —The low-temp. pos. temp. coeff. of the catalytic hydrogenation of crotonic and maleic acids

over Pt changes to a neg. temp. coeff. between 60° and 80°. The true energy of activation appears to be about 25,000 cal. per mol. for both acids. P. H. Emmett

The adsorption of hydrogen by iron synthetic-ammonia catalysts P. H. Emmett and R. W. Harkness. *J. Am. Chem. Soc.* 57, 1631-5 (1935); cf. C. A. 28, 1243; 1583. <sup>1</sup>Exptl. evidence is presented to show that the 2 types of activated adsorption of H<sub>2</sub> that occur on Fe synthetic-NiH catalysts are in part at least adsorptions on the surface of the catalysts rather than any type of soln. within the metal. The rate of the lower temp. (type A) activated adsorption agrees closely with that calcd. by assuming that all H<sub>2</sub> mole. are adsorbed that strike the catalyst with the observed energy of activation, 14,400 cal.

P. H. Emmett  
The catalytic interconversion of ortho-para hydrogen over iron, platinum and nickel catalysts P. H. Emmett and R. W. Harkness. *J. Am. Chem. Soc.* 57, 1621-31 (1935); cf. C. A. 27, 4730.—The ortho-para interconversion of H<sub>2</sub> over Fe synthetic-NiH catalyst was studied as a function of the temp., pressure, time of contact and presence of various poisons. Both types of activated adsorption of H<sub>2</sub> on Fe are poisons for the conversion of ortho to para H<sub>2</sub> at liquid-air temp. The low-temp. ortho-para conversion over Ni and Pt is also inhibited by the activated adsorption of H<sub>2</sub>. P. H. Emmett

Chemical reactivity and catalysis of solids in transformations J. Arvid Hedvall. *Stenok Kem Tids.* 47, 101-88 (1935) (in German).—A review covering 42 papers in which the following topics are discussed: X-ray radiation; metastable crystal forms with incomplete lattice structure; lattice structure with varying polarization; microstructure; crystallographic transformation and magnetic states A. R. Rose

Catalytic decomposition of hydrogen peroxide in the presence of mixed manganese and cupric salts M. Dobelsky and L. Dobelsky-Chajkin. *Compt. rend.* 201, 604-6 (1935).—Although Mn ions (e. g., MnSO<sub>4</sub> aq.) exert no catalytic action on the decompn. of H<sub>2</sub>O<sub>2</sub> and Cu ions (e. g., CuSO<sub>4</sub> aq.) very little, a mixt. of the 2 is very active. With 0.05 N MnSO<sub>4</sub> the velocity const., K, is a max. with the addn. of 0.04 N CuSO<sub>4</sub>, and with const. concn. (0.04 N CuSO<sub>4</sub>) K increases with the concn. of MnSO<sub>4</sub> to at least 0.15 N MnSO<sub>4</sub>. Other salts (except chlorides, whose action is peculiar, cf. C. A. 28, 6050<sup>1</sup>), generally retard or stop the reaction, but those of Zn and Cd accelerate it. C. A. Sutherland

The effect of ferromagnetic transformation on the catalytic power of nickel in the reaction  $2CO \rightarrow CO_2 + C$  J. Arvid Hedvall and Folke Sandford. *Z. physik. Chem.* B29, 455-63 (1935); cf. C. A. 29, 1314<sup>1</sup>.—Four kinds of Ni catalysts were prep'd. and carefully analyzed for impurities. The Curie point was det'd. for each. The reaction  $2CO \rightarrow CO_2 + C$  catalyzed with this Ni, was then studied and, as with other reactions, the rate increased sharply at the Curie point. The effect of impurities on the reaction was also studied as well as the condition of formation of Ni carbide and its effect on the reaction. O. M. Murphy

The mechanism of carbon oxidation in the presence of certain metallic oxides. Don Martin and J. E. Day. *Proc. Indiana Acad. Sci.* 44, 118-20 (1934).—Since the oxidation temp. of C with Ag<sub>2</sub>O as a secondary substance, is the same in O<sub>2</sub> as in N<sub>2</sub>, Ag<sub>2</sub>O must be a stoichiometric carrier. With Fe<sub>2</sub>O<sub>3</sub> and CuO as secondary substances, the oxidation temp. is lower in an atm. of O<sub>2</sub> than in N<sub>2</sub>; therefore these oxides are adsorption O<sub>2</sub> carriers.

W. J. Peterson  
Oxidation of sugars by air in the presence of ceric hydroxide sol and cerous hydroxide gels. J. C. Choch and P. C. Rakshit. *J. Indian Chem. Soc.* 12, 357-70 (1935).—Heterogeneous oxidation processes in the presence of catalysts were studied by use of a modification of the Barcroft-Warburg app. for respiration. Mixts. contg. 5 cc. of (I) and 5 cc. of dil. alkali were introduced into the cell and the pressure drop due to absorption of O<sub>2</sub> was noted from time to time. The p<sub>H</sub> remained const. for 5 hrs., the av. duration of the expt. For p<sub>H</sub> up to 9.6 no oxidation

was observed during 5 hrs. in the absence of the sol. Oxidation takes place at the surface of the colloidal particles which adsorb the sugar mole. almost instantaneously in quantities independent of the concn. of the sugar solns. Even at very low concns. of alkali, sugars undergo oxidation by air in the presence of Ce(III). Oxidations were performed at p<sub>H</sub> 7.05, 7.09 and 8.6 with phosphate buffers and a suspension of Mg(OH)<sub>2</sub>. Levulose is slightly oxidized by air in phosphate buffers even in the absence of catalysts. The brown ppt. obtained during the oxidation in the presence of Ce(III) was proved to be ceric hydroperoxide (C. A. 25, 3304) and not Ce(III). In the presence of visible radiations, the rate of absorption of O<sub>2</sub> is somewhat increased. H<sub>2</sub>NCH<sub>2</sub>CO<sub>2</sub>H at p<sub>H</sub> as low as 7.0 is stable to air in the presence of Ce(III), at 32°. The oxidation of glucose is, however, strongly retarded in the presence of H<sub>2</sub>NCH<sub>2</sub>CO<sub>2</sub>H buffers. In the above expts. Ce(III), not only serves as a detector for H<sub>2</sub>O<sub>2</sub> produced during the course of anaerobic oxidation, but its particles provide an active surface for the dehydrogenation of the sugars preliminary to the combination of the liberated H<sub>2</sub> with O<sub>2</sub> to form H<sub>2</sub>O<sub>2</sub>. Equations representing the postulated chem. reactions are given. The initial catalytic surface of Ce(III) is rapidly converted into ceric hydroperoxide by preliminary dehydrogenation of the substrate sugars. After the 1st hr. the relative surface areas attain const. values and O<sub>2</sub> is absorbed at a steady rate which is the difference between the rate of absorption of O<sub>2</sub> to form H<sub>2</sub>O<sub>2</sub> and the rate of decompn. of ceric hydroperoxide. H<sub>2</sub>NCH<sub>2</sub>CO<sub>2</sub>H is a powerful inhibitor of the preliminary dehydrogenation and the subsequent formation of peroxide. The slightly catalytic action of illumination on aerobic oxidation is ascribed to the acceleration of the rate of reaction in the breakdown of 4Ce(III), OOH, to 4Ce(III), 2H<sub>2</sub>O and 3O<sub>2</sub>. Such a reaction would entail a larger relative ratio of surface of Ce(III), to that of H<sub>2</sub>CrO<sub>4</sub>(III). C. R. Adair

Active oxides. XCII. Reciprocal actions between solid substances. Gustav F. Hüttig, Theodor Meyer, Herbert Kistel and Suzanne Casalis. *Z. anorg. allgem. Chem.* 224, 225-32 (1935).—Active states of the systems CuO/Fe<sub>2</sub>O<sub>3</sub> and CuO/Cr<sub>2</sub>O<sub>3</sub> during the transition from the mixt. to cryst. comp'd. were characterized by their catalytic effect on N<sub>2</sub>O decompn. The changes in magnetic properties during aging of the systems: Fe<sub>2</sub>O<sub>3</sub>/Cr<sub>2</sub>O<sub>3</sub>, Fe<sub>2</sub>O<sub>3</sub>/Al<sub>2</sub>O<sub>3</sub>, Fe<sub>2</sub>O<sub>3</sub>/SiO<sub>2</sub>, Fe<sub>2</sub>O<sub>3</sub>/TiO<sub>2</sub>, Cr<sub>2</sub>O<sub>3</sub>/Al<sub>2</sub>O<sub>3</sub> and Cr<sub>2</sub>O<sub>3</sub>/SiO<sub>2</sub> were studied and the changes in hygroscopicity of the systems: MgO/Fe<sub>2</sub>O<sub>3</sub>, FeO/Fe<sub>2</sub>O<sub>3</sub>, ZnO/Fe<sub>2</sub>O<sub>3</sub>, Al<sub>2</sub>O<sub>3</sub>/Fe<sub>2</sub>O<sub>3</sub>, ZnO/Cr<sub>2</sub>O<sub>3</sub> and CuO/Al<sub>2</sub>O<sub>3</sub> were det'd. These data furnish evidence for certain ranges of existence of active intermediate states. C. R. P. Jeffreys

Conditions of formation of manganese trichloride and of its catalytic decomposition. M. Dobelsky and R. Cohen. *Compt. rend.* 201, 602-2 (1935).—A Mn<sup>++</sup> salt is oxidized to MnCl<sub>3</sub> in HCl aq. soln. of any concn. by H<sub>2</sub>MnO<sub>4</sub>, H<sub>2</sub>CrO<sub>4</sub> or HClO<sub>4</sub>; in HCl aq. soln. of concn. above 0 N by H<sub>2</sub>O<sub>2</sub>, HNO<sub>3</sub>, HNO<sub>2</sub> and H<sub>2</sub>S<sub>2</sub>O<sub>8</sub>; other oxidizers have no effect. The MnCl<sub>3</sub> soln. is more stable the greater the concn. of HCl. Its decomposition is very slow at room temp., but is rapid even at 0° in the presence of (in decreasing order of activity, and more rapidly save in the presence of Ag, as the concn. of HCl is greater) Ag, Pt, Pb and Cu<sup>++</sup> ions. Co, Ni, Fe<sup>++</sup>, Mo<sup>++</sup>, V<sup>++</sup>, Ti<sup>++</sup>, Hg<sup>++</sup>, Au<sup>++</sup> and U<sup>++</sup> have no catalytic effect. C. A. S.

A generalized thermodynamic notation. H. A. C. McKay. *J. Chem. Physics* 3, 715-10 (1935).—A generalized notation is described which leads to a method of writing down from one generalized equation all the members of a family of thermodynamic equations (cf. Koenig, C. A. 29, 1318<sup>1</sup>). In particular, the signs of the various terms are very easily manipulated. A method is given for obtaining the generalized equation when any one member of a family is known. The method is easily extended to problems of capillarity, magnetization, etc.

G. M. P.  
Thermodynamics of stationary systems. I. The thermoelement. B. Bruls. *Proc. Roy. Soc. (London)* A151, 640-61 (1935).—The quant. application of the first and

second laws of thermodynamics to stationary systems requires the introduction of 2 arbitrary assumptions: (1) the max work to be expected from a reversible process remains unaltered by the presence of a simultaneous irreversible process, and (2) there exists a const. ratio between the Joule effect and the "polarization" effect. The first assumption leads to the 2 Kelvin relations connecting the Seebeck, Peltier and Thomson coeffs; and the second leads to a new relation connecting the Seebeck coeff with the thermal and elec conductivities of the material. It is concluded that the whole problem of the thermoelement reduces to a knowledge of the thermal and elec conductivities. **F. D. Rossini** *Ibid* A151, 651-65 —Utilizing the 2 arbitrary assumptions already introduced for the thermoelement (see above), B. develops the quant thermodynamic relations for the diffusion element, and obtains equations relating the Helmholtz coeff with the Peltier coeff, with the coeff of the "homogeneous" effect, and with the coeffs of diffusion and elec cond. The whole problem of the diffusion element reduces to a knowledge of diffusion and elec cond; the only difference between the case of the thermoelement and the diffusion element follows from the fact that there exist more than one energy carrier in electrolytic systems.

**F. D. Rossini**

The thermal conductivity of quartz at low temperatures W. J. de Haas and Th. Biermasz *Physica* 2, 673-82 (1935) —The thermal cond. of a quartz cylindrical rod, axis coinciding with the crystal axis, 5 cm long, 0.303 cm diam was measured between Cd wire resistance thermometers. The ends were clamped in Cu caps, electrically heated. The app was submerged in a cryostat and evacuated, with cooling by liquid O or H. For the lowest temp (liquid He) a 3 X 0.13-cm rod was used, and a Pb wire thermometer. From the final results between  $T = 2.77$  and  $80.9^\circ$  abs is seen that the resistance increases sharply below  $10^\circ$  abs, the min lying at about this temp. No proportionality of  $\kappa$  resistance  $1/T$  with  $T$  or  $T^2$  is found. A few values of  $1/T$  are  $1.12 \times 10^{-4}$  at  $2.77^\circ$  abs, 0.483 at  $3.87^\circ$ , 0.285 at  $4.74^\circ$ , 0.07 at  $14.94^\circ$ , 0.123 at  $18.84^\circ$ , 0.109 at  $23.00^\circ$ , 0.333 at  $29.0^\circ$ , 1.47 at  $74.6^\circ$ , 1.75 at  $88.9^\circ$ . Inhomogeneities can increase the resistance to the double value in the liquid-H range, which is particularly sensitive. After heat treatment, 8 hrs at  $340^\circ$ , 5 hrs at  $570^\circ$  and slow cooling (recombination of ions) the resistance values around  $20^\circ$  abs increase up to 10%. The increase of thermal resistance of pure metals at very low temps has evidently a character similar to that for insulators (de Haas and Bremmer, *C. A.* 26, 1490, 4518, 4992).

**B. J. C. van der IJvoeren**

Thermochemical data for titanium oxides Nohyuku Nasu *Kinzoku-ko-Aenkyu* 12, 411-18 (1935), cf. *C. A.* 29, 5726 —By use of the exptl values obtained in the previous study (N. Nasu, *C. A.* 29, 7773)  $\Delta H$  calcd  $\Delta F^\circ$ ,  $\Delta H$  and  $\Delta S$  of the following reactions: (a)  $2TiO_2 + H_2 = Ti_2O_3 + H_2O$ ,  $\Delta H = 4095 + 0.874 T + 0.003856 T^2$ ,  $\Delta F^\circ = 4095 - 2.0125 T \log T - 0.003856 T^2 + 10.1 T$ ,  $\Delta H_{1000} = 4700$  cal,  $\Delta F_{1000}^\circ = 5280$  cal;  $\Delta S_{1000} = 1.95$  cal/degree. (b)  $Ti_2O_3 + 0.5 O_2 = 2TiO_2$ ,  $\Delta H = -61,520 - 1.814 T - 0.005506 T^2 + 0.00000074 T^3$ ,  $\Delta F^\circ = -61,520 + 4.1769 T \log T + 0.005506 T^2 + 0.00000037 T^3$ ,  $\Delta S_{1000} = -62,530$  cal,  $\Delta F_{1000}^\circ = -59,770$  cal,  $\Delta H_{1000} = -9.26$  cal/degree. (c)  $2Ti + 3/2 O_2 = Ti_2O_3$ ,  $\Delta H_{1000} = -388,070$  cal. (d)  $2TiO_2 + CO = Ti_2O_3 + CO_2$ ,  $\Delta F^\circ = -6005 + 2.1552 T \log T - 0.003806 T^2 + 0.00000008 T^3 + 10.64 T$ ,  $\Delta F_{1000}^\circ = -6220$  cal. The lattice energy of  $Ti_2O_3$  was calcd from the Born Haber thermochem cycle to be  $U = 3569.51$  cal, and was compared with the theoretical value calcd from Kapustinsky's new equation of the lattice energy. The discrepancy between the exptl and the theoretical values is 2.6%. This is attributed to the uncertainty which will be caused by applying effective ion radius of  $Sc^{+++}$  for that of  $Ti^{+++}$  to the crystal.

Specific heat, entropy and free energy of sulfur ( $S_8$ )

vapor at temperatures between  $100^\circ$  and  $5000^\circ K$  1 Godnev and A. Sverdlm. *S. Physik* 97, 124-30 (1935) cf. *C. A.* 29, 6131 —The sp. heat at const. vol, entropy and free energy at const. pressure are calcd. from spectroscopic data for  $S_8$  vapor in the perfect gas state. The values of the free energy agree with those obtained by Montgomery and Kassel (*C. A.* 28, 5324). **B. S.**

The theory of solid bodies at high temperatures, with special regard to the temperature dependence of C, Gerhard Damkohler. *Ann. Physik* 24, 1-30 (1935) —The Grüneisen-Debye theory of solid bodies is extended on the assumption of a temp. dependence of the vibration frequency. The existing data on  $C_p/1/V_0$ ,  $(\partial V/\partial T)$ , and  $1/V_0$ ,  $(\partial V/\partial P) T$ , are utilized to compute values of C over a large range of temp. for NaCl, KCl, KBr, Ag, Cu and Pb. With the exception of Cu and Pb, a decrease in C occurs with increasing temp., at temps. above about  $200^\circ$  to  $300^\circ$ . For a linear chain, an expression is derived for the Helmholtz free energy as a function of the temp. and the length of chain, though the method employed is practicable only for the temp. region in which the anharmonic part of the potential energy is equal to or less than  $kT$ . The Gibbs thermodynamic potential of a linear chain as a function of the temp. and pressure is derived. The Morse and Born-Mayer potential-energy curves are discussed in relation to D's theory. **F. D. Rossini**

A note on the specific heat of liquid deuterium oxide R. S. Brown, W. H. Barnes and O. Maass. *Can. J. Research* B3B, 167-9 (1935) —Preliminary detns. of the sp. heat of liquid  $D_2O$  from  $4^\circ$  to  $65^\circ$  are described. The sp. heats over the temp. ranges  $4^\circ$  to  $26^\circ$ ,  $26^\circ$  to  $45^\circ$ , and  $26^\circ$  to  $65^\circ$ , are 1.018, 1.003 and 1.008, resp., while the av. sp. heat between  $4^\circ$  and  $65^\circ$  is 1.01 cal. per g. per deg. **J. W. Shipley**

The heat capacity of potassium chloride from  $2.3^\circ$  to  $17^\circ$  abs W. H. Keelson and C. W. Clark. *Physica* 1, 698-700 (1935) —Variability of Debye  $\theta$  has previously been found for metals (Ag), it is now studied for a non conductor (cf. Blackman, *C. A.* 29, 3903). A cylindrical Cu calorimeter was used,  $103 \times 34$  mm, suspended in a vacuum vessel, equipped with phosphor bronze and constantan resistance thermometers and an elec. heater. The calorimeter contained 1.03 mols. KCl; it served as heat conductor. In agreement with Blackman's theory there is a gradual rise of  $\theta$  down to  $6^\circ$  abs, then a rapid rise, max at  $4.5^\circ$ , followed by a drop in  $\theta$ . The drop may be due to desorption of He from the crystal surfaces. As compared with the Ag heat-capacity curve, the drop in  $\theta$  with T is not as rapid, owing to electron heat. If a term  $1.526 \times 10^{-4} T$  is subtracted from the Ag values they approach the KCl values satisfactorily. **B. J. C. van der IJvoeren**

The heat of vaporization of water and the specific volume of the saturated vapor to 202 kg./sq. cm. (365°) 1 Jakob and W. Iritz. *Physik. Z.* 36, 651-69 (1935) —Data were obtained at  $270^\circ$ ,  $330^\circ$ ,  $350^\circ$ ,  $360^\circ$  and  $365^\circ$  (56, 131, 169, 190 and 202 kg./sq. cm.). Utilizing these and their own previous calorimetric data, together with the data of L. B. Smith and Keyes (*C. A.* 28, 7095) on the sp. vol. of the liq., J. and P. calc. values for the heat of vaporization and the sp. vol. of the vapor from  $0^\circ$  to  $372^\circ$ . Comparison is made with other existing data.

**F. D. Rossini**

Some physical properties of mixtures of water and glycol G. Roemstatt. *Industrie chimique* 22, 648-51 (1935) —Data are given showing the rise in temp. produced on mixing various proportions of  $H_2O$  and glycol at  $15^\circ$ , the vols. occupied by the resulting solns., the wt% of glycol per l. and the contraction in vol. of the solns. Curves are given showing the d. at  $0^\circ$ ,  $15^\circ$ ,  $30^\circ$  and  $45^\circ$  of aq. solns. contg. 0-100% glycol, the  $\pi$  at  $15^\circ$ ,  $30^\circ$  and  $45^\circ$  of similar solns., and their initial b. ps. The various detns. were made on solns. contg. 5, 10, 15, 20, 25, 35, 50, 60, 75 and 85% glycol. A Papineau-Couture dissociation energy of carbon monoxide and the heat of sublimation of carbon 11 Lessheim and R. Samuel *Nature* 136, 608 (1935); cf. Goldfinger and Laszloffi, *C. A.* 29, 5730 —From spectroscopic data the disson energy

of CO is calculated to be 10.45 kcal. and the heat of sublimation of C ( $\beta$ -graphite) 155.7 kg.-cal./mol. E. O. W.

### 5—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR.

Theory of elementary particles. II. Electromagnetic whorls and elementary particles. N. S. Japolsky. *Phil. Mag.* 20, 641-706(1935), cf. *C. A.* 29, 7783.

E. J. Rosenbaum

Electronic structures of molecules. XIV. Linear triatomic molecules, especially carbon dioxide. Robert S. Mulliken. *J. Chem. Physics* 3, 720-39(1935), cf. *C. A.* 29, 7787.—Electron configurations are given for  $\text{CO}_2$ ,  $\text{BO}_2$ ,  $\text{N}_2\text{O}$ ,  $\text{C}_2\text{O}$ ,  $\text{NO}_2$ ,  $\text{N}_2$ ,  $\text{NCO}$ ,  $\text{NCS}$ ,  $\text{BeF}_2$ ,  $\text{HfCl}_2$ ,  $\text{COS}$ ,  $\text{CIBO}$ ,  $\text{NO}_2$  and the  $\text{HeI}_2$  type of mol. All the electron configurations are formally analogous, they are formally identical in isoelectronic molecules. The relations of electron configurations to valence concepts are discussed. This method gives a simple description of intermediate cases (double-bonded  $\text{A}=\text{B}=\text{C}$ , single-bonded  $\text{A}-\text{B}-\text{C}$ , homopolar  $\text{A}=\text{B}-\text{C}$ , heteropolar  $\text{A}^+-\text{B}^+=\text{C}$ ,  $\text{A}=\text{B}-\text{C}$ ,  $\text{A}^+=\text{B}-\text{C}$ , etc.). The min. ionization potentials of  $\text{CO}_2$ ,  $\text{CS}_2$  and  $\text{HfCl}_2$  correspond to the removal of a nearly nonbonding  $\pi$  electron of the O, S or Cl atom. The ultraviolet emission bands of  $\text{CO}_2$  probably represent transitions among 4 electron states of  $\text{CO}_2^+$  which correspond to the 4 lowest ionization potentials of  $\text{CO}_2$ : 13.72, 17.09, 18.00 and 21.5 eV. If this interpretation is correct, the  $\text{CO}_2^+$  mol is linear in these states. The min. potential of 13.72 eV disagrees with the value based on electron impact. Linear  $\text{NO}_2^+$  is composed of a stable system of closed shells, the final electron added to make  $\text{NO}_2$  would have to go into a fairly high energy antibonding orbital. Evidently the actual  $\text{NO}_2$  avoids this by being triangular. Ultraviolet absorption spectra of  $\text{CO}_2$ ,  $\text{CS}_2$  and  $\text{COS}$  are also considered.

G. M. P.

Relation between the internuclear distances and force constants of molecules and its application to polyatomic molecules. Richard M. Badger. *J. Chem. Physics* 3, 710-14(1935); cf. *C. A.* 29, 2903. Clark, C. A. 23, 7143; Allen and Longair, *C. A.* 29, 4671.—The relation between internuclear distances and force constants is found to persist in polyat. mol. The internuclear distances of  $\text{CCl}_4$ ,  $\text{SiCl}_4$ ,  $\text{SnCl}_4$ ,  $\text{SF}_6$ ,  $\text{SeF}_6$  and  $\text{TeF}_6$  were predicted from vibrational data alone, and were found to agree well with exptl. values.

G. M. P.

A new conception of the chemical elements and the forces between bearing metal and lubricant. Heinrich Herbst. *Chem.-Ztg.* 59, 777-8(1935) D. F. Brown

Rotatory power of quartz for rays perpendicular to the optic axis and its dispersion between 2537 and 5780 Å. Georges Bruhat and Louis Weil. *Compt. rend.* 201, 887-9(1935); cf. *Ibid.* 719.—A repetition of the authors' previous expts; and their extension to the region  $\lambda$  3021-2537 Å. by means of their quartz compensator gave substantially the same result for  $\alpha$  and  $\rho$ , while  $\rho/\rho_0$  (the ratio of the rotatory power of rays  $\perp$  to the axis to that of rays  $\parallel$  thereto) averages  $-0.54$  instead of  $-0.52$ . Thus for this interval at least the rotatory dispersion of quartz is the same for rays  $\perp$  and  $\parallel$  to the axis.

C. A. Silberrad

Electron diffraction by gases. I. R. Maxwell, S. B. Hendricks and V. M. Mosley. *J. Chem. Physics* 3, 699-709(1935).—The method of electron diffraction was used to det. the C—O—C valence angle in  $p,p'$ -( $\text{C}_6\text{H}_5$ ) $_2\text{O}$ ; it is  $118^\circ \pm 3^\circ$ . By this method it was detd. that  $\text{P}_4$  and  $\text{As}_4$  have regular tetrahedral structures, with at. seps of 2.21 and 2.44 Å, resp. These at. distances are approx. the same as those found by crystal structure analysis. This shows that these distances do not change greatly when the bond angle decreases from  $100^\circ$  to  $10^\circ$ . The app. is described.

G. M. P.

The theory of image errors of the electron microscope. Walter Glaser. *Z. Physik* 97, 177-201(1935).—The 3

Detn. of U, and the U content of sea water (Hemmerger, Karlik) 7.

distortion errors are fully discussed. A necessary and sufficient condition for their vanishing is given for a general rotation-symmetrical optical medium.

B. Swirles

Use of electron lenses for  $\beta$ -rays. Otto Klemperer. *Phil. Mag.* 20, 545-61(1935).

E. J. Rosenbaum

Ion-optical images with electrical lenses. Jürgen Koch and Wilhelm Walcher. *Z. Physik* 97, 131-7(1935).—Images of apertures are formed by the use of an electron system and a stream of K ions. The ion images are compared with electron images. Magnetic deviation expts. show that the images are formed by heavy positively charged particles. An image of a surface emitting ions can be obtained.

S. Tolansky

A new interference phenomenon in the passage of fast electrons through crystals. F. Kirchner and H. Lassen. *Ann. Physik* 24, 113-23(1935).—A new type of crystal lattice interference has been found in the investigation of thin Ag layers. The interference points form a cross. This phenomenon is ascribed to the irradiation of many small Ag crystals, which are spread on the surface, oriented exactly parallel.

Harold Gershinowitz

The influence of the space-charge on the paths of the electrons in the magnetron. Hans Aweender, Alfred Thoma and David M. Tombs. *Z. Physik* 97, 202-10(1935).—A solution is given of the equations of motion of electrons in an electrostatic field and under their mutual electrostatic interaction. It is shown that the electrons then move in straight lines. The influence of a magnetic field is found by a perturbation method.

B. Swirles

The mechanism of high frequency discharge. II. Deek. *Z. Physik* 97, 353-75(1935).—The spectrum of a high-frequency discharge in Hg vapor is compared with that of the pos. column. No difference of intensity for corresponding lines could be detected. Also absorption measurements gave the same no. of excited states in high-frequency discharge as in the pos. column; if a Maxwell distribution is assumed for the velocities in both cases the electron temps. are found to be the same for a large pressure region. Conclusion. The mechanism of high-frequency discharge can be interpreted similarly to that of the pos. column.

B. Swirles

The disappearance of hydrogen in the presence of positive ions. C. H. Kunsman and R. A. Nelson. *J. Chem. Physics* 3, 754(1935).—Evidence is presented to show that the authors' previous conclusions (*C. A.* 23, 3402; 26, 4246; 29, 524) are valid, although they are not in agreement with those of Schechter (*C. A.* 29, 5732).

G. M. P.

Striations in the positive column in the hydrogen glow discharge. Hans H. Paul. *Z. Physik* 97, 330-54(1935).—The mechanism of striations is studied on the basis that these are equipotential surfaces. The conditions are varied. The cross section gradient is important. Current voltage characteristics are found by use of 2 probes, one of which is movable in the tube axis. In the middle of the striations 2 velocity groups of electrons occur. A theory is proposed and is supported by the data. The varying forms of striations are due to a varying "ion mantle effect".

S. T.

Products and processes of ionization in methyl chloride as determined by a mass spectrometer. S. H. Bauer and T. R. Hogues. *J. Chem. Physics* 3, 687-92(1935).—The ions  $\text{MeCl}^+$ ,  $\text{Me}^+$ ,  $\text{CCl}^+$ ,  $\text{CH}_2^+$ ,  $\text{Cl}^+$ ,  $\text{HCl}^+$ ,  $\text{CH}^+$ ,  $\text{C}^+$  and  $\text{H}^+$  were found to be produced in  $\text{MeCl}$  as primary products (they are listed in order of decreasing intensity). The appearance potentials for  $\text{MeCl}^+$ ,  $\text{Me}^+$  and  $\text{Cl}^+$  are 11.0, 14.7 and 26 v., resp.

G. M. P.

Sputtering of metals by the impact of slow ions and measurement of the threshold value of the sputtering. Heinrich Lüder. *Z. Physik* 97, 158-70(1935).—Argon ions are drawn perpendicularly from a glow cathode and

directed onto a thin metal wire acting as a sputtering electrode. The amt sputtered is deid. by measuring the wire resistance. The velocity of the ions is measured and the sputtering carried to an impact velocity of 40 v. The probable threshold values using  $A^+$  are  $Na = 7 v$ ,  $Cu = 12 v$ ,  $Fe = 14 v$ ,  $W = 24 v$ . The sputtering produced by alkali atoms is measured, the wires being heated to prevent alkali condensation. The sensitivity is improved by thinning the sputtering wires by evapn. Threshold values are,  $K^+$  on  $W = 36 v$ ,  $Cs^+$  on  $W = 15 v$ ,  $Li^+$  on  $W = 80 v$ ,  $Cs^+$  on  $Cu = 15 v$ . Calcd values are compared with the measurements and the various theories discussed. S Tolansky

Comparison of the decrease in intensity of the primary cosmic radiation in different materials. J. Clay. *Physica* 2, 645-9(1935).—Generally the decrease in ionization is found greater for equiv. layers of materials (Pb, Fe, water, air) if the  $d$  is lower. Absolute intensity of cosmic rays. J. Clay. *Ibid* 650-1. B. J. C. van der Hoeven

Absorption of the asymmetric component of cosmic radiation. V. M. Dukelskii and N. S. Ivanova. *J. Exptl. Theoret. Phys. (U. S. S. R.)* 5, 512-19(1935).—"The azimuthal asymmetry of the cosmic radiation was measured by a set of 3 Geiger-Müller coincidence counters on Mount Alaguz in Soviet Armenia, 35° 12' N latitude, 3250 m altitude. With zenith angle 45° the west-east azimuthal ratio was 1.08 ± 0.015. A 10-cm lead absorber between the counters reduced this to 1.03 ± 0.014." F. H. Rothmann

The frequency and magnitude of the showers produced in lead by penetrating radiation. H. Geiger and O. Zeiler. *Z. Physik* 97, 300-11(1935); cf. H. Geiger and E. Funke, *C. A.* 29, 3907<sup>1</sup>.—With different geometrical arrangements of counters the threefold and fourfold coincidences due to showers produced in lead are counted. It is calcd. from the results that on an av. 0.6 shower per hr. and per sq. cm. are emitted from a sheet of lead 1.5 cm. thick. By use of the theory of Geiger and Fäulster that each shower consists of one very energetic electron pair (C-rays) and their continuous radiation (D-rays), it is calcd. that with each C-electron approx. 200 D-rays are emitted. The "recoil" effect observed by Fäulster is explained on this theory. The mean absorption coeff. of the D-rays is approx. 1 cm<sup>-1</sup> Pb, corresponding to about  $6 \times 10^4$  a. v. B. Swirles

Theory of radioactive fluctuations. Arthur E. Ruark and Lee Devol. *Phys. Rev.* 48, 772(1935).—Math. G. M. P.

Nuclear theory. Kugao Nakabayashi. *Z. Physik* 97, 211-20(1935).—The mass defects and nuclear radii are calcd. by the Thomas-Fermi method, exchange forces of Majorana's type (*C. A.* 27, 5000) between neutron and proton, and Coulomb forces between the protons are assumed; the particle density is assumed const. An expression is obtained for the binding energy, and the outstanding discrepancies with expt. are discussed. B. Swirles

$\beta$ -Radioactivity of neutrons. Lloyd Motz and Julian Schwinger. *Phys. Rev.* 48, 704-5(1935).—Math. G. M. P.

Velocity of slow neutrons by mechanical velocity selector. J. R. Dunning, G. B. Pegram, G. A. Fink, D. P. Mitchell and E. Segrè. *Phys. Rev.* 48, 704(1935). G. M. P.

Absorption and detection of slow neutrons. D. P. Mitchell, J. R. Dunning, E. Segrè and G. B. Pegram. *Phys. Rev.* 48, 774-5(1935).—The transmission of slow neutrons is plotted against the mass per sq. cm. of the absorber, with the absorber-detector pairs B-E, B-Li, Li-B, Li-Li, Cd-B and Cd-Li. The B and Li absorption curves deviate from the exponential curve, because of the inhomogeneity of the neutron beam and the dependence of the absorption upon the velocity distribution of the neutrons. G. M. P.

Excitation of  $\gamma$  rays by slow neutrons. Seshu Kikuchi, Kodo Fushimi and Hiroo Aoki. *Proc. Imp. Acad. (Tokyo)* 11, 253-5, *Proc. Phys.-Math. Soc. Japan* 17, 369-77

(1935).—Hg, Au, Cd, Ni, Fe, Cu, Pb and Al were studied in det. if  $\gamma$ -rays were emitted from them by slow neutrons, all but Pb and Al were shown to emit  $\gamma$ -rays at least for Pb and Al the radiation was much weaker. The cross section of the interaction was estd. at  $5 (10^{-24})$  sq. cm. for Cu, Fe and Ni, somewhat larger for Au and very much greater for Cd. No combination of protons with neutrons to form deuterium was detected. The app. is described and some discussion is given. W. E. V.

The  $\gamma$ -rays emitted in the capture of slow neutrons. F. Rasetti. *Z. Physik* 97, 64-9(1935).—The absorption of slow neutrons by at. nuclei is in general accompanied by the emission of radiation. A rough measurement of the energy of these  $\gamma$ -rays has been made by the method of the coincidences of the secondary Compton electrons. For the elements investigated, Cl, Co, V, Ak, Cd, Ir, Hg the energies were found to be between  $4 \times 10^4$  and  $1 \times 10^6$  e. v. B. Swirles

The number of  $\alpha$ -particles emitted by uranium. Raimund Schedt. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse Abt. IIa*, 144, 191-211(1935).—A total count of 53,083  $\alpha$ -particles was obtained from 2 preparations of  $U_3O_8$ . The app. procedure and calcs. are described in detail. The no. of  $\alpha$ -particles emitted per sec. by 1 g of  $U$  is 12.64 ± 0.70%. Accordingly, the decay const. of  $U_1$  is  $1.567 \times 10^{-10}$  years<sup>-1</sup> ± 0.70%, and the period of half decay,  $T_{1/2} = 4.422 \times 10^9$  years ± 0.70%. G. M. P.

Counting the  $\alpha$ -particles emitted by uranium. Friedrich Hecht. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse Abt. IIa*, 144, 213-15(1935).—A micro method was used for detg.  $U$  which had been used for measurements of radioactivity. The  $U_3O_8$  was dissolved in  $HNO_3$  and taken in fumes with HCl. The vol. was made up to 6-8 cc. and  $H_2S$  passed in. Afterward, all Fe was removed by the hydroxylamine-HCl method (*C. A.* 27, 684; 28, 6300<sup>1</sup>). The filtrate was taken to fumes with aqua regia, and the  $U$  added with 8-hydroxyquinoline. This compd. contains 33.86%  $U$ . All operations except the last filtration were made in porcelain dishes and filters; it was made in Pt. G. M. P.

Mass spectrum of the positive radiation from radium  $C'$ . (Supplement. the spectrum of natural  $H$ -rays.) Lambrecht Wisspott. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse Abt. IIa*, 144, 227-41(1935).—The construction and operation of a mass spectrograph are described, and the theory of its operation is given. A lost camera was constructed for the detection of the undeviated radiation. By use of simultaneous elec. and magnetic deflection, it was found that the long-range radiation of  $Ra C'$  has a specific charge  $e/m = 1/4$ . It is, therefore, an  $\alpha$ -ray. By comparing the spectrum of the normal radiation of  $Ra C'$  ( $R_{90} = 6.96$  cm.) with that of the long range radiation, the 9-cm. group was found to have a ratio of 25  $10^4$ , in good agreement with Rutherford's results. The mass spectrum of natural  $H$ -radiation was recorded, and used as a basis for the mass spectrographic registration of at. fragments. G. M. P.

Calculation of the velocity of  $\alpha$ -particles from their range, and its relation to the number of ion pairs produced. Stefan Meyer. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse Abt. IIa*, 144, 317-30(1935).—The calcn. of the velocity  $v$  (in  $10^8$  cm./sec.) of  $\alpha$ -particles of av. range  $\bar{R}$  (in cm. of air at 15° and 760 mm.) is possible from the formula  $\bar{R} + v = Av + Bv^2 + Cv^3$  ( $A = 0.28508$ ,  $B = 2.1856$ ,  $C = -2.5393$ ,  $C = 1.7335$ ). Further,  $(a - v)^2 = aR$  (the initial velocity  $v_i = 0.143$ ,  $a = 0.6648$ ,  $n = 1 + 1.15185v - 0.07441v^2$ ), or better,  $a = aR$ , where  $R_i$  is the sum of the point value of the ionization curve  $R$ , and the addn.  $r$ ,  $R_i + r = \bar{R} - 0.2$ ,  $a = 1.0377$  and  $n = 1.67851 + 1.16468v - 0.23533v^2$ . Geiger's relation  $v^2 = aR_i$  is valid for the range 3-11 cm. The initial energy of  $\alpha$ -particles is of the order of  $5 \times 10^6$  a. v. The equation for the relation between the range and the total ionization  $k = k_2 R_i^2$  is only a crude relationship for small values of  $R$ . Not only is the formula  $a^2 = aR$  inaccurate, but the relation of the no. of ion pairs

to the energy of the  $\alpha$ -particles increases with increasing velocities. G. M. P.

The  $\gamma$ -radiation of uranium X. E. Stahl and D. J. Coughlin. *Physica* 2, 707-18 (1935).—In a high-pressure Coouzon ionization chamber (17.8 atm.) and with Geiger Müller tubes the hard  $\gamma$ -radiation of U X<sub>2</sub> was studied. The app. has been described (C. A. 27, 5532). Absorption curves show an av. absorption coeff. of  $\mu_{\text{Fe}} = 0.83$  per cm.,  $\mu_{\text{Pb}} = 0.47$  per cm., in fair agreement with Hahn and Meitner (C. A. 17, 3445). Their second radiation with  $\mu_{\text{Fe}} = 2.3$  per cm. could not be found and is thought to be of secondary nature. R. J. C. van der Hoeven.

The nuclear  $\gamma$ -radiation of beryllium. Friedrich Koch and Fritz Rieder. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse Abt. IIa*, 144, 331-7 (1935).—The  $\gamma$ -radiation from  $\alpha$ -radiated Be was studied in a magnetic field with a Wilson chamber. In the formation of electron pairs there occurred preponderantly, if not always, equal distribution of the available energy. The numerical distribution of positrons and of photoelectrons of various energies indicates  $\gamma$ -lines at 5.6, 4.2, 2.6, 2.1 and  $1.4 \times 10^6$  e. v., with possible lines at 10.2, 5.6 and  $1.7 \times 10^6$  e. v. G. M. P.

Branching ratio of the actinium family of radioactive elements. Marcus Francis and Tchong Da-Tchang. *Phil. Mag.* 20, 623-32 (1935).—The branching ratio was determined for 2 pitchblende samples. Copptin, with both  $\text{ZrF}_4\text{O}_2$  and  $\text{Ta}_2\text{O}_5$  was used. Concordant results were obtained whose mean is  $4.03 \pm 0.17$ . B. J. R.

The disintegration of lithium by swift protons. K. Jakovlev. *J. Expil. Theoret. Phys. (U. S. S. R.)* 5, 505-8 (1935).—The formation of 8.4-cm.  $\alpha$ -particles from Li bombarded by high-velocity protons began at 27 kv. velocity and increased rapidly up to 118 kv. The results agree well with those of Oliphant and Rutherford (C. A. 27, 4720). F. H. Rathmann.

Nuclear evolution of iron, cobalt and nickel. H. J. Walke. *Phil. Mag.* 20, 738-9 (1935). cl. C. A. 28, 6822.—Equations are written for the possible formation of Ni and Co from  $^{56}\text{Fe}^{II}$ . E. J. Rosenbaum.

Ercitation of secondary  $\gamma$ -rays by means of neutrons I. General. Effects in paraffin. R. Fleischmann. *Z. Physik* 97, 242-64 (1935).—Neutrons are slowed down with paraffin and are then able to produce nuclear  $\gamma$ -rays from H, Fe, Cu, Cd and Pb. The absorption of the H  $\gamma$ -rays is measured in paraffin, Al and Pb. The interaction of the neutrons with paraffin is discussed. The  $\gamma$ -rays arise from the fusion of slow neutrons with  $^1\text{H}$  forming  $^2\text{H}$ . The rays possess a quantum energy of  $1.5 \times 10^6$  e. v. The mass of the neutron is calculated as  $1.0083$ . II. Measurements on iron, copper, cadmium and lead. *Ibid.* 263-76.—By suitable arrangements of absorbing layers neutrons are slowed down and measurements made on the absorption of the excited  $\gamma$ -rays. The absorptions for various thicknesses of paraffin, Fe, Cu, Cd and Pb are measured for slow neutrons. The absorption coeffs. of the excited radiation are measured in paraffin, Al, Fe, Cu and Pb with various sources. The quantum energies of the excited radiations vary between  $0.45$  and  $2.6 \times 10^6$  e. v. S. Tolansky.

Protons from the disintegration of lithium by deuterons L. A. Delcasso, W. A. Fowler and C. C. Lauritsen. *Phys. Rev.* 48, 848 (1935); cl. C. A. 29, 5733.—Li, bombarded by 700-kev. deuterons, gave proton groups with ranges of  $31.7 \pm 0.5$  and  $23 \pm 1$  cm., and  $\alpha$ -particle groups with ranges of  $13.8 \pm 0.7$  and  $8.9 \pm 1.0$  cm. The masses of  $\text{Li}^3$  and  $\text{He}^4$  are calculated to be  $8.0183$  and  $8.0072$ , resp. The protons are associated with the formation of radio- $\text{Li}^3$ . G. M. P.

Synthesis of radioelements by deuterons accelerated by means of an impulse generator. Frédéric Joliot, André Lazard and Pierre Savat. *Compt. rend.* 201, 829-8 (1935).—A generator capable of producing impulses of voltage  $3 \times 10^6$  v. (cf. Scheup and Solima, *Rev. gen. Elec.* 37, 799 and 38, 241 (1935)), combined with an acceleration tube similar to that of Brach and Lange (C. A. 25, 5545), is described. This method of accelerating the ions by impulses is more powerful than the continuous

method and does not require the extremely low pressures in the tube. It was used to produce accelerated deuterons with which C and B were bombarded, producing radio-carbon, and amts. of radionitrogen much greater than obtainable by bombarding B with  $\alpha$ -particles from natural radioelements:  $^{12}\text{C} + ^2\text{H} = ^{13}\text{N} + ^1\text{H}$  (cf. Cockcroft, *et al.*, C. A. 28, 2900). C. A. Silberrad.

The radioactive climate and the radioactive waters of Badgastein, and their bioclimatic and balneological significance. Walter Kosmath and Otto Gerke. *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse Abt. IIa*, 144, 339-55 (1935).—A survey of the radioactivity of the soil, water and air was made at several stations in and near Badgastein, during April, 1935. G. M. P.

Radiometric examination of a rhyolite flow. Edinold Rothé and A. Ilse. *Compt. rend.* 201, 892-3 (1935); cl. C. A. 29, 6771.—Portions of a rhyolite flow in a quarry near Weischbrunn (Alsace) show increased radioactivity (up to double) as compared with the average shown by rocks in that neighborhood. C. A. Silberrad.

Experiments on heavy hydrogen V. The elementary reactions of light and heavy hydrogen. Thermal conversion of ortho-deuteronium and the interaction of hydrogen and deuterium. Adalbert Farkas and Ladislav Farkas. *Proc. Roy. Soc. (London)* A152, 124-51 (1935). cl. C. A. 29, 417.—The rate of reconversion of ortho-D and the interaction of H and D were measured between  $50^\circ$  and  $100^\circ\text{K}$ . and at pressures between 3 and 74 mm. Hg. The mechanisms are (I)  $\text{D} + \text{ortho-D}_2 \rightarrow \text{para-D}_2 + \text{D}$ , (IIa)  $\text{D} + \text{H}_2 \rightarrow \text{HD} + \text{D}$ , (IIb)  $\text{H} + \text{D}_2 \rightarrow \text{HD} + \text{D}$ . The rate for I is 2.4 times slower than the corresponding reaction with para-D. The difference is due mainly to differences in the frequency of collisions and the concn. of D atoms. The energy of activation is  $0.5$  kcal. greater than for the corresponding II reaction. For II, the difference in rate is due to the energy of activation, which is  $1.7$  kcal. greater for IIb than for IIa. The activated complexes  $\text{HIII}$ ,  $\text{DIII}$ ,  $\text{HDD}$  and  $\text{DDD}$  have zero-point energies similar to those of  $\text{H}_2$ ,  $\text{HD}$  and  $\text{D}_2$ . From a consideration of the possible vibrational frequencies in the complexes, an estimate can be made of their zero point energies and an energy-level scheme constructed. The conclusions are consistent with the exptl. results. VI. Ratio of the magnetic moment of the proton to the magnetic moment of the deuteron. *Nature* 152-7.—The conversion of ortho-D to normal D catalyzed by O was studied between  $83^\circ$  and  $203^\circ\text{K}$ . The rate constant obtained was compared with that for the para-H conversion. From the results, the ratio of the magnetic moment of the proton to that of the deuteron can be calculated (cl. C. A. 29, 6826) as  $5.06 \pm 0.11$ . G. M. Murphy.

The principles of a new method for the measurement of the intensity of x rays. V. I. Vekker, A. V. Rubergal and M. P. Ivanov. *J. Expil. Theoret. Phys. (U. S. S. R.)* 5, 490-5 (1935).—A Geiger-Müller counter is modified by combination with a thyatron relay and used to measure the intensity of x-rays at the rate of ten to a thousand quanta per second. Data are given on the time of discharge in the ordinary counter and in the modified system with the discharge chamber walls supplied by d. c. F. H. Rathmann.

Relation between density of blackening and x-ray intensity for characteristic copper radiation and Agfa-Lane film. F. D. Miles. *Trans. Faraday Soc.* 31, 1452-40 (1935).—The d. of blackening is found to be proportional to the x-ray intensity up to a d. of 1.0, with an error of less than 4% at the highest d. There is no three-fold effect. E. J. Rosenbaum.

The L<sub>2</sub> absorption edges of protoactinium (91). V. Doljok and J. Marek. *Z. Physik* 97, 70-2 (1935).—The wave lengths of the  $\text{L}_{\text{M}}$  and  $\text{L}_{\text{I}}$  edges are given with an accuracy of  $\pm 0.1 \text{ \AA}$ . U. and of  $\text{L}_{\text{I}}$  edge to within  $\pm 0.2 \text{ \AA}$ . U. The  $\text{L}_{\text{I}}$  edge is much more diffuse than that of the others. The values of the positions of the further  $\text{L}_{\text{a}}$  levels are calculated from the measured L values. S. T.

Scattering of x-rays varies discontinuously with the angle of scattering. Jean Laval. *Compt. rend.* 201, 889-91 (1935).—The scattering by a crystal, solid of mono-

chromatic x-rays outside the limits of selective reflection 1 and H. J. Reimers *Z. Physik* 97, 1-7 (1935) —The displacements in the Cs lines 1s-7p to 1s-30p which are produced by methane, ethane and propane are measured. All the lines are strongly displaced to the red, the max values being 16.45, 20.99, 25.79 cm.<sup>-1</sup> for methane, ethane and propane, resp. In each case the displacements increase up the series to a limit value. Displacements increase with heavier mol. The effective cross section to slow electrons found for CH<sub>4</sub> is 73 sq cm/cc and for C<sub>2</sub>H<sub>6</sub> 120 sq cm/cc. A table of the effective cross sections is given for He, Ne, Ar, Kr, Xe, H<sub>2</sub>, CH<sub>4</sub> and C<sub>2</sub>H<sub>6</sub>. Measurements are made of the half width and displacement of the 1s-3p doublet of K when mixed with various gases. The displacements and half width do not move parallel.

The width of the  $K_{\alpha}$  lines of gaseous krypton and of elements in chemical combination. Ernst Wilhelm *Z. Physik* 97, 312-20 (1935) —By use of cathode-ray excitation, and analyzing by means of a double-crystal spectrometer the breadths of the  $K_{\alpha}$  lines of Kr, Rb (RbCl<sub>3</sub>), Br (KBr), and Cu (Cu, CuO, CuF) are measured. The values for Kr lie upon the same curve as the elements of at no 26-47, the state of aggregation having no observable effect upon the width. The values found for Rb, Br and Cu lie above the curve and show an effect due to the chemical combination.

The intensity of x ray lines of gold. Leo Fuchler *Physica* 2, 597-605 (1935) —See C. A. 29, 5015.

Selective x ray diffraction from artificially stratified metal films deposited by evaporation. Jesse W. M. DuPont and J. Paul Youtz *Phys Rev* 43, 703 (1935) —A method is described by which 100 alternate layers (each) of Cu and Au were deposited on glass. The thickness of the deposit was 10,000 Å. Because of the diffusion of the atoms in the solid state, the intensity of the Mo K diffraction maxima decreases exponentially, with a "half-life" of 2 or 3 days.

An x ray method for the study of "bound water" in hydrophilic colloids at low temperatures. W. H. Barnes and W. F. Hampton *Can J Research* 13B, 215-25 (1935), cf. C. A. 26, 4226 —A new method is described for the study of hydrophilic colloids by the application of x-ray methods of analysis to the frozen gels. The possibilities of the method and its limitations are shown by a qual study of the amt and variation with temp of the so-called "bound" H<sub>2</sub>O in gelatin gels over the temp -3° to -50°.

Kinetic interpretation of the coloring of glass by hard x-rays. Robert Livingston and Carl E. Nurnberger *J. Phys Chem* 39, 1011-19 (1935) —Some expts have been performed on the rate of coloring of Pyrex glass by irradiation with hard x-rays, and on the distribution of relative absorptions, of the colored glass, as a function of the wave length for visible light. A simple hypothesis of the rate of coloring has been suggested. An equation has been derived from this hypothesis and it has been shown that the exptl measurements are in agreement with this equation. A discussion of the analogous effects of radiations from Ra is included.

The electrical and magnetic effect on the helium lines with rectangular crossed fields. Walter Steubing and Wilhelm Redepenning *Ann Physik* 24, 161-82 (1935) —The expts previously described (C. A. 29, 4201) have been extended. The theoretical difficulties which stood in the way of the investigation are discussed and it is explained why He, rather than H, was investigated first.

The vacuum arc spectra of rubidium and lithium. S. Datta and Parimal Chandra Bose *Z. Physik* 97, 321-9 (1935) —The source used gives sharp lines. For Rb the satellites for the third and fourth members of the diffuse series are found, giving the splitting of the D levels. The structure of the red Li line 6708 Å is examined at various pressures. The existence of Li in the sunspots is questioned.

Perturbation of higher cesium terms through paraffin hydrocarbons and measurements on the 1s-3p doublet of the principal series of potassium. Chr. Fuchthauer

and H. J. Reimers *Z. Physik* 97, 1-7 (1935) —The displacements in the Cs lines 1s-7p to 1s-30p which are produced by methane, ethane and propane are measured. All the lines are strongly displaced to the red, the max values being 16.45, 20.99, 25.79 cm.<sup>-1</sup> for methane, ethane and propane, resp. In each case the displacements increase up the series to a limit value. Displacements increase with heavier mol. The effective cross section to slow electrons found for CH<sub>4</sub> is 73 sq cm/cc and for C<sub>2</sub>H<sub>6</sub> 120 sq cm/cc. A table of the effective cross sections is given for He, Ne, Ar, Kr, Xe, H<sub>2</sub>, CH<sub>4</sub> and C<sub>2</sub>H<sub>6</sub>. Measurements are made of the half width and displacement of the 1s-3p doublet of K when mixed with various gases. The displacements and half width do not move parallel.

The strengthening, due to drying, of the mercury lines in a mercury-hydrogen discharge. H. Beck *Z. Physik* 97, 352-60 (1935) —The strengthening of the lines observed in H<sub>2</sub> dried with P<sub>2</sub>O<sub>5</sub> by Güntherschulze (C. A. 27, 4732) and others is confirmed. The spectroscopic results do not agree with those of Schnitzer (C. A. 23, 6629); the discrepancies are traced to lack of uniformity in his exptl conditions. It appears probable that the protons are responsible for the strengthening of the lines.

A photographic method of measuring the intensities of spectral lines. Erwin W. Müller. *Z. Physik* 97, 87-106 (1935) —A photographic method is described enabling relative intensities to be measured. A high accuracy can be obtained without the use of a photometer. A double line method enables intensity variations of lines, and also the comparison of neighboring lines, to be made. The absorption of light filters can easily be measured without complex instruments. The relative intensities of bremsstrahlung lines can be determined with the help of a continuous source.

Hydrogen in the upper atmosphere. Joseph Kaplan *Nature* 136, 549-50 (1935) —The afterglow of N<sub>2</sub> is quenched by minute amounts of H<sub>2</sub>. This and spectroscopic evidence indicate that H<sub>2</sub> (as well as H<sub>2</sub>O) is absent, or present in very low concentration, at the atomic level at which the aurora occurs.

Excitation of spectral lines of the hydrogen molecule by electron impact. A. A. Krut'kov and L. S. Orlovskiy *Physica* 2, 611-22 (1935) —A narrow electron beam, passed through 2 grids for acceleration and capture of ions, is used for excitation of H<sub>2</sub> in a Faraday cage. The excitation functions of the singlet and triplet systems of H<sub>2</sub> were determined (4634, 4617, 4581 and 4340 Å) at pressures from 0.045 to 0.0123 mm. The dissociation of the gas is determined from the change in intensity with pressure. The change in intensity of atomic lines differs from that of molecular lines at 30 e.v., indicating that excited atoms are formed from dissociation of excited molecules as well as by direct atomic excitation. Several characteristic curves are given.

Ultraviolet fluorescence spectra of iodine vapor, Mc Lennan bands. T. Duchinsky and Peter Pringsheim *Physica* 2, 633-44 (1935); cf. C. A. 29, 7194 —The diffuse Mc Lennan bands (C. A. 7, 5704; 9, 408) were studied at various pressures, temps and excitation conditions (Cd, Hg, Zn lamps). Typical differences were obtained and their origin is discussed. The interpretation is considered as yet incomplete.

Emission spectrum of selenium oxide. Léon Bloch, Eugène Bloch and Choong Shin-Paw *Compt rend* 201, 824-5 (1935), cf. C. A. 30, 257 —The emission spectrum of SeO extends from 3800 to 2880 Å, any portion of greater Å being masked by that of Se due to decomposition. It consists of some 30 bands, mostly double-headed, all degraded toward the red, and expressed by the formula  $\lambda = 3373.5 + 533.4(r + 1/2) = 877(r + 1/2) + 1908.9(r + 1/2) - 4.8(r + 1/2)^2$ , whence the energy of dissociation of the normal mol is 5331 cal. (Cf. Asundi, cf. C. A. 30, 257).

The fine structure of the C bands of calcium hydride. B. Gröndström *Z. Physik* 97, 171-6 (1935) —Details are given for the rotation doublets of the CaD C bands.

The appearance of the doublets stands in close relation to the perturbations described by Watson (*C. A.* 20, 2082). The perturbations are discussed.

A method of measuring light absorption at low light intensity and short exposure. Manilvel v. Ardenne and P. W. H. H. Z. *Physik. Chem.* A174, 115 (1915).—An arrangement is described for measuring a light intensity of  $7 \times 10^{-10}$  cal/sec. with an accuracy of 1% and an exposure time of 1 sec. A photo-cell was used whose beam produces a larger (greater than  $10^8$  Ohm) connection resistance termination in voltage which is measured by an amplifying instrument. By a periodic interruption of the beam of light an a-c amplifier can be used.

Emission spectrum of the flame of bromine burning in hydrogen and mechanism of the reaction. I. K. K. K. K. *Proc. Imp. Acad. (Tokyo)* 11, 262 (1915). Forty-three bands, degraded to the red, are found between 1876 and 1840 Å. Iron in the flame burning in H<sub>2</sub>. The band heads are tabulated. The band heads are given by  $\nu = 16841.2 - 1.16181 \nu' - 1.24 \nu'' - 0.0087 \nu'''$ ;  $(1000 \text{ cm}^{-1} = 1.15 \times 10^3 \text{ cm}^{-1})$  for  $\nu = 5, 6, 7, 8$ ;  $\nu' = 1, 2, 3, 4$ ;  $\nu'' = 1, 2$ ; the spectrum is due to excited Hg under. The mechanism is discussed.

Photography of the third harmonic of hydrogen chloride. A. H. C. and C. W. W. *Phys. Rev.* 48, 706 (1915).—The third harmonic of HCl at 105.1 Å is being investigated. The band origin is at 10522.7 cm<sup>-1</sup>.

Two new bands of CO. In the photographic infrared. G. H. H. H. *Phys. Rev.* 48, 706 (1915).—Two new CO bands were photographed, with heads at 1.2311  $\mu$  and 1.2174  $\mu$ . The path length was 1 cm, the pressure, 1.10 atm. These lines give values of 8291 and 8293 cm<sup>-1</sup>, agreeing well with the values 8291 and 8293 cm<sup>-1</sup>, predicted for the pair of bands  $\nu_1$  (7, 2) and  $\nu_2$  (4, 1) by Adel and Deming (*C. A.* 27, 3668).

Infrared absorption of cyanides and thiocyanates. W. H. H. H. *Phys. Rev.* 48, 706 (1915).—An analysis of KCN, NaCN, K<sub>2</sub>CN<sub>2</sub>, Na<sub>2</sub>CN<sub>2</sub>, K<sub>2</sub>CN<sub>2</sub>, Na<sub>2</sub>CN<sub>2</sub>, KCN, MeCN, PhCN, EtCN and Me<sub>2</sub>CN<sub>2</sub> were studied in the region 1.2-7.5  $\mu$ . An absorption band which occurred in all the compounds in the region 1.8-1.9  $\mu$  was attributed to changes in the vibrational energy of the formal CN group. At about 1.1  $\mu$  appeared only in highly ionized cyanides, and was attributed to free CN ions. A double band appeared near 7  $\mu$  in the KCN salt. It was not characteristic of the cyanide or thiocyanate anions. Hydrolysis and solvation effects are discussed in more detail.

Absorption spectra of iodine solutions and the influence of the solvent. J. J. J. *Trans. Faraday Soc.* 31, 1172 (1935).—Mol. extinction coefficients were determined in the range 450-600 m $\mu$  for iodine in 1 in CCl<sub>4</sub>, CHCl<sub>3</sub>, CH<sub>2</sub>Cl<sub>2</sub>, C<sub>2</sub>H<sub>5</sub>Cl, C<sub>2</sub>H<sub>5</sub>Br, C<sub>2</sub>H<sub>5</sub>I, C<sub>2</sub>H<sub>5</sub>OH, C<sub>2</sub>H<sub>5</sub>SH, C<sub>2</sub>H<sub>5</sub>SCl, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>5</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>4</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>3</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>2</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>1</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>0</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-1</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-2</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-3</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-4</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-5</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-6</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-7</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-8</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-9</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-10</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-11</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-12</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-13</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-14</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-15</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-16</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-17</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-18</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-19</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-20</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-21</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-22</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-23</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-24</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-25</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-26</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-27</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-28</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-29</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-30</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-31</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-32</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-33</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-34</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-35</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-36</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-37</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-38</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-39</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-40</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-41</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-42</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-43</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-44</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-45</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-46</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-47</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-48</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-49</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-50</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-51</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-52</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-53</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-54</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-55</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-56</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-57</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-58</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-59</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-60</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-61</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-62</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-63</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-64</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-65</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-66</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-67</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-68</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-69</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-70</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-71</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-72</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-73</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-74</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-75</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-76</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-77</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-78</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-79</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-80</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-81</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-82</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-83</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-84</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-85</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-86</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-87</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-88</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-89</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-90</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-91</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-92</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-93</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-94</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-95</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-96</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-97</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-98</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-99</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-100</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-101</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-102</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-103</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-104</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-105</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-106</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-107</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-108</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-109</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-110</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-111</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-112</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-113</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-114</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-115</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-116</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-117</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-118</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-119</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-120</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-121</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-122</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-123</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-124</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-125</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-126</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-127</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-128</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-129</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-130</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-131</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-132</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-133</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-134</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-135</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-136</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-137</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-138</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-139</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-140</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-141</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-142</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-143</sub>, C<sub>2</sub>H<sub>5</sub>SC<sub>2</sub>H<sub>-144</sub>, tion spectrum of the compd reveals a band at 2900 A. which furnishes direct evidence for the existence of free CO groups in the mol, thus favoring one of the proposed structures for the constitution of earvone "hydrosulfide" as the most probable. W. F. Meggers

Investigation of the polarization of Raman scattering. Fritz Heideneich. *Z. Physik* 97, 277-99(1935).—The polarization of the Raman spectra of dichloroethane, hexachloroethane, cyclohexane and  $\text{AsCl}_3$  is examined, by the method of circular polarization. The observed values can be well correlated with the mol structures. The relation between the linear and circular polarization of the scattered radiation from benzene,  $\text{CCl}_4$ , EtOH, toluene and cyclohexane is quantitatively examined. The normally circularly polarized Raman lines agree better with the results of other workers (who use unpolarized primary radiation), than the inverse circularly polarized lines. The broadening of the Rayleigh lines, usually attributed to unresolved rotation Raman structure, is examined. Pure rotation produces inverse circular polarization, the degree of broadening increasing with the anisotropy. Other types of broadening produce depolarization. Only toluene, benzene and AcOH give inverse circular polarization, while EtOH, water and cyclohexane show normal circular polarization, i. e., broadening due to other causes than Raman rotation exists in these mols. Rotation branches in  $\text{NH}_3$  are observed. Normal circular polarization is observed in  $\text{CS}_2$ . S. Tolansky

Raman spectrum and constitution of fuming sulfonic acid. N. Gopala Pai. *Phil Mag* 20, 616-23(1935).—In 21% fuming  $\text{H}_2\text{SO}_4$  all the lines characteristic of  $\text{H}_2\text{SO}_4$  are present, although weakened, no  $\text{SO}_3$  lines are found and addnl lines are found which are attributed to the  $\text{H}_2\text{SO}_4$  mol. At greater concns the lines of  $\text{SO}_3$  and also those of  $\text{SO}_2$  appear and become more intense with increasing concn. The more intense  $\text{H}_2\text{SO}_4$  lines persist even in 80% solns. E. J. Rosenbaum

Relation between ultraviolet absorption and Raman spectra of pyridine. Victor Henri and Pierre Ancenot. *Compt. rend.* 201, 895-6(1935), cf. C. A. 29, 3235f.—The absorption spectrum of  $\text{C}_5\text{H}_5\text{N}$  has been examined at various temps and pressures up to 231° and 910 mm. There are 5 fundamental frequencies (600, 857, 903, 1031 and 1159  $\text{cm}^{-1}$ ) corresponding with those deduced from the Raman spectrum, and practically identical with the fundamental frequencies of  $\text{C}_6\text{H}_6$  (because of the nearness of the at wts of N and CH). The 5 series forming the  $\text{C}_5\text{H}_5\text{N}$  spectrum are given. Light of  $\lambda$  greater than 2750 A. has no photochem. action on  $\text{C}_5\text{H}_5\text{N}$  vapor. C. A. Silberrad

The Raman effect of organic molecules. (The vibration spectrum of acrylonitrile and styrene oxide.) B. Timm and R. Mecke. *Z. Physik* 97, 221-4(1935); cf. C. A. 29, 4265f.—The following Raman lines are found:  $\text{C}_3\text{H}_3\text{CN}$ , 211(2), 384(1), 1289(1), 1612(2), 2338(5), 3076(3), 3115(3). For  $\text{C}_8\text{H}_8\text{O}$ , 807(0), 873(1), 1128(1), 1268(5), 2924(1), 2970(1), 3008(4), 3047(1). The valency bonds and vibration frequencies are discussed. S. Tolansky

Reaction rate of acetic anhydride and water. E. K. Plyler and E. S. Barr. *J. Chem. Physics* 3, 679-82 (1935).—The infrared absorptions of AcOH and  $\text{Ac}_2\text{O}$  were measured in the range 1-6.5  $\mu$ . Several bands below 5  $\mu$  which were similar for the 2 compds were attributed to CH bonds. An intense band was found in  $\text{Ac}_2\text{O}$  at 5.45  $\mu$  and in AcOH at 5.75  $\mu$ . By measuring the intensities of these bands, the reaction velocity of  $\text{Ac}_2\text{O}$  with  $\text{H}_2\text{O}$  was determined. The reaction was approx. unimol for any concn. The reaction const. decreased as time increased its value differed at different concns. The reaction const. was determined at 25°, 50° and 75°. Values of the reaction const. and of other consts are tabulated. G. M. P.

The Raman spectrum of arsenic trichloride. Don M. Yost and Thomas F. Anderson. *J. Chem. Physics* 3, 714(1935).—The modes of vibration of  $\text{AsCl}_3$  given by Brodskii and Sack (C. A. 29, 6504f) are reassigned, on the basis of polarization expts (Cabannes and Rousset, C. A. 26, 2117). Conclusion. Central forces alone are in-

adequate for the treatment of the  $\text{AsCl}_3$  type mol.

Raman spectra of oxalic acid. James H. Hibben. *J. Chem. Physics* 3, 675-9(1935).—Raman spectra of anhydrous oxalic acid, its aq and alc. solns., and of  $(\text{COOH})_2 \cdot 2\text{H}_2\text{O}$  are given, and are compared with the results of Rao (C. A. 29, 6350f). Spectra of the aq soln and of  $(\text{COOH})_2$  show that the 2  $\text{COOH}$  groups do not behave identically: in alc. soln. both groups behave alike. The magnitude of the force consts. in the CO groups is consistent with the strength of this acid. CO oscillations are either very weak or absent in  $(\text{COOH})_2 \cdot 2\text{H}_2\text{O}$ . Chichibabin's tautomeric form (C. A. 23, 1114) is excluded. G. M. P.

Use of Raman effect to distinguish the cis-trans isomerism of the methylcyclohexanols. Jean Tabuteau. *Compt. rend.* 201, 897-8(1935).—The Raman spectra of cis- and trans-o-, m- and p-methylcyclohexanols and the corresponding acetates have been compared. The differences between the spectra of the cis- and trans-isomers are most marked for frequencies between 800 and 900  $\text{cm}^{-1}$ , also in the spectra of the alc. and corresponding acetate the percentage of identical lines is greater for the cis- than for the trans-isomer, the difference decreasing in the order o, m, p. C. A. Silberrad

Polarized fluorescence of organic compounds. S. M. Mitra. *Z. Physik* 97, 138-53(1935); cf. C. A. 29, 2087f.—Measurements are made of the polarization of the fluorescence radiation from succinylfluorescein and succeinyl-ether in soln in glycerol, castor oil, sugar soln, collodion-ether, glycerol-water and gelatin. The dependence of the polarization on wave length is measured. The effects of temp, viscosity and concn. are examined. The exptl. results are discussed. S. Tolansky

Inorganic photosyntheses. Gennaro Calcinai. *Chim. ind. ital.* 65, 538-66(1935).—A study was made of the possibility of obtaining  $\text{H}_2\text{SO}_4$ ,  $\text{H}_2\text{SeO}_4$ ,  $\text{H}_2\text{PO}_4$ ,  $\text{H}_2\text{AsO}_4$ ,  $\text{H}_2\text{SbO}_4$  and  $\text{SiH}(\text{OH})_3$  by the action of light on suspensions of S, Se, yellow P, As, Sb, amorphous and cryst. B. and amorphous and cryst. Si in water. The subject has been studied very little. Each purified element was kept in highly purified water at atm. pressure for 7-11 months, after which the filtered solns. were analyzed. With S,  $\text{H}_2\text{SO}_4$  but no  $\text{SO}_3$  was formed, whereas S in boiling water for many hrs., even with a current of O gave neither  $\text{H}_2\text{SO}_4$  nor  $\text{SO}_3$ . Accordingly the formation of  $\text{H}_2\text{SO}_4$  from S and water is a strictly photochem. reaction. The residual S was in the same stable form. With Se only  $\text{H}_2\text{SeO}_4$  was in soln, while the residue was in part red Se. Therefore Se probably forms  $\text{H}_2\text{SeO}_4$ , and the latter decomposes into red Se, until an equal is reached. With P, there were formed  $\text{H}_2\text{PO}_4$ , less  $\text{H}_3\text{PO}_4$ , and a doubtful trace of  $\text{H}_4\text{P}_2\text{O}_7$ . The residue was red P. Probably therefore the chief reaction is the transformation of yellow to red P. Red P then reacts thus:  $\text{P} + 6\text{H}_2\text{O} \rightarrow 3\text{H}_2\text{PO}_4 + \text{PH}_3$ . These products in turn react thus:  $2\text{H}_2\text{PO}_4 + \text{H}_2\text{PO}_4 + \text{PH}_3 + \text{O}_2 \rightarrow \text{H}_2\text{PO}_4 + \text{H}_2$  and  $4\text{H}_2\text{PO}_4 + 3\text{H}_2\text{PO}_4 + \text{PH}_3$ , while  $\text{H}_2\text{PO}_4$  combines with water and is oxidized to  $\text{H}_3\text{PO}_4$ . Perhaps, however,  $\text{H}_2\text{PO}_4$  is first formed, and then gives  $\text{H}_3\text{PO}_4$  and  $\text{H}_4\text{P}_2\text{O}_7$ . With As, the soln. contained  $\text{H}_2\text{AsO}_4$  and a trace of  $\text{H}_3\text{AsO}_4$ . Likewise with Sb,  $\text{H}_2\text{SbO}_4$  and a trace of  $\text{H}_3\text{SbO}_4$  were formed. It is probable therefore that arsenolite, semarsenite, arsenites, arsenates, antimonites and antimonates by nature are formed by oxidation of As and Sb. With B the soln. contained only  $\text{H}_2\text{BO}_3$ , less being formed with cryst. B than with amorphous B. With Si, there was recovered from the soln. the  $\text{SiH}(\text{OH})_3$  of Mendeleev (cf. The Principles of Chemistry, 1903). Less was obtained with cryst. Si than with amorphous Si. C. C. Davis

The action of radon on polymethylenes—cyclopentane and cyclopentene. G. B. Heissig. *J. Phys. Chem.* 39, 1067-73(1935); cf. C. A. 26, 4535.—Pure cyclopentane (I) was prepd. from cyclopentene by depolymerization at 185-215° and from cyclopentene (II) by hydrogenation in alc. soln. in an Adams app. with a Pt oxide catalyst and was dried, washed with  $\text{H}_2\text{O}$ , concd.  $\text{H}_2\text{SO}_4$ , dil. NaOH (in the second case also alk.  $\text{KMnO}_4$ ), dried over

CaCl<sub>2</sub>, then bright Na, distd. under its own vapor pressure at 0°, and condensed at -80°, b<sub>m</sub> 48.8°, vapor pressure (cf. C. A. 29, 1771) 107.3 mm. at 0°, 4.4 mm. at -52°. It was prepd. by heating 110 g. of cyclopentanone (from cyclopentanone reduced at 150° by H<sub>2</sub> at 1600 lb. pressure in the presence of a Raney Ni catalyst, yield 91%) with 600 g. hydrated oxalic acid at 110° for 2 hrs. It was dried over CaCl<sub>2</sub>, distd. from Na, and from a trap at 0° and condensed at -182°; b<sub>m</sub> 43.5-43.8°, vapor pressure 131 mm. at 0°, 1.0 mm. at -77.5°. On polymerization by  $\alpha$ -rays from Rn at 25° each formed a liquid. The  $M_n/M_v$  value of I is 1.7; that of II, 4.5. These values are in agreement with the heats of formation for I, 18.9 kg.-cal., and for II, -18 kg.-cal. and with  $\Delta(H_2 + CH_4)_{100}$

-AHC

Janet E Austin

Photochemistry of the future. G. Sollazzo. *Boll chim farm* 74, 773-9(1935).—A discussion. H. L. G.

The light sensitivity of several reactions. Chr. Winther. *Z. physik. Chem* A174, 41-8(1935).—The "photochem" oxidation of citric acid, tartaric acid, lactic acid and oxalic acid by chromic acid and of KCl by K persulfate was studied first in the dark, then in blue light, where strong absorption takes place, and finally in green light, where absorption is slight. For the total reactions the quantum sensitivity is less than 0.05 so that it must be considered insensitive to the light used. R. H. Baechler

Diabatic reactions and primary chemiluminescence. R. A. Ogg, Jr. and M. Polányi. *Trans. Faraday Soc* 31, 1375-84(1935).—A theory is developed for reactions in which atoms are converted into ions. The potential energy surface for such a homogenic reaction is described for adiabatic and diabatic transitions. In a series of similar reactions the activation energy decreases as the heat of reaction increases. It is predicted that the reaction velocity of  $M + ClR \rightarrow MCl + R$  should increase as M is varied in the order Na, K, Rb and Cs. The luminescence produced when Na vapor reacts with SnCl<sub>4</sub> is attributed to the diabatic process:  $Na + SnCl_4 \rightarrow NaCl + SnCl_3$ , followed by  $2SnCl_3 \rightarrow SnCl_4 + SnCl_2 + h\nu$ . This process is considered to be the inverse of pre-dissociation. E. J. Rosenbaum

Mechanism of reactions between alkali atoms and halogen hydrides. A. G. Evans and M. G. Evans. *Trans. Faraday Soc* 31, 1400-10(1935).—Theoretical. The method of Ogg and Polányi (preceding abstr.) is applied to these reactions, which are considered as transitions from a homopolar to an ionic energy surface. Activation energies are calculated. The increased probability of the colded state is significant for Na and HCl, and K and HBr or HI, which reactions are the most exothermic of those considered. This increased probability accounts for the abnormal collision diams. found previously for these reactions. The relative rates of reactions of H and D compounds are discussed. The probability of a nonadiabatic transition with a D atom is 1.4 times as great as for a H atom. E. J. Rosenbaum

Photochemistry of methylene blue. Knut M. Brandt. *Arkiv Kemi, Mineral. Geol.* 12B, No. 7, 5 pp.(1935).—The photosensitized reduction of methylene blue was studied in the presence of EtOH, Fe salts and a Na<sub>2</sub>HPO<sub>4</sub> buffer to keep the pH at 8.6. A considerable dark reaction occurred only when both EtOH and Fe<sup>++</sup> ions were present. In all cases photosensitization was observed. The greatest effect was observed in the soles, which contained both EtOH and Fe<sup>++</sup> ions. The reduced soles were reoxidized in the dark, as was observed previously with acidic soles. An equil. is established which is displaced toward the leuco-methylene blue side. E. J. R.

Photodissociation of single crystals of some nitrates in polarized light. L. K. Narayanaswamy. *Trans. Faraday Soc* 31, 1411-12(1935); cf. C. A. 29, 3900.—The degree of disson. of nitrates decreases in the order K, Na, Sr, Ba, Cd, Al, Pb and NH<sub>4</sub>. The long-wave limit of the active radiation is 250 m $\mu$ . Nitrite was found only in a thin layer at the surface, since at greater depths the O cannot escape and recombination results. Polarized radiation the vibrations of which are along the normal to the plane of the nitrate ions is much less effective in disson. the ions than radiation with vibrations in the plane of the ions. E. J. Rosenbaum

Fluorescent screens. I. G. Farbenindustrie A.-G. Brit. 432,432, July 26, 1935. An intensifying screen for x-ray photography comprises a layer of a fluorescent substance of low mol. wt., e. g., ZnS or a sulfide of an alk. earth, and a layer of a fluorescent substance of high mol. wt., e. g., CaWO<sub>4</sub>, the former layer being arranged nearer the x-ray tube. The photographic film or plate is arranged between the layers of the screen.

Fluorescent screens, particularly for Braun tubes. Radioaktengesellschaft D. S. Loewe and Kurt Schlesinger. Brit. 431,404, July 8, 1935. See Fr. 768,767 (C. A. 28, 7165).

## 4—ELECTROCHEMISTRY

COLIN G. FINK

*Elec. Eng.* 54, 1195-9(1935).—See C. A. 29, 6843.

The recovery of potassium chloride by electrolysis with silver electrodes. N. A. Petrov and M. V. Lazareva. *Trans. Inst. Pure Chem. Reagents* (U. S. S. R.) No. 14, 76-80(1935).—Chloride ion can be completely removed from KCl solns. by deposition on Ag electrodes. The best conditions are a concn. of 1.5 mol./l. and an anode c. d. of 0.02-0.03 milliamp./sq. cm. This method is not suitable for the purification of KOH solns. Lewis W. Batz

Hydro power and metallurgical development in Norway. Carl W. Volz. *Mining and Met.* 16, 453-6(1935).—Electro-furnace pig Fe of high purity is replacing charcoal Fe. Special steels are being produced: Cr, Cr-V, W, high-speed tool steel and stainless steels. Sponge Fe is being made by a process primarily dependent on elec. power. A new process for electrolytic refining of Ni from a sulfide

The engineering development of electrochemistry and electrometallurgy. Paul Bunet. *Elec. Eng.* 54, 1320-31(1935).—Some notes on the engineering development of electrochem. and electrometallurgical industries, with particular reference to those in France. The 3-phase and single-phase production of CaCl<sub>2</sub> are compared, and the production of Al, AlN and other electrochem. and electrometallurgical products is discussed. W. H. Boynton

Induction heating at low temperatures. Edgar L. Bailey. *Elec. Eng.* 54, 1210-12(1935).—Inductively heating Fe parts for drying coatings discloses interesting features which may be applied to other low-temp. processes. The elec. design of the oven and currents for induction heating at low temps. are considered and indicate low maintenance and operating costs, cleanliness and reduced processing time. W. H. Boynton

Electric furnaces with carbon radiator. Henri George.

mat contg 45% Ni and 37% Cu has resulted in import of mat from Canada. S and Cu are being produced from chalcopryite. Electrolytic Zn and Cd are being produced from imported ores. Na output is increasing. Norway has made important contributions to Al metallurgy and is the third largest producer. The manuf. of carbide and ferroalloys in the elec. furnace is important. A. H. E.

Cathode film control and metal deposition. Colin G. Fink. *J. Chem. Education* 12, 520-4 (1935).—On the basis of exptl. data a cathode film is found to be necessary for successful metal deposition. Furthermore, this film must be held between fairly definite limits as to thickness and H-ion concn. The film can be maintained within the desired limits by the rotating-cathode method, a definite cathode speed and cathode c. d. corresponding to the desired film thickness and  $p_H$ . The range of film thickness and its  $p_H$  are different but specific for each metal. Curves are given showing the relationship between the film thickness and  $p_H$  as affected by various factors such as temp., speed of cathode, c. d., etc. Some problems in metal deposition that have been solved by the rotating cathode are discussed. By varying the cathode speed, cathode-film  $p_H$  and c. d. the usual order of deposition of the metals can be shifted to meet the requirements of the particular case. The method is recommended for the deposition of those metals and alloys which have not yet been satisfactorily produced from aq. solns. W. G. P.

Theoretical, experimental, and practical studies of the question of electrolysis in subterranean canals. Gibrat. *Bull. soc. belge ing. ind.* 1935, 577-612.—The math. derivation and practical execution of a differential potentiometer arrangement for predicting the likeness and intensity of electrolysis are given. The elec. methods of protection are discussed and their application in some specific cases is described. Leopold Fessel.

Power company service to arc furnaces. L. W. Clark. *Elec. Eng.* 54, 1173-8 (1935).—A general procedure is outlined in planning elec. service for unusual loads such as the elec. arc furnace. W. H. Boynton.

Black nickel. Jos. L. Downes. *Monthly Rev. Am. Electroplaters' Soc.*, Aug., 1935, *Platers' Guide* 31, 12-16 (Nov., 1935). W. H. Boynton.

The theory of fused salt electrolysis. Energy efficiency of the electrolysis of carnallite. I. O. Sheerhakov and A. A. Sheerhakov. *J. Phys. Chem.* (U. S. S. R.) 6, 649-63 (1935).—Electrolysis of both natural and artificial carnallite was carried out in an Fe cell with a graphite anode with a total current of from 100 to 400 amps and the temp. gradually rising from 520° to 700°, voltage dropping from 7.2 to 3.2. On the assumption of losses due to secondary cathode processes the yield as a function of the c. d. is given by  $\eta = 1 - kI^{-1/2}$  and the depolarization voltage by  $E_d = kE_d I^{-1/2}$ . Both the theory and the exptl. data show the possibility of a max. yield with respect to energy input, for the electrodes used, of 78.7% by theory and 72.8% by expt. The calc'd. and exptl. values of the depolarization voltage are 0.117 and 0.130 v. for an av. c. d. of 53 amp./sq. cm. F. H. Rathmann.

Limiting and interrupting the current by a mercury cathode. A. I. Nikiforov and T. M. Sviridov. *Z. Physik* 97, 398-401 (1935).—A Hg cathode of small surface area, enclosed in a W metal cell, is exam'd. Only a limited amt. of current will pass through the cell. An explanation is offered. S. Tolansky.

Industrial applications of electrolysis. H. J. T. Ellingham. *Chemistry & Industry* 1935, 895-902. E. H.

Inversion of a sucrose solution in contact with a wall traversed by an electric current. Philippe Fabre. *Compt. rend. soc. biol.* 120, 179-81 (1935).—When a weak d. c. (60 ma at 480 v.) was passed through a 20% soln. of sucrose contg. 1% of KCl partial inversion of the sucrose occurred if the cell was divided into 2 compartments by a porous cup. If the cup was removed no inversion took place. The effect is ascribed to a polarization of the surfaces of the porous cup by the current passing through the walls. The electrodes were not placed in the sucrose soln. but were in sep. vessels connected to the 2 compartments

of the reaction cell by glass siphons filled with KCl soln. L. E. Gilson.

Electrolytic preparation of heavy water. The relation between electric current density and the isotopic separation coefficient. Anon. *J. Electrochem. Soc. Japan* 3, 127 (1935).—The procedure and actual data of prep. 24 cc. of heavy water of the intensity of 88% D<sub>2</sub>O and 3.0 cc. of 95% D<sub>2</sub>O are reported. Results are recorded of expts. on the relation between elec. c. d. and the isotopic sep. coeff. It is concluded that there is no effect of the c. d. upon the sep. coeff. under the following exptl. conditions: process of electrolysis; initial vol. of 20% NaOH soln. in 0.05% H<sub>2</sub>O water is kept const. by continuously supplying water of 0.05% D<sub>2</sub>O free from NaOH. Electrodes are Ni temp. is 18°, vol. contraction by electrolysis 1/5, range of c. d. is 0.05-1.0 amp. per sq. cm. Thus was obtained 0.21% D<sub>2</sub>O repeatedly within the range of the c. d. mentioned. C. G. I.

Electrolytic preparation of hydrogen peroxide. H. Sidersky. *J. S. African Chem. Ind.* 18, 44-61 (1935).—The electrolytic processes involve a vacuum distn. which cannot be controlled to give good yield and satisfactory concn. simultaneously. S. records detailed studies of (a) the reactions occurring during the vacuum distn. of the H<sub>2</sub>O<sub>2</sub> (and its K and NH<sub>4</sub> salts); (b) the detn. of the possibilities of the direct conversion of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> into H<sub>2</sub>O<sub>2</sub>. B. E. Anderson.

Effect of total voltage on breakdown in vacuum. H. W. Anderson. *Elec. Eng.* 54, 1315-20 (1935).—A review of results of a series of high-voltage breakdown tests between metal electrodes in high vacuum. The inverse relation between cathode gradient at breakdown and gap length leads to the conclusion that the current that flows between electrodes as the conditions for high-voltage breakdown are approached must involve neg. ions from the anode. The deposition of anode material upon the cathode, which would occur in the event of such neg. ion emission, was found to take place. Inter-electrode current at const. cathode gradient varied with the voltage, proving the above hypothesis. W. H. Boynton.

Sparking potential of hydrogen in high frequency discharge. Raymond Zouckermann. *Compt. rend.* 201, 649-51 (1935); cf. *C. A.* 27, 4163.—Under similar conditions curves of sparking potential (V) vs. pressure (p) were detd. for  $\lambda$  101 (I) and 12 m. (II) in pure H<sub>2</sub> (s) and in H<sub>2</sub> contg. traces of Hg vapor (b). Ia and Ib show a min. for  $V = 342$  v.,  $p = 0.2$  mm., and are identical for pressures above the min., but for lower pressures Ib lies above Ia, while the color of the discharge changes from rose to blue when Hg is admitted. In IIa the min. is for  $V = 74$  v.,  $p = 0.002$  mm., as Hg vapor is admitted the min. moves toward lower potential and lower pressure. C. A. Silberrad.

Structure and properties of nickel deposited at high current densities. Wm. Blum and Charles Kasper. *Trans. Faraday Soc.* 31, 1203-11 (1935); cf. *C. A.* 29, 7831.—Deposits were made from NiSO<sub>4</sub> and NiCl<sub>2</sub> baths as such and sat'd. with boric acid at c. d. from 22 to 45 amp./sq. dm. at the boiling temp. of the solns. (about 102°) and at a  $p_H$  of 1.0-2.0. Deposits were made in 5-l. glass jars with 5-cm. sepn. of electrodes. For macrographic etching glacial acetic acid plus < 1% HNO<sub>3</sub> was employed. Deposits from NiCl<sub>2</sub> solns. were fine-grained smooth, strong (approx. 7000 kg./sq. cm. tensile), hard (about 200 Vickers) and brittle, and the corresponding NiSO<sub>4</sub> deposits were rough, coarse-grained, soft (approx. 120 Vickers) and ductile (approx. 4300 kg./sq. cm. tensile). Boric acid slightly softens the NiSO<sub>4</sub> deposit. Variation of  $p_H$  from 1.0 to 2.0 makes no definite change in properties. Cathode efficiencies are always higher for chloride (approx. 85%) than for sulfate (approx. 60%) deposits. The need for a great deal more work over a wide range of conditions is remarked as well as need for more discriminating methods of examn. of the deposits. H. A. Smith.

The thermal theory of cathode sputtering. II. The elementary process. N. D. Morgulis. *J. Exptl. Theoret. Phys.* (U. S. S. R.) 5, 588-94 (1935); cf. *C. A.* 29,

7789<sup>1</sup>.—The theory of Bippel (*C. A.* 21, 2425) is further developed.

Changes of temperature with time in arc discharges with alternating current. D. Th. J. ter Horst, H. Brinkman and L. S. Orstein. *Physica* 2, 652-68 (1935), cf. t. II., Diss. Utrecht, 1934.—An a.-c. arc, C electrodes in air, was studied at different frequencies (100 to 500), 2-4 amps, 60-85 v., 5-mm arc, 6-mm. electrodes. The spectrograph slit was perpendicular to the electrodes, half-way. A stroboscopic interrupter was interposed between arc and spectrograph, giving 6° phase intervals. The temp. was detd. from violet CN bands. The temp. variations are given in diagrams, they decrease with increased frequency. From oscillograph diagrams the energy production per vol. unit was detd. and on the basis of this an energy balance made up for the discharge. The output items are heating of arc gas between electrodes, heat losses by conduction, radiation and convection. An equation is derived for the total heat cond. of the arc including mol and atom effects due to disson. From the calcn. is derived a phase lag between energy and temp. function in fair agreement with the exptl. data, it varies with the frequency, at 50 cycles the delay angle is 25°, at 250 cycles it is 45°. The thermal theory of the arc discharge (O. and B., *C. A.* 29, 354) is again confirmed.

B. J. C. van der Hoeven

Experimental study of the influence of the support or cathode on the structure of electrolytic deposits obtained in aqueous solution. Albert M. Portevin and Michel Cymboliste. *Trans. Faraday Soc.* 31, 1211-18 (1935).—The influence (1) of the rate of formation of crystal nuclei and (2) of the rate of growth of such nuclei is fundamental in detg. the structure of electrolytic deposits. The fineness, orientation and form of the crystals making up the deposit depend on (1) and (2). The fundamental concepts (1) and (2) depend upon the conditions exterior to the cathode and upon the surface and structure of the cathode. The geometry, chem. and cryst. condition of the cathode surface affect markedly the condition of the deposit. The influence of surface irregularities due to scouring, cataphoresis, cracks and holes is illustrated by photomicrographs. The sep. effects of the type of metal of the cathode, oxidation, selective soln., adsorbed colloids and gas bubbles are illustrated for Cr and Ni deposits. To obtain cryst. continuity between cathode and deposit the Deily layer as well as any layer of foreign matter must be thoroughly removed. Such continuity is also influenced by (1). If (1) is large the continuity may be entirely lacking. Cryst. continuity of Zn and Cd deposits on cathodes of these metals, resp., is known. Deposits of Ni on Cu cathodes and of Cd on Sn and Pb are also known.

H. A. Smith

The cathode bead discharge. H. Beck. *Z. Physik* 97, 370-81 (1935).—The current-voltage characteristic of the discharge is found. A condition for the formation of beads is that the cathode surface shall be electrically clean. The discharge may take place in Zn and Cd. The effect of a magnetic field is investigated. B. Swirles

"Somatoid" elements of structure in electrolytic metal deposits. V. Kohlshütter. *Trans. Faraday Soc.* 31, 1181-8 (1935).—Small but microscopically visible particles possessing a definite "organization" acquired in the process of formation are termed somatoids. They are characteristic aggregations of crystallites. The form and nature of somatoid formations do not depend on the compn. and crystallographic properties of the material involved. They are morphological individuals characteristic of definite states realized during their formation rather than definite substances. Colloids play the principal role in somatoid formation. Somatoids are products of the combined action of crystn. forces with surface forces. Unstable forms of some substances acquire a certain stability when existing as somatoids. Electrolytic deposits due to the topochem. nature of the reaction are often somatoidal in nature. It is desired especially to call the attention of the electrochemists to the role played by somatoids in electrocpn. of metals and to the possibility and value of examp. such deposits by morphological methods. An

extended discussion will appear elsewhere. 15 references

H. A. Smith

Effects of film formation on the structure of electrodeposited metallic coatings. E. Liebreich. *Trans. Faraday Soc.* 31, 1188-94 (1935).—Hydroxides are generally formed at even the lowest c. ds. at the surface of the cathode and profoundly affect the type of deposit obtained. The surfaces of the deposit often react chemically with the OH<sup>-</sup>. In the cathode potential c.-d. curves of Pt on Ag in a soln. of NiSO<sub>4</sub>, Pt shows a slight reaction just prior to the evolution of H<sub>2</sub>, while Ag shows a very marked inflection at this point. Metals showing slight reaction form a thin homogeneous film on the surface not reduced by H<sub>2</sub>. Metals exhibiting a pronounced inflection, and hence tendency to react, form films readily reduced by H<sub>2</sub>, thus presenting an active surface. The formation of films on such a metal depends on the soly. of the products of reaction at the surface. In plating Cr the overvoltage is not due to phys. factors so much as the reduction of the film of oxides formed at the cathode. The peculiarities of the behavior of Cr deposits on various metals from various types of solns. are critically discussed.

H. A. Smith

Cathodic film in the electrolytic reduction of aqueous chromic acid solutions. Frich Müller. *Trans. Faraday Soc.* 31, 1194-2202 (1935).—It is remarked that the reason for the failure of Cr to deposit on Pt cathodes in very pure H<sub>2</sub>CrO<sub>4</sub> solns. is due to the formation of a film of Cr chromates on the Pt. Deposition of Cr on C cathodes does proceed, however. C.-d. electrode potential curves for C cathodes rise to a max. at about +0.4 v., thereafter decreasing in a low value at about 0 v., then rising somewhat again. The mechanism of the reaction at the C cathode is worked out in detail based on the supposition that, compared to a Pt surface, a C surface is quite rough and the reaction varies from point to point on the cathode. The mechanism of the action at the cathode in pure H<sub>2</sub>CrO<sub>4</sub> and in H<sub>2</sub>CrO<sub>4</sub> with addnl. sulfate and other ions is presented in considerable detail. The fluctuating type of current obtained in the presence of sulfite is illustrated with typical oscillograms.

H. A. Smith

Determination of the structure of electrodeposits by metallurgical methods. D. J. Macnaughtan and A. W. Hothersall. *Trans. Faraday Soc.* 31, 1168-77 (1935).—For Ni deposits the Brinell hardness varies inversely with crystal size. After a thorough consideration of methods for making hardness measurements the Brinell impression is considered to be the most generally useful. A deposit thickness of 0.01 in. is considered sufficient to eliminate the influence of base metal on hardness readings of 100-400 Brinell with a 1-mm. ball and a 10-kg. load. No correlation is possible between cathode potential and hardness or microstructure. Co-deposited H does not affect the nature of the Ni deposit. Highest hardness values are assoc. with high pH. Alkali metal ions give a harder deposit than chloride ions. Thus, colloidal Ni compds. are considerable as important in producing fine grain size and hard deposits. Annealing treatment (4 hrs. at 1000° in vacuo) showed the presence of foreign matter in the hard deposits that was lacking in the soft ones. Low-temp. treatments (200°) indicate that the soft metal deposited at low cathode efficiencies is highly stressed and contains considerable amts. of dissolved H while hard deposits at high efficiencies are little stressed and contain little H.

H. A. Smith

Chemical and physical properties of electrolytically deposited metals in relation to their structure. M. Schlöter. *Trans. Faraday Soc.* 31, 1177-81 (1935).—Electrolytic metals are never absolutely pure. One of the most important impurities is H. H in Ni deposits is both mechanically and chemically held. Mechanically bound H is liberated on heating to about 400° while chemically bound gas is only liberated above 600°. At a given pH the H content of the metal varies inversely with c. d. and at a given c. d. the H content varies directly with the acidity. High overvoltages (corresponding to large amons) are assoc. with high H absorption by the metal. It is found that the lattice consists of Cu and Ag deposited

from solns contg  $1^-$  are larger than for deposition in solns free from  $1^-$ . Thus anions can take part in the deposition and even enter the crystal lattices of the metal. Such Ag deposits will not tarnish in the presence of  $H_2S$ , and they vary in color up to a golden yellow depending on the quantity of  $1^-$  in the deposit. A Cu deposit contg  $1^-$  turns blue in sunlight "iodized". Ag deposits seem to have a body-centered tetragonal lattice. It is believed that other anions, halogens, oxides, hydroxides and sulfides may enter the lattice of electrodeposited metals.

Theoretical valuation of electrode potentials. Shoji Makishima. *Z. Elektrochem.* 41, 697-712 (1935).—See C. A. 29, 6845, 7823.

G. G.

A new arrangement for measuring polarization voltage. B. Gross. *Physik Z.* 36, 648-9 (1935).—A vacuum tube (half-wave rectification), is used, and the measuring instrument is connected in parallel to the electrolytic cell. The tube is connected in series, with its cathode connected to the cathode of the cell, and its grid is regulated by the polarization current itself, through a rheostat. The current used for heating the tube should be kept as low as possible. In the primary circuit, it can be completely suppressed by using a 3-electrode tube, the grid of which gives a neg. current of a few v. Wiring diagrams are given.

E. R. Rushton

Improvement in the quality of tin plate by superimposed electrodeposition of tin. A. W. Hotherhall and W. N. Bradshaw. *J. Soc. Chem. Ind.* 54, 320-0T (1935); *Ch. C. A.* 28, 5344.—The McNaughton process of electrodeposition of thin coating of Sn on tin plate has been investigated to det. the behavior of diff. acid and alk. plating solns., the effect of preparatory cleaning treatments, e. d. and thickness of deposits, polishing after deposition and the effect of bending the tin plate before and after plating. Optimum results were obtained with alk. solns., low e. d. and cleaning in boiling Na disulfate soln. The polishing process did not increase porosity.

M. McMahon

Inhibitors—safe and dangerous. Ulick R. Evans. *Trans. Electrochem. Soc.* 69, 15 pp. (preprint) (1935).—An attempt to inhibit the anodic reaction of a corrosion-change controlled by the cathodic reaction will usually diminish the corroded area more quickly than it diminishes the total destruction of metal, and thus increase the intensity of corrosion if the addn. has been insufficient to stop attack altogether, such methods of inhibition are dangerous. This intensification of attack will not occur where the corrosion is under anodic control, or where the inhibitor is one which smoothes the cathodic reaction. The principles are applied in discussing the addn. of alkali to hard, soft and saline waters, and also the treatment of brine with chromate. The classification of protective processes into safe and dangerous groups can be extended to protection by oxide films, paints and metallic coats.

C. G. F.

The anodic behavior of copper in aqueous solutions of orthophosphoric acid. P. A. Jacquet. *Trans. Electrochem. Soc.* 69, 22 pp. (preprint) (1935).—A Cu surface anodically etched in aq. solns. of orthophosphoric acid becomes as bright as though it had been polished, if voltage and e. d. are kept within definite limits. If properly controlled, anodic etching will reveal the crystal structure of the metal. The phenomenon seems to be based on the passivation of the anode and is a function of concn. polarization. The anodic-etch method has been applied in metal sections intended for metallographic examn.; excellent results were obtained. As compared with the usual acid-etching method, the anodic has the advantage of being much more rapid and less expensive.

C. G. F.

The electrolytic preparation of anthranic acid. J. W. Shipley and J. M. Calhoun. *Can. J. Research* 13B, 123-32 (1935).—The electrolytic reduction of o-nitrobenzoic acid in alic.  $H_2SO_4$  at a Pb cathode was investigated. The effect of various exptl. conditions was studied and a max. yield of 92% of amine obtained under favorable conditions. No evidence of the reduction of the carboxyl group was observed.

J. W. Shipley

Purification of electrode carbons for spectrum analysis. Th. Zürrer and W. D. Treadwell. *Helv. Chim. Acta* 18, 1181-9 (1935); cf. Heyne, *C. A.* 26, 6074.—The working portions of small electrode carbons are freed from impurities which interfere in emission spectra by passing a 12-amp. arc between them for 2-3 min. in an atm. of  $Cl_2$  together with 5%  $Cl_2$ . No  $Cl_2$  is necessary in most cases, but the presence of B, Cu and Mg in the carbons would require it.  $HCl$  is not effective. Tables are given showing the strength of lines of 15 elements in carbons purified in various ways.

W. F. Bruce

Gas reactions in the silent discharge at atmospheric pressure. I. A new screened point-discharge with change from a high-current to a low-current discharge form. P. A. Thuessen and H. Bartel. *Z. tech. Physik* 16, 285-93 (1935).—In order to get this type of discharge screen is essential. The low-current form resembles a glow-discharge at low pressure. The material of the point, or of the plate cathode, has no influence on the discharge. At low gas pressure the current max. is higher and the transition range is sharper. At increased temp. the current max. is higher but the transition range is broader. Pure gases do not show the effect. A mixt. of N and 15% O shows it very well.

J. B. Austin

Gaseous discharge tube especially designed as an intense source of continuous ultraviolet radiation. R. H. Munch. *J. Am. Chem. Soc.* 57, 1835-5 (1935).—A simple low-voltage H<sub>2</sub> discharge tube with thin Pyrex window has been developed which is an intense source of ultraviolet. When filled with rare gases or Hg the tube is useful as a source of line spectra of these elements.

M. McMahon

Anode materials for high-vacuum tubes. E. C. Spitzer. *Elec. Eng.* 54, 1246-51 (1935).—Since the power output of a tube is proportional to the amt. of heat that can be dissipated safely from its anode, the anode is one of the most vital parts of high-vacuum tubes. Materials considered include W, Mo, Ni and C (graphite). The final choice of material depends upon the limitations involved.

W. H. Boynton

The evolution of the x-ray tube. P. Kraus, *Sci. J. Chem. Education* 12, 553-8 (1935).

E. H.

Applications of a photoelectric cell. Anthony H. Lamb. *Elec. Eng.* 54, 1188-90 (1935).—The characteristics of one type of dry disk photoelec. cell are described and a no. of typical applications given.

W. H. Boynton

New light sources for exposure tests and fluorescence analyses. Walter M. Münzinger. *Astrocellulose* 6, 179-80 (1935).—An incandescent lamp contg. Hg vapor is described.

F. M. Symmes

Bottom brick for Ajax elec. furnaces (Vakhratsev) 19.

Oxide coatings on cathodes for elec. discharge device (U. S. pat. 2,019,548) 9. Vulcanizing long lengths electrically (Brit. pat. 432,943) 30. Elec. furnace for melting glass (U. S. pat. 2,022,112) 19. Halogenated di- and triphenylmethanes (Brit. pat. 433,072) 10. Turbine blades (Brit. pat. 432,356) 9. Coating Al and its alloys (Brit. pat. 433,367) 9.

Batteries. Accumulatoren i fabri. A.-G. Brit. 433,809, Aug. 21, 1935. The gas that collects in the space above the electrolyte while a battery is in use or on open circuit is absorbed by electrodes that are given a potential by connection with the main electrodes.

Batteries. P. R. Mallory & Co., Inc. Brit. 433,771, Aug. 20, 1935. A voltaic couple consists of an electrode of Cd, Al, Zn or other electropos. material in contact with an electrode of solid  $CrO_2$ .

Storage battery. Robert H. Lewis (to Firestone Battery Co.). U. S. 2,019,823, Nov. 5. Structural details. Storage battery. Frank S. Carlie (to Carlie & Doughty, Inc.). U. S. 2,021,288, Nov. 19. Structural features.

Storage battery. Walter C. Roberts (to B. F. Goodrich Co.). U. S. 2,022,090, Nov. 26. Structural details.

Storage batteries. Leonard Fuller. Brit. 432,775, Aug. 1, 1935. A dry storage battery is made by placing

a pasted neg. electrode in position in a container and then making the pos. electrode by filling the container with  $\text{PbO}_2$  or  $\text{PbO}$  which has been electrolytically formed and compressing it against a separator covering the neg. electrode. The electrolyte is absorbed in the electrodes and may be introduced into the active material before or after the pos. active material has been placed in the container.

**Storage-battery electrodes.** Karl W. J. Hjelmblad Brit. 433,518, Aug. 16, 1935 Structural features are given

**Condensers.** Porzellan Fabrik Kahla Brit. 432,791, July 30, 1935 A condenser is made with heat-resisting ceramic insulating-material as the dielec., the armatures being produced by burning on layers of precious metal by a process such as that of Brit. 407,559 (C. A. 28, 4987)

**Condensers.** Roger B. Peacock and Imperial Chemical Industries Ltd. Brit. 433,140, Aug. 9, 1935 Chlorinated rubber, with or without a plasticizer such as chlorinated Pb, is used as dielec. The rubber may be coated on the surface of the metal electrodes or used to impregnate a paper separator.

**Electrolytic condenser.** Julius F. Lohfeld (in Ergon Research Laboratories, Inc.) U. S. 2,021,455, Nov. 19 Structural features

**Electrolytic condensers.** Joseph B. Brennan Brit. 433,518, Aug. 21, 1935 See Fr. 773,812 (C. A. 29, 13314) The solns must be acidified

**Electrolytic condenser.** Siemens & Halske A.-G. (Walter Michaelis, applicant in Ger.) Fr. 785,674, Aug. 10, 1935 Hydroxyalkylamines, e. g., triethanolamine, are used as electrolyte or a constituent of the electrolyte in the formation or use of the condensers

**Electrolytic cells suitable for condensers.** Howard E. Rhodes (to Aerovox Corp.) U. S. 2,019,094, Nov. 5 An Al electrode is formed by impressing a voltage on it in the presence of an electrolyte including borax and boric acid, and then impressing a higher voltage in the presence of an electrolyte including a mist formed from boric acid and  $\text{aq. NH}_3$  soln.

**Electrolytic condenser electrodes.** Joseph B. Brennan Brit. 433,491, Aug. 15, 1935. The electrode comprises a base having applied thereto a reticulated surface consisting of fine coherent particles of metal. Preferably molten Al is sprayed onto a base of metal, paper, wax, rubber, glass, etc.

**Mercury turbine condenser and associated apparatus.** Leonard R. Biggs (to General Elec. Co.) U. S. 2,020,097, Nov. 5. Structural and operative details

**Making endless metal bands by electrodeposition.** Seamless Metals Ltd. and Charles Rice Brit. 432,095, July 19, 1935 Metal is deposited on a cathode in the form of an endless band mounted on a frame round which anodes are moved continuously by a conveyor. The cathode may be of Cu coated with Ag to permit detachment of the deposit; the edge portions are coated with a resist. App. is described.

**Depositing metals by electric discharge.** Paul Alexander and La Dispersion Cathodique (en abrégé DSCA) Soc. anon. Brit. 432,469, July 26, 1935 The cathode to be disintegrated is first treated for the removal of gases strongly incorporated in the surface by active adsorption or "chemisorption." This preferably is effected by heating in an atm. of a gas, e. g.,  $\text{H}_2$ , that reacts with the adsorbed gas. Heating may be by a preliminary discharge or otherwise. The heating temp. should be above  $800^\circ$  and in the case of Pt and W should be above  $1300^\circ$ . Liberation of the adsorbed gas is facilitated by ionization of the filling gas by means of x-rays, Ra or by auxiliary electrodes. The formed products are evacuated continuously by pumping. In 432,470, July 26, 1935, articles are coated by cathodic disintegration with a hard metal of the Fe or W group, including Mn, Fe, Co, Ni, Mo, W and Cr. The 2nd metal is preferably a precious metal, e. g., Pt, Ir. The articles coated may be of enameled porcelain, fused quartz, enameled metal or glass; they should be heated, e. g., to  $200\text{--}300^\circ$ , during deposition. A mirror may be made by deposition of Ag on an initial deposit of Ni or Mo.

1 Plates coated according to the process may be used as elec. heating resistances.

**Plating metals.** Heinz Tichauer, Jean Frasch and Henri Jolivet. Fr. 785,717, Aug. 17, 1935. In covering metals such as Al by electrolysis, particularly for plating with Ni, a basic bath, in which a small amt. of an org. acid such as malonic acid is incorporated, is used. An example of a bath for plating Al contains  $\text{NiCl}_2$ , 18–20,  $\text{NaOH}$  6–8, the malonic acid 1–2,  $\text{NaCl}$  1–3% and water the rest. The metal may be preliminarily treated in a bath contg. Zn salts

**Chromium plating.** Richard Schneidewind. U. S. 2,020,342, Nov. 12. The "throwing power" of Cr-plating baths is increased by adding a quinone such as 0.5% or less of anthraquinone, hydroquinone or naphthaquinone to the bath

**Apparatus for the electrolytic generation of gases under pressure.** Rudolf A. Erren Brit. 432,698, July 31, 1935

**Electrolytic purification of liquids.** Jean Billiter. Brit. 431,655, July 15, 1935 In the electro-dialytic purification of liquids in a 3-compartment cell, the anode space is not flushed, the anode liquor thereby increasing in acid strength and cond. Pure acid may be added from time to time to maintain an anolyte cond. of 10–3 reciprocal ohms per cc. The cathode liquor may similarly be allowed to increase in strength and its cond. further increased by adding pure bases. Cells are described

**Electrolytic transmission of sodium through glass.** Marconi's Wireless Telegraph Co. Ltd. and Ernest W. B. Gill Brit. 432,898, Aug. 2, 1935 Na is introduced into the interior of an elec. lamp or discharge tube having an envelope made wholly or in part of a substance contg. Na by immersing the device in a molten bath of a Na compd. and passing an elec. discharge in the vessel without the use of internal electrodes. App. is described.

**Refining iron and iron alloys by electrolysis.** Ernst Kelsen and Edgar Aussenit Austrian 142,870, Sept. 25, 1935 (Cl. 48a). Products of reduced S content are obtained by adding an alk. earth salt, e. g.,  $\text{BaCl}_2$ , to the electrolyte, whereby  $\text{SO}_4$  ions derived from S in the crude material are eliminated.

**Treatment of electrolytic iron.** Ernst Kelsen and Edgar Aussenit. Austrian 142,871, Sept. 25, 1935 (Cl. 40b). The magnetic properties of electrolytic Fe are improved by removing as much as possible of the occluded  $\text{H}_2$ . This is effected by subjecting the metal to a heat treatment in which the temp. is alternately raised and lowered, under such conditions of reduced pressure that the partial pressure of  $\text{H}_2$  is kept below 1 mm.

**Treatment of electrolytic iron and iron alloys.** Ernst Kelsen and Edgar Aussenit. Austrian 142,872, Sept. 25, 1935 (Cl. 48b). The surface of the material is highly polished, and occluded  $\text{H}_2$  is then removed by the usual heat treatment. The products have a greater resistance to rusting than those produced by the known process in which the surface is polished after the heat treatment.

**Electrolytic surface treatment of aluminum and its alloys.** Ralph B. Mason (to Aluminum Co. of America). Brit. 433,454, Aug. 15, 1935. An article of Al or Al alloy is provided with a highly reflective surface by anodic or a.-c. treatment in an electrolyte contg. a fluoroborate. Suitable electrolytes are solns. of  $\text{HBF}_4$ ,  $\text{NH}_4\text{BF}_4$  or  $\text{Pb}(\text{BF}_4)_2$ . Aceto-tri-fluoroboric acid, obtained by treating  $\text{AcOH}$  with  $\text{BF}_3$ , may be used.  $\text{NH}_4\text{F}$  may be added. The treated surface may be coated with a clear transparent lacquer or may be subjected to further anodic treatment in a  $\text{H}_2\text{SO}_4$ ,  $\text{CrO}_3$  or  $(\text{COOH})_2$  bath to produce a transparent oxide coating.

**Coloring aluminum and its alloys.** Vereinigte Aluminium-Werke A.-G. Ger. 619,163, Sept. 23, 1935 (Cl. 48a. 16). Addn. to 607,473 (C. A. 29, 17239). Articles of Al or its alloys, before they are colored in known manner, are superficially oxidized by electrolytic treatment with a. c. in a bath contg.  $\text{CrO}_3$  and  $(\text{COOH})_2$ .

**Beryllium.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Fr. 785,072, Aug. 1, 1935. Be is obtained by submitting to electrolysis at  $370\text{--}400^\circ$  a mixt. of

Be chloride (40-60%) and an alkali chloride, the f. p. of the mixt. being below 450°.

Gold Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Fr. 784,928, July 29, 1935. Au free from Pt or of low-Pt content is obtained by using a product contg. both these metals as anode in an electrolyte free from chlorides of precious metals and composed of HCl or chlorides or both, with c. ds. of about 1200 amps. per sq. m. or more. The resulting mud is afterward treated to sep. other metals such as Cu or Ag, e. g., by treatment with  $\text{HNO}_3$  or  $\text{H}_2\text{SO}_4$ .

Producing fluoride coatings on light metals and their alloys Siemens & Halske A-G (Hellmut Fischer, inventor). Ger. 619,415, Oct. 1, 1935 (Cl. 45a. 16). The metal or alloy is subjected to electrolytic treatment in a fused electrolyte comprising a compd. or mixt. of compds. of F m. at a relatively low temp., e. g., 150-220°. Suitable electrolytes are  $\text{KHF}_2$  or  $\text{NaHF}_2$  or mixts. thereof, and also double fluorides of Na and Bi, K and Mg, Na and Al or an alkali metal and Sb. Anodic treatment with d. c. is preferred, but a c. may also be used. The cathode may be a fused metal or alloy of low m. p., which alloys with the metal of the electrolyte. Various uses for the fluoride-coated light metals or alloys are indicated, e. g., for coating app. to be used in contact with F or its compds., or as supports for light-sensitive materials or cements for uniting metal surfaces. The fluoride coating also facilitates the absorption or adhesion of dyes or lacquers.

Electrochemical treatment of clay, Giovanni Rodio. Brit. 433,253, July 23, 1935. Clay soil is hardened by passage of an elec. current from an electrode of Al to 1 of Cu, Fe or other metal, preferably a metal widely sep. from Al in the electrochem. series.

Electrolytic furnaces E. I. du Pont de Nemours & Co. Brit. 433,633, Aug. 19, 1935. In the electrolysis of a fused salt mixt., e. g.,  $\text{NaCl}$  and  $\text{CaCl}_2$ , in a cell comprising narrowly spaced electrodes of large area, sep. of undesired solid metal is avoided by artificially increasing the rate of circulation of the electrolyte between the electrodes.

Electrolytic furnaces for producing aluminum Siemens-Platzwerke A-G for Kohleisabrakt. Brit. 433,508, Aug. 15, 1935. Contact surfaces are machined on the electrodes during the feeding of the latter by means of a cutting edge of hard metal, e. g., a W-Co alloy, provided on the contact plates. The plates are of soft metal.

Electric furnace, with means for indicating the magnetic condition of the charge Hevi Duty Electric Co. Ger. 619,398, Sept. 30, 1935 (Cl. 18 & 1.50). See Brit. 366,542 (C. A. 27, 1604).

Electric muffle furnace with gas-circulating means Siemens-Schuckertwerke A-G (Johann Schnepf and Otto Günther, inventors) Ger. 619,479, Oct. 1, 1935 (Cl. 18c. 11.10).

Electric induction furnaces for melting metals Gustaf A. Juhlin and Associated Electrical Industries Ltd. Brit. 433,339, Aug. 13, 1935. The charge is subjected to a vertical alternating magnetic flux and simultaneously to a horizontal magnetic field rotating about a vertical axis.

Electric resistance heated furnace Numan R. Stancel (to General Elec. Co.) U. S. 2,020,127, Nov. 5. Structural features.

Roof construction for electric furnaces Howard A. McPherson (to American Manganese Steel Co.) U. S. 2,021,424, Nov. 19.

Electric heating and conditioning of wire or the like as in wire-drawing operations Wm. H. Wood, Oscar C. Trautman and Wm. E. Benninghoff (to Ira Crouse). U. S. 2,019,555, Nov. 5. Various details of app. and operation are described.

Electrical pyrometer Samuel Ruben (to Verna Mfg. Corp.) U. S. 2,021,491, Nov. 19. A Cu shell carries a layer of cuprous oxide on its inner surfaces and is substantially filled with graphite powder. One electrode is in contact with an unoxidized portion of the Cu shell and another is imbedded in the graphite powder.

Electric-arc apparatus for making artificial gems by fusion of powdered oxides Alfred Schmid Ger. 619,331, Oct. 3, 1935 (Cl. 12m. 6).

Electrical precipitation of suspended particles from gases Walther Deutsch (to International Precipitation Co.) U. S. 2,019,485, Nov. 5. Various details of app. and operation are described.

Electric apparatus for determining the temperature of conductive bodies such as calendar rollers. Georg Kemath (to Siemens & Halske A-G). U. S. 2,020,067, Nov. 5. Various structural, elec. and operative details.

System for making electric resistances by depositing carbon on supports Bernhard Beveschlag Ger. 619,299, Sept. 25, 1935 (Cl. 21r. 54.05).

Static contact rectifiers Süddeutsche Apparate-Fabrik G. m. b. H. Brit. 432,619, July 30, 1935. A dry contact rectifier comprises a light metal base, e. g., Al, coated with a layer of a metal of the Fe group, a layer of Se firmly applied and a 2nd electrode pressed or sprayed onto the layer of Se.

Electric rectifying and conversion system employing mercury vapor or a rare gas Jürgen von Isendörff (to Westinghouse Elec. & Mfg. Co.) U. S. 2,020,922, Nov. 12. Various structural, elec. and operative details.

Mercury arc rectifier Joseph Siejan and Leon R. Ludwig (to Westinghouse Elec. & Mfg. Co.) U. S. 2,020,915, Nov. 12. Structural, elec. and operative details.

Backfiring indicator for mercury-arc rectifiers Bernard F. Lenahan (to Westinghouse Elec. & Mfg. Co.) U. S. 2,020,942, Nov. 12. Structural, elec. and operative details.

Vapor electric device with a mercury cathode Eugene H. Reid (to General Elec. Co.) U. S. 2,020,962, Nov. 12. Structural and operative details.

Röntgen meter Charles C. Lauritzen (to Coll. Institute of Technology). U. S. 2,022,117, Nov. 20. Structural and elec. details.

Photoelectric cells Electrical Research Products, Inc. Ger. 619,402, Oct. 1, 1935 (Cl. 21g. 29). See Brit. 351,606 (C. A. 27, 4964).

Photoelectric tube Harvey C. Rentschler (to Westinghouse Lamp Co.) U. S. 2,019,634, Nov. 5. An envelope is used having a portion permeable to radiation below 2700 Å, and contg. an anode which may be formed of W and a photoemissive cathode having a W photo-sensitive surface.

Electric discharge devices such as neon and sodium-vapor lamps Cornelius Bol and Adrianus Lamberus (to General Elec. Co.) U. S. 2,020,718, Nov. 12. An insulating base is used which is formed of asbestos, ceramic and tale and the pores of which are filled with a hardening resin such as a phenol-formaldehyde resin.

Gaseous electric discharge device suitable for cathode-glow lighting Ted E. Foulke (to General Elec. Vapor Lamp Co.) U. S. 2,020,722, Nov. 12. One only of a plurality of electrodes is coated with an alk. compd. such as  $\text{BaCl}_2$  or  $\text{SrCO}_3$  which is reducible to the oxide and the electrode is heated sufficiently to effect such reduction to oxide, a gaseous atm. such as Hg vapor, Ne or He is provided about the electrodes, and a steep wave bombardment of the coated electrode is produced to reduce some of the oxide to metal and to sputter the metal onto another electrode. U. S. 2,020,723 relates to elec. structural and operative details of an elec. gaseous discharge device suitable for use with Ne, A and Hg.

Gaseous electric discharge device which may contain neon, argon, mercury, etc. Georg Gaudies and Martin Reger (to General Elec. Co.) U. S. 2,020,727, Nov. 12. Various structural, elec. and operative details.

Gaseous electric discharge devices such as those containing metal vapor Otto Fritz and Alfred Rüttmann (to General Elec. Co.) U. S. 2,020,724-5, Nov. 12. Various structural, elec. and operative details.

Gaseous electric discharge device containing sodium vapor and suitable for high-intensity lighting Georg Gaudies (to General Elec. Co.) U. S. 2,020,726, Nov. 12. Various structural, elec. and operative details.

Gaseous electric discharge device which may contain sodium, etc. Marcello Pirani and Martin Reger (to

General Elec. Co.). U. S. 2,020,736, Nov. 12 Structural, elec. and operative details.

Electric discharge devices such as those producing ultraviolet rays containing a gaseous atmosphere such as mercury vapor. Gustav Zecher (to General Elec. Co.). U. S. 2,020,715, Nov. 12. Structural, elec. and operative details.

Gaseous electric discharge lamps for illumination such as those containing metal vapor. Willem Uyterhoeven and Cornelis Verburg (to General Elec. Co.). U. S. 2,020,706, Nov. 12. Various structural, elec. and operative details.

Gaseous electric discharge lamps for illumination such as those containing neon and sodium vapor. Willem Uyterhoeven and Aart de Bruin (to General Elec. Co.). U. S. 2,020,707, Nov. 12 Structural, elec. and operative details.

Gaseous electric discharge arc lamp which may contain argon and mercury or neon and sodium, etc. Marcello Pirani and Alfred Rüttenauer (to General Elec. Co.). U. S. 2,020,737, Nov. 12 Structural, elec. and operative details.

Negative glow device containing inert gas such as neon or argon and giving flaming light effects. Andrew P. Henninger, Jr. U. S. 2,020,411, Nov. 12 Structural details.

Electric glow-discharge lamp. Gustav Zecher and Johannes Brujnes (to General Elec. Co.). U. S. 2,020,716, Nov. 12 Structural and elec. details, of Hg-vapor lamps, etc.

Electric lamps. Soc. anon. pour les applications de l'électricité et des gaz rares (L'at. livements Claude-Faz & Silva). Fr. 785,139, Aug. 2, 1935. The lamps are filled with a mixt. of Kr and Xe and less than 8% of N, the formation of arcs being avoided by replacing the usual Ni leads by Mo. The persistence of the arc which forms by rupture of the W filament is avoided by placing one or 2 fuses in the foot of the lamp. Fr. 785,140. The Kr and Xe remaining in the conduit after filling the lamps are recovered by drawing the gases by a vacuum pump through a condenser dipping into liquid N, O or air.

Electric lamp containing alkali metal vapor. Harvey C. Rentschler and Donald L. Henry (to Westinghouse Lamp Co.). U. S. 2,019,633, Nov. 6. An envelope contains an atm. of a condensable alkali metal vapor such as that of Na and a thermionically active oxide-coated electrode or the like, together with means such as a mesh metal getter for rendering ineffective gas derived within the envelope which would normally lower the efficiency of the device when expressed in lumens per watt.

Sodium-vapor lamp. John W. Marden (to Westinghouse Lamp Co.). U. S. 2,019,613, Nov. 6 Structural features.

Discharge lamps. Patent-Treuhand-Gesellschaft für elektrische Glühlampen m. b. H. (to The General Electric Co. Ltd.). Brit. 432,320, July 24, 1935. All the electrodes are composed of Te and the envelope is of a transparent material, e. g., quartz, that resists for at least 100 hrs. the attack of Te vapor at a temp. of the lamp corresponding to 0.1 mm. pressure. Fluorescent substances excited by the ultraviolet component of the light may be associated with the lamp.

Discharge lamps. Patent-Treuhand-Gesellschaft für elektrische Glühlampen m. b. H. (to The General Electric Co. Ltd.). Brit. 432,614, July 30, 1935. In high-pressure Hg-vapor lamps having thermionic electrodes and a filling of rare gas, 0.2-5% of Cs is added to the Hg and the glass of the envelope contains not less than 20% Al<sub>2</sub>O<sub>3</sub> or more than 60% SiO<sub>2</sub>. Blackening of the envelope being thus avoided. The glass may also contain oxides of B, Mg and Ca. The thermionic electrodes may comprise a sintered mixt. of 90% of mixed BaO and CaO and 10% W.

Discharge lamps. Compagnie des lampes. Fr. 785,301, Aug. 7, 1935. The spectrum formed by Hg-vapor lamps is improved by the addn. of K, Li or alloys thereof, correctly proportioned to increase the red radiation.

Electric discharge lamp containing a metal vapor. Willem Uyterhoeven, Martinus van Dam and Cornelis Verburg (to General Elec. Co.). U. S. 2,020,708, Nov. 12 Structural and operative details.

Electric discharge lamp system for illumination and containing sodium vapor. Hendrik A. W. Klinkhamer, Aart de Bruin and Ferdinandus H. A. van Steekelenburg (to General Elec. Co.). U. S. 2,020,786, Nov. 12. Various structural, elec. and operative details.

Luminous gas-discharge tubes such as those containing neon. Edward S. Woolrich (to Flexlume Corp.). U. S. 2,020,393, Nov. 12 Structural features.

Apparatus (with a photometer chamber) for testing and asserting electric incandescent lamps. Caspar Reiter, Walther-Winfried Loel, Curt Samson, Felix Bolck and Max R. Grossmann (to General Elec. Co.). U. S. 2,020,964, Nov. 12 Various structural, elec. and operative details.

Caps for electric lamps and discharge devices. Patent-Treuhand-Gesellschaft für elektrische Glühlampen m. b. H. (to The General Electric Co. Ltd.). Brit. 433,260, Aug. 12, 1935. A screw-cap comprises a sleeve of Al which has all or part of its surface insulated by oxidizing it electrolytically.

Caps for electric lamps and discharge devices. Patent-Treuhand-Gesellschaft für elektrische Glühlampen m. b. H. (to The General Electric Co. Ltd.). Brit. 433,274, Aug. 12, 1935. In a metal cap having 1 or more contact pins projecting therefrom, each pin fits into a hole in the metal and is insulated from the cap by means only of a layer of oxide formed on the surface of the metal before the pin is placed in the hole. The cap is preferably made of Al, with a layer of oxide formed thereon by electrolytic oxidation.

Activating alkaline earth oxide-coated cathodes. Charles H. Prescott, Jr. (to Bell Telephone Laboratories, Inc.). U. S. 2,019,661, Nov. 5. The cathode is heated in a highly evacuated vessel to which a material such as CH<sub>4</sub> yielding free C upon thermal decompn. is supplied, and activation is completed by chemically combining the free C with the alk. earth oxides on the cathode to form free alk. earth metal. App. is described.

Oxidizing electrodes such as those of cathode-ray tubes. Sanford F. Fessig (to Radio Corp. of America). U. S. 2,020,305, Nov. 12. For producing a uniform oxide layer of desired thickness, electrodes such as those comprising Ag globules are subjected to an atm. of O and an elec. field is developed between the electrode under treatment (which is supported in a container) and an independent exterior electrode movable to vary the effectiveness of the field. App. is described.

Thermionic cathodes. Franz Skaupy. Ger. 619,133, Sept. 23, 1935 (Cl. 21g. 13 03). Addn. to 600,374 (C. d. 28, 65377). A core wire is coated with a suitable metal oxide mixt. by decomg. the mixed vapors of the corresponding metal acetylacetonates, as described in Ger. 600,374. The preferred oxide mixt. comprises approx. equivalent proportions of an emitting oxide, e. g., BaO, and an acidic oxide stable to heat, e. g., Al<sub>2</sub>O<sub>3</sub> or ZrO<sub>2</sub>.

Thermionic cathodes. "Flin" A-G für elektrische Industrie. Austrian 142,527, Sept. 25, 1935 (Cl. 21g). Cathodes of relatively long life are made by depositing an emitting oxide layer on a support of an alloy contg. Ni 60-80, Co 15-22, Fe 6-8 and Ti 4-6%, with or without 3-6% of another element of the 4th periodic group. A specified alloy contains Ni 67, Co 17, Fe 6, Ti 5, Si 3 and Mn 2%.

E. K. BULLOCK

Infrared radiation and photography in the dark. A. Seyewitz. *La Nature*, No. 2962, 300-1 (1935).—Photographic plates are sensitized with kryptocyanine and objects to be photographed are irradiated from lamps contg. Kr at 12,000 Å. The industrial application of infrared photography is considered. James C. Munch.

The use of infrared photography in navigation. Ragnar Thoren. *Nord Tid Fotografi* 19, 1-4 (1935).—Plates with max sensitivity at 7100 Å were used, without hypersensitizing, for photographing the coast of Denmark at a distance of 20,000 m through a slight fog (visibility 14,000 m). The exposure was  $\frac{1}{16}$  sec. J. W. Holst.

Three-color pictures by the Duxochrome process. R. Weizsäcker. *Fot Rundschau* 72, 282-4 (1935).—A review of the operations in the Duxochrome process. Prints are made from color-separation negatives on films bearing dyed Ag halide emulsions. After development, fixing, washing to remove excess dye, and removal of the Ag, the residual dye images are removed from the films and superimposed on a paper support. P. W. Vittum.

Color sensitometry. John Eggert. *Z. wiss. Fot.* 34, 54 (1935).—By the use of a standard yellow filter over the light source of the DIN sensitometer, a DIN value for the color sensitivity is attained. The difference between general sensitivity and yellow sensitivity gives a "yellow-differential" value in DIN degrees. The simplicity of the measurement is discussed. Some applications noted are: the simple and accurate measurement of emulsion sensitivity, the distinguishing of various yellow filters; and the determination of filter factors for filter-emulsion combinations merely by simple calculations from data in tables.

The care of tank developers. W. Trier. *Fot. Ind.* 33, 491-2 (1935).—A comprehensive study includes elimination of impurities and especially the prevention and elimination of bacterial infections in developers.

Tests with the selenium toning bath. E. van Beugen. *Focus* 22, 221-2 (1935).—Se baths, such as are obtained by dissolving Se in an alkali metal sulfite soln., produce images of suitable coloration when acting directly upon fine grain images (chloride and chlorobromide), but not on coarser (bromide) images. On the contrary, the coarser grain is favorable to good color and image quality when a bleach is used before the Se bath to which, in this case,  $\text{Na}_2\text{S}$  has been added. C. E. Ives.

Topographical relations in image reversals. Luppocramer. *Fot. Kor.* 71, 89-92 (1935).—Plates coated with a nearly pure (but not entirely free from  $\text{AgBr}$ )  $\text{AgI}$  gelatin emulsion, prep'd. as previously described (C. A. 24, 2069), after a preliminary uniform exposure to white light followed by a similar tablet exposure, show on development in alk. amolol both ordinary solarization and a "2nd reversal," whereas without the preliminary exposure they show only solarization. The sensitivity of this emulsion for the 2nd reversal, after the preliminary exposure, appears to be much greater than its primary sensitivity. The results are discussed from the same standpoint as was taken in the article on varieties of the Bequerel effect (C. A. 29, 7839<sup>a</sup>). E. R. Bullock.

Silver halides peptized in gelatin by supersonic waves (Dangers). 2. Films of cellulose derivs. (Fr. pat. 785,639) 23

Color photography. Richard Gschöpi. *Brit.* 432,349, July 22, 1935. In the production of multicolor prints upon paper, films, etc., by the imbibition process, colloidal sols. of dye bases are used for coloring the photographic gelatin printing matrices. The colloidal sol. is prep'd. by adding to the soln. of the dye, e. g., thionine blue, an alkali, e. g.,  $\text{NH}_4\text{OH}$ , until the soln. is alk. In certain cases, a slight excess of alkali may be added, a

protective colloid, e. g., dextrin, may be added prior to the alkali to avoid flocculation. Cf. C. A. 29, 7839<sup>a</sup>.

Color photography. Opticolor A-G. *Brit.* 433,088, Aug. 6, 1935. In reproducing lenticular color-record material by developing the images by the reversal process with the addition to the developer of agents that increase the sharpness of detail, i. e.,  $\text{AgBr}$  solvents, e. g.,  $\text{NH}_4\text{OH}$ ,  $\text{KCN}$ , the addition of such agents is kept so small that the prints, and also, if desired, the originals from which such prints are produced, are free from a microscopically fine cloudy structure of the reduced Ag which becomes perceptible during exhibition as smudgy images.

Color photography. Béla Gáspár. *Fr.* 785,523, Aug. 12, 1935. The adhesive layer or the intermediate layers contain agents which destroy directly dyes diffusing into them from adjacent layers, or they participate indirectly in the decoloration of the dye. Thus diffusion of leucocolors is prevented by  $\text{HgCl}_2$ .

Color photography. Béla Gáspár. *Fr.* 785,665, Aug. 16, 1935. Photographic colloids are colored by dyes which contain metal in a complex state, e. g., those known by the names "Néolan" and "Lanasol" color. Diffusion and efflorescence is thereby avoided.

Photographic material. Cerd Heymer (to Agfa Anso Corp.). U. S. 2,000,007, Nov. 12. A support carries at least two emulsion layers dyed to have different colors and colored for the same color to which the respective layer is specially sensitive, at least one of these emulsion layers contg. also a filter dye, sol. in the photographic treating baths, which absorbs at least part of the spectral region which is transmitted by the color of this layer and to which this layer is sensitive, for equalizing the gradation of the emulsion layers. A blue sensitive emulsion layer dyed green may be used with a red sensitive emulsion layer dyed red and contg. a blue-green filter dye.

Sensitive photographic material. Samuel E. Sheppard and Waldemar Vanselow (to Eastman Kodak Co.). U. S. 2,019,737, Nov. 5. Cd, mercuric, mercurous, melleous, Ag, thallous, quadrivalent Th or stannic ortho-arsenates are used as light-sensitive materials with gelatin, etc.

Photographic processes. Arthur Ernest Field. *Brit.* 431,384, July 8, 1935. A negative, especially for use in the production of photomech. printing surfaces, is treated with a bleaching reagent, e. g., a bath comprising (1) 1 in an aq. soln. of  $\text{KI}$ , (2)  $\text{K}_4\text{Fe}(\text{CN})_6$  and  $\text{KBr}$ , or (3)  $\text{KMnO}_4$  acidified with  $\text{AcOH}$  or  $\text{HCl}$ , to produce a photographic image of pos. appearance, retouched, etched or reduced by a  $\text{Ag}$  halide solvent, e. g., in a bath contg.  $\text{KCN}$ ,  $\text{Na}_2\text{S}_2\text{O}_3$  or  $\text{KI}$ , the portions of the image not to be retouched being coated with cellulose varnish or litho crayon, and finally treated with a soln. that blackens the  $\text{Ag}$  salt image and reconverts the image to a neg. image. After bleaching with 1 soln., the excess is removed with a  $\text{KOH}$  bath. After bleaching with  $\text{KMnO}_4$ , stains are removed by treatment with a  $\text{K}$  metabisulfite bath. After retouching with  $\text{KCN}$ , the scum is removed by dil.  $\text{HNO}_3$  or  $\text{AcOH}$ . The rebleaching bath may comprise  $\text{Na}_2\text{S}$  or a metal-hydroquinone developer, or a mixt. of  $\text{Na}_2\text{S}$  and a developer. After washing, the negative may be intensified with  $\text{HgCl}_2$ ,  $\text{HgBr}_2$ , or  $\text{HgI}_2$ , or a redeveloping and intensifying soln. comprising adurol, citric acid,  $\text{AgNO}_3$ ,  $\text{HNO}_3$ , and  $\text{H}_2\text{O}$ . The fixing soln. for the original negative may include  $\text{KI}$ .

Photographic emulsions. 1. G. Farbenindustrie A-G. *Brit.* 432,909, Aug. 7, 1935. This corresponds to Fr. 768,047 (C. A. 29, 1341<sup>a</sup>). Cyanine dyes contg. an unsubstituted or substituted  $\beta, \beta'$ -naphthoxazole nucleus are also used.

Photographic emulsions. Soc. pour l'ind. chim. à Bille. *Ger.* 619,538, Sept. 25, 1935 (Cl. 57b. 8.01). See *Brit.* 428,205 (C. A. 29, 6520<sup>a</sup>).

Sensitizing silver halide emulsions. Walter Dieterle and Hermann Durr (to Agfa Anso Corp.). U. S. 2,000,007.

636, Nov. 12. 1,1'-Dimethyl-4,4'-diethylamino-2,2'-bis(hydroxymethyl)ocyanine Iromide, etc., are used as sensitizers, emulsions so sensitized being sensitive to a range of wave lengths from about 545 mμ to about 720 mμ with a max. at about 685 mμ.

**Photographic images.** I. G. Farlenind, A.G. Brit. 785,071, Aug. 23, 1953. Ag images of white coloration are obtained by incorporating in the developer deriva of org bases or imag. salts which dissolve Ag, e.g., thiocyanate or guanidine or of K, deriva. of xantogenic achi, NH<sub>4</sub>Cl or NH<sub>4</sub>thiocarbamate. As these in the conen necessary have a solvent action on the gelatin also, this is made very hard.

**Treating superposed photographic images.** Leopold D. Manes and Leopold Godowsky, Jr. U. S. 2,019,718, Nov. 5. In the differential treatment of images superposed in different depths of an emulsion, the emulsion is bathed in a strong soln of I until a complete image is bleached, and the bleaching action is then quickly interrupted by bathing the emulsion to a diluente soln.

**"Ben Day" photographic tones.** Fayette I. Marsh and Charles H. Andersen U. S. 2,010,700, Nov. 5. Various reflective coloring matters having different reflective values are placed upon the surface of a master drawing to be toned so that they are as need where "Ben Day" tones are to subsequently appear on a photographic negative of the drawing, the drawing has superposed upon it a transparency contg. a "Ben Day" pattern, and the combination is photographed with the transparency nearest the camera.

**"Ben Day" tones photographically produced.** Fayette I. Marsh and Charles H. Andersen (in Charles V. Price) U. S. 2,021,191, Nov. 10. A negative of a master drawing is made on a white translucent support, there is superimposed on the reverse side of the negative a transparency contg. a "Ben Day" pattern, the face of the transparency contg. the pattern being placed nearest the operator, and on the exposed face of the thus positioned transparency, in selected areas where tones or shades are to subsequently appear on a photograph of the drawing, various reflective coloring materials are placed which have different reflective values; the regular portions of the negative and transparency are reversed and the negative is exposed through the stencil to a sensitized film, the transparency is removed and the negative is then exposed alone.

**Photographic films.** Siemens & Halske A.-G. Brit. 433,538, Aug. 12, 1935. Addn. to 407,810 (C. A. 28, 535b). A metallic film of Al, Al alloy or a metal, e.g., Cu, coated with Al, has as a photographic base a porous carrier layer of an Al compd, artificially produced on the Al surface, and is impregnated with light-sensitive substances as in 407,830. The photos layer may be produced by plunging the metal into aq. solns. or fused substances, with or without application of d. c. or a.c. Impregnation with light-sensitive substances may be effected by coating, spraying or immersion. Developed Ag pictures may be toned and the photos layers may be colored.

**Photographic films.** Kodak Ltd. and Raymond I. Cawther, Brit. 433,625, Aug. 10, 1935. Addn. to 204,822 (C. A. 27, 2104). The protective collod layer coated on the antihalation dye layer of the film according to 204,822 is formed with a mat surface, which diminishes specular reflection of light which may pass through the dye layer and, if the layer is not removed during processing, provides a surface for retouching. The collod layer may contain an inert dispersed material, e.g., levigated starch or laryta, having a refractive index different from that of the collod, e.g., gelatin, or the collod layer, e.g., of cellulose nitrate or acetate, may be cast on a mat surface.

**Sensitized films.** N. V. Philips' Gloeilampenfabriek, Brit. 433,580, Aug. 10, 1935. See I. 783,221 (C. A. 29, 740b).

**Light sensitive films.** N. V. Philips' Gloeilampenfabriek, Brit. 785,041, July 31, 1935. Images are obtained by photochem. means using a diam compd. and a mercurous salt. The salt is generally incorporated in the film with the diazo compd. but may also be after exposure of the film contg. the diazo compd. Much greater con-

trasts are obtained. The fixation of the image may be effected by water washing.

**Films for additive color photography.** Gabriel G. Moreno (to C. M. C. Corp.). U. S. 2,020,761, Nov. 12. Two consecutive series of images are recorded on 2 strips of film, pairs of images being recorded simultaneously one on each film, the films having their photographic emulsions in an antistatic contact, one of the emulsions being preferentially sensitive to green and the other preferentially sensitive to red, the 2 films are developed separately, followed by printing every other pair of isomorphous images from both films upon a single positive film in juxtaposition.

**Splicing films having photographic sound-record bands.** Albert Narath (to General Elec. Co.). U. S. 2,021,010, Nov. 12. Various operative details.

**Photographic films and plates.** I. G. Farbenindustrie A. G. Brit. 433,410, Aug. 16, 1935. A slight support to which films may be affixed for exposure or liquid treatment consists of a base carrying a permanently adhesive layer consisting of a degraded aluminum oxide, gelatin, and, in cold H<sub>2</sub>O. The collod may be applied dissolved in H<sub>2</sub>O or a volatile org solvent, e.g., glycol monoacetate, AcOH and dioxane admixed with H<sub>2</sub>O. Chloral hydrate and KCN are selected degrading agents. The solns. may be stabilized by adding, e.g., phthalic, salicylic or acetic acids. In an example, a film is pressed, for exposure or development, upon a glass plate bearing an adhesive layer formed from a compn comprising gelatin, H<sub>2</sub>O, ethylmethylhydrazine, MeOH, phthalic acid and glycerol. The adhesive layer may be given a mat surface by addn. of finely divided agents, e.g., SnO<sub>2</sub>, BaSO<sub>4</sub>, hydrated SiO<sub>2</sub>.

**Color separation negatives for colored reproductions.** Michael Kronschnid (in part in August Rottgege) U. S. 2,020,688, Nov. 12. A plurality of different masking negatives of an original are successively produced through differently colored filters, each negative during its production being masked by the previously completed negative, a light-sensitive plate in a camera is exposed through at least two of the masking negatives in succession and the plate is also exposed directly to the original.

**Photographic plates, etc.** I. G. Farbenindustrie A.-G. Brit. 433,581, July 24, 1935. A Ag halide emulsion is developed in the presence of an arylimide in formula R.NS.CH<sub>2</sub>NH<sub>2</sub>, in which R is a C<sub>10</sub> or polynuclear ring residue substituted by a halogen atom and (or) alkyl group, or a residue of an unsaturated polynuclear system.

The arylimide may be added in the developer or incorporated during the preparation of the light-sensitive material in an intermediate layer, a backing or a coating on the emulsion, for photographic paper, it may be incorporated in the paper pulp, laryta coating or sizing agent or in the finished paper. It may also be incorporated in exposed material by bathing prior to development. Specified compds. are dichloro-, dichloro-6-methyl-, 4,6- and 6,6-dichloro-, 4,6-dichloro- and 6,6-dichlorobenzimidazoles, 1,2-naphthimidazole, 1,2-anthrimimidazole and 4,6-acetylnaphthimidazole.

**Photographic plates.** Siemens & Halske A.-G. Brit. 432,984, Aug. 7, 1935. Addn. to 407,830 (C. A. 28, 535b). The carrier layers produced on the surface of Al or Al alloy according to 407,830 are subjected, after formation and before applying the light-sensitive material, to an intermediate chem. and (or) thermal treatment to render them less brittle and more flexible. The treatment may consist in dipping the layers in cold or warm solns. of acids or alkalies or salts having an acid or alk. reaction.

**Storing photolithographic plates.** Morland & Ingey Ltd. and Arthur G. Remfall, Brit. 431,415, July 8, 1935. To prevent deterioration, plates coated with alk bromated collod are stored, before use, in a vacuum or in a desiccated air or other gas. The desiccating agent may be CaCl<sub>2</sub>, silica gel or P<sub>2</sub>O<sub>5</sub>.

**Reflex prints.** Lodewijk P. J. van der Grinten (to N.-V. Chemische Fabrik L. van der Grinten). U. S. 2,022,014, Nov. 20. On an original, there is applied a

Action of hydrogen sulfide on insoluble chromates. I. Lead chromate and silver chromate. H. B. Dummickoff and Brahm Prakash. *J. Indian Chem. Soc.* 12, 505-17 (1935); cf. C. A. 23, 1074; 25, 2876; 26, 390 — Analysis of the reduction products of  $PbCrO_4$  indicated that the reaction proceeded as follows at 15–20°:  $63H_2S + 42PbCrO_4 \rightarrow 42PbS + 4Cr_2(SO_4)_3 + Cr_2(S_2O_3)_3 + 3S + 32Cr(OH)_3 + 15H_2O$ . At higher temps. more sulfate was formed at the expense of thiosulfate. The same general products were obtained on the reduction of  $Ag_2CrO_4$  with the exception that sulfite is also found. This indicates that sulfite and not thiosulfate is the precursor of sulfite.

H. E. Phipps

Preparation of bromine bleaching powder. E. J. Williams. *School Sci. Rev.* 17, 277-8 (1935) O. R.

The properties of ferric chlorosulfate. Francesco Scaife. *Gazz. chim. ital.* 65, 589-93 (1935) — To the salt (I) formed by the action of Cl on concd. aq.  $FeSO_4$ , Röhm (C. A. 16, 1714) assigned the formula  $FeSO_4Cl \cdot 6H_2O$  (II), and assumed its decompn. to be  $3FeSO_4Cl \rightarrow Fe_2(SO_4)_3 + 2H_2SO_4$ . In the original paper, precise directions for its prepn. are lacking, but a communication from R. describes a different method, by which a solid mixt. of  $FeSO_4$ ,  $H_2O$  and  $FeSO_4 \cdot 7H_2O$  (IV) is treated with Cl. By this method R. obtained products, the soly of which differed from that described, and a com. sample differed likewise. Numerous expts. led to a satisfactory method, as follows. Cl is passed into satd. aq. II until all Fe is ferric, the soln. is replenished with more II and treated with Cl, and this process repeated until a thick brown liquid (giving no ppt. with  $K_4Fe(CN)_6$ ) is obtained. This is let stand over CaO and then  $H_2SO_4$  in vacuo until partially dry and then dried in air at room temp. It is then stable, has the compn. II, and is insol. in  $Et_2O$  (no uncombined  $FeCl_3$ ). The assertion of R. that III is insol. in water and in  $EtOH$  is erroneous. Tests of the soly of III in water, in  $EtOH$  and in aq.  $EtOH$ , and of a mixt. of III,  $FeCl_3$  and water in proportions to form II in  $EtOH$  showed complete soln. only in the latter case.  $EtOH$  added to a mixt. of I (2 mols.) and  $Na_2SO_4 \cdot 10H_2O$  (1 mol.) in a min. of water causes to sep. a blond-red oil which crystallizes to the new double sulfate,  $3Na_2SO_4 \cdot Fe_2(SO_4)_3 \cdot 2FeSO_4 \cdot OH \cdot 7H_2O$  (IV), yellow, its aq. solns. are opalescent, decomposes without fusion when heated. The mother liquor contains uncombined III and  $Na_2SO_4$ . Accordingly I behaves as a double salt of III and  $FeCl_3$  rather than as a complex, since III unites with  $Na_2SO_4$  and since  $FeCl_3$  and excess  $Na_2SO_4$  remain uncombined. In an analogous way  $EtOH$  added to I and  $(NH_4)_2SO_4$  gives  $Fe_2(SO_4)_3 \cdot (NH_4)_2SO_4 \cdot 2H_2O$ . The results in general show that I is not a complex salt of the type assumed by Röhm, but is a weak double salt of the compn.:  $Fe_2(SO_4)_3 \cdot FeCl_3 \cdot 18H_2O$ .

C. C. Davis

$Li_2FeF_6$ . A. H. Nielsen. *Z. anorg. allgem. Chem.*

224, 84 (1935) —  $Li_2FeF_6$  was prepd by dissolving  $FeCl_3 \cdot 6H_2O$  in HF, and adding an aq. soln. of  $Li_2CO_3$ . The white ppt. was washed by decantation with  $H_2O$ , alc. and  $Et_2O$ , and dried at room temp. It is a white, isotropic powder having  $n$  of about 1.42; difficultly sol. in  $H_2O$ , but dissolved by HCl giving a strong yellow color. R. H. L.

The systems alkaline earth chloride-alkaline earth oxide and the decomposition of alkaline earth chlorides by water vapor. Bernard Neumann, Carl Kröger and Herbert Jüttner. *Z. Elektrochem.* 41, 725-36 (1935) — Cooling curves for the systems were detd. in a dry atm. of  $N_2$  in a Ni crucible at temps. up to 1320°, as high as the Ni would stand. Some  $SrCl_2$  sublimed at 1350°. Temp.-compn. curves showed the compds.  $4SrCl_2 \cdot SrO$ ,  $BaCl_2 \cdot 2BaO$ ,  $BaCl_2 \cdot 3BaO$  and  $4CaCl_2 \cdot CaO$ , the last with a congruent m. p. at 839° and a transition point at 700°. The compd.  $SrCl_2 \cdot 2SrO$  is probably formed; it has a incongruent m. p. and a transition point at 1022°. Decompn. of the chlorides by  $H_2O$  vapor takes place at or above their m. ps. only, i. e., at 970° for  $SrCl_2$ , 910° for  $BaCl_2$ , and 780° for  $CaCl_2$ . Decompn. isotherms were detd. from the resp. m. ps. to 1040° for  $SrCl_2$ , to 1145° for  $BaCl_2$  and 1090° for  $CaCl_2$ , and phase diagrams are given.

E. R. Rushton

System water-sulfuric acid-nickel sulfate. Raymond Rohmer. *Compt. rend.* 201, 672-4 (1935), cf. C. A. 28, 12892 — The system was examd. at 25° and 50° and partially at 80° and 90°. At 25° 3 stable hydrates,  $NiSO_4 \cdot nH_2O$ ,  $n = 7, 6$  and 1, with one metastable,  $n = 4$ , and some indication of one with  $n = 2$  were found. Results at 50° were similar, save that  $NiSO_4 \cdot 7H_2O$  was not found. Above 54.7° the only solid phases were  $NiSO_4$ ,  $H_2O$  and  $NiSO_4$ .

C. A. Subertrad

Silver mercuric complex. J. Bougault and E. Cattelain. *J. pharm. chim.* 21, 531-5 (1935) — See C. A. 29, 6803.

S. Waldbott

Organic cupratetrahlorides and cupratetrambromides. Jean Amiel. *Compt. rend.* 201, 904-6 (1935), cf. C. A. 29, 13357 — By mixing concd. solns. of the constituents and evap. at 60° in vacuum the compds.  $[CuX_4](YH)$  are obtained, where  $X = Cl$  or  $Br$  and  $Y = PhNH_2$ ,  $i-C_4H_9NH_2$ ,  $C_6H_5N$ ,  $C_6H_5NH_2$  and  $C_6H_5N$ . The Cl compds. are yellow, the Br black, both are permanent in the air, insol. in  $Et_2O$ ,  $CHCl_3$ ,  $CH_2Cl_2$ ,  $C_6H_6$ ,  $C_6H_5$ ,  $C_6H_{10}$  and pinene, slightly sol. in  $Me_2CO$  and  $AcOH$ , more in alc., decomposed by  $H_2O$ ,  $H_2SO_4$  or strong bases; on heating they melt with decompn. With piperazine  $[CuX_4] \cdot C_4H_{10}N_2 \cdot 2H_2O$  is formed, which soon loses  $2H_2O$  in a dry vacuum; excess of  $CuX_2$  or piperazine give  $[CuX_4] \cdot (C_4H_{10}N_2)_2$  and  $CuX_2 \cdot 2[C_4H_{10}N_2 \cdot 2HX] \cdot 4H_2O$ , resp.

Inorganic photosyntheses (Calcagni) 3.

## 7—ANALYTICAL CHEMISTRY

W. T. BALL

A new electroanalytical method for the determination of alkalis. Karl Abresch. *Angew. Chem.* 48, 683-5 (1935). — The test soln. is electrolyzed in a container having a layer of Hg on the bottom as anode and a cathode which consists of a glass capillary dripping Hg through the soln. During the sepn. of a cation the current strength increases as amalgam formation occurs (as soon as the sepn. potential is reached). With increasing voltage the current strength reaches a const. value and the amt. of this satn. current is proportional to the concn. of the cation in the soln. Constancy of temp. and viscosity of the soln., and of the dripping velocity are essential. The perchlorate and Pt chloride methods of the sepn. of K from Na are described in detail as auxiliary parts of the electrolytic detn. The methods permit the sep. detn. of alkalis in solns. contg. the cations Fe, Al, Ca, Mg, K, Na and any kind of anions. For the analysis of a K-bearing ash 20 mm is required when an accuracy of  $\pm 1\%$

of the detd. value is desired. A series of 12 tests requires 1-1.5 hrs. Detailed directions and exptl. results are given. Five references.

Karl Kammermeyer

The use of Aluminum in the determination of small quantities of aluminum. V. M. Peshkova. *Trans. Inst. Pure Chem. Reagents* (U. S. S. R.) No. 14, 42-8 (1935). — To 15 cc. of the neutral soln. add 5 cc. of  $N$  HCl and 5 cc. of 3  $N$   $NH_4OAc$  and 5 cc. of 0.1% Aluminum reagent. After 5 min. add 0.5 cc. 5  $N$   $NH_4OH$  and 0.5 cc. 5  $N$   $NH_4$  carbonate as little as 2.5  $\gamma$  Al will give the test, but the color varies somewhat if alkali or alk. earth ions are present: Fe should be absent or added to the standards.

Lewis W. Butz

The determination of small quantities of arsenic. G. G. Karanovich. *Trans. Inst. Pure Chem. Reagents* (U. S. S. R.) No. 14, 93-5 (1935). — The app. of Martin and Pien (C. A. 24, 5253) permits the detn. of 0.0001-0.0005 mg. As in samples of 0.1-1.0 g. The method is

ufficiently accurate to differentiate between 0.1 and 0.2 % of As.

**Determination of chromium. III. Rapid method for determining chromium in chrome steels.** Daniel Brard *Ann chim anal chim appl* 17, 317-19 (1935); cf. C. A. 28, 7857. —In a 100 ml. Pyrex flask treat 0.5 g. of the alloy with 15 ml. of a mixt. of 10 ml.  $\text{HClO}_4$ , d 1.61 and 5 ml. of concd  $\text{HNO}_3$ . Heat gently. Continue heating until after all  $\text{HNO}_3$  is removed and the soln shows a green color due to  $\text{Cr}^{+++}$ . Then increase the heating somewhat until fumes of  $\text{HClO}_4$  are evolved copiously. Finally boil the acid for a min. to make sure that the oxidation to chromic acid is complete. Cool, add 50 ml. of water and boil 5 min. to expel  $\text{Cl}_2$  resulting from the decomposition of the  $\text{HClO}_4$ . Cool, add an excess of standard  $\text{FeSO}_4$  soln and titrate the excess with  $\text{KMnO}_4$ . Cf. Willard and Young, C. A. 22, 3111.

**The thiocyanate test for iron.** T. N. Karskov *Trans Inst Pure Chem Reagents (U. S. S. R.)* No. 14, 81-7 (1935). —Fe can be detd. in sol. chlorides, nitrates and sulfates of the alkali and alk. earth metals and Mn by means of the thiocyanate test. For Fe and Pb salts and for  $\text{Cd}(\text{NO}_3)_2$  and  $\text{CdSO}_4$  it cannot be used, and it is not entirely satisfactory for Zn salts.

**The determination of iron in sea water.** Thomas G. Thompson and Raymond W. Bremner *J. consel intern exploration mer* 10, 33-8 (1935); cf. C. A. 26, 4551. —To 100 cc. of sea water, add 6 cc. of concd  $\text{H}_2\text{SO}_4$ , and evaporate to strong fumes. Cool, add a little water and oxidize with excess of  $\text{KMnO}_4$  at about 100°, and finally boil with Br. Expel excess  $\text{Br}_2$ , dil. to 83 cc. at room temp., add 10 cc. KCNS soln and extract the red  $\text{Fe}(\text{CNS})_3$  with 10 cc. of isoamyl alc. Compare the color with that obtained similarly from known quantities of Fe.

**Determination of iron and aluminum by the method of Crispin natural phosphates.** R. Meunier and P. Martens *Ann chim anal chim appl* 17, 313-14 (1935). —In the method of C., the acid soln. of the phosphate is suitably neutralized and the Fe + Al pptd. as basic phosphates leaving the alk. earths and most of the  $\text{H}_2\text{PO}_4$  in the filtrate. The ppt. is dissolved in  $\text{HNO}_3$ , P is removed by treatment with  $\text{NH}_4\text{OH}$ , molybdate and the Fe and Al are pptd. with  $\text{NH}_4\text{OH}$ . Even after dissolving and reprecipitating the hydrated oxides of Fe and Al, the ppt. weighs too much owing to the retention of some molybdate. It is better to take the first basic acetate ppt., dissolve it in acid and reprecipitate in the same way. The ignited ppt. will then contain  $\text{Fe}_2\text{O}_3$  +  $\text{Al}_2\text{O}_3$  +  $\text{P}_2\text{O}_5$ . From this ppt. the Fe can be detd. volumetrically by the method of Zimmerman-Reinhardt and the Al by adding pure NaOH to the acid soln., filtering off the  $\text{Fe}(\text{OH})_3$ , and detg. the Al in the filtrate as phosphate. W. T. H.

**Hymol test for potassium.** E. A. Wildman *Proc Indiana Acad Sci* 44, 121-3 (1934). —Hymol ("Gardol", "Drene", "Dreft"), a new detergent which appeared on the market in 1933, is said to be a mixt. of Na alkyl sulfates in which the alkyl radicals are those of the alcs. formed by the reduction of coconut-oil fatty acids. Such alkyl sulfates of Li,  $\text{NH}_4$ , Mg, Na and Ca are readily sol. in  $\text{H}_2\text{O}$  at 20°. The K salt is only slightly sol. A 3% soln. of the Na hymol salt has been found to be an excellent reagent for the qual. detn. of K. The procedure is: Divide the filtrate from group IV into 3 equal parts. Use 2 of the portions for the Mg and Na test before making the K test. Remove  $\text{NH}_4$  salts as usual from the third portion. Take up the residue in about 15 cc. of  $\text{H}_2\text{O}$  that contains a few drops of  $\text{AcOH}$ . Filter if not clear. To 5 cc. of the unknown soln., add 1 cc. of a 3% soln. of the hymol salt reagent. A white ppt. within 1 min. indicates K. If no ppt. is obtained or if it were previously found that Mg is present cool the test tube in ice  $\text{H}_2\text{O}$ . A significant amt. of K forms a ppt. within 1 min., unless there is a very large quantity of Mg. In the latter case use the cobaltinitrate test.

**A rapid photometric method for the determination of silicon in light metals.** Hans Finst *Z. Metallkunde* 27, 107-14 (1935), cf. C. A. 29, 3937. —A photometric or colorimetric method is developed whereby from traces to

2% of Si can be accurately detd. in Al or Mg in 15-20 min. Al is dissolved in NaOH, reducing agents are removed by  $\text{H}_2\text{O}_2$  in alkali and then by  $\text{KMnO}_4$  after acidifying with  $\text{HCl}$ . The residual  $\text{KMnO}_4$  color is removed with  $\text{H}_2\text{C}_2\text{O}_4$ . The greenish yellow soln. produced by addn. of  $(\text{NH}_4)_2\text{MoO}_4$  is then compared with suitable water or  $\text{CaCrO}_4$  standards in a colorimeter or photometer. Less than 1% Fe, Zn, Cu, Mn and traces of Sn, Pb, Ti, Cr, V, S and Na do not interfere, and methods of handling larger amts. of Fe, Cu and Ni are given. (Special standards must be used for Al alloys contg. appreciable amts. of Mg.) Ni vessels are recommended. Dil.  $\text{HNO}_3$  is used as a solvent for Mg, otherwise it is treated the same as Al.

G. Derge.

**The determination of very small amounts of uranium, and the uranium content of sea water.** Friedrich Herreger and Berta Karlik *Sitzber. Akad. Wiss. Wien, Math.-naturw. Klasse Abt. IIa*, 144, 217-26 (1935). —A spectrographic and microphotometric method was used to measure the fluorescence of very small amts. of U with NaF. As little as  $10^{-14}$  g. was detd. The method was applied to the detn. of U in sea water;  $0.30-2.3 \times 10^{-14}$  g. U per l. was found.

G. M. P.

**Determination of zinc in copper alloys containing less than 0.5% zinc.** Christo Nikolov *Przemysł Chem* 19, 137-0 (1935). —Of Al filings 0.6 g. is quite sufficient to displace 1 g. Cu from soln. The soln. should contain 8 ml.  $\text{HCl}$  (1.1) per 100 ml. The pptn. should last less than 1 hr. (Sn if present should be removed first by dissolving the sample in  $\text{HNO}_3$ .) Tests in which quant. addns. of Zn were detd. showed this method to be accurate.

A. C. Zachlin.

**Combination of catalysts to reduce digestion times in the determination of nitrogen. II. Dairy products.** Charles I. Poe and R. R. Schafer, *J. Dairy Sci* 18, 733-39 (1935). — $\text{H}_2\text{O}_2$  when used with Cu, Hg and Se (separately or in combination) reduces the digestion time somewhat and does not impair the accuracy of the detn. The combination of the 3 catalysts showed a reduction in digestion time from 105 to 13 min., compared to that of the Gunning method. When  $\text{H}_2\text{O}_2$  was used with these 3 catalysts the time was reduced to 10.7 min.

P. D. A.

**The iodine question in Westphalia.** Rudolf Balke *Landw. Jahrb.* 81, 939-1002 (1935). —The detn. of I in soils, water, spinach and milk are outlined. The I contents of a no. of minerals from which the soils originated varied from 0.420 p. p. m. (rag limestone) to 0.425 p. p. m. (graywacke) with an av. for the 23 rocks of 1.450 p. p. m. Those materials resulting from the weathering of the rocks showed without exception a higher I content than the original material. The I content of the soil examd. varied from 1.450 p. p. m. to 10.300 and av. 3.765. This was considered high for the heavy rainfall of this district. A meadowland with about 50% higher humus than a plowed land had an I content about 25% higher than the plowed land. The I content of the water varied from 0.00012 to 0.0196 p. p. m. and milk from 0.281 to 0.90 p. p. m. No correlation was found between the I accumulated in beets, potatoes, white cabbage or carrots and the I content of the soil. A higher accumulation of I was found in the leaves of potatoes, beets and carrots than in the other parts of the plant. Spinach took up more I than any other plant, and the accumulation of I was proportional to the I content of the soil. I fertilization increased the I content of spinach. It was established that the soly. of the I was higher in light soils than in heavy soils.

K. C. Beeson.

**Potenhiometric determination of the iodine value.** Karol Drewski *Przemysł Chem* 19, 63-75 (1935). —The app. consists of a glass 1 l. vessel into the bottom of 2 legs of which there are sealed Pt wires which connect to the potentiometer. Equal amts. of standardized oxidizing or reducing soln. are placed in each leg of the vessel. In one leg this is then covered with a soln. of the oil in  $\text{CCl}_4$ , and in the other with solvent alone. The solns. are mixed and the p. d. between the 2 legs is read after 5 or 10 min. From that value of the oxidation-reduction potential the corresponding I value is then found on stand-

ardured curves. Solns. of BrI and ClI show a p. d. of 100 mv. when 120 mg. of linseed oil is introduced and involve an error of about 1-1.5%. The precision of this method is not inferior to that of the method of Hanus. Temp. has but little effect on the results. A. C. Z.

Determination of barium fluosilicate in insecticide powders. A. Bonis. *Ann. fals.* 28, 461-3 (1935).—Calculation of the Ba fluosilicate from the detn. of F generally gives greatly erroneous results. The following method has been found satisfactory. Fuse 0.5 g. of sample with 5 g. of a 1:1 Na<sub>2</sub>CO<sub>3</sub>-K<sub>2</sub>CO<sub>3</sub> mixt., take up in boiling water, filter and wash the residue (R); digest the alk. filtrate at gentle heat for several hrs. after addn. of 4-5 g. (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>, filter the flocculent SiO<sub>2</sub> ppt. (S'), to the filtrate add a few tenths of a g. of ZnO dissolved in NH<sub>4</sub>OH, evap. nearly to dryness on the water bath, take up in hot water, filter, dissolve the residue in HCl, evap. to dryness, take up in dil. HCl, filter and wash the 2nd SiO<sub>2</sub> ppt. (S''). To the filtrate from the NH<sub>4</sub> zincate treatment add 1 drop of helminthine, make just acid with dil. HCl and then faintly alk. with 1-2 cc. of 10% Na<sub>2</sub>CO<sub>3</sub>, heat to boiling, add sufficient CaCl<sub>2</sub> to ppt. F and the excess of Na<sub>2</sub>CO<sub>3</sub>, boil till the ppt. is granular, filter, wash, transfer to an evapor. dish, digest for a few mins. on the water bath with a few cc. of 10% AcOH, filter, wash, dry, ignite and weigh; calc. Ba fluosilicate from the wt. of CaF<sub>2</sub>. As a check on the results dissolve R in dil. HCl, evap. to dryness on the water bath, treat for a few mins. in the cold with concd. HCl, dil. with boiling H<sub>2</sub>O, filter, wash, ignite and weigh the 3rd SiO<sub>2</sub> ppt. (S'''). total SiO<sub>2</sub> = S' + S'' + S'''. If the original product was free from SiO<sub>2</sub>, the result should correspond to the F detn. as above. If other SiO<sub>2</sub>-contg. materials (tak, clay, kieselguhr, etc.) are present, in the filtrate from S'' ppt. Ba by addn. of 10% H<sub>2</sub>SO<sub>4</sub> to the boiling soln., filter, wash, ignite and weigh. The Ba thus detd. should correspond to the F detn. A. Papineau-Couture.

Volumetric determination of carbonyl compounds. I. Stage Hahnel. *Frank. Rev. Ind.* 47, 233-48 (1935).—Essential methods (acidimetric, alkalimetric or iodometric) are unsatisfactory for acetals, ethydr, acetone, etc. Hydroxylamine may be used (cf. Olander, C. A. 22, 344) but a better indicator than has been used must be found. The influence of acetyl on analytical reactions has been too often neglected. A. R. Rose.

Simplified alkalimetric determination of phosphoric acid. Robert Heubrunn. *Phosphorsäure* 5, 66-49 (1935).—A comparison of the Neumann method and the Borgardt method as modified by Glassmann gave concordant results. K. C. Borsch.

Chemico-toxicological study of carbon tetrachloride. Frido Caravino. *Boll. chim. farm.* 74, 741-8 (1935).—CCl<sub>4</sub> is detected by a method similar to that used by Viall (C. A. 6, 2438) for the detn. of CHCl<sub>3</sub> and chloral. Expts. in which guinea pigs ingested CCl<sub>4</sub> showed that its presence could be proved by this method in the viscera 12 days after death. The test is sensitive enough to detect 0.0035 g. CCl<sub>4</sub> in 50 cc. alc. and can be used for detn. by condensing the product of H combustion, passing it into NH<sub>4</sub>OH, acidifying with HNO<sub>3</sub> and titrating with AgNO<sub>3</sub>. Helen Lee Gruehl.

Chemical detection of arson attempts. Hermann Schmidt-Hebbel. *Pharm. Zentralhalle* 76, 673-5 (1935).—Some general suggestions are offered looking to the possible detection of chemicals or other substances which may have been used in attempts at arson. W. O. E.

Studies in the field of organic analysis. I. Determination of sulfur in certain organic compounds. N. N. Mel'nikov. *J. Ges. Chem. (U. S. S. R.)* 5, 839-40 (1935).—Heat 0.2-0.5 g. of the substance with 10-15 cc. of H<sub>2</sub>O<sub>2</sub> (d. 1.7). To the hot mixt. add gradually, with stirring, 1.5-4 g. of finely powd. KMnO<sub>4</sub> (explosions sometimes take place). After 10-15 min. remove excess of KMnO<sub>4</sub> with H<sub>2</sub>O. Dil. the mixt. with 300-400 cc. of water, add HCl and det. the H<sub>2</sub>SO<sub>4</sub> with BaCl<sub>2</sub> as usual. The method is not suitable for the detn. of S in volatile compds., thiocyanates and heterocyclic S compds., difficulty excluded. II. Determination of copper in organic compounds. N. N. Mel'nikov. *Izv. S. S. R.* 81-2.—Proceed with the treatment of a sample with H<sub>2</sub>SO<sub>4</sub> and KMnO<sub>4</sub>, as in the detn. of Ti (cf. C. A. 29, 814). After 15-20 min. add 20-3 cc. of water and remove the excess of KMnO<sub>4</sub> with oxalic acid or H<sub>2</sub>O<sub>2</sub>, boiling some time if the latter is used. Cool, dil. with water to 100-250 cc., add 0.5 g. of KI, 20-3 cc. of 10% KSCN and titrate with Na<sub>2</sub>SO<sub>3</sub> in the presence of starch soln. by Bruhn's method (C. A. 12, 223; 13, 939, 15, 351). The method is accurate to 0.15-2%. Chas. Blane.

Determination of diolefins by the hydrogenation method. B. A. Dolgoplosk. *Soviet. Khimika* 1935, No. 5, 11-18.—The detn. was made in a special app. by passing the gas contg. butadiene dtd. with H (27-30 cc. of gas to 9-100 cc. of mixt.) over a catalyst and observing the change in vol. The catalysts used were 50% Ni or 30% Pd pptd. on asbestos, preferably the latter. The time of hydrogenation over Ni or Pd in the cold was 5-7 min., for the total analysis 12-15 min. In the presence of 0.03% CO the catalyst became poisoned unless it was heated. Butadiene was detd. by this method in different products obtained in the manuf. of synthetic rubber from alc. and good results were obtained. A. Pestoff.

Microvolumetric determination of methoxyl. David T. Gibson and Thomas H. Canfield. *J. Chem. Soc.* 1935, 1419-20.—Viebeck and Schwarppach (C. A. 23, 475) devised an iodometric method for detg. methoxyl and Viebeck and Brecher (C. A. 25, 896) based a micro-method upon it which is now modified as follows: As absorbent for MeI, mix 0.5 cc. of Br<sub>2</sub> with 18 cc. of 20% KBr, reserve half of the soln. for a blank test and place the rest in absorption tubes. After the absorption, add 43 cc. of 25% KAcO and remove excess Br<sub>2</sub> by treating with 1 cc. of 5% HCO<sub>2</sub>H. Then add 2 cc. of 10% KI and 25 cc. of 5 N H<sub>2</sub>SO<sub>4</sub> and titrate the liberated I<sub>2</sub> with Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. C. J. West.

Effect of temp. on the bacterial ammonification of urea (Tandon) 15. Triple mixtures of the rare earths and urea for Cs (Goswami, Sarkar) 6.

Quantitative spectrum analysis by discharge apparatus. W. C. Heraeus G. m. b. H. Ger. 589,853, 613,183 and 613,186, Mar 15, 1935 (Cl. 42, 3.08).

## S—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHEATY AND J. F. SCHAEFER

Bolivian minerals. V. Franchete. Friedrich Ahlfeld, Hans Himmel and Willi Kleber. *Zentr. Mineral. Geol.* 1935A, 202-8; cf. C. A. 29, 6339.—Crystallographic. Franchete is orthorhombic, pseudo-tetragonal.

Strengite from Pierstein. Hans Himmel and Robert Schroeder. *Zentr. Mineral. Geol.* 1935A, 289-92.—Crystallographic.

Kaolin and clay. Their difference in structure and ease of formation. Albert Vassel. *Kern. Rundschau* 43, 457-60 (1935).—Weathering of feldspar leads either to kaolin

or clay, the formulas assigned being 6Al<sub>2</sub>O<sub>3</sub>·12SiO<sub>2</sub>·9H<sub>2</sub>O and 2Al<sub>2</sub>O<sub>3</sub>·4SiO<sub>2</sub>·3H<sub>2</sub>O, resp. The predominance of clay is due not so much to increased weathering leading to finer subdivision as to the greater ease of formation of the smaller mol. Clay and kaolin were heated at 150° and then subjected to 20% boiling caustic. From the resistance to soln. it was concluded that clay decomposes to zeolite, and kaolin to metakaolin. Thirty-two references. P. S. Rodler.

Three kaolins. D. Beltrankin and V. Ivanova. *Zentr. Mineral. Geol.* 1935A, 298-308.—Normal kaolinite and

fibrous hydrokaolin from Sagha, Transcaucasia, and halloysite from Auddy, Urals, were analyzed and examined optically. Heating curves taken with a temp. increase of 6°/min showed minima at 530-600°, corresponding to the loss of constitutional water, and maxima at 930-950°, corresponding to the exothermic formation of mullite. The optical properties of dehydrated samples indicated the following stages in the dehydration: (1) loss of adsorbed water, (2) loss of water of constitution (300-400°), (3) formation of  $\gamma$ - $\text{Al}_2\text{O}_3$  and (4) reaction of  $\gamma$ - $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$  to form mullite. Michael Fleischer

Ore deposits—they follow the synclines. James Bichan *Can Mining J.* 56, 523-5(1935). W. H. B. A concretionary sulfide deposit at Culm near Haselbach in the Riesengebirge. Adolf Posenenitz. *Zentr. Mineral. Geol.* 1935A, 309-10. Michael Fleischer

Organic mineral substances. V. Porphyrins in coals. Alfred Treibs *Ann.* 520, 144-50(1935); cf. *C. A.* 29, 4708<sup>+</sup>.—Examination of the 7 and 20% HCl exts. of various coals show the presence of deuterio-, meso- and desoxy-phyllerythro- and etio-porphyrins; porphyrans were seldom present. No coporphyrin was found in various samples of coprolites. C. J. West

Geochemical constants of iron A. E. Fersman *Uspekhi Khim.* 4, 731-55(1935).—At the at. no., the valences and the ionic radius of Fe are considered in relation to other elements, with the corresponding relations of physicochem. properties. The various chem. compounds which can be formed by replacement and migration under the conditions found in nature are discussed from the standpoint of their relative stabilities, or solubilities in

water and weak acids, etc., and applied to the conditions of formation of Fe ores. P. H. Rathmann

Occurrence of selenium in the Colorado River and some of its tributaries. Kenneth T. Williams and Horace G. Byers *Ind. Eng. Chem., Anal. Ed.* 7, 431-2(1935).—Analyses of 23 samples of water from the Colorado River, its tributaries and drainage ditches, showed Se contents varying from 0 to as much as 2.8 p.p.m. The sources of the Se in drainage waters were traced to certain soils, shales and alk. crusts. One of the salt crusts contained as much as 260 p.p.m. of Se. The data together with field observations indicate clearly the possibility of improvement of semidesert land by irrigation and drainage, where such management is practicable. M. S. Anderson

The content of heavy water in the water of crystallization of minerals. H. E. H. Riesenfeld and M. Toback *Ber.* 63B, 1902-9(1935); cf. *C. A.* 29, 41<sup>+</sup>.—The  $\text{H}_2\text{O}$  of crystal of polyhalite from Stassfurt, a primary mineral was found by the float method to contain 163.9 mols  $\text{D}_2\text{O}$  per 10<sup>4</sup> mols  $\text{H}_2\text{O} + \text{D}_2\text{O}$ . That of gypsum from San Hara, a secondary mineral, contained 164.1. These values are lower than the values (183-225) reported by other workers for natural waters and minerals. R. and T. suggest that the  $\text{D}_2\text{O}$  content of the  $\text{H}_2\text{O}$  of crystal of minerals does not differ from that of natural waters because the speed of crystal formation is slow as compared with the speed of exchange of  $\text{D}_2\text{O}$  and  $\text{H}_2\text{O}$  between the crystal and liquid phases. John E. Milbery

As in Canada (Danlous-Dumesnil) 9

## 9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, OSCAR B. HARDER AND RICHARD BIMBACH

Metallurgical developments and the mining industry. L. Sanderson *Can Mining J.* 56, 526-7(1935).—A brief review of metallurgical developments during the past year. Mn steels, welding high-Mn steels, highly alloyed cast irons, alloy steels, stainless steels and aces, Ni-Mo, Mn-Mo and special C steels are discussed. W. H. B.

The Kundahood Mine. H. B. Jeffery. *Mining Mag.* 53, 255-77(1935).—Operations on this mine on the Kolar Goldfield, Southern India are described. The gold-bearing reef is believed to be a derivation of the earliest of a series of granites intruding a belt of hornblende schists. The flow sheet of ore treatment shows sixty 1250-lb. Californian stamps and blankets. The classification plant for the tailings consists of one primary and one secondary Caldecott cone for each of the 5 tube mills, where the ore is ground to about 75% minus 200 mesh. The overflow of secondary cones after agitation for 10 hrs is transferred to the Butters filter plant. The filtrate passes through sand classifiers to extractor boxes filled with Zn shavings. The stamp-mill and tube-mill concentrates are stamp milled in 850-lb. stamps with screens of 1200 holes per sq. in. and passed over amalgamating plates and James cone tables, the heads of the latter are harnessed and amalgamated on a battery, while the tailings are returned to the main current. The extra by stamps, tube mills and cyanidation is 55, 31 and 12%, resp., or an over all extra of about 98%.

A. W. Furbank. The Meridian concentrator. J. P. Dick *Can Mining J.* 56, 509-13(1935).—A description of the flotation concentrator of the Meridian Mining Co., Ltd. at Camborne, B. C. A flowsheet is included. W. H. Boynton

Treatment of precious-metal mat. C. C. Downie. *Metallurgia* 13, 21-2, 25(1935).—The treatment consists of a sulfate roast, leaching with 2%  $\text{H}_2\text{SO}_4$ , and pptn of Ag with Cu. J. L. Gregg

Gold in Canada. H. Maurice Danlous-Dumesnil *Rev. ind. minerale* No. 356, 499-506, No. 357, 523-30(1935); cf. *C. A.* 29, 5357<sup>+</sup>.—The geology and the working of the mines at the 3 principal centers, Porcupine and Kirkland Lake (Ontario) and Noranda (Quebec), are described. C. D. West

Siemensite and its application in the basic open hearth furnace. E. Greiner. *Rev. universelle mines* 11, 503-6(1935).—Operating data with Siemensite, composed of 20-40%  $\text{Cr}_2\text{O}_3$ , 25-45%  $\text{Al}_2\text{O}_3$ , 18-30%  $\text{MgO}$  and 8-14% other constituents, are given. The material is obtained by reducing fusion in an elec. arc furnace and cast in chill molds. The heat resistance is higher than Seger cone 42, sp. gr. 3.2-3.4, it softens under 2 kg./sq. cm. pressure above 1800°. Comparisons with other refractories are compiled in tables. M. Hartenbaum

New oil fired assay furnace combines roasting, fusion and cupellation. G. B. O'Malley. *Chem. Eng. Mining Rev.* 28, 491-2(1935).—An illustrated description. W. H. Doynton

Waste-heat boilers in open-hearth practice.—2nd report of the open-hearth committee. R. Percival Smith, et al. *Iron Steel Ind.* 8, 511-15(1935).—Mechanically induced draft of the boiler frequently enables an increase in output in the open-hearth production. Capital expenditure, operating costs, steam costs at the main boilers and fuel savings are some of the factors that must be considered in deciding whether waste-heat boiler installations are justifiable. C. B. Jenn

Use of coke-oven and town gas in open-hearth furnaces. J. B. R. Brooke. *Iron Steel Ind.* 9, 3-5(1935).—Town gas and coke-oven gas analyses are similar except for the CO and methane content; the town gas has been "steamed" and shows a high CO and a low methane content. Either gas can be used in open-hearth furnaces if the cost is not too high. A luminous flame which is more readily controllable and which radiates heat to the bath is used in open-hearth practice. Producer gas gives a luminous flame from the incandescent particles of C liberated by the tar and benzene in the gas at (100-800°). Tar adds, are necessary when burning coke-oven gas to give the luminosity. Since coke-oven gas is about 3 1/2 times as rich as producer gas the checker chambers must be considerably reduced in size and well insulated. This preheating may crack the methane and block up the small checkers. The H<sub>2</sub> would also make the flame difficult to control. Continental experience has found that the best

results are obtained by using a gas mixt. with 25-30% coke-oven gas, the remainder blast-furnace gas. The gases must be thoroughly mixed to prevent striation. The coke-oven gas should not be below 25% of the mixt. and may be as high as 40% during the melting down period. The mixt. should be preheated as high as possible; 1150-1250° will suffice. The moisture content of the gases must be kept low. A reduction of gas port area of 27 1/2% gives better results than the area originally designed for producer gas. Furnace life has been increased, better fuel consumption secured, less oxidation of the bath secured and furnace operations are more closely controlled when mixed gases are used. High CO and low methane content of town gas would give a very low luminosity. The calorific value of the gas is also lower than coke-oven gas. This would not be suitable for mixing with blast-furnace gas, but when tar is added town gas could be used, provided the cost is not excessive. C. B. Jenni.

Modern foundry practice W. G. Morgan. *J. Inst. Production Engrs.* 14, 480-94 (1935). M. W. Schwarz. Production of cupola malleable castings. F. H. Riggan. *Trans. Am. Foundrymen's Assoc.* Preprint No. 35-19, 11 pp (1935).—Malleable Fe melted in a cupola is adapted to the continuous production of light castings and has higher C and lower strength than malleable Fe melted in an air furnace; high fluidity and low shrinkage, 49,000 lb per sq. in. tensile strength, 34,000 lb per sq. in. yield strength and 9% elongation. The operating details and tech. control necessary to produce uniformly satisfactory castings are described. Frank G. Norris.

Notes on roll failures with reference to chilled iron cast rolls containing chromium and molybdenum Selwyn Caswell. *Foundry Trade J.* 53, 369-71 (1935). D. S.

Metallurgical research at McGill Alfred Stansfield. *McGill News* 16, No. 4, 27-31 (1935).—Results are reported of investigations on a penetration of Au, Ag, Pt and Cu into Pb cylinders; electrolytic production of Mg and of Cl; elec. smelting of Zn and Fe ores, elimination of S, softening points of mixts. of SiO<sub>2</sub>, CaO, TiO<sub>2</sub> with Al<sub>2</sub>O<sub>3</sub>; and the production of TiO<sub>2</sub> pigments. J. C. Munch.

Crystal orientations in a nickel casting and their alteration by rolling and recrystallization. G. Tammann and F. Laass. *Z. Metallkunde* 27, 8-8 (1935).—A 4-cm. Ni cube was cut from a casting of the same cross section and orientations were detd. by observation of points of max. light reflection, cubic, dodecahedral and octahedral types were distinguished, the last being further divided into [111] and [211] groups. Orientation distributions are detd. on the casting for faces parallel and perpendicular to the cooling surface, on cold rolled samples cut from the casting, and on these specimens when recrystd., and correlated with similar information on Al and Cu. On the castings [111] surfaces predominate near the cooling face, [100] 12 mm. from the surface, similar to Al, and indicating most rapid grain growth in [111] direction when heat dissipation is fast, in [100] direction when slow. However, Cu showed [100] orientation. Changes in orientation during rolling are the same as those for Al and Cu. With increasing reductions the fraction of octahedral types increases and alignment of these in [111] direction occurs. However, up to 20% reduction Ni showed an anomalous decrease of the octahedral type and increase of cubic orientations, which cannot be explained by slip on [111] planes in the [111] direction. Samples which had been reduced 33% recrystd. at 750°, while recrystn. occurred at 650° after 90% reduction. In both cases grains were too small to permit orientation detns. until after heating to 1300° when octahedral surfaces predominated, as in Al, whereas Cu showed mainly [100]. G. Derge.

Cold rolling L. Weiss. *Z. Metallkunde* 27, 73-5 (1935).—It is shown that by the use of 2 arbitrary factors which were developed previously (*Z. Metallkunde* 20, 280 (1928), 23, 47 (1931)), and which evaluate the effect of dynamic working during the rolling process and of initial thickness of the material upon yield point of the material, it is possible to est. the resistance of the material to deformation. By this means the effects upon rolling

pressure of the roll diam. and of friction between rolls and material are calc. and shown to be in agreement with exptl. values. A graph is developed which relates possible reduction in thickness to roll diam., original thickness of the material, and frictional conditions. The limitations placed upon rolling pressures by elastic deformation of the rolls are described and related to possible reduction of thickness. G. Derge.

A research into tests for materials used in cold-pressing operations, with special reference to the fluid-pressure cupping test. H. J. Gough and G. A. Hankins. *J. Roy. Aeronaut. Soc.* 39, 1047-80 (1935). M. W. Schwarz.

The apparent increase in the plasticity of metals under the action of reversible twisting. V. D. Kuznetsov. *J. Exptl. Theoret. Phys. (U. S. S. R.)* 5, 550-5 (1935).—Iron rods on reversible twisting break at a tension of 2.5 kg./sq. mm. without increase in length but at 23-30 kg./sq. mm. ordinarily with a relative lengthening of 23 to 29%. F. H. Rathmann.

The characteristic behavior of the elasticity modulus of ferromagnetic materials M. Kersten. *Z. Metallkunde* 27, 97-101 (1935).—The theory of magnetic domains, as developed by Weiss and Heisenberg, is described simply, especially with regard to magnetostriktion. It is shown that the deviations from Hooke's law which occur in ferromagnetic materials, even in the absence of an external magnetic field, may be explained upon this basis. Likewise the theory explains the experimentally detd. variations of the elasticity modulus of Ni and their dependence upon cold work and external field. By applying the theory to the temp. coeff. of the elasticity modulus, the change found at the Curie point for Ni is explained, and a reasonable picture is provided for the behavior of Elmar. G. Derge.

Crystallization in binary systems with eutectics. E. Raub. *Z. Metallkunde* 27, 77-83 (1935).—The grain size and structure in binary systems were observed by metallographic methods. It was found that these are both detd. by the characteristics of the primary constituent, but are also influenced by other factors which affect pure metals, such as size and shape of the casting, pouring temp. and rate of cooling. Expts. have shown that the structure has little effect on the mech. properties when the constituents have widely varying properties, but the structure is determinative when the components have similar properties. With 83% Ag-Cu alloy as an example of the latter type it is shown that recrystn. and deformation processes are similar to those in pure metals and solid solns., the distribution of phases having little importance. For this alloy it is shown that cold rolling leads to anisotropy, as in pure metals, as does subsequent recrystn., both effects being strongest at high reduction and high annealing temp. Demonstrated by data on extension and tensile strength, the first shows a max. on the latter a min. in test foils cut 45° to rolling direction. G. Derge.

The preparation of thin wires by freezing liquid metal jets G. Tammann and G. Moritz. *Z. Metallkunde* 27, 114-15 (1935).—By forcing low-melting metals through conical nozzles 0.04 to 0.1 mm. in diam., liquid jets 20 to 100 cm. long, resp. were formed. These solidified into wires which showed a variation in diam. of about 3%. Pressures of 3 to 5 atm. were used. With lower pressures, or liquids more than 40° above the m. p., the jets tended to break into droplets because of the action of surface tension. Smooth wires were obtained from Sn, Bi, Zn, Pb, Al, and the binary eutectics of Bi, Cd, Pb and Zn. Rough surfaces resulted from Cd and Sb. Good jets could not be obtained with Ag or Cu with pressures up to 13 atm. Wires of the pure metals contained single crystals up to 1 cm. long. G. Derge.

Determination of the heats of transformation of cobalt. H. v. Steinhilber and A. Schulze. *Z. Metallkunde* 27, 90-2 (1935).—See C. A. 29, 4253 (1935). G. Derge.

Some experiments with austenitic cast irons. P. A. Russell. *Foundry Trade J.* 53, 325-7 (1935). D. S. Temper brittleness in cast iron and the influence of nickel and molybdenum. J. E. Hurst. *Foundry Trade J.* 53, 572-3 (1935). D. S.

Endurance limit of black heart malleable iron. E. G. Mahin and J. W. Hamilton. *Trans. Am. Foundrymen's Assoc.*, Preprint No. 35-2, 7 pp (1935).—Malleable Fe contg. Si 1.00, C 2.44, Mn 0.31, S 0.072, and P 0.168% and having 55,340 lb per sq. in. tensile strength, 35,600 lb. per sq. in. yield point, and 18.6% elongation had an endurance limit of 30,600 lb. per sq. in. and an endurance ratio of 0.54. The few previously reported values for similar material are approx. 25,000 lb. per sq. in. The high value for such unround material as malleable Fe is attributed to the good resistance of the metallic phase to repeated stresses, which resistance is not impaired by the graphite nodules because of the absence of sharp projections thereon. The special polishing technique necessary to maintain the true outline of the graphite nodules is described.

Definitive investigation for the good preservation of older types of iron. K. Daevs. *Naturwissenschaften* 38, 653-6 (1935).—D. thinks, reasoning from recent corrosion exps., that the good corrosion resistant properties of older irons are due (1) to relatively high P and Cu contents, (2) to the protective layer formed after long use in contact with human skin or by annealing in inert oil or (3) to the former purity of the atm. under which conditions a very closely adhering protective film is formed.

Controlled atmosphere—applications to heating of steel. T. B. Beehtel. *Iron Steel Engr.* 12, 1-4 (Nov. 1935).—An illustrated discussion.

Controlled atmospheres in steel treating. H. W. Gillett. *Metals & Alloys* 6, 195-203, 204-7, 235-40, 263-8, 323-7 (1935).—A discussion of the character, cost, and action of different usable gases with a description of the furnaces in which to apply controlled atms. and a final article on "Correlation of Experiments and Experiences." The articles are profusely illustrated with photographs of furnaces and equipment for producing gases. Eighty-six references.

Thermal treatment of alloy tool steels. K. Saxton. *Heat Treating and Forging* 21, 618-19, 621 (1935). D. S.

Some factors relating to the strength of steels. Georges Delbart. *Rev. ind. minérale* No. 357, 607-22 (1935).—A review. The effects of varying chem. compn., thermal and mech. treatments on the strength and microstructure of steel are discussed and illustrated by numerous figures and photomicrographs.

Acceleration of structural reaction in steel by mechanical constraint. Pierre Chevillard and Xavier Waché. *Compt. rend.* 201, 877-9 (1935); cf. *C. A.* 29, 6551<sup>1</sup>.—Samples of a Cr-Mo-V steel (C 0.1, Cr 7.0, Mo 0.7 and V 0.2%) air-tempered and reheated for 1 hr. at 675° and then subjected to loads of 2.5-40 kg./sq. mm. at 450°, 500°, 550° and 600° were then subjected to an ordinary tensile test at the ordinary temp. (a), after which the resistivity (b), residual magnetism and coercive field (c) and dilatation (d) were detd. and micrographic exam. (e) was carried out. (a) shows a distinct softening increasing as the temp. at which the sample was loaded and the load itself was increased. As (b), (c) and (d) showed no physicochem. change this must be due to structural change, i. e., a coalescence of the carbide, though not scarcely visible in (e). Such a steel would only be satisfactory for loads not exceeding 8 kg./sq. mm. and temp. not above 600°.

Elastic limits of some structural steels. Georges Delbart and Hervé Prancelle. *Rev. ind. minérale* No. 355, 403-72 (1935).—Elastic limits are detd. for various alloy steels (Mn-Si, Ni-Cr-Mo, Cr-Mo-V) after various thermal treatments.

"Electric" transfer of carbon in solid steel. W. Seith. *Z. Elektrochem.* 41, 5-8 (1935).—The diffusion of atoms in substitutional and interstitial solid solns may primarily be a function of the differential ionization of the atoms involved in the solid soln. This idea is derived from the electron gas concept of the structure of metals. In the Pd-H system the elec. transfer of H ions in the Pd has been definitely shown. Similarly the transfer of Al ions in an Au-Pb alloy (0.02% Au at 200°) has been less

well established. In the present investigation Arceco wires 0.15 cm. in diam. were used. A Cu covering 0.03 mm. thick was plated on a wire 30 cm. long in zones 1 cm. long sep'd. by bare wire zones of 2-3 cm. long. These wires were then carburized in city gas for 2 hrs. at 970°. The C content of those sections of the wire not protected by Cu averaged 1%. The wires (thus prep'd) were then heated *in vacuo* in a glass tube at about 1000°. Under these conditions exps. were made where (a) no current was passed through the wire, (b) a.c. was passed and (c) where a d.c. was passed through the wire for 250-500 amp hrs. Photomicrographs and elec. cond. measurements were made to det. the transfer of C. The relation between the diffusion const.  $D$  and the ionic molality  $B$  is  $D = BRT/nF$ , where  $R$  is the gas const.,  $T$  the abs. temp. and  $F$  the electrochem. equiv.  $D$  was detd. from a.c. measurements of resistance to be 0.083 sq. cm./d. By use of this value of  $D$  and the assumption of singly ionized Cations,  $B$  is calc'd. to be 0.825  $10^{-4}$  cm./sec. in its field of 1 v./cm. Values of  $B$  calc'd. from cond. and max. of C move are 1.6 and 2.2  $10^{-4}$  sq. cm./sec. for the same field. This indicates that, on the av., the C ion is more than singly ionized.

Measurement of thermoelectric forces of some alloys at temperatures from 25° to 17.5° absolute. W. H. Keesom and C. J. Mattheijs. *Physica* 2, 623-32 (1935).—The thermoelec. force was measured relative to a normal Ag alloy wire of Ag-Au alloys and alloys of Au with Fe, Co, Ni, Mn or Cr at temps. from 25° to 17.5° abs. In most of the Au-Fe and Au-Ni alloys a neg. max. appears at lower temp. of admixt. Tables and curves are given for each combination. For practical use in thermometry at liquid He or H<sub>2</sub> temps. the alloy of Au with 1 or 2% Cu against normal Ag + 0.37 at % Au gives the largest thermoelec. force; the Au + 1.89 at % Fe alloy is likewise useful. All alloys tested give neg. potential against the Ag alloy normal.

Surface preparation and painting of magnesium alloys. A. W. Winston, J. B. Reil and W. H. Gross. *Ind. Eng. Chem.* 27, 1333-7 (1935).—Data on preferred procedure for obtaining proper paint adhesion and protection against sea water are given. The HNO<sub>3</sub>-K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> pickle treatment and the effect of various factors in its operation and control upon subsequent paint adhesion are described. Most iridescent coatings are preferred to bright yellow ones. The effect of the compn. of primers and finishing coats, especially of inhibitory pigments such as Zn chromate, on adhesion and protection is discussed and typical satisfactory paint schedules are given.

Recent developments in light-alloy platings. H. J. Maloney. *J. Inst. Production Engrs.* 14, 495-506 (1935).

Oxide film of alloys containing small percentages of aluminum. Ichiro Itaka and Shinzo Miyake. *Proc. Imp. Acad. (Tokyo)* 11, 256-7 (1935); *Nature* 136, 437 (1935).—Cu alloys contg. 2-36% Al show practically no oxide formation (scales) when heated for hrs. at red heat. Cathode ray photographs show that the alloy is protected by a film of Al<sub>2</sub>O<sub>3</sub>.

Liquation phenomena in cast bolt and bar brass. Ch. Bernhoft. *Z. Metallkunde* 27, 115-10 (1935).—A 55% Cu, 40% Zn and 2% Pb brass was cast into uncoiled cylindrical molds 160 mm. in diam. and 800 mm. long. Measurements showed that the Pb content and Brinell hardness were both low in the center of the middle section. A 64% Cu, 36% Zn brass was cast into both water-cooled and uncoiled molds 600 X 65 mm. in cross section by 780 mm. high. The Cu content was low in the center at the top, middle and bottom of the casting.

Hardenable copper nickel-tin bronzes. I. Sandcast alloys. F. Feiz. *Korrosion u. Metallschutz* 11, 217-29 (1935); cf. *C. A.* 29, 6054<sup>4</sup>.—The field of Sn bronzes capable of improvement by heat treatment is reviewed and 28 references are given. A large no. of cast alloys, contg. 0.25% Mn, 2% Zn, and up to 10% Sn and 40% Ni was investigated, mainly by Rockwell hardness measurements. A new  $\alpha$ -phase boundary is proposed for the system Cu-Ni-Sn, comprising a wide scope of improvable

alloys. All alloys within the limits of 10% Sn and 40% Ni could be rendered mechanically workable by homogenizing. The progress of hardening during tempering periods of 100 hrs. at various temps. was investigated on typical alloys of this group. A max. improvement effect was observed with about equal parts of Sn and Ni. The max. hardness values, contrary to the rate of hardening, were proportional to the degree of supersatn. Alloys with sufficient supersatn. showed a close relation between the m. p. and the rate of hardening. Ni improved the mech. properties of bronze sand castings, especially the elongation and the proportional limit. With increasing excesses of Ni, the characteristics of Ni-Cu alloys were approached. Economic advantages of these alloys are seen in the improvement of the mech. properties by heat treatment and in the substitution of half of the Sn by Ni.

Leopold Pessel

The hardness of sprayed metal coatings. Kessler and Th. Everts. *Z. Metallkunde* 27, 104-11 (1935).—Sprayed metallic coatings of Zn, steel, V2A, Cu, Al and monel are discussed. The effects of temp of the basis material, distance of spray or from the material, gas pressures, types of spray aim, feeding speeds, and rates of coverage upon structure, scratch hardness, and Brinell no. are discussed and optimum conditions given.

G. Derge

Effect of alkaline detergents upon metals. Aluminum, copper, tin and zinc. Chester L. Baker. *Ind. Eng. Chem.* 27, 1358-64 (1935).—Strips of the metals were immersed in solns. of NaOH, Na<sub>2</sub>CO<sub>3</sub>, trisodium phosphate, Na metasilicate and 6 other Na silicate solns. of various SiO<sub>2</sub>/Na<sub>2</sub>O ratios. The loss of wt after various periods of immersion at 60° in various concns. of the liquids was detd. and the surface attack observed. The silicates of soda impaired the surfaces less than the other alkalis considered, with the exception of the behavior of the Na<sub>2</sub>CO<sub>3</sub> soln. toward Zn. Among the silicates, an increasing ratio of SiO<sub>2</sub> to Na<sub>2</sub>O seemed to give greater protection. A method of obtaining a more siliceous silicate soln., and thus greater protection, by adding to Na metasilicate a less alk. substance, such as Na acid phosphate, is outlined.

Leopold Pessel

The possibility of preventing corrosion in hot-water systems. L. W. Haase. *Gesundh.-Ing.* 58, 621-4 (1935); cf. C. A. 29, 4496\*, 7203\*.—Factors responsible for corrosion in various types of hot-water systems and means of combating such corrosion are reviewed.

M. G. Moore

The corrosion of aluminum. J. M. Bryan. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 187-95 (1935).—The corrosion of Al by citric acid was studied for 14 days at 25° and for 3 days at 75° by immersing 3 X 1 in strips for 1/3 of their length in 130 cc of soln. in the presence of air; daily readings of the gas buret gave an indication of the type of corrosion occurring and, where necessary, a gas analysis was carried out at the end of the tests. In the absence of citric acid, a 2% NaCl soln. and a similar soln. contg. 25% sucrose had little or no effect in contact with Al, either at 25° or at 75°; in presence of a concn. of NaCl greatly acted as an inhibitor. A purified Al (99.5%) corroded more rapidly in 1% citric acid than an ordinary com. sample (99.2% Al), and an alloy contg. 3.5% Mg, 0.5% Mn and 0.7% impurities corroded at about the same rate as the purified Al; fine abrasion of the surface with emery increased the rate of corrosion about 10-13%. A study of the effects of variation in pH at 25° and 75° showed that NaCl has a much greater effect at 25° than at 75°; at 25° the rate of corrosion increased greatly with increase in H-ion concn., and was mainly of the oxidation type; at 75° corrosion was stimulated only below pH 3.0, there being inhibition at higher pH values and the corrosion being mainly of the H-evolution type over the whole pH range. At 25°, on varying the NaCl concn. from 0 to 3% and keeping the citric acid const. at 0.5%, there was marked stimulation of the H-evolution type of corrosion when the concn. of NaCl exceeded about 1%; when the NaCl concn. was kept const. at 1.5% and the citric acid varied from 0 to 2%, the H-evolution type of corrosion was practically a linear function of the citric acid concn. At 75° an increase in

the amt. of NaCl in unbuffered 0.5% citric acid soln. greatly increased the rate of corrosion; in solns. buffered to pH 4.0 with 1.5% of Na citrate, the effect was relatively small, there being a slight retardation of corrosion with concns. less than about 2% NaCl and a slight stimulation at higher concns. The relative rates of corrosion of Sn and Al in citric acid for 3 days at 75° were approx. the same for pH 4-5.5, but below pH 4 the corrosion of Sn was much faster for the limited period, being nearly double that of Al at pH 2.4; the corrosion of the Sn was mainly of the oxidative type and would cease when the O was exhausted, while that of Al was of the H-evolution type and would continue until the acid was neutralized. A study of the corrosion of Al by fruit exts. showed considerable corrosion at 75° by gooseberry and black currant, moderate corrosion by preengage, red currant, strawberry and raspberry, and small or negligible corrosion by cherry and blackberry; at 25° corrosion was relatively slow, and little or no H was evolved; the results indicate that factors other than H-ion concn. and total acidity influence the rate of corrosion. From results obtained with blackberries and cherries it seems likely that these fruits tend to form a film on Al at 75°, but this was not sufficiently protective to prevent the formation of H-swells in an actual canning test.

A. Papineau-Couture

Influence of certain organic hydroxy compounds on the corrosion of iron in oxygenated salt solutions. W. Stewart Patterson and R. C. A. Culbert. *J. Soc. Chem. Ind.* 54, 327-317 (1935). cf. C. A. 28, 6630\*.—The corrosion of mild steel strip contg. 0.15% C in 0.01 N K<sub>2</sub>SO<sub>4</sub> soln. was observed for a period of 340 hrs. At intervals, the specimens were weighed and the O<sub>2</sub> content of the soln. was detd. The corrosion product was Fe(OH)<sub>2</sub> and a thin, strongly adhering film of ferrous-ferrie oxide which furthered corrosion by differential aeration and was due to the reducing action of the metal. At a low O<sub>2</sub> concn., the rate of corrosion was directly proportional to it. At higher concns. the corrosion was more rapid and became ultimately const. and independent from further increases in the O<sub>2</sub> concn. In another series, fasting 72 hrs., erythritol and mannitol were added in varying amts. Up to a crit. concn. of these addns., corrosion was retarded apparently by adsorption of the inhibitor to the corrosion product, which thus became softer, less adherent, and therefore less conducive to differential aeration. At higher concns., beyond the crit. point, the inhibitor's retarding action was due to peptization of the corrosion product and further elimination of differential aeration. No evidence of inhibition due to adsorption on the metal surface could be observed. In other series, extending for 72 hrs., the effects of 5 inhibitors, i. e., mannitol, mesoerythritol, sorbitol, glycerol and glycol, were compared. The amt. of retardation was controlled by the quantity of inhibitor present, the no. of OH groups per mol. of inhibitor, and the space arrangement of the OH groups within the mol.

Leopold Pessel

Corrosion of wrought iron pipes by water. Wilhelm Rädker. *Ges.-u. Wasserfach* 78, 793-4 (1935).—The conditions under which ferrous metal pipes are used are as important as the compn. of the metal. Analyses of the corrosion products are valuable in detg. the causes of corrosion. In one case, deposits from a pipe which had failed in a short time showed high carbonate content, because of the high CO<sub>2</sub> content of the water. In the absence of O<sub>2</sub>, deposits consist of equal parts of FeO and Fe<sub>2</sub>O<sub>3</sub>, in the presence of dissolved O<sub>2</sub> the latter predominates. A case of local corrosion of a pipe due to O<sub>2</sub> is discussed.

R. W. Ryan

Development of specifications for protection of underground pipes. K. H. Logan. *Ind. Eng. Chem.* 27, 1354-7 (1935); cf. C. A. 28, 85\*.—The more important results of pipe-coating research are summarized and the essentials of an adequate protective coating are given. The need for quant. data on the properties of pipe coatings and for specifications for coatings suitable for various soil conditions is stressed. Such specifications can be developed from available and obtainable data.

Leopold Pessel

Effect of various inorganic substances on the corrosion

of mild steel by citric acid at about  $pH$  3.5. T. N. Morris *Dept Sci Ind Research, Rept Food Investigation Board* 1934, 180(1935).—Aq solns were prepd contg 10 g citric acid and 5 g Na citrate per l, together with 0.01 and 0.05 M  $Na_2HPO_4$ , 0.01 and 0.05 M  $NaNO_3$ , 0.01 and 0.05 M NaCl, and 0.01 mg per l  $K_2Cr_2O_7$ , resp. Corrosion tests carried out on 3 X 1 in strips of steel at 25° for 3 days showed that  $Na_2HPO_4$  had a much greater buffering effect than any of the other salts. This effect was shown to be responsible for the diminished corrosion observed.

A. Papineau-Couture  
The corrosion of tin. J. M. Bryan *Dept Sci Ind Research, Rept Food Investigation Board* 1934, 177-9 (1935).—Expts were carried out to ascertain the effects of NaCl and sucrose, resp., on the rates of corrosion of Sn by solns of citric acid at 25° and 75° in presence of a limited amt of air. Addn of 2% NaCl had a slight inhibiting effect in corrosion, which was more pronounced on untreated specimens than on those in which the surfaces of the metal had been abraded with fine emery. Addn of 1% NaCl to a 0.5% citric acid soln of  $pH$  2.4 at 25° had no effect, but as the  $pH$  increased to 5.5 (by addn of Na citrate buffer) there was a slightly increasing inhibiting effect. Addn of 25% sucrose at 25° produced an appreciable inhibition over the whole  $pH$  range studied, the rate of corrosion being reduced to  $1/2$  at  $pH$  2.4 and to  $1/3$  at  $pH$  5.5. At 25°, addn of varying amts of sucrose to 0.5% citric acid soln progressively retarded the rate of corrosion as the concn. increased. This inhibition seems to be due mainly to the effect of sugar in reducing the soly of air in the solns, since the corrosion (like that in plain citric acid solns) was entirely of the oxidative type. At 75°, concns of less than 15% sucrose inhibited corrosion, while greater concns stimulated it, the latter effect, however, may have been due to the action of one or more of the decompn products formed by caramelization. Addn of Sb to the Sn produced a small reduction in corrosion, amounting to 8% with 0.25% Sb and to 11% with 0.5%, larger addns did not give further reduction.

A. Papineau-Couture  
Are welding in argon gas. Gilbert E. Doan and Wm C. Schulte *Elec Eng* 54, 1144-9(1935).—Research work in a gas reveals 3 phenomena not previously assoc. with the welding arc: (1) the impossibility of maintaining a stable arc in highly purified A under ordinary conditions, (2) the absence of all crater formation under pure Fe in pure A, and (3) the absence of all observable "pinch effect" accompanying the detachment of the Fe globules from the electrode wire. The melting rates per kw.-hr in A and in air are approx. equal. Pure Fe welds made in A possess high ductility, 90% reduction of area and 30% elongation. The app for exptl welding in pure gases is illustrated and welding methods are described. W. H. Boynton

Metallic contaminations of foods (Datta) 12. Al in the food industries (Akers) 12. Steel alloys in food manu. (Montelli) 12. Ni and its alloys (LaQue) 12. Cu, brass and bronze in the food industries (Cole) 12. Cu alloys in food manu. (Kemp) 12. Sn as an anticorrosion coating (Conser) 12. Pb in the food industries (Wormser) 12. Inhibitors [of corrosion] (Evans) 4. Corrosion of metals by contact with leather (Innes) 29. Thickness of the amorphous layer on polished metals (Hopkins) 2. Oxidation of metals (Preston, Bircumshaw) 2. Analytl triethiocarbonates [for use as ore flotation agents] (U. S. pat 2,021,726) 10. Coloring Al and its alloys (Ger. pat 619,163) 4. Tunnel kiln (Ger. pat 612,524) 19.

Froth-flotation concentration. Carl G. R. Melzer. Brit 432,105, July 22, 1935. Addn to 407,963 (C. A. 28, 5030). Precious metals or their comds such as selenides or tellurides are concd from their ores by froth flotation in a pulp contg a small amt of 1 or more of the sulfides and (or) tho salts of Cu, Ag, Pb or Hg, formed by coagulating, e. g., by heating or by slow agitation, very finely divided or colloidal particles of the sulfide or tho salt. Examples are given of the concn. of the precious metal in a pyritic Au ore and in an ore free from pyrites.

1 Apparatus for concentrating gold ores. Eldred A. Knapp and Wm. R. Bates. Brit. 432,677, July 31, 1935. Au or Au ore is concd by causing the pulp to flow down a stationary inclined table or strake that is adjustable between 2 limiting inclined positions in 1 of which it communicates with a tailings launder and in the other with a concentrates launder, the upper surface of the table or strake being covered by a detachably mounted blanket consisting of a sheet of rubber having a riffling, undulating, pitted or other irregular surface.

Gold for dental use. Baker & Co., Inc. Brit 432,881, July 30, 1935. Spongy, cohesive Au for fillings is prepd by pptg Au from soln, heating the ppt in a high-boiling liquid, e. g., concd  $H_2PO_4$  or concd  $H_2SO_4$ , at 150-250° and washing and drying. Preferably, a  $AuCl_3$  soln is neutralized by an alkali, heated to 80° and the Au pptd by (COOH), or  $NaNO_3$  added in excess, the soln and ppt are then boded and any Au remaining in soln is pptd by (COOH), if  $NaNO_3$  was used for the 1st pptn or by (COONa), or an alkali if (COOH), was used. The  $pH$  should be 6-7 at this point. The liquid is decanted and the ppt washed in  $H_2O$ , heated to 150-250° in conc.  $H_2SO_4$ , repeatedly washed with dist.  $H_2O$  and dried below 100°.

Obtaining metals such as tin, zinc or iron from ores. Hendrik J. J. Janssen (to Shell Development Co.). U. S. 2,019,785, Nov. 5. An ore such as an oxide of Sn, Zn or Fe is suspended in a liquid fuel such as oil and a suspension stabilizer such as a soap is added, the resulting slurry is atomized and burned with air in such quantity that only incomplete combustion takes place and the ore is reduced. App. is described.

Iron ores. Georges Gredt. Fr. 785,085, Aug. 16, 1935. Oolitic Fe ores are enriched by calcining the ground ore at a temp. near the fusing point of the ore sufficiently long to transform the oolitic grain to  $Fe_2O_3$  and/or to obtain sufficient hardness and d. of the oolites. The ore is then cooked with water.

Testing lithium-bearing ore. Raymond J. Kepner and Robert Plantier (to Grasselli Chemical Co.). U. S. 2,022,003, Nov. 26. An ore such as a hydrolite ore is calcined with at least one-third as much  $CaCl_2$  at a temp. of about 700-930°, and Li values are extd. with water.

Zinc ores. Associated Metals & Minerals Corp. Fr. 784,884, July 27, 1935. Impurities such as Pb and Cd are removed from ores of Zn by adding chlorinating agents and heating to 1300-1500°. The chlorinating agent ( $NaCl$ ) is added to the charge in the form of solid particles and is mixed with water in such amt., or is heated so rapidly that the chlorinating agent remains practically undissolved.

Apparatus for vaporizing zinc. The New Jersey Zinc Co. Ger. 616,891, Aug. 5, 1935 (Cl. 40a. 34.80).

Apparatus for fractional condensation of metal vapor such as zinc and cadmium in a condenser rotating about a horizontal axis. Arthur Leyser (to Fried. Krupp Grusonwerk A.-G.). U. S. 2,021,365, Nov. 19. Various structural and operative details.

Refining metals. Victor Hertl. Austrian 142,886, Sept. 25, 1935 (Cl. 182). Fused metals are degassed by the action of supersonic vibrations of a frequency of 60,000 or more. Methods of procedure are indicated.

Refining nickel. Societ  d'electrochimie, d'electrometallurgie et des aceries electriques d'Ugine. Brit 432,439, July 25, 1935. See Fr. 785,165 (C. A. 28, 6037) and Ger. 594,651 (C. A. 28, 4395\*).

Apparatus for fuming or roasting ores. Allmanns Ingenieurbyran H. G. Torulf. Fr. 785,382, Aug. 8, 1935.

Roasting sulfide ores. Verein f r chem. und metallurgische Produktion. Ger. 619,313, Sept. 27, 1935 (Cl. 40a. 2.01).

Oscillating tubular furnace with horizontal hearth, particularly for roasting ores. Metaliges A.-G. (Hans Klencke and Manfred Sachs, inventors). Ger. 619,364, Sept. 28, 1935 (Cl. 40a. 6.01).

Oscillating furnace with an elongated hearth suitable for ore treatment. Hans Klencke and Manfred Sachs (to American Lurgi Corp.). U. S. 2,019,912, Nov. 5. Structural and mech. features.

Siemens-Martin furnace. "Termin" Società per l'Industria e l'Elettricità. Ger. 616,593, Aug. 1, 1935 (Cl. 186 14 05). Details of the furnace head are given.

Sintering plant. Humboldt-Denkmotoren A.-G. Ger. 616,611, July 30, 1935 (Cl. 40a. 3 60). Details of a traveling grate are given.

Rotating-drum melting furnace. Wm. F. Wiltshire. Ger. 616,732, Aug. 6, 1935 (Cl. 31a. 2 30).

Apparatus for melting metals such as various non-ferrous metals. John W. Brown U. S. 2,020,191, Nov. 5.

Melting steel scrap in shaft furnace. Mathias Frankl. Ger. 616,457, Oct. 1, 1935 (Cl. 19a. 6 01). A method of charging the furnace is described.

Blast furnace top. Karl F. Juengling U. S. 2,021,555, Nov. 19.

Heat storage for blast furnaces. Steinhilber and Thon-Industriegesellschaft "Brohlthal" (Edward Pohl, inventor). Ger. 616,518, July 30, 1935 (Cl. 19a. 14).

Apparatus for regenerative heating of gases such as in blast-furnace operation. Percy H. Royster (to Research Corp.). U. S. Reissue 19,767, Nov. 12. A reissue of original 1,849,371 (Cl. A. 28, 1318).

Apparatus (with a selenium cell) for determining the temperature of molten metals. Irrel L. Collins and Carl Osland. U. S. 2,020,019, Nov. 5. Light which serves to reflect a Se cell or the like passes through a tube one end of which is immersed in the molten metal.

Melting and casting iron. Wm. A. Brown (to Carborundum Co.) U. S. 2,020,171, Nov. 5. In remelting iron and forming castings from it, SiC is brought into contact with the molten iron in the presence of a substantial quantity of slag, and serves to facilitate obtaining of sound castings.

Increasing the carbon content of cupola-melted iron. Theodore Takl, Jr. (to Marie C. Takl). U. S. 2,021,189, Nov. 19. For increasing the C in cupola-melted iron having a relatively high C content, there is added to the molten metal, after it leaves the cupola, a mixt. of carbonaceous material such as graphite or charcoal about 80 and NaNO<sub>2</sub> about 20%.

Apparatus for manufacture of hollow ingots such as those of steel. Ernest J. Jones (to Emerson-Jones Ltd.). U. S. 2,019,820, Nov. 5. Structural and mech. features.

Isolating unsound metal from ingots. Geo. A. Dornin. U. S. 2,021,227, Nov. 19. A gap or crevice is formed between a core including the unsound metal to be isolated and the surrounding zone of metal, without substantial displacement of the core axially of the ingot to divide the core into such zone, and the zone is then displaced away from the core. App. is described.

Casting magnesium. Österreichisch Amerikanische Magnesit A.-G. Austrian 142,935, Oct. 10, 1935 (Cl. 31b). Molds for casting Mg are coated with a sulfide of Sb or Bi on the surfaces with which the Mg comes into contact. Pore-free castings of smooth, corrosion-resisting surface are obtained.

Metal containing compositions. Heinrich Borobski. Brit. 422,278, July 21, 1935. A colloidal mixt. of a metal with a non-alloyable additive substance, e. g., graphite, is made by wetting the latter, before its addition, to the molten metal, with a liquid, e. g., H<sub>2</sub>O, glycerol, oil, that completely evaps. In the metal, in a modification, a mixt. of the metal, additive substance and wetting liquid is heated until the metal is melted and the liquid completely evaps. The invention is suitable for the production of bearing metals or alloys having Cu, Pb, Zn, Sn or Al bases. In the manuf. of bronzes and like alloys, a component, e. g., Zn, Sn, may be added to the additive substance as a fine powder before or after the wetting but prior to the addition of the wetted substance to the molten metal. App. is described.

Recovering light metals. F. L. du Pont de Nemours & Co. Brit. 432,810, Aug. 2, 1935. To recover Na, etc., from the sludges produced in the production of light metals by the electrolysis of fused metal salts or to recover a substantially light metal from a mixt., the sludge is introduced into a bath of molten salt of sp. gr. higher than that of the

metal or alloy to be recovered and of a compn. such that the metallic constituents of the sludge do not react with it or such that 1 or more of such constituents react with 1 or more of the constituents of the bath to form a metal or metals, the bath being maintained above the m. p. of the metal or alloy to be recovered, such metal or alloy being floated off. App. is described.

Aluminum. I. G. Luthenium. A.-G. (Rich. Noack, inventor). Ger. 602,811, May 25, 1935 (Cl. 12a. 20). Al or its alloys are used in app., etc., which comes into contact with halo-derivatives of H<sub>2</sub>SO<sub>4</sub>, such as SOCl<sub>2</sub>, SO<sub>2</sub>Cl<sub>2</sub>, and ClHSO<sub>3</sub>, or with SO<sub>2</sub>.

Aluminum. Karl Mitterhiller and Walter Frühwein. Ger. 607,601, July 9, 1935 (Cl. 40a. 20 01). Al is obtained from Al<sub>2</sub>O<sub>3</sub> by treating a mixt. of Al<sub>2</sub>O<sub>3</sub> and C with AlH<sub>3</sub>, AlI<sub>3</sub> or AlBr<sub>3</sub>, and decomposing the product to Al halide and metallic Al by heating. An example is given. Cl. C. A. 29, 7174.

Copper. The American Metal Co. Ltd. Ir. 781,923, July 29, 1935. In casting deoxidized Cu contg. a small amt. of deoxidant such as P a layer of water is added to the mold and further water is added at the same time as the metal in amt. sufficient to maintain a layer of water above the metal in the mold. An improved surface on the casting is thereby obtained.

Apparatus for hardening iron rails by treatment with liquids. Les petits fils de France de Wendel. Ger. 619,219, Sept. 26, 1935 (Cl. 18c. 2 23).

Hardening steel. Firma Adolf Thöl. Ger. 619,158, Oct. 1, 1935 (Cl. 18c. 1 70). Phosphate-contg. residues from the treatment of soybeans are added to oil baths used for hardening steel. The infusibility of the baths is thus reduced, and their hardening action is modified.

Tempering and cementation baths. Arrigo Consoulti. Ir. 781,933, Aug. 13, 1935. The bath is composed of NaCN, K<sub>2</sub>CO<sub>3</sub> (preferably 37), NH<sub>4</sub>Cl, 1, H<sub>2</sub>Cl<sub>4</sub>, 45, Na<sub>2</sub>CO<sub>3</sub>, 7, NaCl 10 and graphite 0.5% part.

Pickling acid. Vereinigte Stahlwerke A.-G. (Wilhelm Mühlendyck and Heinrich Mainz, inventors). Ger. 616,842, Aug. 8, 1935 (Cl. 48d. 2 02). Steam is led into waste H<sub>2</sub>SO<sub>4</sub> from C<sub>2</sub>H<sub>4</sub> and mineral-oil refineries at 80° for 1/2 to 1 hr., or the waste acid is diluted to 35-40 BE, and heated to 90° for the same time, to give H<sub>2</sub>SO<sub>4</sub> suitable for use in pickling or descaling Fe or steel.
